Circuit Testing Procedures - Non-DTC-Based Diagnostics - Ram Pickup

WARNING

WARNING

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING: **Always wear safety glasses for eye protection.**

WARNING: **Use safety stands anytime a procedure requires being under a vehicle.**

WARNING: **Be sure that the ignition switch always is in the off position, unless the procedure requires it to be on.**

WARNING: **Set the parking brake when working on any vehicle. An automatic transmission should be in park. A manual transmission should be in neutral.**

WARNING: **Operate the engine only in a well-ventilated area.**

WARNING: **Keep away from moving parts when the engine is running, especially the fan and belts.**

WARNING: **To prevent serious burns, avoid contact with hot parts such as the radiator, exhaust manifold(s), tail pipe, catalytic converter and muffler.**

WARNING: **Do not allow flame or sparks near the battery. Gases are always present in and around the battery.**

WARNING: **Always remove rings, watches, loose hanging jewelry and avoid loose clothing.**

DESCRIPTION

CIRCUIT FUNCTIONS

All circuits in the diagrams use an alpha/numeric code to identify the wire and its function. To identify which circuit code applies to a system, refer to the Circuit Identification Code Chart below. This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

CIRCUIT IDENTIFICATION CODE CHART

CIRCUIT	FUNCTION
A	BATTERY FEED
B	BRAKE CONTROLS
C	CLIMATE CONTROLS
D	DIAGNOSTIC CIRCUITS
E	DIMMING ILLUMINATION CIRCUITS
F	FUSED CIRCUITS
G	MONITORING CIRCUITS (GAUGES)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WIRING HARNESS TESTING

TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

- Jumper Wire - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

  WARNING: Never use a jumper wire across a load, such as a motor, connected between a battery feed and ground.

- Voltmeter - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

  CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

- Ohmmeter - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

  CAUTION: Most of the electrical components used in today's vehicles are Solid State.

When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

1 - SPECIAL TOOL 6801
2 - PROBING END

- Probing Tools - These tools are used for probing terminals in connectors. Select the proper size tool from Special Tool Package (special tool #6807, Terminal Tools), and insert the probing end (2) into the terminal being tested. Use the other end of the tool (1) to insert the meter probe.

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture
- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

1. Verify the problem.
2. Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to the appropriate wiring diagrams.
3. Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
4. Isolate the problem area.
5. Repair the problem area.
6. Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the appropriate wiring diagrams.

STANDARD PROCEDURE

CHECK A BATTERY OR IGNITION VOLTAGE CIRCUIT WITH A 12-VOLT TEST LIGHT

DIAGNOSTIC TEST

Fig. 2: Checking For Voltage Using 12-Volt Test Light
Courtesy of CHRYSLER GROUP, LLC

1.

   1. Turn the ignition off.
   2. Disconnect the wire harness connector of the component that is receiving the voltage.

   NOTE: Check connectors - Clean/repair as necessary.

3. At this time, leave all in-line connectors connected.

NOTE: **Before inspecting any circuits, first test the 12-volt test light. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery +. If the test light is good, it should illuminate brightly.**

4. Connect the 12-volt test light to a known good ground.
5. Use the test light lead to carefully probe the Battery or Ignition Voltage circuit in the harness connector.
6. First check with the ignition off, next check with the ignition on, and lastly check while cranking the engine.

   Does the test light illuminate brightly?

   Yes

   - The circuit is not open at this time or the condition that originally caused the open may not be present at this time. Continue to monitor the test light and wiggle the wire harness and connectors to check for an intermittent open or excessive resistance condition.
   - Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   No

   - Repair the open in the circuit. Use the wiring application as a guide to trace the circuit and look for any in-line connectors where the short could occur.
   - One way to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.
   - If this is a fused circuit, make sure to inspect the fuse. If the fuse is open, check the circuit for a short to ground before installing a new fuse. The circuit may have a short to ground causing the fuse to open. This short to ground could be in the wire harness or in one of the components the circuit is supplying voltage to.

CHECK A CIRCUIT FOR A SHORT TO GROUND

DIAGNOSTIC TEST

Fig. 3: Measuring Resistance Between Ground And ECT Sensor Signal Circuit In Sensor Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1.

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuit suspected as being shorted to ground.

NOTE: **Check connectors - Clean/repair as necessary.**

NOTE: **Before checking the circuit for a short to ground, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the**

resistance between ground and the circuit being checked. The leads of the meter can add up to or over 0.5 of an Ohm of resistance.

3. With the component wire harness connectors disconnected, use a meter set to measure Ohms (?), and measure the resistance between the circuit and a known good ground.
4. Use the negative lead of the meter and touch a known good ground.
5. Use the positive lead of the meter and carefully probe the circuit suspected as having the short.

   Is the resistance to ground below 10k Ohms ?

   Yes

   - Repair the short to ground. Use the wiring application as a guide to follow the path of the circuit.
   - One way to help isolate the short is to disconnect any in-line connectors that the circuit being tested runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

   No

   - The circuit is not shorted to ground or the condition that originally caused the short may not be present at this time. Continue to measure the resistance, wiggle the wire harness and connectors while checking for an intermittent short.
   - Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK A CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

Fig. 4: Testing For Voltage Potential
Courtesy of CHRYSLER GROUP, LLC

The purpose for the following procedure is to show different methods of checking the voltage of a circuit. When diagnosing a DTCs it might be necessary to verify that proper voltage is on a circuit or that a circuit is not shorted high. Below are four examples of checking the voltage in a circuit.

Test Procedures
CHECKING FOR VOLTAGE ON A CIRCUIT, Refer to 1.
CHECKING FOR A SHORT TO BATTERY VOLTAGE USING A MULTIMETER, Refer to 2.
CHECKING FOR A SHORT TO IGNITION VOLTAGE USING A MULTIMETER, Refer to 3.
CHECKING FOR A SHORT TO VOLTAGE USING A 12-VOLT TEST LIGHT, Refer to 4.

DIAGNOSTIC TEST

1. **CHECKING FOR VOLTAGE**

Fig. 5: Measuring Voltage On ECT Sensor Signal Circuit Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The connector displayed in the graphics are only an example.

1. Turn the ignition off.
2. Disconnect the wire harness connector of the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground circuit.
6. Use the positive lead of the multimeter and probe the circuit you are checking for voltage.

7. Ignition on, engine not running.

   Is the voltage within specifications for this circuit?

   Yes

   - The circuit is functioning properly or the condition that originally caused the open or short may not be present at this time. Continue to measure the voltage and wiggle the wire harness and connectors while checking for an intermittent open or short.
   - Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins that may apply.

   No

   - Repair the open or short to ground in the circuit. Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur.
   - One way to help isolate the open or short is to disconnect any in-line connectors that the circuit being checked runs through and check for the voltage again. If the voltage is present, the open or short is on the other side of the in-line connector.

2. **CHECKING FOR A SHORT TO BATTERY VOLTAGE USING A MULTIMETER**

Fig. 6: Checking For Short To Battery Voltage Using Multimeter
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuit that is suspected as having a short.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground circuit.
6. Use the positive lead of the multimeter and probe the circuit you suspect has a short.

Is there any voltage present?

Yes

- Repair the short to battery voltage. Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One way to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the voltage and wiggle the wire harness to check for an intermittent short.

NOTE: **By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring application as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an Ohm meter. Refer to STANDARD PROCEDURE and perform the CHECK FOR A SHORT BETWEEN MULTIPLE CIRCUITS diagnostic procedure.**

- Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

3. **CHECKING FOR A SHORT TO IGNITION VOLTAGE OR TO CHECK FOR VOLTAGE ON A CIRCUIT USING A MULTIMETER**

Fig. 7: Measuring Voltage On ECT Sensor Signal Circuit Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected as being shorted.
3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground circuit.
6. Use the positive lead of the multimeter and probe the circuit you suspect has a short.
7. Ignition on, engine not running.

   Is any voltage present?

Yes

- Repair the short to ignition voltage. Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One way to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the voltage and wiggle the wire harness to check for an intermittent short.

NOTE: **By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring application as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an Ohm meter. Refer to STANDARD PROCEDURE and perform the CHECK FOR A SHORT BETWEEN MULTIPLE CIRCUITS diagnostic procedure.**

- Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

4. **CHECKING FOR A SHORT TO VOLTAGE USING A 12-VOLT TEST LIGHT**

Fig. 8: Checking For Voltage Using 12-Volt Test Light
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected as being shorted.

   NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.

NOTE: **Before inspecting any circuits, first test the 12-volt test light. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery +. If the test light is good, it should illuminate brightly.**

4. Connect the 12-volt test light to a known good ground circuit.
5. Use the lead of the test light and carefully probe the circuit you suspect has a short.

WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

6. First, check with the ignition off, next with the ignition on, and lastly while cranking the engine.

   Does the test light illuminate brightly?

   Yes

   - Repair the short to voltage. Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur.
   - One way to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

   No

   - The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness to check for an intermittent short.

     NOTE: **By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring application as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an Ohm meter. Refer to STANDARD PROCEDURE and perform the <u>CHECK FOR A SHORT BETWEEN MULTIPLE CIRCUITS</u> diagnostic procedure.**

   - Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related component and wire harness connectors.

- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK A GROUND CIRCUIT FOR AN OPEN USING A 12-VOLT TEST LIGHT

DIAGNOSTIC TEST

Fig. 9: Using 12 Volt Test Light Connected To 12 Volts To Check Ground Circuit In Stop Lamp Switch Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1.
    1. Turn the ignition off.
    2. Disconnect the wire harness connectors of the components that contain the ground circuit suspected as containing excessive resistance.

        NOTE: Check connectors - Clean/repair as necessary.

    3. At this time leave all in-line connectors connected.

        NOTE: Before inspecting any circuits, first test the 12-volt test light. Connect

the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery +. If the test light is good, it should illuminate brightly.

4. With all the component wire harness connectors disconnected, connect the 12-volt test light to Battery +.
5. Use the test light lead to lightly probe the ground circuit in the harness connector.

   Does the test light illuminate brightly?

   Yes

   - The suspected ground circuit is not open or the condition that originally caused the open or excessive resistance is not present at this time. Another way to check for an open would be to use an Ohm meter and measure the resistance of the ground circuit. While continuing to measure the resistance of the circuit, wiggle the wire harness and connectors to check for an intermittent open or poor connection.
   - Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   No

   - Repair the open in the circuit between the two wire harness connectors. Use the wiring application as a guide to trace the circuit and look for any in-line connectors where the short could occur.
   - One way to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.

CHECK FOR A SHORT BETWEEN MULTIPLE CIRCUITS

DIAGNOSTIC TEST

Fig. 10: Measuring Resistance Between TP Signal Circuit And TP Sensor Ground Circuit At Throttle Body Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1.

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuits that are suspected as being shorted together.

NOTE: **Check connectors - Clean/repair as necessary.**

3. At this time leave all in-line connectors connected.

NOTE: **Before you measure the resistance between any circuits, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded after**

measuring the resistance between the circuits. The leads of the meter can add up to or over 0.5 of an Ohm of resistance.

4. With all the component wire harness connectors disconnected, use a multimeter set to Ohms (?), and measure the resistance between the applicable circuits in one of the harness connectors.
5. Use one lead of the multimeter and carefully probe the circuit suspected as being shorted.
6. Use the other lead of the meter and one at a time, carefully probe the other circuits in the harness connector.

   Is the resistance below 10k Ohms when probing any two circuits?

   Yes

   - Repair the short between the circuits. Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur.
   - One way to help isolate the short is to disconnect any in-line connectors that the circuit being tested runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

   No

   - The circuit is not shorted or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness and connectors while checking for an intermittent short.
   - Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK FOR AN EXCESSIVE CURRENT DRAW

DIAGNOSTIC TEST

1.
   1. Turn the ignition off.
   2. Disconnect the Negative Battery cable (ground).
   3. Using a multimeter, set the multimeter leads up to properly measure Amperage.
   4. Connect the ground lead that is plugged into the COM port of the multimeter to the Negative Battery cable.
   5. Connect the other lead of the multimeter that is plugged into the Amp port of the multimeter to the negative battery post/terminal.

CAUTION: Do not crank the engine or turn on any accessories that may draw more than 10 Amps. You may open the protective fuse in the multimeter.

NOTE: To get a more accurate reading and current draw, wait 20 minutes to make sure all modules have powered down before continuing. Some modules may stay powered up longer than others.

6. While monitoring the amperage reading, remove a fuse and see if the amperage drops.
7. If the amperage does not drop, install that fuse you just removed and remove the next fuse.

   Does the amperage drop to between 0.02 to 0.04 of an Amp when removing any fuses.

   Yes

   - Use the wiring application as a guide to find out what components or modules are powered by the fuse. At this point you can install the fuse and begin disconnecting the components powered by the fuse. When the amperage drops after disconnecting a component you will know which component is at fault. It is important to know how long some modules are supposed to remain awake. You don't want to replace a component that is operating normally.

   No

   - The condition that originally caused the draw may not be present at this time.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded ground terminals.
   - Perform any Technical Service Bulletins that may apply.

CHECK THE RESISTANCE IN A CIRCUIT USING AN OHM METER

DIAGNOSTIC TEST

Fig. 11: Measuring Resistance Of Sensor Ground Circuit From AAT Sensor Harness Connector To TIPM Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **This is not the best way of checking for an open ground circuit. When checking for an open in a ground circuit, perform the Check a Ground Circuit for an Open Using a 12-Volt Test Light diagnostic procedure.**

1.

1. Turn the ignition off.

2. Disconnect the wire harness connectors of the components that contain the circuit suspected as being open.

   NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.

   NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked. The leads of the meter can add up to or over 0.5 of an Ohm of resistance.

4. With the component wire harness connectors disconnected, use a multimeter set to Ohms (?), and measure the resistance of the circuit.
5. Use one lead of the meter and probe the circuit in one harness connector.
6. Use the other lead of the meter and probe the same circuit in the other harness connector.

   Is the resistance in the circuit below 20k Ohms?

   Yes

   - Repair the excessive resistance in the circuit between the two wire harness connectors. Using the wiring application as a guide, trace the circuit and check for any in-line connectors where the open or excessive resistance could occur.
   - One way to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open or excessive resistance is not present, the open or excessive resistance is on the other side of the in-line connector

   No

   - The circuit does not contain any excessive resistance or the condition that originally caused the excessive resistance may not be present at this time. Continue to measure the resistance of the circuit, wiggle the wire harness and connectors to check for an intermittent open or poor connection.
   - Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK THE VOLTAGE ON A 5-VOLT SUPPLY CIRCUIT

DIAGNOSTIC TEST

1. **MEASURE THE VOLTAGE BETWEEN THE 5-VOLT SUPPLY CIRCUIT AND GROUND**

Fig. 12: Measuring Voltage Between 5-Volt Supply Circuit And Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the sensor harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Turn the ignition on.
4. Use a multimeter set to measure DC voltage.
5. Connect the negative lead of the meter to a known good ground.
6. With the positive lead of the meter, carefully probe the 5-volt supply circuit.

Is the voltage between 4.7 and 5.2 volts?

Yes

- Go To 2.

No

- Check the 5-volt supply circuit for an open or short to ground. Perform the appropriate Sensor Reference Voltage DTC diagnostic procedure for assistance, if one exists.

2. **MEASURE THE VOLTAGE BETWEEN THE 5-VOLT SUPPLY AND SENSOR GROUND CIRCUIT**

Fig. 13: Measuring Voltage Between 5-Volt Supply And Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. The multimeter is still set to measure DC voltage.
2. Move the negative lead of the meter to carefully probe the sensor ground or sensor return circuit in the harness connector.
3. With the positive lead of the meter, carefully probe the 5-volt supply circuit.

Is the voltage between 4.8 and 5.2 volts?

Yes

- At this time the 5-volt supply and sensor ground circuit are working properly. Continue to measure the voltage between the wires, wiggle the wire harness and connectors while checking for an intermittent condition.
- Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open or excessive resistance in the Sensor Ground (Sensor Return) circuit.

ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

Fig. 14: Electrostatic Discharge Symbol
Courtesy of CHRYSLER GROUP, LLC

All ESD sensitive components are solid state and a symbol is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the part is ESD sensitive, assume that it is.

1. Always touch a known good ground before handling the part. This should be repeated while handling the part and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.
2. Avoid touching electrical terminals of the part, unless instructed to do so by a written procedure.
3. When using a voltmeter, be sure to connect the ground lead first.
4. Do not remove the part from it's protective packing until it is time to install the part.
5. Before removing the part from it's package, ground the package to a known good ground on the vehicle.

VOLTAGE DROP TEST

THEORY OF OPERATION

Voltage drop is the reduction in voltage in an electrical circuit between the source and load components. The wires and connectors of a circuit should contain next to no resistance. All the voltage should be used through the load. The "load" is the component using the power, such as a light, starter, or blower motor. If a circuit has excessive resistance, it prevents the wire from carrying sufficient current under high load conditions. A voltage drop test is an effective way to find excessive resistance in connections and circuits. To preform a voltage drop test, a Digital Volt Ohm Meter (DVOM) is used to measure the voltage drop across a live circuit or connection while it is under the load. If the circuit or connection being tested has excessive resistance, the DVOM will measure the voltage that the resistance is using. Little or no voltage drop should be read, ideally less that 0.4 of a volt, anything greater indicates excessive resistance and the circuit or connection should be inspected for cleaning or repair.

1.
    1. Turn the ignition off.
    2. Use the wiring application as a guide, trace the circuit being tested and locate the components related to the circuit.
    3. Set your multimeter up to check for DC voltage.
    4. Carefully back probe the two component harness connectors of the circuit being tested.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do

not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: **If you are testing the starting circuit, disable the engine so the engine does not start.**

5. Crank the engine for five seconds if you are testing the starting circuit and monitor the multimeter voltage reading.
6. For circuits that don't require the engine running, turn the ignition on.
7. For circuits that require the engine running, start the engine.

NOTE: **If the circuit you are checking needs to be turned on, such as Blower Motor or a lamp, do so now.**

8. Monitor the voltage reading.
9. The voltmeter will show the difference in voltage between the two points.

Is the voltage less than 0.4 of a Volt?

Yes

- At this time the circuit is functioning properly. Continue to measure the voltage between the components and wiggle the wire harness and connectors while checking for an intermittent condition.
- Use the wiring application as a guide to trace the circuits and look for any in-line connectors where the excessive resistance could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the excessive resistance in the circuit.
- Use the wiring application as a guide to trace the circuit and look for any in-line connectors where the excessive resistance may occur.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.

WIRE SPLICING

CAUTION: If additional wire is needed when making a splice repair to any wire, it is important that the same or next larger size wire gauge be used. Refer to the appropriate wiring diagram for the original wire gauge size.

Fig. 16: Splice Band
Courtesy of CHRYSLER GROUP, LLC

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.
2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire repair area.
3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

Fig. 17: Crimping Tool
Courtesy of CHRYSLER GROUP, LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number (special tool #10042, Crimper, Wire/Terminal) or equivalent) crimp the splice band and wires together securely.

Fig. 18: Solder Splice

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using rosin core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.

Fig. 19: Heat Shrink Tube
Courtesy of CHRYSLER GROUP, LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of the tubing.

1 - DRESS COVER
2 - CONNECTOR LOCK

3 - CONNECTOR

1. Disconnect battery.
2. Release Connector Lock (2).
3. Disconnect the connector (3) being repaired from its mating half/component.
4. Remove the dress cover (if applicable) (1).

6. Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector.

INSTALLATION

INSTALLATION

1. Select a wire from the terminal repair kit that best matches the color and gage of the wire being repaired.
2. Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
3. Splice the repair wire to the wire harness (see wire splicing procedure). Refer to **WIRE SPLICING**.
4. Insert the repaired wire into the connector.
5. Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
6. Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
7. Connect battery and test all affected systems.

CALL OUT	DESCRIPTION	QUANTITY
1	Hood Switch Harness	1
2	Wireless Ignition Module (WIN)	1
3	FOBIK	2
4	WIN Antenna	1
	Hood Latch	

5	Assembly	1
6	Zip Ties	10

CAUTION: XBM remote start can ONLY be installed on vehicles that have the following factory options: Automatic Transmission, Remote Keyless Entry and Immobilizer.

WinFobik based vehicles, the sales code must be added to the database and the Restore Vehicle Configuration (using a diagnostic scan tool) must be performed prior to installing the new WIN module. Failure to do so will render the WIN module's remote start function inoperative.

The technician should wait 1/2 hour between adding XBM sales code in DealerConnect before installing the WIN module & restoring vehicle configuration. In the interim, the technician can install all other components except the WIN module.

NOTE: Prior to installation, obtain the four digit PIN from the dealership's parts department.

RESTORE VEHICLE CONFIGURATION

NOTE: The wiTECH software level must be at the latest release to perform this procedure.

1. VIN must be updated with the sales code of the added accessory in order to enable system functionality. Using the DealerCONNECT website and the wiTECH diagnostic application, complete the vehicle configuration.
2. Log on to https://dealerconnect.chrysler.com.
3. In the "Vehicle Option" screen under the "Global Claims System" category in the "Service" tab, enter the vehicle VIN, four digit pin number obtained from the dealership parts department and add sales code(s) noted below as a "Dealer Installed Option".

XBM (REMOTE START)

1. Confirm that the new sales code has been successfully added to the VIN.
2. With the wiTECH diagnostic application, perform the following steps form the Initial Start Up Screen:

- Select the "DIAGNOSTIC PROCEDURES" tab
- Highlight "RESTORE VEHICLE CONFIGURATION"
- Select the "Run Diagnostic" button
- Select "CONTINUE"
- Verify that the vehicle VIN number is correct
- Once verified, select the "Correct VIN" button

- Note On-Screen instructions and select the "Close" button

HOOD SWITCH AND HARNESS INSTALLATION

NOTE: **There may be an unused factory installed hood switch harness taped back on the existing vehicle harness located behind the radiator just below the upper radiator crossmember. If present, detach it, route it under the radiator crossmember through to the hood latch assembly and connect. If the factory hood switch harness is not present, follow steps 9-32.**

9. Using the supplied wiring harness in the kit, connect the hood switch harness (1) to the hood latch assembly (2).

NOTE: Totally Integrated power module electrical connectors are color coded to ease location reference.

25. Connect the electrical connector by pushing straight on and rotating the connector arm inboard, until the

connector is firmly locked in place on the TIPM assembly.

26. Turn the TIPM so that the connector side is facing down. Install the assembly onto the TIPM battery tray bracket making sure to line up the lower retaining tab with the retaining slot in the tray.
27. Push the TIPM (1) downward to lock the upper retaining clips into the bracket (2).

6. Install the two fasteners (2) that secure the steering column opening cover (1) to the instrument panel.
7. Position the hood release handle onto the column opening cover and fully engage the retainer clip that secures the hood release handle to the steering column opening cover.
8. Connect the negative battery cable.

PROGRAMMING THE WIN

CAUTION: Read all notes and cautions for programming procedures.

NOTE: Have the vehicle PIN readily available before running the routine

CAUTION: If the PCM and WIN are replaced at the same time, the PCM MUST be programmed before the WIN.

1. Connect a battery charger to the vehicle.
2. With the wiTECH diagnostic application, perform the following steps:
   - Select "WIRELESS CONTROL MODULE (WCM)"
   - Select the "MISCELLANEOUS FUNCTIONS" tab
   - Highlight "WIN REPLACED"
   - Select the "Start Misc Function" button
   - Select "NEXT"
   - Enter the PIN when prompted.
   - Select "NEXT"
   - Verify that the PIN number is correct
   - Once verified select "NEXT"
   - Select "NEXT"
   - Note On-Screen instructions and select the "FINISH" button
   - Cycle ignition key after the successful routine completion.

PROGRAMMING IGNITION KEYS TO THE WIN

CAUTION: Read all notes and cautions for programming procedures.

NOTE: Have the vehicle PIN readily available before running the routine

1. Connect a battery charger to the vehicle.
2. With the wiTECH diagnostic application, perform the following steps:
   - Select "WIRELESS CONTROL MODULE (WCM)"

- Select the "MISCELLANEOUS FUNCTIONS" tab
- Highlight "PROGRAMMING IGNITION KEYS OR KEY FOBS"
- Select "NEXT"
- Enter the PIN when prompted.
- Select "NEXT"
- Verify that the PIN number is correct
- Once verified select "NEXT"
- Note On-Screen instructions and select the "FINISH" button
- Cycle ignition key after the successful routine completion.

NOTE: If the original keys do not successfully program to the new WIN after the proper procedures are followed correctly, programming new keys will be necessary.

NOTE: A maximum of eight keys can be learned by the WIN. Once a key is learned by a WIN, that key has acquired the Secret Key for that WIN and cannot be transferred to any other vehicle.

ECU RESET

NOTE: The wiTECH software level must be at the latest release to perform this procedure.

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. With the wiTECH diagnostic application, perform the following steps:
   - Select "WIRELESS CONTROL MODULE (WCM)"
   - Select the "MISCELLANEOUS FUNCTIONS" tab
   - Highlight "RESET ECU"
   - Note On-Screen instructions and select the "NEXT" button
   - Select "FINISH"

WINDOW CALIBRATION

NOTE: Vehicles equipped with the auto up feature must have the windows calibrated after a battery disconnect.

NOTE: The door must be completely closed when starting this step.

1. Sit in the driver seat and close the door.
2. Lower the window part of the way down.
3. Run the window to the full up position and continue to hold the switch for an additional two seconds.
4. Run the window to the full down position and continue to hold the switch for an additional two seconds.
5. Raise the window to the full up position.
6. Repeat the steps for the remaining windows.

UPDATE PRESSURE THRESHOLDS

NOTE: The wiTECH software level must be at the latest release to perform this procedure.

NOTE: The vehicle must be driven before the TPMS light will turn off.

CAUTION: Read all notes and cautions for programming procedures.

NOTE: Have the vehicle PIN readily available before running the routine

1. Connect a battery charger to the vehicle.
2. With the wiTECH diagnostic application, perform the following steps:
    - Select the "TIPMCGW"
    - Select the "MISCELLANEOUS FUNCTIONS" tab
    - Highlight and select "UPDATE PRESSURE THRESHOLDS"
    - Note On-Screen instructions and select the "NEXT" button
    - Verify current settings, select the "NEXT" button to change settings
    - Select "NEXT"
    - Enter the PIN when prompted.
    - Select "NEXT"
    - Verify that the PIN number is correct
    - Once verified, select "NEXT"
    - Select "NEXT"
    - Wait for the WCM/WIN to update it's configuration
    - Once the WCM/WIN configuration is complete, select "NEXT"
    - Note On-Screen instructions and select the "FINISH" button

TEMPORARY REMOTE START DISABLE

NOTE: The wiTECH software level must be at the latest release to perform this procedure.

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. With the wiTECH diagnostic application, perform the following steps:
    - Select the "TIPMCGW"
    - Select the "MISCELLANEOUS FUNCTIONS" tab
    - Highlight and select "TEMPORARY REMOTE START DISABLE"
    - Note On-Screen instructions and select the "NEXT" button
    - Select the "DISABLE" button to activate the remote start function
    - Select "YES" to reset the module and exit the routine, select "NO" to toggle the value back
    - Select "FINISH"

CLEAR ALL DTC'S

NOTE: The wiTECH diagnostic application is the preferred method for clearing all DTC's.

NOTE: The wiTECH software level must be at the latest release to perform this procedure.

ACTIVATE THE REMOTE START

To activate the remote start the vehicle must have been driven at least 35 MPH.

With the vehicle off, and the doors closed and locked, verify the remote start is functioning properly.

5.7L ENGINE BLOCK HEATER

NOTE: **It may be necessary to reposition the catalytic converter at the exhaust manifold to install this accessory. LET THE VEHICLE COOL DOWN COMPLETELY BEFORE INSTALLATION OF THIS PRODUCT.**

1. Remove negative battery cable located under passenger side front seat.
2. Remove the engine cover.
3. Remove the air cleaner housing assembly.
4. Raise and support the vehicle.
5. If equipped, remove the skid plate.
6. If necessary, saturate the bolts (4) and nuts (1) with heat valve lubricant. Allow 5 minutes for penetration.
7. If necessary, remove the bolts (4) and flanged nuts (1) at the exhaust manifold.
8. If necessary, reposition the front exhaust pipe/catalytic converter assembly (3) away from the exhaust manifold.

11. Plug in the engine block heater cord (1) into the element.
12. Lower the vehicle.
13. Begin routing the cord (1) upward, position and install locator clips (2) onto the existing engine studs.

CAUTION: Make sure the harness is clear of any moving parts or extreme heat sources.

14. Connect the clip (3) to the engine wiring harness. Let the remainder of the harness drop to the right hand side of the engine, towards the floor.
15. Raise the vehicle.

CAUTION: Make sure the harness is clear of any moving parts or extreme heat sources.

NOTE: Engine removed for clarity.

16. On 1500 models, route the engine block heater harness (1) to the right hand side inner frame rail.
17. On 1500 models, insert the PIA fasteners (3) into the inner frame rail.
18. On 1500 models, insert the PIA fastener (4) into the lower inside portion of the right hand side radiator support.

NOTE: PIA clip exploded for clarity.

19. On 1500 models, insert the PIA fastener (2) into the upper inside portion of the right hand side radiator support.

25. If necessary, raise the vehicle and position the front exhaust pipe/catalytic converter assembly (3) to the exhaust manifold.
26. Install the bolts (2) at the front exhaust pipe/catalytic converter assembly (4) to exhaust manifold flange.
27. Install the nuts (1) at the front exhaust pipe/catalytic converter assembly to muffler flange at the exhaust manifold. Tighten to 47 N.m (35 ft. lbs.) torque.

28. If equipped, install the skid plate.
29. Lower the vehicle.
30. Install the air cleaner housing assembly.
31. Install the engine cover.
32. Connect the negative battery cable.

3	Tie Straps	2

PROCEDURE STEPS:

4.7L Engines: The engine block heater element will locate on the passenger side towards the rear of the engine

just under the exhaust manifold.

3.7L Engines: The engine block heater element will locate on the passenger side towards the middle of the engine just under the exhaust manifold.

Fig. 48: Cylinder Block Drain Plug
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It may be necessary to reposition the catalytic converter at the exhaust manifold to install this accessory. LET THE VEHICLE COOL DOWN COMPLETELY BEFORE INSTALLATION OF THIS PRODUCT.**

WARNING: **Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.**

NOTE: **DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.**

1. Remove the negative battery cable.
2. Remove the engine cover.
3. Remove the air cleaner housing assembly.
4. Raise and support the vehicle.
5. If equipped, remove the skid plate.
6. Attach one end of a hose to the draincock. Put the other end into a clean container.
7. **DO NOT REMOVE THE RADIATOR CAP** when draining the coolant from the reservoir/overflow tank. Open the radiator draincock and when the tank is empty, remove the radiator cap and continue draining the cooling system.
8. If equipped with 4.7L engine, locate the rear core/freeze plug to be removed on the right hand side of the

engine just under the exhaust manifold.

9. If equipped with 3.7L engine, locate the second core/freeze plug from the rear to be removed on the right hand side of the engine just under the exhaust manifold.
10. If necessary, saturate the catalytic converter to exhaust manifold bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
11. If necessary, remove the catalytic converter to exhaust manifold bolts and nuts at the exhaust manifold.
12. If necessary, reposition the front exhaust pipe/catalytic converter assembly away from the exhaust manifold.
13. Using a blunt tool such as a drift, punch or a screw driver and a hammer, strike the bottom edge of the cup plug (1).
14. Using a suitable pair of pliers, grasp the core/freeze plug (1) and remove.

CAUTION: Make sure the harness is clear of any moving parts or extreme heat sources.

NOTE: PIA clip exploded for clarity.

NOTE: Engine removed for clarity.

22. Route the engine block heater harness (1) across the top of the frame rail.
23. Connect the PIA fastener (4) to the viking bracket (3).
24. Route the harness (1) up and insert the PIA fasteners (2, 5) into the inside portion of the right hand side radiator support.
25. If necessary, position the front exhaust pipe/catalytic converter assembly (3) to the exhaust manifold.
26. Install the bolts at the front exhaust pipe/catalytic converter assembly (4) to exhaust manifold flange.
27. Install the nuts (1) at the front exhaust pipe/catalytic converter assembly to muffler flange at the exhaust manifold. Tighten to 47 N.m (35 ft. lbs.) torque.
28. If equipped, install the skid plate.
29. Lower the vehicle.
30. Clip the end of the heater cord (1) into the top of the radiator support.
31. Using the kit supplied tie wraps, secure the remainder of the harness to the battery cable.
32. Install the air cleaner housing assembly.
33. Install the engine cover.
34. Fill the cooling system and evacuate any air that may be trapped in the system.
35. Connect the negative battery cable.

WARNING: On vehicles equipped with airbags, disable the airbag system before

attempting any steering wheel, steering column, seat belt tensioner, or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and personal or fatal injury.

1. Disconnect and isolate the negative battery cable.

PARK VIEW REAR BACK-UP CAMERA VEHICLE CONFIGURATION

Vehicle VIN must be updated with the sales code of the added accessory in order to enable system functionality. Using the DealerCONNECT website and the scan tool, complete the procedure below:

1. Log on to https://dealerconnect.chrysler.com
2. In the "Vehicle Option" screen under the "Global Claims System" category in the "Service" tab, enter the vehicle VIN and add the sales code **XAC (Park View Rear Back-Up Camera)** as a "Dealer Installed Option".
3. Confirm that the new sales code has been successfully added to the VIN.

   With the scan tool connected to both the internet (via Ethernet port or wireless connection) and the vehicle, follow the steps below:

4. Using the scan tool select the **VEHICLE PREPARATION** and then select **RESTORE VEHICLE CONFIGURATION** .
5. Follow the step by step instructions on the scan tool to complete the Park View Rear Back-Up Camera vehicle configuration.
6. When the **Park View Rear Back-Up Camera Vehicle Configuration** is complete, go to the **Validation Process** to verify that the vehicle has been updated.

VALIDATION PROCESS

From the "Initial Start Up" screen on the scan tool follow the steps below:

1. Using the scan tool follow the menu to **ECU VIEW** , select **TIPMCGW CENTRAL GATEWAY** , **MORE OPTIONS** , **ECU DETAILS** and then **CONFIG INFO**
2. Verify **REAR CAMERA PRESET- - - -SET** is present.

SDARS VEHICLE CONFIGURATION

Vehicle VIN must be updated with the sales code of the added accessory in order to enable system functionality.

Using the DealerCONNECT website and a scantool, complete the procedure below.

- Log on to Http://dealerconnect.chrysler.com.
- In the "Vehicle Options" screen under the "Global Claims System" category in the "Service tab, enter the vehicle VIN and add the sales code **RSC (SIRIUS SATELLITE RADIO)** as a "Dealer Installed option".
- Confirm the new sales code has been successfully added to the VIN.

With the ScanTool connected to both the internet (via Ethernet port or wireless connection) and the vehicle, follow the steps below:

- In the "Initial Start Up" screen select **VEHICLE PREPARATION**
- Toggle down and highlight **RESTORE VEHICLE CONFIGURATION**
- Press **START**
- Press **NEXT**
- If necessary, select proper vehicle line and model year and press **NEXT**
- Confirm correct selection and press **NEXT**
- Enter vehicle VIN using the on screen keyboard or confirm that the Auto Filled VIN plate is correct and press **NEXT**
- Press **OK**
- Enter the user ID, password and dealer code using the one screen keyboard and press **OK**

NOTE: At this point the ScanTool is downloading the vehicle configuration from the network.

- Confirm that the new vehicle configuration has been successfully programmed, follow the on screen instructions and press **FINISH**

VALIDATION PROCESS

from the "Initial Start up" screen on the ScanTool follow the steps below:

- Using a ScanTool follow the menu to **ECU VIEW** , select either **TPIMCGW CENTRAL GATEWAY** or **FCMCGW CENTRAL GATEWAY** depending on the vehicle.
- Select **MORE OPTIONS, ECU DETAILS,** and then **CONFIG INFO** .
- Verify **SDARV - - - - SET** is present.
- Drive the vehicle outside for a clear satellite signal to the antenna and verify system operation.

6. If equipped, transfer the underhood lamp (1) and remote starter plunger (3) to the new accessory hood.
7. Transfer the hood striker to the new accessory hood and tighten the bolts (2) to 17 N.m (12.5 ft. lbs.).
8. Install the hood silencer pad on the new accessory hood by pressing the seven retaining clips (4) into the new accessory hood.

Fig. 225: Hinge Nuts

9. With the help of an assistant, position the hood onto the hood hinge (2) and loosely install the two nuts (1) that secure the hood to the hinge (2). Repeat steps for the opposite side.

NOTE: Quad Cab shown in illustration, Regular Cab and Crew Cab similar.

10. Adjust the hood to the correct position. Refer to **HOOD FLUSHNESS CHART**. Once the hood is positioned properly, tighten the hood hinge nuts (1) to 18 N.m (13 ft. lbs.).

12. Connect the washer fluid hose (1) and the hose in the retaining clips (2).

Fig. 228: Bezel & Center Clip
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Previous model year kits may include hood assemblies without center clip retainer openings. To determine which hood is in your kit, look for a small rectangular hole near the front of each bezel opening on the hood. If the center clip retainer openings are not present on the hood, foam tape will be required to install the bezels. If the center clip retainer openings are present on the hood, foam tape is not necessary to install the bezels.**

13. If the center clip retainer openings are not present on the hood, remove the center clip (2) from the bezel

(1). Repeat steps for the opposite side.

Fig. 229: Foam Tape Location
Courtesy of CHRYSLER GROUP, LLC

14. If the center clip retainer openings are not present on the hood, apply 152.4 mm (6 in.) (2) of the supplied foam tape to the hood bezels (1) as shown in illustration. Press down firmly for 30 seconds minimum to ensure good adhesion. Peel the tape protector back on a 45° angle on both ends of the tape. Repeat steps for the opposite side.

Fig. 230: Hood Bezel
Courtesy of CHRYSLER GROUP, LLC

15. Install the bezel into the accessory hood.

• If the clip retainer openings are present on the hood, position the bezel into the accessory hood by

loading the top edge first (1), then push downward in the center of the bezel (3) to engage the center clip. Continue pushing downward in the center and rearward (4) until all the clips are engaged. Repeat steps for the opposite side.

• If the clip retainer openings are not present on the hood, position the bezel properly into the accessory hood by loading the top edge first (1). Pushing downward in the center and rearward (4) until all the clips are engaged. Peel the tape protector (2) off to expose the tape adhesive. Press down firmly for 30 seconds minimum to ensure good adhesion. Repeat steps for the opposite side.

24. Connect the liftgate power lock jumper harness (1) to the liftgate power lock overlay body harness (2).
25. Route the harness down the drivers side body harness and secure where necessary.
26. Route up through the fender well to the engine compartment up to the Totally Integrated Power Module (TIPM).

Fig. 246: B+ Terminal Cable & Nut
Courtesy of CHRYSLER GROUP, LLC

27. Remove the B+ terminal nut (1) from the Totally Integrated Power Module (3) (TIPM) B+ terminal. Remove the B+ cable (2) from the TIPM.
28. Using a suitable flat blade tool, disengage the TIPM upper retaining tabs from the battery tray bracket.

Fig. 247: Totally Integrated Power Module (TIPM)
Courtesy of CHRYSLER GROUP, LLC

29. Grasp the TIPM (1) and rotate the assembly up to free it from its mounting bracket (3). Position the assembly upside down to access the electrical connectors located on the bottom of the unit.
30. Disconnect connector C5, letter E labeled on the bottom of the TIPM. Release by depressing the locking tab and rotating the connector arm outboard, until the connector is free from the TIPM assembly (1). Be certain to pull the connector straight off.
31. Cut the tailgate power lock harness to length.

Fig. 248: Totally Integrated Power Module Cavity 18 & 22
Courtesy of CHRYSLER GROUP, LLC

32. Cut the P34 circuit TN/LB from cavity 18, using steps 33 through 37 solder in the W/P tailgate wire.
33. Cut the P38 circuit TN/DB from cavity 22, using steps 33 through 37 solder in the BK/DB tailgate wire.
34. Cut each wire and remove 13mm (0.5 in.) of insulation from each wire that needs to be soldered/spliced.
35. Place a piece of supplied adhesive lined heat shrink tubing on one side of each cut wire. Insure the tubing will be long enough to cover and seal the entire soldered area.

CAUTION: Do not use acid core solder.

Fig. 249: Adhesive Lined Heat Shrink Tubing

37. Using crimping tool (1), Mopar® p/n 05019912AA or equivalent, crimp the splice clip and wires together.

Fig. 251: Soldering Connection
Courtesy of CHRYSLER GROUP, LLC

38. Solder (3) the connection (2) together using rosin core solder (1).

Fig. 252: Heat Shrink Tube
Courtesy of CHRYSLER GROUP, LLC

39. Center the heat shrink tubing (2) over the solder joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) comes out of both ends of the tubing.
40. Secure the power lock actuator harness to the TIPM harness.

Fig. 253: Totally Integrated Power Module (TIPM)
Courtesy of CHRYSLER GROUP, LLC

NOTE: Totally Integrated power module electrical connectors are color coded to ease location reference.

41. Connect the electrical connector by pushing straight on and rotating the connector arm inboard, until the connector is firmly locked in place on the TIPM assembly.
42. Turn the TIPM so that the connector side is facing down. Install the assembly onto the TIPM battery tray bracket making sure to line up the lower retaining tab with the retaining slot in the tray.
43. Push the TIPM (1) downward to lock the upper retaining clips into the bracket (2).

3. If equipped, remove the manual window crank (1) using a window crank removal tool (2).

Fig. 258: Interior Door Handle Trim & Interior Door Panel
Courtesy of CHRYSLER GROUP, LLC

4. Remove the six screws (1) that secure the door trim panel (6).
5. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, remove the mirror trim cover (4).

CAUTION: The door trim panel is attached to the door by molded plastic retaining clips that are integral to the door trim panel. Do not pull the door trim panel directly off of the door or damage to the trim panel and/or the power switch assembly will occur.

6. Lift the door trim panel straight upward to disconnect the molded plastic retaining clips from the door.
7. If equipped, disconnect the door wire harness from the power door switch assembly and remove the door trim panel.

16. If equipped, connect the door wire harness to the power door switch assembly.

CAUTION: The door trim panel is attached to the door by molded plastic retaining clips that are integral to the door trim panel. Do not force the door trim panel onto the door or damage to the trim panel and/or the power switch assembly will occur.

17. Position the door trim panel and align the molded plastic retaining clips to the door.
18. Push the door trim panel straight downward until all of the retaining clips are fully engaged to the door.
19. Install the six screws (1) that secure the door trim panel to the door (6).
20. If equipped, install the manual window crank.
21. Position the interior door handle trim (3) onto the interior door panel (6).
22. Install the screw (2) that secures the interior door handle trim to the interior door panel. Tighten the screw securely.
23. Install the mirror trim cover (4)

FRONT TOW HOOKS

SPECIFICATIONS

SCAN TOOL DATA - POWERTRAIN CONTROL MODULE (PCM) (NGC)

The following chart lists data values taken from the Scan Tool Powertrain Control Module (PCM) data list for the NGC controller. The values were taken at key on, engine off and at idle. The data is to be used for reference only.

The following data values were recorded under the following conditions unless otherwise specified:

- No DTCs set
- Key On, Engine Off values recorded at ambient air temperature.
- Engine at operating temperature.
- Vehicle in Park or Neutral
- A/C Off
- Speed Control Off
- Accessories Off
- Altitude at 55.7 meters (600 ft) above sea level

Some data values can vary as much as 20 percent due to the following:

- Vehicle age and wear
- Altitude
- Weather
- Ambient air temperature
- Engine, Transmission and other Vehicle Options
- Aftermarket Accessories

NOTE: **There are footnotes located next to values in the data table to reference specific conditions or additional information. They are listed in detail after the data table.**

Footnotes

1. Value may vary due to altitude and weather.
2. O2 Sensor will toggle from Low to High every few seconds.
3. Pre-catalyst O2 Sensors will toggle from 0.0 volt to 1.0 volt when operating in closed loop.
4. Post-catalyst O2 Sensors should remain near a fixed value.

5. Value may vary due to ambient air temperature.
6. Value will change due to fuel level change. Voltage will increase as available fuel decreases.
7. Will vary due to fuel level and ambient air temperature.
8. Can be different due to vehicle option.
9. Value is application specific.

INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS

DESCRIPTION

DESCRIPTION

Chrysler LLC uses international symbols to identify various systems on the vehicle.

The graphic symbols illustrated are used to identify various instrument controls, vehicle controls and service information references. The symbols correspond to the controls and displays that are located on the instrument panel and throughout the vehicle.

LABEL, VEHICLE EMISSION CERTIFICATION INFORMATION (VECI)

DESCRIPTION

DESCRIPTION

Fig. 5: Vehicle Emissions Certification Information Label
Courtesy of CHRYSLER GROUP, LLC

1 - VECI LABEL LOCATION
2 - RADIATOR SUPPORT

NOTE: **The Vehicle Emission Control Information (VECI) label(s) must be in place for the life of the vehicle. When replacing the component in which the VECI label is adhered, a new VECI label must also be adhered to the new component.**

All models have a VECI Label (1). Chrysler LLC permanently attaches the label in the engine compartment. The label cannot be removed without defacing label information and destroying label.

There are unique labels for vehicles built for sale in the state of California and the country of Canada. Canadian labels are written in both the English and French languages.

The VECI label contains the following:

- Engine family and displacement.
- Evaporative family.
- Certification application.
- Engine timing specifications (if adjustable).
- Idle speeds (if adjustable).
- Spark plug and gap.

VEHICLE CERTIFICATION LABEL

DESCRIPTION

DESCRIPTION

19125

Fig. 6: Vehicle Certification Label - Typical
Courtesy of CHRYSLER GROUP, LLC

A vehicle certification label is attached to every Chrysler LLC vehicle. The label certifies that the vehicle conforms to all applicable Federal Motor Vehicle Standards. The label also lists:

- Month and year of vehicle manufacture.
- Gross Vehicle Weight Rating (GVWR). The gross front and rear axle weight ratings (GAWR's) are based

on a minimum rim size and maximum cold tire inflation pressure.

- Vehicle Identification Number (VIN).
- Type of vehicle.
- Type of rear wheels.
- Bar code.
- Month, Day and Hour (MDH) of final assembly.
- Paint and Trim codes.
- Country of origin.

The label is located on the driver-side door shut-face.

VEHICLE IDENTIFICATION NUMBER

DESCRIPTION

VEHICLE IDENTIFICATION NUMBER

Fig. 7: Locating Vim Plate
Courtesy of CHRYSLER GROUP, LLC

The Vehicle Identification Number (VIN) plate (1) is located on the lower windshield fence near the left a-pillar. The VIN contains 17 characters that provide data concerning the vehicle. Refer to the VIN decoding chart to determine the identification of a vehicle.

The VIN is also imprinted on the:

- Equipment Identification Plate.
- Vehicle Safety Certification Label.
- Frame rail.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the VIN. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

Flexplate	70 ft. lbs. (95 N.m)
Flywheel	55 ft. lbs. (75 N.m)
6.7L	100 ft. lbs. (137 N.m)
Fuel System	
Pressure Specification	
Diesel	As high as 26, 107 psi (1800 bar)
Gas	58 psi +/- 2 psi
Fuel Pressure Test Procedure	
Diesel	**CHECKING THE FUEL DELIVERY SYSTEM**
Gas	**CHECKING THE FUEL DELIVERY SYSTEM**
Fuel Filter Location	
Diesel	The fuel filter/water separator assembly is located on left side of engine above the starter motor.
Gas	Fuel filter is part of fuel pump module.

DIAGNOSIS AND TESTING

B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets if a Direct Current (DC) offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of four to six seconds.

POSSIBLE CAUSES

Possible Causes
AMPLIFIER

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on and open one of the front doors.

       NOTE: A front door must remain open whenever checking or erasing Amplifier DTC's.

    2. Using the scan tool, record and erase the Amplifier DTC's.
    3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
    4. Turn the Radio on and set the volume to 20.
    5. Adjust the speakers to the front and center.
    6. Using the scan tool, read the active Amplifier DTC's.

       Does the scan tool display active: B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

       Yes

       - Replace the Amplifier in accordance with the Service Information.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on and open one of the front doors.

        NOTE: A front door must remain open whenever checking or erasing Amplifier DTC's.

    2. With the scan tool, record and erase the Amplifier DTC's.
    3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
    4. Turn the Radio on and set the volume to 20.
    5. Adjust the speakers to the front and center.
    6. With the scan tool, read the active Amplifier DTC's.

        Does the scan tool display active: B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

        Yes

        - Go To 2.

        No

        - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
        - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **LEFT INSTRUMENT PANEL (I/P) SPEAKER**

Fig. 2: Left Instrument Panel (I/P) Speaker Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTC's.
3. Turn the ignition off.
4. Disconnect the Left I/P Speaker harness connector.
5. Turn the ignition on.
6. Turn the radio on and set the volume to 25.
7. With the scan tool, read the active Amplifier DTC's.

   Does the scan tool display active: B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Go To 3.

No

- Replace the Left Instrument Panel Speaker.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK THE (X209) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 3: Checking Amplified Left Front I/P Speaker (+) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Amplifier C1 harness connector.

3. Measure the resistance between ground and the (X209) Left I/P Speaker (+) circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (X209) Left I/P Speaker (+) circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **CHECK THE (X299) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 4: Checking Amplified Left Front I/P Speaker (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (X299) Left I/P Speaker (-) circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (X299) Left I/P Speaker (-) circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Amplifier in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   5. Adjust the speakers to the front and center.
   6. With the scan tool, read the active Amplifier DTC's.

      Does the scan tool display active: B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK FOR VOLTAGE ON THE (X209) LEFT INSTRUMENT PANEL (I/P) SPEAKER (+) CIRCUIT**

Fig. 6: Measuring Voltage On The Left Instrument Panel (I/P) Speaker (+) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Amplifier C1 harness connector.
3. Disconnect the Amplified Left I/P Speaker harness connector.
4. Turn the ignition on.
5. Measure the voltage between the (X209) Left I/P Speaker (+) circuit and ground.

   Is there any voltage present?

   Yes

   - Repair the (X209) Left I/P Speaker (+) circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X299) LEFT I/P SPEAKER (-) CIRCUIT**

Fig. 7: Measuring Voltage On The Left I/P Speaker (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (X299) Left I/P Speaker (-) circuit and ground.

   Is there any voltage present?

   Yes

   - Repair the (X299) Left I/P Speaker (-) circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Amplifier in accordance with the Service Information.

time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE OPERATION OF THE LEFT FRONT I/P SPEAKER**

Fig. 9: Checking The Operation Of The Left Front I/P Speaker
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Left I/P Speaker harness connector.
3. Turn the ignition on.
4. Turn the radio on and set the volume to 25.
5. Adjust the speakers to the front and center.
6. With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left I/P Speaker

circuits in the Amplified Left I/P Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

- Replace the Amplified Left I/P Speaker in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK THE (X209) LEFT I/P SPEAKER (+) CIRCUIT FOR AN OPEN**

Fig. 10: Checking Amplified Left I/P Speaker Circuits For An Open

1. Turn the ignition off.
2. Disconnect the Amplifier C1 harness connector.
3. Measure the resistance of the (X209) Left I/P Speaker (+) circuit between the Amplifier C1 harness connector and the Left I/P Speaker harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

- Go To 4.

No

- Repair the (X209) Left I/P Speaker (+) circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (X299) LEFT I/P SPEAKER (-) CIRCUIT FOR AN OPEN**

1. Measure the resistance of the (X299) Left I/P Speaker (-) circuit between the Amplifier C1 harness connector and the Left I/P Speaker harness connector.

   Is the resistance below 2.0 Ohms?

Yes

- Replace the Amplifier in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repair the (X299) Left I/P Speaker (-) circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE OPERATION OF THE AMPLIFIED LEFT I/P SPEAKER**

Fig. 13: Checking The Operation Of The Amplified Left I/P Speaker
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Left I/P Speaker harness connector.
3. Measure the resistance of the speaker between the two terminals.

NOTE: **The graphic shows the connector for reference only. Measure at the speaker terminals.**

Is the resistance of the speaker less than 1 Ohm?

Yes

- Replace the Left I/P Speaker in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on and open one of the front doors.

        NOTE: A front door must remain open whenever checking or erasing Amplifier DTC's.

    2. Using the scan tool, record and erase the Amplifier DTC's.
    3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
    4. Turn the Radio on and set the volume to 20.
    5. Adjust the speakers to the front and center.
    6. Using the scan tool, read the active Amplifier DTC's.

        Does the scan tool display active: B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

        Yes

        - Go To 2.

1. Turn the ignition off.
2. Disconnect the Left Front Door Speaker harness connector.
3. Measure the resistance of the speaker between the two terminals.

NOTE: **The graphic shows the connector for reference only. Measure at the speaker terminals.**

Is the resistance of the speaker less than 1 Ohm?

Yes

- Replace the Left Front Door Speaker in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK THE (X201) LEFT FRONT DOOR SPEAKER (+) CIRCUIT, AND THE (X291) LEFT FRONT DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER**

1. **CHECK FOR AN INTERMITTENT CONDITION**
   1. Turn the ignition on and open one of the front doors.

      NOTE: A front door must remain open whenever checking or erasing Amplifier DTC's.

2. With the scan tool, record and erase the Amplifier DTC's.
3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
4. Turn the Radio on and set the volume to 20.
5. Adjust the speakers to the front and center.
6. With the scan tool, read the active Amplifier DTC's.

   Does the scan tool display active: B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

   Yes

   - Replace the Amplifier in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

1. Turn the ignition off.
2. Disconnect the Left Rear Speaker harness connector.
3. Turn the ignition on.
4. Turn the radio on and turn the volume to 25.
5. Adjust the speakers to the rear and center.
6. With a Voltmeter set to read in A/C voltage, measure the voltage of the Left Rear Speaker circuits in the Left Rear Speaker harness connector.

   Is the voltage present greater than 1 Volt?

   Yes

   - Replace the Left Rear Speaker in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK THE (X205) LEFT REAR SPEAKER (+) CIRCUIT FOR AN OPEN**

1. Turn the ignition off.
2. Disconnect the Amplifier C2 harness connector.
3. Measure the resistance of the (X205) Left Rear Speaker (+) circuit between the Amplifier C2 harness connector and the Left Rear Speaker harness connector.

   Is the resistance below 2.0 Ohms?

Yes

- Go To 4.

No

- Repair the (X205) Left Rear Speaker (+) circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (X295) LEFT REAR SPEAKER (-) CIRCUIT FOR AN OPEN**

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
   1. Turn the ignition on and open one of the front doors.

      NOTE: A front door must remain open whenever checking or erasing Amplifier DTC's.

   2. Using the scan tool, record and erase the Amplifier DTC's.
   3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
   4. Turn the Radio on and set the volume to 20.
   5. Adjust the speakers to the rear and center.
   6. Using the scan tool, read the active Amplifier DTC's.

      Does the scan tool display active: B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

      Yes

      - Go To 2.

      No

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on and open one of the front doors.

        NOTE: A front door must remain open whenever checking or erasing Amplifier DTC's.

    2. With the scan tool, record and erase the Amplifier DTC's.
    3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
    4. Turn the Radio on and set the volume to 20.
    5. Adjust the speakers to the rear and center.
    6. With the scan tool, read the active Amplifier DTC's.

        Does the scan tool display active: B1481-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

        Yes

        - Go To 2.

        No

        - Test complete, the condition or conditions that originally set this DTC are not present at this

time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE OPERATION OF THE SUBWOOFER SPEAKER**

1. Turn the ignition off.
2. Disconnect the Subwoofer Speaker harness connector.
3. Turn the ignition on.
4. Turn the radio on and turn the volume to 25.
5. Adjust the speakers to the rear and center.
6. With a voltmeter set to read in A/C voltage, measure the voltage of the Subwoofer Speaker circuits

in the Subwoofer Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

- Replace the Subwoofer Speaker in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

3. With the scan tool, erase Amplifier DTC's.
4. With the scan tool, reset the amplifier.
5. With the scan tool, read Amplifier DTC's.

Does the scan tool display active: B1488-CABIN EQ MISMATCH PERFORMANCE?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK AMPLIFIER BUSSED INPUTS/SENSORS**
   1. With the scan tool in Amplifier Data Display, read the Cabin Equalization Curve number in the Bussed Inputs and Sensors Sections.

NOTE: **The Cabin EQ Curve settings in the Inputs/Sensors section should match one another. The Cabin EQ# in the Inputs section is the information that is received from the TIPM. The Cabin EQ in the Sensors section is the information that is Stored in the Amplifier's memory.**

Do the Cabin EQ settings match one another?

Yes

- Replace the Amplifier in accordance to the service information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **VERIFY COMMUNICATION WITH TIPM**
   1. With the scan tool, read the active modules on the BUS.

Does the scan tool show the TIPM active on the BUS?

Yes

- Go To 4.

No

- Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response From TIPM (Totally Integrated Power Module) diagnostic procedure.

4. **CHECK TIPM FOR ACTIVE DTC's**
   1. With the scan tool, erase TIPM DTC's.
   2. Turn the ignition off. Wait approximately 10 seconds.
   3. Turn the ignition on.
   4. With the scan tool, read TIPM DTC's.

   Are any active DTC's present?

   Yes

   - Refer to **TIPM - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on and open one of the front doors.

        NOTE: A front door must remain open whenever checking or erasing Amplifier DTC's.

    2. With the scan tool, record and erase the Amplifier DTC's.
    3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
    4. Turn the Radio on and set the volume to 20.
    5. Adjust the speakers to the front and center.
    6. With the scan tool, read the active Amplifier DTC's.

    Does the scan tool display active: B14B9-CHANNEL 9 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

    Yes

    - Replace the Amplifier in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

1. Measure the resistance of the (X391) Amplified Subwoofer 2 (-) circuit between the Amplifier C1 harness connector and the Subwoofer Speaker harness connector.

   Is the resistance below 2.0 Ohms?

Yes

- Replace the Amplifier in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repair the (X391) Amplified Subwoofer 2 (-) circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
   1. Turn the ignition on and open one of the front doors.

      NOTE: A front door must remain open whenever checking or erasing Amplifier DTC's.

   2. With the scan tool, record and erase the Amplifier DTC's.
   3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
   4. Turn the Radio on and set the volume to 20.
   5. Adjust the speakers to the rear and center.
   6. With the scan tool, read the active Amplifier DTC's.

      Does the scan tool display active: B14C2-CHANNEL 10 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

      Yes

      - Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE OPERATION OF THE AMPLIFIED SUBWOOFER SPEAKER**

Fig. 139: Checking The Operation Of The Amplified Subwoofer Speaker
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Subwoofer Speaker.
3. Measure the resistance of the speaker between the two terminals.

NOTE: **The graphic shows the connector for reference only. Measure between the speaker terminals.**

Is the resistance of the speaker less than 1 Ohm?

Yes

- Replace the Subwoofer Speaker in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK THE (X301) AMPLIFIED SUBWOOFER 2 (+) CIRCUIT, AND THE (X391) AMPLIFIED SUBWOOFER 2 (-) CIRCUITS FOR A SHORT TOGETHER**

1. Turn the ignition off.
2. Disconnect the Amplifier C1 harness connector.
3. Measure the resistance between the (X301) Amplified Subwoofer 2 (+) circuit, and the (X391) Amplified Subwoofer 2 (-) circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (X301) Amplified Subwoofer 2 (+) circuit, and the (X391) Amplified Subwoofer 2(-) circuit for a short together.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Amplifier in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

1. **TEST FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase any Instrument Cluster DTC's.
    3. Turn the ignition off, wait ten seconds then turn the ignition on.
    4. With the scan tool, read DTC's.

    Does the scan tool display: B222C-VEHICLE CONFIGURATION NOT PROGRAMMED?

    Yes

    - Go To 2.

    No

    - The condition that caused this code to set is not present at this time. Using the wiring diagram as a guide, inspect the wiring and connectors for an intermittent condition. Operate the system several times and recheck for active DTC's.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **VERIFY COMMUNICATION WITH TIPM**
    1. With the scan tool in ECU VIEW, read active modules on the bus.

    Does the scan tool show the TIPM active on the bus?

    Yes

    - Go To 3.

    No

    - Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response From TIPM diagnostic procedure.
3. **CHECK TIPM FOR ACTIVE DTC's**

1. With the scan tool, erase TIPM DTC's.
2. Turn the ignition off. Wait approximately ten seconds.
3. Turn the ignition on.
4. With the scan tool, read TIPM DTC's.

   Are any active DTC's present?

   Yes

   - Refer to **TIPM - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Go To 4.

4. **CHECK CLUSTER VEHICLE INFORMATION WITH SCAN TOOL**
   1. With the scan tool in Cluster ECU Identification, read the Original and Current VINs, and the Body Style of the vehicle.

      Does the information displayed match the vehicle?

      Yes

      - Replace the Instrument Cluster in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

      No

      - Replace the TIPM in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DESCRIPTION

DESCRIPTION

Several combinations of radio receivers and speaker systems are offered. The audio system uses an ignition switched source of battery current so that the system will only operate when the ignition switch is in the RUN or ACCESSORY positions.

A optional navigation radio (RB4) is available on this vehicle. With this system, the operator has the option of choosing a street address, point of interest, trip itinerary as well as other features.

The audio system includes the following components:

- Antenna (radio, satellite)
- Power amplifier (with premium speaker system only)
- Radio noise suppression components
- Radio receiver
- Remote radio switches (if equipped)
- Satellite receiver (if equipped)
- Speakers

Certain functions and features of the audio system rely upon resources shared with other electronic modules in the vehicle over the Controller Area Network (CAN) bus network. The data bus network allows the sharing of sensor information. For diagnosis of these electronic modules or of the data bus network, the use of a scan tool and the proper Diagnostic Procedures information is recommended.

OPERATION

OPERATION

The audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast or satellite, (if equipped) radio signals in both the Amplitude Modulating (AM) and Frequency Modulating (FM) commercial frequency ranges.

The audio system components operate on battery current received through a fuse in the Totally Integrated Power Module (TIPM) on a fused ignition switch output (run-acc) circuit so that the system will only operate when the ignition switch is in the Run or Accessory positions.

The optional navigation radio system receives GPS signals from up to eight satellites to display the position and direction of the vehicle. Map information is supplied through a DVD-ROM. An electronic gyro-sensor and the vehicle's speed sensor enable the system to display the present vehicle position even in locations where GPS

signals may be blocked.

When a destination is selected, the navigation system uses information from the map to quickly calculate a route. As the vehicle is driven along the chosen route, the operator is guided with pictorial displays and voice prompts.

On vehicles that are equipped with the optional remote radio switches, the Instrument Cluster receives hard wired resistor multiplexed inputs from the remote radio switches. The programming in the Instrument Cluster allows it to process those inputs and send the proper messages to the radio receiver over the CAN network to control the radio volume up or down, station seek up or down, preset station advance, and mode advance functions.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - VIDEO

Any diagnosis of the video system should begin with the use of a scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

STANDARD PROCEDURE

STANDARD PROCEDURE - RADIO BACKUP

The radio's internal hard disk drive (HDD) can be backed up using an external hard disk drive to save customer data in the event that a radio replacement is required. **This procedure can only be performed with radios equipped with a hard disk drive (RER, REN, RHR, RHB, RBZ & REU).**

1. Turn the ignition to RUN, engine OFF.
2. Power on the external HDD.
3. Connect the external HDD to the radio using the USB (Universal Serial Bus) cable. The radio display will change to the "Manage My Files" screen.
4. Connect the scan tool and perform the following steps to place the radio into "Dealership Mode":
    - ECU View
    - Radio
    - Misc. Functions

- Service Mode
- Start
- Next

5. Follow the on screen instructions on the radio to back up and restore the radio HDD.

AMPLIFIER

DESCRIPTION

DESCRIPTION

The optional Infinity premium speaker system includes a separate Infinity audio power amplifier. The amplifier is an eight-channel unit rated at 368 total output watts. The amplifier is located behind the glove box. If equipped, an additional amplifier rated at 140 watts is located under the center passenger seat.

ANTENNA, SATELLITE, AUDIO

DESCRIPTION

DESCRIPTION

The satellite radio antenna cable connects the roof mounted antenna to the satellite receiver. It has two connectors at each end and is routed above the headliner, then down the right side of the vehicle floor below the carpet.

OPERATION

OPERATION

The satellite radio antenna receives signals from orbiting satellites and sends these signals to the satellite receiver module. The satellite radio antenna must have open space in which to operate. Items carried on the roof, parking inside etc. can have an effect on the antenna's ability to receive signals.

CABLE, ANTENNA, SATELLITE

DESCRIPTION

DESCRIPTION

The satellite coaxial antenna cables runs from the radio to the roof mounted antenna.

There are two coaxial cables that run in series, the first cable runs from the back of the radio through the instrument panel harness to the right cowl area. The second coaxial runs from the right cowl area down along the right scuff area to the rear of the cab. The coaxial continues up the right C-pillar and across the rear roof support.

For more information on testing the coaxial cables, refer to **DIAGNOSIS AND TESTING** .

DESCRIPTION

DESCRIPTION

The AM/FM audio coaxial antenna cables runs from the radio to the right front fender.

The coaxial cable runs from the back of the radio through the instrument panel harness to the right cowl area. The second part of the antenna is the coaxial pigtail to the wip antenna, mounted to the right front fender. The coaxial cable then runs from the cowl through the right inner front fender.

For more information on testing the coaxial cables, refer to **DIAGNOSIS AND TESTING** .

CAMERA, REAR

DESCRIPTION

DESCRIPTION

Fig. 9: Rear View Camera
Courtesy of CHRYSLER GROUP, LLC

The Rear View Camera (RVC) (4) (also known as ParkView™), is a camera on chip device utilizing Complementary Metal Oxide Semiconductor (CMOS) technology. CMOS technology is used for a wide variety of digital or analog circuits. In this application, it supports the analog image sensor of the RVC. The RVC function is to provide a wide angle video image of the area behind the vehicle, including areas that might not be normally visible from the seated position of the vehicle operator, only while the transaxle gear selector is in the Reverse position. This video image then displays to the vehicle operator within the display screen of the audio system receiver unit near the center of the instrument panel.

The RVC is intended to be an auxiliary viewing aid and is not promoted as an obstacle detection or safety device. It does not remove vehicle operator responsibility to recognize and obey official traffic laws or regulations or to take sensible precautions and care to avoid pedestrians, other vehicle traffic or both fixed and

moving obstacles through the habitual use of safe and defensive driving techniques.

The RVC is located within the tailgate handle. The camera lens is visible just to the left of the tailgate release handle, while the body of the camera and the camera connections are concealed within the tailgate.

Hardwired circuitry connects the RVC to the electrical system of the vehicle. These hardwired circuits are integral to several wire harnesses, which routes throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The RVC cannot be adjusted or repaired. If the RVC is damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The Rear View Camera (RVC) is powered by a battery feed received through the backup lamp switch output circuit from the Totally Integrated Power Module (TIPM) so that is only active when the transaxle is shifted into the REVERSE position. In addition, the radio receiver monitors messages on the Controller Area Network (CAN) data bus to determine the selected transaxle gear and overrides any other display to show the RVC video output, whenever it detects that the transaxle is in REVERSE. A momentary blank video display screen immediately following the gearshift transition into the REVERSE position is considered normal operation. The camera electronics receive a path to ground at all times through a takeout and eyelet terminal of the liftgate wire harness that is secured by a ground screw to the right side of the liftgate inner panel.

The output of the camera is a video signal compatible to the National Television System Committee (NTSC) standard composite video M format, or NTSC-M. The video signal is delivered to the radio video display unit through the entire length of the vehicle by camera signal and the camera return circuits that are arranged as a twisted pair, with an additional grounded foil jacket to protect the video signal from corruption due to stray radiated signals within the vehicle environment. The ground shield is terminated only at the video display (radio) end, not at the camera. Portions of these video signal wires are contained within the liftgate lightbar wire harness, the liftgate wire harness, the body wire harness and a jumper harness located between the radio and the body harness connector below the instrument panel at the right cowl side inner panel.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REAR CAMERA

The hardwired circuits of the Rear View Camera (RVC) and those between the RVC and the radio receiver may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RVC or the radio

receiver. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to radio receiver operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Be certain to confirm both of the following prior to attempting any further diagnosis or testing of the RVC. Use a diagnostic scan tool to confirm the rear view camera is setup in the vehicle configuration. From the initial start up screen of the diagnostic scan tool, navigate to ECU VIEW , select TIPMCGW CENTRAL GATEWAY , MORE OPTIONS , ECU DETAILS and then CONFIG INFO . Verify that REAR CAMERA PRESET - - - - SET is present. If not, the Sales Code XAC (Park View Rear Back-Up Camera) will have to be added to the vehicle configuration to enable the RVC, in vehicles equipped with a MyGIG multimedia entertainment system (Sales Codes RE1, REN, REP, RER, REU, REW, REX or REZ), be certain that the RVC is set to ENABLED using the CAMERA SETUP option in the MyGIG system settings.

COMPONENTS, RADIO NOISE SUPPRESSION

DESCRIPTION

DESCRIPTION

Radio noise suppression devices are Installed on this vehicle. Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) can be produced by any on-board or external source of electromagnetic energy. These electromagnetic energy sources can radiate electromagnetic signals through the air, or conduct them through the vehicle electrical system.

When the audio system converts RFI or EMI to an audible acoustic wave form, it is referred to as radio noise. This undesirable radio noise is generally manifested in the form of "buzzing," "hissing," "popping," "clicking," "crackling," and/or "whirring" sounds. In most cases, RFI and EMI radio noise can be suppressed using a combination of vehicle and component grounding, filtering and shielding techniques. This vehicle is equipped with factory-installed radio noise suppression devices that were designed to minimize exposure to typical sources of RFI and EMI; thereby, minimizing radio noise complaints.

Factory-installed radio noise suppression is accomplished primarily through circuitry or devices that are integral to the factory-installed radios, audio power amplifiers and other on-board electrical components such as generators, wiper motors, blower motors, and fuel pumps that have been found to be potential sources of RFI or EMI. External radio noise suppression devices that are used on this vehicle to control RFI or EMI, and can be serviced, include the following:

- **Engine-to-body ground strap** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the engine cylinder head(s). The other is secured to the plenum at the exhaust heat shield forward/outer attaching stud.
- **Resistor-type spark plugs** - This type of spark plug has an internal resistor connected in series between the spark plug terminal and the center electrode to help reduce the production of electromagnetic radiation that can result in radio noise.

OPERATION

OPERATION

There are two common strategies that can be used to suppress Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) radio noise. The first suppression strategy involves preventing the production of RFI and EMI electromagnetic signals at their sources. The second suppression strategy involves preventing the reception of RFI and EMI electromagnetic signals by the audio system components.

The use of braided ground straps in key locations is part of the RFI and EMI prevention strategy. These ground straps ensure adequate ground paths, particularly for high current components such as many of those found in the starting, charging, ignition, engine control and transmission control systems. An insufficient ground path for any of these high current components may result in radio noise caused by induced voltages created as the high current seeks alternative ground paths through components or circuits intended for use by, or in close proximity to the audio system components or circuits.

Preventing the reception of RFI and EMI is accomplished by ensuring that the audio system components are correctly installed in the vehicle. Loose, corroded or improperly soldered wire harness connections, improperly routed wiring and inadequate audio system component grounding can all contribute to the reception of RFI and EMI. A properly grounded antenna body and radio chassis, as well as a shielded antenna coaxial cable with clean and tight connections will each help reduce the potential for reception of RFI and EMI.

MAST, ANTENNA

DESCRIPTION

DESCRIPTION

The antenna mast cable is secured below the fender panel by the antenna cap nut through a mounting hole in the passenger front fender. The coaxial antenna cable is then routed beneath the fender sheet metal and through an entry hole in the passenger side cowl panel into the interior of the vehicle.

Inside the vehicle, the coaxial cable is connected to an instrument panel antenna coaxial cable with an in-line connector that is located behind the passenger side cowl trim panel. The coaxial cable is then routed behind the instrument panel to the back of the radio.

For more information on testing the coaxial cables, refer to **DIAGNOSIS AND TESTING** .

OPERATION

OPERATION

The antenna body and cable connects the antenna mast to the radio. The radio antenna is an electromagnetic circuit component used to capture radio frequency signals that are broadcast by local commercial radio stations in both the Amplitude Modulating (AM) and Frequency Modulating (FM) frequency ranges. These electromagnetic radio frequency signals induce small electrical modulations into the antenna as they move past the mast. The antenna body transfers the weak electromagnetic radio waves induced into the rigid antenna mast into the center conductor of the flexible primary antenna coaxial cable. The braided outer shield of the antenna coaxial cable is grounded through both the antenna body and the radio chassis, effectively shielding the radio waves as they are conducted to the radio. The radio then tunes and amplifies the weak radio signals into stronger electrical signals in order to operate the audio system speakers.

MONITOR, MEDIA SYSTEM

DESCRIPTION

DESCRIPTION

The video entertainment system, consist of:

- Battery powered remote control
- Two headsets
- Video monitor/DVD Player located on the headliner.

In addition to video DVDs, the system will play audio DVDs, audio CDs, MP3 audio disc, and video CDs. There are plug-in jacks on the monitor/player to show video directly from a video camera, connect video games for display on the screen, and play music directly from a MP3 player.

OPERATION

OPERATION

A seven inch (diagonal measurement) liquid crystal display (LCD) screen supports both 3 X 4 and 6 X 9 video formats. The hinged screen latches in the closed position and swings down for viewing.

REMOVAL

REMOVAL

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the two mounting fasteners.
3. Using a trim stick, press the retaining clip at the rear of the monitor (3). Move the monitor from side to side to release from headliner (2).
4. Disconnect electrical harness connector (1) and remove monitor.

INSTALLATION

INSTALLATION

1. Connect electrical harness connector (1) to monitor (3).
2. Position monitor and press into place.
3. Install and tighten mounting fasteners.
4. Connect battery negative cable.

RADIO

DESCRIPTION

DESCRIPTION

Interaction with the radio features is done through the ISC screen module and switch bank located in the center stack of the instrument panel.

RADIO ANTI-THEFT CODE PROCEDURE

For the vehicles that are equipped with power net or NTG4 radios. If the TGM or the radio have been removed or replaced. A four digit security code is required in order for the radio to function:

1. The key must be in the "RUN" position.
2. Press the "ON/VOL" control button.
3. The word "CODE" or " Please enter Anti-Theft Code" will appear on the display.
4. Enter the 4-digit code by pressing the corresponding preset buttons in sequence.

NOTE: **If three consecutive attempts are made to enter an invalid anti-theft code the radio will enter a 'WAIT' state. While in this state the radio display will read 'WAIT'. To exit the 'WAIT' state the radio must remain powered with the ignition in the run position for a continuous 30 minutes (the vehicle may be driven during this time). After exiting the 'WAIT' state the radio will again display 'CODE' and a valid anti-theft code may be entered.**

OPERATION

OPERATION

The radio receiver operates on ignition switched battery current that is available only when the ignition switch is in the On or Accessory positions. The electronic digital clock function of the radio operates on fused battery current supplied through the IOD fuse, regardless of the ignition switch position.

NOTE: **USB devices (e.g., camera memory USB adaptors, etc.) must comply with the MSD (Mass Storage Device) standard. This USB terminal can provide power to the inserted device. The devices current limitation must be less or equal to 500mA.**

REMOVAL

REMOVAL

Fig. 32: Electrical Connectors, AM/FM Antenna Connectors, Navigation Antenna Connector & USB Connector Port
Courtesy of CHRYSLER GROUP, LLC

NOTE: **For REQ radios, turn ignition to RUN and press the SET + SCAN buttons simultaneously to place the radio into transportation mode. The radio will display "Transportation" on the display within 5 seconds. If the radio is inoperative or not REQ, skip this step.**

1. If radio is equipped with an internal hard disk drive (HDD), perform a complete backup of user data. Refer to **STANDARD PROCEDURE**.
2. Disconnect the negative battery cable.
3. Remove the center trim bezel from the instrument panel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL** .

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

4. Remove the fasteners securing the radio to the instrument panel.
5. Pull the radio out far enough to access the back of the radio.
6. Disconnect the AM/FM antenna (2) and electrical connectors (1).
7. If equipped, disconnect the navigation antenna (3).
8. If equipped, disconnect the USB connectors (4).
9. Remove the radio from the instrument panel.

INSTALLATION

INSTALLATION

1. Position the new radio near the instrument panel.
2. Connect the AM/FM antenna (2) and electrical connectors (1).
3. Connect the satellite/navigation antenna (3).
4. If equipped, connect the USB connectors (4).
5. Seat the radio into the cavity in the instrument panel.
6. Install the fasteners securing the radio to the instrument panel. Tighten the fasteners securely.
7. Install the instrument panel center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, INSTALLATION** .
8. Connect the battery negative cable.
9. If radio is equipped with an internal hard disk drive (HDD), restore user data from backup. Refer to **STANDARD PROCEDURE**.

SPEAKER

DESCRIPTION

DESCRIPTION

STANDARD

The standard equipment speaker system includes speakers in four locations. One 15.2 X 22.8 centimeter (6 X 9 inch) full-range speaker is located in each front door. There is also one full-range 13.3 centimeter (5.25 inch) diameter full-range speaker located in each rear door (quad cab) or B-pillar (regular cab).

PREMIUM

The optional premium speaker system features eleven Premium model speakers in seven locations. Each of the standard speakers is replaced with Premium model speakers. One 8.8 centimeter (3.50 inch) diameter speaker is located on each end of the instrument panel top pad. One 6.3 centimeter (2.50 inch) diameter speaker is located in the center of the instrument panel top pad. One 15.2 X 22.8 centimeter (6 X 9 inch) Premium speaker is located in each front door. There is also one coaxial 13.3 centimeter (5.25 inch) diameter Premium full-range speaker located in each rear door (quad cab) or B-pillar (regular cab). The premium speaker system also includes a power amplifier mounted behind the glove box. The total available power of the premium speaker system is 368 watts. If equipped, a 25.4 centimeter (10 inch) subwoofer is located behind the center passenger seat along with a amplifier (rated at 150 watts) located under the center passenger seat. The total available power if equipped with the subwoofer and second power amplifier is 518 watts.

OPERATION

OPERATION

Two wires connected to each speaker, one feed circuit (+) and one return circuit (-), allow the audio output signal electrical current to flow through the voice coil. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SPEAKER

Any diagnosis of the Audio system should begin with the use of a scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

WARNING: **Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.**

CAUTION: **The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio and/or amplifier may result.**

1. If all speakers are inoperative, check the fuses in the Totally Integrated Power Module (TIPM). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Check the amplifier fuse (if equipped) in the TIPM. If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

3. Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 4.
4. Turn the radio receiver OFF. Turn the ignition OFF. Disconnect and isolate the battery negative cable. If vehicle is **not** equipped with an amplifier, remove the radio receiver. If vehicle is equipped with an amplifier, disconnect wire harness connector at output side of amplifier. Go to Step 5.
5. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the radio receiver wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 6. If not OK, repair the shorted speaker feed (+) and/or return (-) circuits(s) to the speaker as required.
6. Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector or if equipped, the amplifier wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuits(s) as required.

SWITCH, REMOTE RADIO

OPERATION

OPERATION

The six switches in the two remote radio switch units are normally open, resistor multiplexed momentary switches that are hard wired to the Totally Integrated Power Module (TIPM) through the clockspring. The TIPM sends a five volt reference signal to both switch units on one circuit, and senses the status of all of the switches by reading the voltage drop on a second circuit.

When the TIPM senses an input (voltage drop) from any one of the remote radio switches, it sends the proper switch status messages on the Controller Area Network (CAN) data bus network to the radio receiver. The electronic circuitry within the radio receiver is programmed to respond to these remote radio switch status messages by adjusting the radio settings as requested. For diagnosis of the TIPM or the CAN data bus, the use of a scan tool and the proper Diagnostic Procedures information is recommended.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REMOTE SWITCHES

Any diagnosis of the Audio system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: **Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.**

Fig. 57: Identifying Remote Radio Switches
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the remote radio switch(es) from the steering wheel. Refer to **SWITCH, REMOTE RADIO, REMOVAL**.
3. Use an ohmmeter to check the switch resistances as shown in the Remote Radio Switch Test chart. If the remote radio switch resistances check OK, refer to 4. If not OK, replace the faulty switch.

REMOTE RADIO SWITCH TEST

Switch	Switch Position	Minimum Resistance	Nominal Resistance	Maximum Resistance
Right (White)	Volume Up	6.732 ohms	6.8 ohms	6.868 ohms
Right (White)	Volume Down	14.850 ohms	15 ohms	15.151 ohms
Right (White)	Mode Advance	0 ohms	0 ohms	0 ohms
Left (Black)	Seek Up	1.188 ohms	1.2 ohms	1.212 ohms
Left (Black)	Seek Down	3.267 ohms	3.3 ohms	3.333 ohms
Left (Black)	Pre-Set Station Advance	.465 ohms	.47 ohms	.474 ohms

4. Connect the battery negative cable. Turn the ignition switch to the On position. Check for 5 volts at the radio control mux circuit cavities of the steering wheel wire harness connectors for both remote radio switches. If OK, refer to 5. If not OK, repair the open or shorted radio control mux circuit to the Totally Integrated Power Module (TIPM) as required.

5. Disconnect and isolate the battery negative cable. Disconnect the 22-way instrument panel wire harness connector from the TIPM. Check for continuity between the remote radio switch ground circuit cavities of the steering wheel wire harness connectors for both remote radio switches and a good ground. There should be no continuity. If OK, refer to 6. If not OK, repair the shorted remote radio switch ground circuit to the TIPM as required.
6. Check for continuity between the remote radio switch ground circuit cavities of the steering wheel wire harness connectors for both remote radio switches and the 22-way instrument panel wire harness connector for the TIPM. There should be continuity. If OK, refer to the appropriate Diagnostic information to test the TIPM and the CAN data bus. If not OK, repair the open remote radio switch ground circuit as required.

DIAGNOSIS AND TESTING

B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

Fig. 1: Front Left Audio Speaker Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The (X201) Left Front Speaker (+) circuit and the (X291) Left Front Speaker (-) circuit are outputs of the

Radio. The Radio controls and monitors these circuits for a concern.

For a detailed description of the Audio System. Refer to **DESCRIPTION** .

For additional information regarding the operation of the Audio System. Refer to **OPERATION** .

WHEN MONITORED:

With the Radio on.

SET CONDITION:

The Radio detects a short to ground condition on the speaker output circuit.

POSSIBLE CAUSES

Possible Causes

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**

   NOTE: This vehicle has a Front I/P Speaker wired in parallel with the Front Door Speaker.

   1. Turn the ignition on and open one of the front doors.

      NOTE: A front door must remain open whenever checking or erasing Radio DTC's.

   2. Using the scan tool, record and erase the Radio DTC's.
   3. Turn the Radio on.
   4. Adjust the speakers to the front and center.
   5. Using the scan tool, read the active Radio DTC's.

      Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

      Yes

      - Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE LEFT FRONT SPEAKERS**
   1. Make sure one of the front doors is still open.
   2. Using the scan tool, erase the DTC's.
   3. Turn the ignition off.
   4. Disconnect the Left Front Speaker harness connector from the Left Front Speaker.
   5. Disconnect the Left Front I/P Speaker harness connector from the Left Front I/P Speaker.
   6. Turn the ignition on.
   7. Turn the radio on.
   8. Using the scan tool, read the active Radio DTC's.

   Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

   Yes

   - Go To 4.

   No

   - Go To 3.

3. **CHECK THE LEFT FRONT I/P SPEAKER**
   1. Make sure one of the front doors is still open.
   2. Using the scan tool, erase the DTC's.
   3. Turn the ignition off.
   4. Re-connect the Left Front Speaker harness connector to the Left Front Speaker.
   5. Turn the ignition on.
   6. Turn the radio on.
   7. Using the scan tool, read the active Radio DTC's.

   Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

   Yes

   - Replace the Left Front Speaker in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

- Replace the Left Front I/P Speaker in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (X201) LEFT FRONT SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 2: Checking Left Front Speaker (+) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Radio C1 harness connector.
3. Measure the resistance between ground and the (X201) Left Front Speaker (+) circuit.

Is the resistance below 5.0 Ohms?

Yes

- Repair the (X201) Left Front Speaker (+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **CHECK THE (X291) LEFT FRONT SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 3: Checking Left Front Speaker (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (X291) Left Rear Speaker (-) circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (X291) Left Rear Speaker (-) circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The (X201) Left Front Speaker (+) circuit and the (X291) Left Front Speaker (-) circuit are outputs of the Radio. The Radio controls and monitors these circuits for a concern.

For a detailed description of the Audio System. Refer to **DESCRIPTION** .

For additional information regarding the operation of the Audio System. Refer to **OPERATION** .

WHEN MONITORED:

With the Radio on.

SET CONDITION:

The Radio detects a short to battery condition on the speaker output circuit.

POSSIBLE CAUSES

Possible Causes
(X201) LEFT FRONT SPEAKER (+) CIRCUIT FOR A SHORT TO VOLTAGE
(X291) LEFT FRONT SPEAKER (-) CIRCUIT FOR A SHORT TO VOLTAGE
RADIO

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**

NOTE: **This vehicle has a Front I/P Speaker wired in parallel with the Front Door Speaker.**

1. Turn the ignition on and open one of the front doors.

NOTE: **A front door must remain open whenever checking or erasing Radio DTC's.**

2. Using the scan tool, record and erase the Radio DTC's.
3. Turn the Radio on.
4. Adjust the speakers to the front and center.
5. Using the scan tool, read the active Radio DTC's.

Does the scan tool read: B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK FOR VOLTAGE ON THE (X201) LEFT FRONT SPEAKER (+) CIRCUIT**

Fig. 5: Measuring Voltage Between Ground & Left Front Speaker (+) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Radio C1 harness connector.
3. Disconnect the Left Front Door Speaker harness connector.
4. Disconnect the Left Front I/P Speaker harness connector.
5. Turn the ignition on.
6. Measure the voltage between ground and the (X201) Left Front Speaker (+) circuit.

Is there any voltage present?

Yes

- Repair the (X201) Left Front Speaker (+) CIRCUIT FOR A SHORT TO VOLTAGE.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X291) LEFT FRONT SPEAKER (-) CIRCUIT**

Fig. 6: Measuring Voltage Between Ground & Left Front Speaker (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between ground and the (X291) Left Front Speaker (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the (X291) Left Front Speaker (-) CIRCUIT FOR A SHORT TO VOLTAGE.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**

NOTE: **This vehicle has a Front I/P Speaker wired in parallel with the Front Door Speaker.**

1. Turn the ignition on and open one of the front doors.

NOTE: **A front door must remain open whenever checking or erasing Radio DTC's.**

2. Using the scan tool, record and erase the Radio DTC's.
3. Turn the Radio on.
4. Adjust the speakers to the front and center.

5. Using the scan tool, read the active Radio DTC's.

   Does the scan tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT FOR AN OPEN?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE LEFT FRONT SPEAKER**

Fig. 8: Checking The Left Front Speaker

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Left Front Speaker.
3. Measure the resistance of the speaker between the two terminals.

NOTE: **The graphic shows the connector for reference only. Measure between the speaker terminals.**

Is the resistance above 5.0 Ohms?

Yes

- Replace the Left Front Speaker in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK THE LEFT FRONT I/P SPEAKER**

Fig. 9: Checking The Left Front I/P Speaker
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Left Front I/P Speaker.
3. Measure the resistance of the speaker between the two terminals.

NOTE: **The graphic shows the connector for reference only. Measure between the speaker terminals.**

Is the resistance above 5.0 Ohms?

Yes

- Replace the Left Front I/P Speaker in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK THE (X201) LEFT FRONT SPEAKER (+) CIRCUIT FOR AN OPEN**

Fig. 10: Checking Left Front Speaker (+) Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Radio C1 harness connector.
3. Measure the resistance of the (X201) Left Front Speaker (+) circuit between the Radio C1 connector, and the Left Front Speaker harness connector and the Left Front I/P Speaker harness.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5.

No

- Repair an open in the (X201) Left Front Speaker (+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **CHECK THE (X291) LEFT FRONT SPEAKER (-) CIRCUIT FOR AN OPEN**

Fig. 11: Checking Left Front Speaker (-) Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (X291) Left Front Speaker (-) circuit between the Radio C1 connector, and the Left Front Speaker harness connector and the Left Front I/P Speaker harness.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Radio in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repair an open in the (X291) Left Front Speaker (-) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**

   NOTE: This vehicle has a Front I/P Speaker wired in parallel with the Front Door Speaker.

   1. Turn the ignition on and open one of the front doors.

      NOTE: A front door must remain open whenever checking or erasing Radio DTC's.

   2. Using the scan tool, record and erase the Radio DTC's.
   3. Turn the Radio on.
   4. Adjust the speakers to the front and center.
   5. Using the scan tool, read the active Radio DTC's.

      Does the scan tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

      Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE RIGHT FRONT SPEAKERS**
   1. Make sure one of the front doors is still open.
   2. Using the scan tool, erase the DTC's.
   3. Turn the ignition off.
   4. Disconnect the Right Front Speaker harness connector from the Right Front Speaker.
   5. Disconnect the Right Front I/P Speaker harness connector from the Right Front I/P Speaker.
   6. Turn the ignition on.
   7. Turn the radio on.
   8. Using the scan tool, read the active Radio DTC's.

   Does the scan tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

   Yes

   - Go To 4.

   No

   - Go To 3.

3. **CHECK THE RIGHT FRONT I/P SPEAKER**
   1. Make sure one of the front doors is still open.
   2. Using the scan tool, erase the DTC's.
   3. Turn the ignition off.
   4. Re-connect the Right Front Speaker harness connector to the Right Front Speaker.
   5. Turn the ignition on.
   6. Turn the radio on.
   7. Using the scan tool, read the active Radio DTC's.

   Does the scan tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

   Yes

   - Replace the Right Front Speaker in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Right Front I/P Speaker in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (X202) RIGHT FRONT DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 13: Checking Right Front Door Speaker (+) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the Radio C1 harness connector.
3. Measure the resistance between ground and the (X202) Right Front Door Speaker (+) circuit

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (X202) Right Front Door Speaker (+) circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **CHECK THE (X292) RIGHT FRONT DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 14: Checking Right Front Door Speaker (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (X292) Right Front Door Speaker (-) circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (X292) Right Front Door Speaker (-) circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**

NOTE: This vehicle has a Front I/P Speaker wired in parallel with the Front Door Speaker.

1. Turn the ignition on and open one of the front doors.

NOTE: A front door must remain open whenever checking or erasing Radio DTC's.

2. Using the scan tool, record and erase the Radio DTC's.
3. Turn the Radio on.
4. Adjust the speakers to the front and center.
5. Using the scan tool, read the active Radio DTC's.

Does the scan tool display active: B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK FOR VOLTAGE ON THE (X202) RIGHT FRONT DOOR SPEAKER (+) CIRCUIT**

Fig. 16: Measuring Voltage Between Ground & Right Front Door Speaker (+) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Radio C1 harness connector.
3. Disconnect the Right Front Door Speaker harness connector.
4. Disconnect the Right Front I/P Speaker harness connector.
5. Turn the ignition on.
6. Measure the voltage between ground and the (X202) Right Front Door Speaker (+) circuit.

Is there any voltage present?

Yes

- Repair the (X202) Right Front Door Speaker (+) CIRCUIT FOR A SHORT TO VOLTAGE.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X292) RIGHT FRONT DOOR SPEAKER (-) CIRCUIT**

Fig. 17: Measuring Voltage Between Ground & Right Front Door Speaker (-) Circuit

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK LEFT REAR SPEAKER**
   1. Make sure one of the front doors is still open.
   2. Using the scan tool, erase the DTC's.
   3. Turn the ignition off.
   4. Disconnect the Left Rear Speaker harness connector from the Left Rear Speaker.
   5. Turn the ignition on.
   6. Turn the radio on.
   7. Using the scan tool, read the active Radio DTC's.

   Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

   Yes

   - Go To 3.

   No

   - Replace the Left Rear Speaker in accordance with the Service Information. Refer to **SPEAKER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK THE (X205) LEFT REAR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

1. Turn the ignition off.

2. Disconnect the Radio C1 harness connector.
3. Disconnect the Left Rear Speaker harness connector.
4. Turn the ignition on.
5. Measure the voltage between ground and the (X205) Left Rear Speaker (+) circuit.

   Is there any voltage present?

   Yes

   - Repair the (X205) Left Rear Speaker (+) CIRCUIT FOR A SHORT TO VOLTAGE.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X295) LEFT REAR SPEAKER (-) CIRCUIT**

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **There are two versions of the B140F DTC test. In order to select the proper test you must know if the vehicle is equipped with an Amplifier. If the vehicle is equipped with an Amplifier use the B140F-PREMIUM test. If the vehicle is not**

equipped with an Amplifier use the B140F-BASE test.

THEORY OF OPERATION

The (X206) Right Rear Speaker (+) circuit and the (X296) Right Rear Speaker (-) circuit are outputs of the Radio. The Radio controls and monitors these circuits for a concern.

For a detailed description of the Audio System. Refer to **DESCRIPTION** .

For additional information regarding the operation of the Audio System. Refer to **OPERATION** .

WHEN MONITORED:

With the Radio on.

SET CONDITION:

The Radio detects an open condition on the speaker output circuit.

POSSIBLE CAUSES

Possible Causes
(X206) RIGHT REAR SPEAKER (+) CIRCUIT FOR AN OPEN (X296) RIGHT REAR SPEAKER (-) CIRCUIT FOR AN OPEN RIGHT REAR SPEAKER

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on and open one of the front doors.

       NOTE: A front door must remain open whenever checking or erasing Radio DTC's.

    2. Using the scan tool, record and erase the Radio DTC's.
    3. Turn the Radio on.
    4. Adjust the speakers to the rear and center.
    5. Using the scan tool, read the active Radio DTC's.

       Does the scan tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

       Yes

       - Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE RIGHT REAR SPEAKER**

Fig. 60: Checking The Right Rear Speaker
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Right Rear Speaker.
3. Measure the resistance of the speaker between the two terminals.

NOTE: **The graphic shows the connector for reference only. Measure between the speaker terminals.**

Is the resistance above 5.0 Ohms?

Yes

- Replace the Right Rear Speaker in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK THE (X206) RIGHT REAR SPEAKER (+) CIRCUIT FOR AN OPEN**

Fig. 61: Checking Right Rear Speaker (+) Circuit For An Open

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Radio C1 harness connector.
2. Measure the resistance of the (X206) Right Rear Speaker (+) circuit between the Radio C1 connector and the Right Rear Speaker harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4.

   No

   - Repair an open in the (X206) Right Rear Speaker (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (X296) RIGHT REAR SPEAKER (-) CIRCUIT FOR AN OPEN**

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (X296) Right Rear Speaker (-) circuit between the Radio C1 connector, and the Right Rear Speaker harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Radio in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repair an open in the (X296) Right Rear Speaker (-) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1420-AUDIO CASSETTE ERROR/INOPERABLE CASSETTE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition on and the radio Cassette player turned on.

SET CONDITION:

The code will set when a damaged Cassette is placed in the Cassette Player.

POSSIBLE CAUSES

Possible Causes
CASSETTE READ FAILURE

DIAGNOSTIC TEST

1. **RADIO**
   1. Replace the problem Cassette with a good, clean, undamaged, cassette.
   2. Turn the radio cassette player on.
   3. With the scan tool, read DTC's.

      Does the scan tool display: B1420: AUDIO CASSETTE ERROR/INOPERABLE CASSETTE?

      Yes

      - Eject the inoperative cassette and replace the Radio/Cassette Player in accordance with the service information. Refer to **RADIO, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Test Complete.

B1421-AUDIO CD READ ERROR/INOPERABLE DISC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition on and the radio CD player turned on.

SET CONDITION:

The code will set if a CD is scratched, damaged, or contains corrupt data.

POSSIBLE CAUSES

Possible Causes
CD READ FAILURE

DIAGNOSTIC TEST

1. **RADIO**
    1. Replace the problem CD with a good, clean, unscratched, music CD.
    2. Turn the Radio on.
    3. With the scan tool, read DTC's.

    Does the scan tool display: B1421 Audio CD Read Error/Inoperable Disc?

    Yes

    - Eject the inoperative CD and replace the Radio in accordance with the Service Information. Refer to **RADIO, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

    - Test Complete.

B1422-AUDIO DVD READ ERROR/INOPERABLE DISC

WHEN MONITORED:

Continuously with the ignition on and the Radio/DVD player turned on.

SET CONDITION:

The code will set if a DVD is scratched, damaged, or contains corrupt data.

POSSIBLE CAUSES

Possible Causes
DVD READ FAILURE

DIAGNOSTIC TEST

1. **RADIO/DVD PLAYER**
    1. Replace the problem DVD with a good, clean, unscratched DVD.
    2. Turn the Radio/DVD player on.
    3. With the scan tool, read DTC's.

    Does the scan tool display active: B1422-AUDIO DVD READ ERROR/INOPERABLE DISC?

    Yes

    - Eject the inoperative DVD and replace the Radio/DVD player in accordance with the Service Information. Refer to **RADIO, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

    - Test Complete.

B1424-IMPROPER DVD-WRONG REGION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition on and the Radio/DVD player turned on.

SET CONDITION:

The code will set if a DVD is not formatted for the proper region or the Radio/DVD player is programmed for the incorrect region.

POSSIBLE CAUSES

Possible Causes
DVD READ FAILURE

DIAGNOSTIC TEST

1. **CHECK THE DVD**
    1. Replace the problem DVD with a DVD formatted for the proper region.
    2. Turn the Radio/DVD player on.
    3. With the scan tool, read DTC's.

    Does the scan tool display active: B1424-IMPROPER DVD-WRONG REGION?

    Yes

    - Go To 2.

    No

    - Test Complete.
2. **RADIO/DVD PLAYER**
    1. With the scan tool, verify the Radio/DVD player is programmed for the proper region.
    2. With the scan tool, read DTC's.

    Does the scan tool display active: B1424-IMPROPER DVD-WRONG REGION?

    Yes

    - Eject the inoperative DVD and replace the Radio/DVD player in accordance with the Service Information. Refer to **RADIO, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

    - Test Complete.

B1429-RADIO DISPLAY HIGH TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition and Navigation Radio on.

SET CONDITION:

The code will set if the temperature inside the display exceeds 70°C (158°F)

POSSIBLE CAUSES

Possible Causes
HIGH TEMPERATURE FAILURE

DIAGNOSTIC TEST

1. **VERIFY THAT DTC B1429-RADIO DISPLAY HIGH TEMPERATURE IS ACTIVE**
    1. With the scan tool, erase the Audio DTC's.
    2. Start the engine and allow the engine to reach normal operating temperature.
    3. If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.
    4. The radio display should operate to 70°C (158°F).
    5. With the scan tool, read the DTC's.

    Does the scan tool display, B1429-Radio Display High Temperature?

    Yes

    - Replace the Radio in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

    - Test Complete.

B142A-RADIO UNIT HIGH TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition and Radio on.

SET CONDITION:

The code will set if the temperature inside the radio is above 65°C (149°F).

POSSIBLE CAUSES

Possible Causes
HIGH TEMPERATURE FAILURE

DIAGNOSTIC TEST

1. **VERIFY THAT DTC B142A-RADIO UNIT HIGH TEMPERATURE IS ACTIVE.**
    1. With the scan tool, erase the Audio DTC's.
    2. Start the engine and allow the engine to reach normal operating temperature.
    3. If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.
    4. The Radio should operate between -23°C and 65°C (-10°F and 149°F).
    5. With the scan tool, read the DTC's.

    Does the scan tool display, B142A-Radio Unit High Temperature?

    Yes

    - Replace the Radio in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

    - Test Complete.

B142D-AUDIO ANTENNA NOT CONNECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on and the Radio in seek mode.

SET CONDITION:

With the Radio in seek mode for two minutes and the Radio does not detect an Antenna connection or does not receive a Radio station signal.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION OPEN ANTENNA CABLE RADIO

DIAGNOSTIC TEST

1. **CHECK THE ANTENNA CONNECTIONS**
    1. Turn the ignition off.

2. Disconnect the Radio Antenna connector.
3. Inspect the Radio Antenna connection.

   Was the Antenna connection clean and secure?

   Yes

   - Go To 2.

   No

   - Repair the Antenna connection as needed.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE ANTENNA AND CABLE**
   1. Connect the Radio Diagnostic Tool (special tool #9977-6-FM, Antenna) to the Antenna connection on the back of the Radio.
   2. Make sure one of the front doors is still open.
   3. Using the scan tool, erase the DTC's.
   4. Turn the ignition on.
   5. Turn the Radio on.
   6. Using the scan tool, read the active Radio DTC's.

      Does this DTC display as active?

      Yes

      - Go To 3.

      No

      - Repair or replace the Radio in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **TEST THE ANTENNA CABLE**
   1. Turn the ignition off.
   2. Disconnect the Antenna cable at the base.
   3. Connect the appropriate Radio Diagnostic Tool (special tool #9977-6-1, Adapter) or (special tool #9977-6-3, Adapter) to the Antenna cable at the back of the Radio.
   4. Connect the appropriate Radio Diagnostic Tool (special tool #9977-6-4, Jumper) or (special tool #9977-6-2, Jumper) to the Antenna cable at the Antenna base.
   5. Measure the Resistance across the tool terminals.

      Is the resistance above 52.5 Ohms?

Yes

- Use the Radio Diagnostic Tool (special tool #9977-6, Kit, Radio Antenna Diagnostic) to locate the open circuit, repair or replace the Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Antenna base in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B142E-GPS ANTENNA NOT CONNECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on and the Radio in navigation mode.

SET CONDITION:

The Radio does not detect a Global Positioning System (GPS) Antenna connection.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION RADIO

DIAGNOSTIC TEST

1. **TEST ANTENNA**
    1. Turn the ignition off.
    2. Disconnect the GPS Antenna connector.
    3. Inspect the GPS Antenna connection.

    Was the Antenna connection clean and secure?

    Yes

    - Go To 2.

    No

    - Repair the Antenna connection as needed.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **ANTENNA**
    1. Refer to the Audio System in the service information and test the Antenna in accordance with the service procedure.

       Is the Antenna OK?

       Yes

       - Go To 3.

       No

       - Repair or replace the Antenna assembly as necessary.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **RADIO**

   NOTE: Reconnect all previously disconnected components.

   NOTE: Move vehicle outside approximately 9.14 m (30 ft.) from any structure.

   1. Turn the ignition and Radio on.
   2. With the scan tool, erase the audio DTC's and operate the navigation system.
   3. With the scan tool, read the audio DTC's.

      Did this DTC reset?

      Yes

      - Replace the Radio in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

      No

      - Test Complete.

B142F-SATELLITE RADIO ANTENNA NOT CONNECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

SET CONDITION:

This DTC sets when the Radio does not detect a Satellite Antenna connection.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION OPEN SATELLITE RADIO ANTENNA CABLE OPEN SATELLITE RADIO ANTENNA SATELLITE RADIO RECEIVER

DIAGNOSTIC TEST

1. **CHECK THE ANTENNA CONNECTION**
    1. Turn the ignition off.
    2. Disconnect the Satellite Radio Antenna connector at the rear of the Radio.
    3. Inspect the Satellite Radio Antenna connection.

    Was the antenna connection clean and secure?

    Yes

    - Go To 2.

    No

    - Clean and secure the antenna connection as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **CHECK THE ANTENNA AND CABLE**
    1. Connect the Radio Diagnostic Tool (special tool #9977-6-SAT, Antenna) to the Satellite Antenna connection on the back of the Radio.
    2. Make sure one of the front doors is still open.
    3. Using the scan tool, erase the DTC's.
    4. Turn the ignition on.
    5. Turn the Radio on.
    6. Using the scan tool, read the active Radio DTC's.

    Does the scan tool display: B142F Satellite Radio Antenna Not Connected as Active?

    Yes

    - Replace the Satellite Radio in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

- Go To 3.

3. **TEST THE SATELLITE ANTENNA CABLE**
    1. Disconnect the Satellite Antenna cable at the Satellite Antenna.
    2. Connect the appropriate Radio Diagnostic Tool (special tool #9977-6-1, Adapter) or (special tool #9977-6-3, Adapter) to the Satellite Antenna cable at the back of the Radio.
    3. Connect the appropriate Radio Diagnostic Tool (special tool #9977-6-4, Jumper) or (special tool #9977-6-2, Jumper) to the Satellite Antenna cable at the Satellite Antenna.
    4. Measure the Resistance across the terminals on the tool.

    Is the resistance above 52.5 Ohms?

    No

    - Use the Radio Diagnostic Tool (special tool #9977-6, Kit, Radio Antenna Diagnostic) to locate the open circuit, repair or replace the Satellite Antenna cable as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    Yes

    - Replace the Satellite Antenna in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK CONNECTOR**
    1. Turn the ignition off.
    2. Inspect the Satellite Radio Antenna connection at the Radio.

    Was the antenna connection clean and secure?

    Yes

    - Go To 3.

No

- Clean and secure the antenna connection as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **SATELLITE RADIO**
    1. Re-connect the antenna cable to the Radio.
    2. Disconnect the Satellite Radio Antenna connector at the Antenna.
    3. Turn the ignition on.
    4. With the scan tool, record, then erase the radio DTC's.
    5. Turn the radio on and put the Satellite Radio in Satellite Mode.
    6. Put the satellite radio in seek up mode for two loops around the band cycle.
    7. With the scan tool, read the active DTC's.

    What Active DTC(s) are displayed?

       - If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **INSIDE REARVIEW MIRROR**
    1. Turn the ignition off.
    2. Disconnect the Rearview Mirror C2 harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

- Go To 3.

No

- Replace the Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

1. Turn the ignition off.
2. Disconnect the Radio C2 harness connector.
3. Measure the resistance between ground and the (X712) Microphone 1 (+) circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (X712) Microphone 1 circuit for short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **(X712) MICROPHONE 1 IN (+) CIRCUIT FOR A SHORT TO VOLTAGE**

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

   NOTE: Verify the connection of the Inside Rearview Mirror harness connector.

   1. Turn the ignition on.
   2. With the scan tool, read the active DTC's.

      Does the scan tool display B143B-MICROPHONE 1 CIRCUIT LOW as active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **CHECK FOR ACTIVE DTC B143E**
   1. With the scan tool, read the active DTC's.

Does the scan tool display B143E-MICROPHONE 2 CIRCUIT LOW also as active?

Yes

- Go To 3.

No

- Go To 6.

3. **CHECK FOR VOLTAGE AT THE INSIDE REARVIEW MIRROR**

Fig. 72: Measuring Voltage Between Microphone Feed Circuit & Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Inside Rearview Mirror harness connector.

3. Turn the ignition on.
4. Measure the voltage between the (X793) Microphone Feed circuit and ground.

   Is the voltage above 10.0 volts?

   Yes

   - Go To 6.

   No

   - Go To 4.

4. **CHECK FOR VOLTAGE AT THE RADIO**

Fig. 73: Checking Microphone Feed Circuit For Voltage At Radio
Courtesy of CHRYSLER GROUP, LLC

1. While back probing, measure the voltage between the (X793) Microphone Feed circuit and ground at the Radio C2 harness connector.

NOTE: **The graphic shows the connector for reference only. Back probe the harness connector.**

Is the voltage above 10.0 volts?

Yes

- Repair the (X793) Microphone Feed circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **RESTORE THE VEHICLE CONFIGURATION**
   1. With the scan tool, restore the vehicle configuration.
   2. Turn the ignition off, then back on.
   3. With the scan tool, read the active DTC's.

   Does the scan tool display B143B-MICROPHONE 1 CIRCUIT LOW as active?

   Yes

   - Replace the Radio in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. **CHECK THE INSIDE REARVIEW MIRROR**

Fig. 74: Checking Inside Rearview Mirror Circuit

1. Turn the ignition off.
2. Disconnect the Inside Rearview Mirror C2 harness connector.
3. Connect a jumper wire between the (X793) Microphone Feed and the (X712) Microphone 1 IN (+) circuits.
4. Turn the ignition on.
5. With the scan tool, read the DTC's.

NOTE: **DTC B143C-MICROPHONE 1 CIRCUIT HIGH should display as active as a result of this test.**

Does the scan tool display B143B-MICROPHONE 1 CIRCUIT LOW as active?

Yes

- Go To 7.

No

- Replace the Inside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK FOR THE (X712) MICROPHONE 1 IN (+) CIRCUIT FOR AN OPEN**

Fig. 75: Checking Microphone 1 In (+) Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Radio C2 harness connector.
3. Measure the resistance of the (X712) Microphone 1 IN (+) circuit between the Inside Rearview Mirror and Radio C2 harness connectors.

   Is the resistance above 10K Ohms?

   Yes

   - Repair the (X712) Microphone 1 IN (+) circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 8.

8. **CHECK FOR THE (X712) MICROPHONE 1 IN (+) CIRCUIT FOR A SHORT TO GROUND**

SET CONDITION:

This DTC sets when the radio is in satellite mode and detects a shorted or open antenna circuit for more than five milliseconds.

POSSIBLE CAUSES

Possible Causes
SHORTED OR OPEN ANTENNA CABLE
SHORTED OR OPEN ANTENNA
SATELLITE RADIO RECEIVER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, erase all Satellite Radio DTC's.
    3. Turn the ignition and radio on.
    4. Put the satellite radio in seek up mode for two loops around the band cycle.
    5. With the scan tool, read the DTC's.

    Does the scan tool display active: B156B-Satellite Radio Antenna Circuit?

    Yes

    - Go To 2.

    No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE ANTENNA AND CABLE**
   1. Disconnect the Satellite Radio Antenna connector at the rear of the Radio.
   2. Connect the Radio Diagnostic Tool (special tool #9977-6-SAT, Antenna) to the Satellite Antenna connection on the back of the Radio.
   3. Make sure one of the front doors is still open.
   4. Using the scan tool, erase the DTC's.
   5. Turn the ignition on.
   6. Turn the Radio on.
   7. Using the scan tool, read the active Radio DTC's.

   Does the scan tool display active: B156B-Satellite Radio Antenna Circuit?

   Yes

   - Replace the Satellite Radio in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **TEST THE SATELLITE ANTENNA CABLE**
   1. Disconnect the Satellite Antenna cable at the Satellite Antenna.
   2. Connect the appropriate Radio Diagnostic Tool (special tool #9977-6-1, Adapter) or (special tool #9977-6-3, Adapter) to the Satellite Antenna cable at the back of the Radio.
   3. Connect the appropriate Radio Diagnostic Tool (special tool #9977-6-4, Jumper) or (special tool #9977-6-2, Jumper) to the Satellite Antenna cable at the Satellite Antenna.
   4. Measure the Resistance across the terminals on the tool.

   Is the resistance above 52.5 Ohms or below 47.5 Ohms?

   No

   - Use the Radio Diagnostic Tool (special tool #9977-6, Kit, Radio Antenna Diagnostic) to locate the open or short circuit, repair or replace the Satellite Antenna cable as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   Yes

- Replace the Satellite Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

With the ignition on.

SET CONDITION:

If the module detects that the battery voltage is less than 9.0 volts for one second.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM RADIO

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on, then off, and then on again.
    2. With the scan tool, read the Radio DTC's.

    Does the scan tool display active: B210D-BATTERY VOLTAGE LOW?

    Yes

    - Go To 2.

    No

    - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **CHECK THE BATTERY VOLTAGE TO THE RADIO**
    1. With the scan tool in Data Display, read the Radio battery voltage.

    Is the battery voltage less than 9.0 volts?

    Yes

- Go To 3.

No

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK FOR CHARGING SYSTEM RELATED DTC's IN THE POWERTRAIN CONTROL MODULE (PCM)**
   1. With the scan tool in ECU View, select PCM and check for any Charging System related DTC's.

      Does the scan tool display any Charging System related DTC's?

      Yes

      - Refer to **DIAGNOSIS AND TESTING - CHARGING SYSTEM** and perform the appropriate charging system or battery DTC diagnostic procedure.

      No

      - Replace the Radio in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B210E-BATTERY VOLTAGE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

If the module detects that the battery voltage is greater 16.5 volts for one second.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM RADIO

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
   1. Turn the ignition on, then off, and then on again.
   2. With the scan tool, read the Radio DTC's.

Does the scan tool display active: B210E-BATTERY VOLTAGE HIGH?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE BATTERY VOLTAGE TO THE RADIO**
   1. With the scan tool in Data Display, read the Radio battery voltage.

      Is the battery voltage greater than 16.5 volts?

      Yes

      - Go To 3.

      No

      - Replace the Radio in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **CHECK FOR CHARGING SYSTEM RELATED DTC's IN THE POWERTRAIN CONTROL MODULE (PCM)**
   1. With the scan tool in ECU View, select PCM and check for any Charging System related DTC's.

      Does the scan tool display any Charging System related DTC's?

      Yes

      - Refer to **DIAGNOSIS AND TESTING - CHARGING SYSTEM** and perform the appropriate charging system or battery DTC diagnostic procedure.

      No

      - Replace the Radio in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B221E-RADIO INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition on and Radio turned on.

SET CONDITION:

The code will set if the Radio detects a Radio internal failure.

POSSIBLE CAUSES

Possible Causes
RADIO INTERNAL FAILURE

DIAGNOSTIC TEST

1. **REPLACE THE RADIO**
    1. When this DTC is active, replace the Radio.

       Repair

       - Replace the Radio in accordance with the Service Information. Refer to **RADIO, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B222C-VEHICLE CONFIGURATION NOT PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

Vehicle configuration information not programmed into the TIPM.

POSSIBLE CAUSES

POSSIBLE CAUSES
NO COMMUNICATION WITH TOTALLY INTEGRATED POWER MODULE (TIPM)
ACTIVE TIPM DTC's
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Turn the ignition off, wait ten seconds then turn the ignition on.

3. With the scan tool, read DTC's.

   Does the scan tool display: B222C-VEHICLE CONFIGURATION NOT PROGRAMMED?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **VERIFY COMMUNICATION WITH TIPM**
   1. With the scan tool, read the active modules on the bus.

      Does the scan tool show the TIPM active on the bus?

      Yes

      - Go To 3.

      No

      - Refer to **NO RESPONSE FROM TIPM (TOTALLY INTEGRATED POWER MODULE)** and perform the diagnostic procedure.

3. **CHECK TIPM FOR ACTIVE DTC's**
   1. With the scan tool, erase TIPM DTC's.
   2. Turn the ignition off. Wait approximately ten seconds.
   3. Turn the ignition on.
   4. With the scan tool, read TIPM DTC's.

      Are any active DTC's present?

      Yes

      - Refer to **TIPM - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 4.

4. **CHECK THE VEHICLE CONFIGURATION INFORMATION WITH SCAN TOOL**

1. With the scan tool run an ECU Details Report, read the Original and Current VINs, and the Body Style of the vehicle.

   Does the information displayed match the vehicle?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **RESTORE THE VEHICLE CONFIGURATION**
   1. With the scan tool, restore the vehicle configuration.
   2. Turn the ignition off, then back on.
   3. With the scan tool, read the active DTC's.

      Does the scan tool display B222C-VEHICLE CONFIGURATION NOT PROGRAMMED as active?

      Yes

      - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

U0010-CAN INTERIOR BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

SET CONDITION:

The controller detects a short to ground on the CAN Interior Bus (125K) (+) circuit or a short to voltage on the CAN Interior Bus (125K) (-) circuit.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT FOR A SHORT TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT FOR A SHORT TO GROUND
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO THE (D265) CAN INTERIOR BUS (+) (125k) CIRCUIT
TOTALLY INTEGRATED POWER MODULE (TIPM)
ANY CAN INTERIOR BUS MODULE

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. Using the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to U0010-CAN INTERIOR BUS** and perform the diagnostic procedure.

      No

      - **Refer to STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

U0011-CAN INTERIOR BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

SET CONDITION:

The controller detects a short to ground on the CAN Interior Bus (125K) (+) circuit or a short to voltage on the CAN Interior Bus (125K) (-) circuit.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT FOR A SHORT TO VOLTAGE

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. Using the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to U0011-CAN INTERIOR BUS OFF PERFORMANCE** and perform the diagnostic procedure.

      No

      - **Refer to STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND

TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)** and perform the diagnostic procedure.

      No

      - **Refer to STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

The battery voltage is between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Instrument Cluster (CCN) for approximately two to five seconds.

POSSIBLE CAUSES

DIAGNOSTIC TEST

1. **VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to U0155-LOST COMMUNICATION WITH CLUSTER/CCN** and perform the diagnostic procedure.

      No

      - **Refer to STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

U0159-LOST COMMUNICATION WITH PARKING ASSIST CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fused installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Parking Assist Control Module for approximately two to five seconds.

POSSIBLE CAUSES

DIAGNOSTIC TEST

1. **VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to U0159-LOST COMMUNICATION WITH PARK ASSIST MODULE (PTS)** and perform the diagnostic procedure.

      No

- **Refer to STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (WIN)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Wireless Ignition Node (WIN) for approximately two to five seconds.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUDIO

Any diagnosis of the Audio system should begin with the use of a scan tool. Check for any Diagnostic Trouble Codes (DTCs) in AUDIO - DIAGNOSTIC CODE INDEX . If there are any DTCs, perform the appropriate diagnostic procedure before proceeding in this information.

Refer to the appropriate wiring information.

WARNING: **Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.**

AUDIO SYSTEM DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
RADIO INOPERATIVE	1. Fuse inoperative.	Check radio fuse and Ignition-Off Draw (IOD) fuse in the Totally Integrated Power Module (TIPM). Replace fuses, if required.
	2. Open wiring.	Check "No Response from Radio". Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** .
NO AUDIO - BUT RADIO LIGHTS UP	1. Antenna problem.	Perform the "Poor or No AM/FM Audio Reception" test. Refer to **DIAGNOSIS AND TESTING**.
	2. Radio or Amplifier (if equipped) connector damaged.	Check for loose or corroded radio/amplifier connector. Repair, as required.
	3. Wiring damaged.	Check for shorted or open wires. Repair wiring as required.
	4. Radio or Amplifier (if equipped) ground damaged.	Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground as required.
	5. Amplifier (if equipped) inoperative.	Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** .
	6. Speakers inoperative.	or if equipped. Refer to **AUDIO - DIAGNOSIS AND TESTING** . Refer to

		AMP - DIAGNOSIS AND TESTING .
NO RADIO DISPLAY	1. Fuse inoperative.	Check radio fuse and Ignition-Off Draw (IOD) fuse in Totally Integrated Power Module (TIPM). Replace fuses as required.
	2. Radio connector damaged.	Check for loose or corroded radio connector. Repair as required.
	3. Wiring damaged.	Check for battery voltage at radio connector. Repair wiring as required.
	4. Radio ground circuit damaged.	Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground as required.
	5. Radio inoperative.	Check "No Response from Radio". Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** .
POOR AM/FM RADIO RECEPTION	1. Antenna inoperative.	Perform the "Poor or No AM/FM Audio Reception" test. Refer to **DIAGNOSIS AND TESTING**.
	2. Radio ground damaged.	Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground as required.
	3. Radio inoperative.	or. Refer to **AUDIO - DIAGNOSIS AND TESTING** . Refer to **AMP - DIAGNOSIS AND TESTING** .
POOR SDAR AUDIO RECEPTION	1. SDAR Antenna Inoperative.	Perform the "Poor or No Satellite Audio Reception" test. Refer to **DIAGNOSIS AND TESTING**.
SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING)	1. Door trim panel loose or missing fasteners.	Inspect door trim panel and correct as necessary. Replace any missing fasteners.
	2. Water shield loose or misaligned.	Inspect water shield and adjust as required.
	3. Items placed in door trim panel map pockets vibrating or moving from side to side.	Remove items from door trim panel. Ensure that vibration is no longer present.
NO COMPACT DISC OPERATION	1. CD damaged.	Insert known good CD and test operation.
	2. Foreign material on CD.	Clean CD and test operation.
	3. Condensation on CD or optics.	Allow temperature of vehicle interior to stabilize and test operation.
	4. Radio inoperative.	or. Refer to **AUDIO - DIAGNOSIS AND TESTING** . Refer to **AMP - DIAGNOSIS AND TESTING** .

POSSIBLE CAUSES

Possible Causes
ANTENNA CONNECTION OPEN OR SHORTED ANTENNA CABLE ANTENNA RADIO

DIAGNOSTIC TEST

1. **CHECK THE ANTENNA CONNECTION**
    1. Turn the ignition off.
    2. Disconnect the Radio C4 harness connector.
    3. Inspect the Audio Antenna harness connection.

    Is the Antenna connection clean and secure?

    Yes

    - Go To 2.

    No

    - Repair the Antenna connection as needed.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **RADIO**
    1. Connect the (special tool #9977-6-FM, Antenna) to the Radio C4 component connector.
    2. Place the test antenna base on the roof of the vehicle.
    3. Turn the ignition on.
    4. Drive the vehicle outside to an un-obstructed area.
    5. Turn the Radio on and select several different known good stations from the AM and FM bands.

    Is the audio reception still poor or not available?

    Yes

    - Replace the Radio in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 3.

3. **ANTENNA**
    1. Turn the ignition off.
    2. Reconnect the Radio C4 harness connector.
    3. Disconnect the Radio Antenna harness connector.
    4. Connect the (special tool #9977-6-FM, Antenna) to the Radio Antenna harness connector.
    5. Turn the Radio on and select several different known good stations from the AM and FM bands.

    Is the audio reception still poor or not available?

    Yes

    - Go To 4.

    No

    - Replace the Radio Antenna in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **ANTENNA CABLE**

5. Connect the appropriate (special tool #9977-6-1, Adapter) (1) or (special tool #9977-6-3, Adapter) (1) to the Radio C4 harness connector (2).
6. Measure the resistance across the tool terminals.

   Is the resistance between 47.5 and 52.5 Ohms?

   Yes

   - The source of the poor reception is not caused by the Radio, Antenna Cable or Radio Antenna.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Antenna Cable in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Satellite Audio Antenna Cable in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

DIAGNOSIS AND TESTING - REAR CAMERA

The hardwired circuits of the Rear View Camera (RVC) and those between the RVC and the radio receiver may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RVC or the radio receiver. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to radio receiver operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

NOTE: **Be certain to confirm both of the following prior to attempting any further diagnosis or testing of the RVC. Use a diagnostic scan tool to confirm the rear view camera is setup in the vehicle configuration. From the initial start up screen of the diagnostic scan tool, navigate to ECU VIEW , select TIPMCGW**

CENTRAL GATEWAY , MORE OPTIONS , ECU DETAILS and then CONFIG INFO . Verify that REAR CAMERA PRESET - - - - SET is present. If not, the Sales Code XAC (Park View Rear Back-Up Camera) will have to be added to the vehicle configuration to enable the RVC, in vehicles equipped with a MyGIG multimedia entertainment system (Sales Codes RE1, REN, REP, RER, REU, REW, REX or REZ), be certain that the RVC is set to ENABLED using the CAMERA SETUP option in the MyGIG system settings.

THEORY OF OPERATION

The Camera is activated when the ignition switch is in the RUN position. The (F71) circuit supplies power to the camera. The camera sends a video signal (std. NTSC i.e. TV) to the navigation radio, using circuits (X970) camera signal, (X971) signal return and (X972) camera shield, which displays on the navigation screen. The

screen toggles functions displaying only one kind of image at a time. And in reverse, the rear camera has priority. The (Z914) circuit is ground for the system.

WHEN MONITORED:

Ignition on, vehicle in reverse.

SET CONDITION:

No rear picture is displayed on radio with the vehicle in reverse.

DIAGNOSTIC TEST

1. **VERIFY OPERATION OF THE RADIO AND BACKUP LAMPS**
    1. Verify the operation of the Radio and Backup Lamps.

       Do the Radio and Backup Lamps operate correctly?

       Yes

       - Go To 2.

       No

       - Diagnose any problems with the Radio and Backup Lamps.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (F71) FUSED RUN RELAY OUTPUT CIRCUIT**

Fig. 8: Measuring Voltage Of Backup Lamp Feed Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Apply the parking brake.
3. Disconnect the Rear Video Camera Assembly Harness Connector.
4. Turn the ignition on.
5. Measure the voltage between the (F71) Fused Run Relay Output circuit and ground.

   Is battery voltage present?

   Yes

- Go To 3.

No

- Repair the (F71) Fused Run Relay Output circuit for an open or short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z914) GROUND CIRCUIT**

1. Turn the ignition off.

2. Measure the resistance between ground and the (Z914) Ground Circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4.

   No

   - Repair the (Z914) Ground circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (X970) CAMERA SIGNAL, THE (X971) RETURN, AND THE (X972) SHIELD CIRCUITS FOR AN OPEN CIRCUIT**

Fig. 10: Checking Camera Signal, The Return, And The Shield Circuits For An Open Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Radio C3 harness connector.
2. Measure the resistance of the (X970) (X971) and (X972) circuits between the Rear Camera harness connector and Radio C3 harness connectors.

   Is the resistance below 5.0 Ohms on the (X970) (X971) or (X972) circuits?

   Yes

- Go To 5.

No

- Repair the appropriate circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE (X970) CAMERA SIGNAL, THE (X971) RETURN, AND THE (X972) SHIELD CIRCUITS SHORTED TO GROUND**

   Is the resistance below 5.0 Ohms on the (X970) (X971) or (X972) circuits?

   Yes

   - Repair the appropriate circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Rear Camera Assembly in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

DIAGNOSIS AND TESTING - REMOTE SWITCHES

Any diagnosis of the Audio system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: **Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.**

Fig. 12: Identifying Remote Radio Switches

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the remote radio switch(es) from the steering wheel. Refer to **SWITCH, REMOTE RADIO, REMOVAL** .
3. Use an ohmmeter to check the switch resistances as shown in the Remote Radio Switch Test chart. If the remote radio switch resistances check OK, go to 4. If not OK, replace the faulty switch.

REMOTE RADIO SWITCH TEST

Switch	Switch Position	Minimum Resistance	Nominal Resistance	Maximum Resistance
Right (White)	Volume Up	6.732 ohms	6.8 ohms	6.868 ohms
Right (White)	Volume Down	14.850 ohms	15 ohms	15.151 ohms
Right (White)	Mode Advance	0 ohms	0 ohms	0 ohms
Left (Black)	Seek Up	1.188 ohms	1.2 ohms	1.212 ohms
Left (Black)	Seek Down	3.267 ohms	3.3 ohms	3.333 ohms
Left (Black)	Pre-Set Station Advance	.465 ohms	.47 ohms	.474 ohms

4. Connect the battery negative cable. Turn the ignition switch to the On position. Check for 5 volts at the radio control mux circuit cavities of the steering wheel wire harness connectors for both remote radio switches. If OK, go to 5. If not OK, repair the open or shorted radio control mux circuit to the Totally Integrated Power Module (TIPM) as required.
5. Disconnect and isolate the battery negative cable. Disconnect the 22-way instrument panel wire harness connector from the TIPM. Check for continuity between the remote radio switch ground circuit cavities of the steering wheel wire harness connectors for both remote radio switches and a good ground. There should be no continuity. If OK, go to 6. If not OK, repair the shorted remote radio switch ground circuit to the TIPM as required.
6. Check for continuity between the remote radio switch ground circuit cavities of the steering wheel wire harness connectors for both remote radio switches and the 22-way instrument panel wire harness connector for the TIPM. There should be continuity. If OK, refer to the proper Diagnostic Procedures Information to test the TIPM and the CAN data bus. If not OK, repair the open remote radio switch ground circuit as required.

DIAGNOSIS AND TESTING - VIDEO

Any diagnosis of the video system should begin with the use of a scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

DESCRIPTION

CHIME WARNING SYSTEM

Fig. 1: Chime Warning System
Courtesy of CHRYSLER GROUP, LLC

A chime warning system is standard factory-installed equipment. The chime warning system uses an electromechanical transducer attached to the electronic circuit board inside of the instrument cluster (1) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants. The instrument cluster also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node (CCN).

The electromechanical transducer generates beep tones, chime tones and click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based instrument cluster utilizes electronic **chime request** messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus along with hardwired inputs to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the CCN allow it to control the audible outputs that are produced through its on-board transducer.

The CCN is capable of producing the following audible outputs:

- **Slow Rate Repetitive Click** - Repeated **click** tones that are issued at a slow rate of about 50 clicks per minute.
- **Fast Rate Repetitive Click** - Repeated **click** tones that are issued at a fast rate of more than about 100 clicks per minute.
- **Fixed Duration Beep** - A short, sharp, single tactile **beep** tone.
- **Single Chime Tone** - A single **chime** tone.
- **Slow Rate Repetitive Chime** - Repeated **chime** tones that are issued at a slow rate of about 50 chimes per minute.
- **Fast Rate Repetitive Chime** - Repeated **chime** tones that are issued at a fast rate of about 180 chimes per minute.

Hardwired circuitry connects the CCN and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the CCN through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The instrument cluster chime warning system circuits and components cannot be adjusted or repaired. If the CCN circuitry or the on-board transducer are damaged or inoperative, the complete unit must be replaced.

PARK ASSIST SYSTEM

Fig. 2: Electronic Vehicle Information Center, Park Assist Module & Park Assist Sensors
Courtesy of CHRYSLER GROUP, LLC

A park assist system is an optional factory-installed electronic parking aid. During parking and other similar vehicle maneuvers this system alerts the vehicle operator to obstacles located in the path immediately behind the vehicle which, due to the surrounding rear vehicle structure, might be otherwise difficult to perceive. When an object is detected, the system displays a textual message within the Electronic Vehicle Information Center (EVIC) display unit to provide the vehicle operator with visual and audible indications of the presence and proximity of such objects.

The park assist system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Vehicle Information Center (1) -** In vehicles equipped with the optional park assist system, the optional EVIC in the instrument cluster displays textual warnings and error messages, and emits audible warnings related to the current operating status of the park assist system. The display also provides an interface that allows the vehicle operator to manually disable or enable the system using the customer programmable features option.
- **Park Assist Module (2) -** Vehicles equipped with the park assist system include a park assist module which is secured to a mounting bracket by two fasteners and is concealed above the headliner.
- **Park Assist Sensors (3) -** Vehicles equipped with the park assist system have four ultrasonic park assist sensors that are concealed behind the rear bumper. Each sensor is snapped into an individual molded plastic mounting bracket located at horizontal intervals along the back side of the rear bumper.

Hardwired circuitry connects the various park assist system components to each other through the electrical system of the vehicle. These hardwired circuits are integral to several wire harnesses, which are routed

throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The park assist system components cannot be adjusted or repaired. If any of the park assist system components is damaged or ineffective, that component must be replaced.

OPERATION

CHIME WARNING SYSTEM

The chime warning system operates on battery voltage received through a fuse in the Totally Integrated Power Module (TIPM) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position. The chime warning system also monitors the ignition switch position so that some chime features are functional only with the ignition switch in the ON position, while others are functional regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

- **Airbag Indicator Warning -** The instrument cluster, also known as the Cab Compartment Node (CCN) transducer will generate one short chime when the ignition switch is in the ON position, and an electronic message is received over the Controller Area Network (CAN) data bus from the Occupant Restraint Controller (ORC) requesting airbag indicator illumination. This warning will only occur following completion of the airbag indicator bulb test, and will only occur once during any ignition cycle.
- **Door Ajar Warning -** The CCN will generate one short chime when the ignition switch is in the ON position, when the door ajar indicator is illuminated, or when a **DOOR(S) OPEN** textual message is displayed in the odometer Vacuum Fluorescent Display (VFD) unit of the instrument cluster. This warning indicates that a door is, or multiple doors are not closed or completely latched while the vehicle is moving.
- **Electronic Stability Control Warning -** The CCN transducer will generate one short chime when the Electronic Stability Control (ESC) has been manually disabled by the vehicle operator using the ESC traction control switch on the instrument panel.
- **Electronic Stability Control Fault Warning -** The CCN transducer will generate one short chime each time the ESC indicator is illuminated in the instrument cluster. This warning indicates a failure condition has been monitored affecting the operation of the ESC related components or circuits. This warning will only occur following completion of the ESC indicator bulb test, and will only occur once during any ignition cycle.
- **Fasten Seat Belt Indicator Warning -** The CCN transducer will generate repetitive chimes at a slow rate to announce that the seat belt switch and the ignition switch indicate that the driver side front seat belt is not fastened with the ignition switch in the ON position. The chime warning system also supports the enhanced seatbelt reminder (beltminder) when this feature is enabled, For more information, refer to **INDICATORS, INSTRUMENT CLUSTER, OPERATION** .

- **Head/Park Lamps-On Warning** - The CCN transducer will generate repetitive chimes at a fast rate to indicate that inputs from the driver door ajar switch, the headlamp switch, and the ignition switch indicate that the exterior lamps are turned ON with the driver side front door opened and the ignition switch in the OFF position. The chimes will continue to sound until the exterior lamps are turned OFF, the driver side front door is closed, or the ignition switch is turned to the ON position, whichever occurs first.
- **Key-In-Ignition Warning** - The CCN transducer will generate repetitive chimes at a fast rate to indicate that inputs from the driver side front door ajar switch, the ignition switch and the key-in ignition circuitry of the Wireless Ignition Node (WIN) indicate that the key is in the ignition with the driver side front door open and the ignition switch in the OFF position. The chimes will continue to sound until the key is removed from the ignition switch, the driver side front door is closed, or the ignition switch is turned to the ON position, whichever occurs first.
- **Low Fuel Indicator Warning** - The CCN transducer will generate one short chime when the low fuel indicator is illuminated in the instrument cluster. This warning indicates that the monitored fuel level in the fuel tank is low. This chime will only occur once during any ignition cycle.
- **Low Wash Indicator Warning** - The CCN transducer will generate one short chime when the low washer fluid indicator is illuminated in the instrument cluster. This chime will only occur once during any ignition cycle.
- **Overspeed Warning** - The CCN transducer will generate one short chime when the vehicle speed is over a pre-programmed speed value. This feature is only enabled on vehicles that have been configured for sale in a Middle East Gulf Coast Country (GCC).
- **Park Brake Reminder** - The CCN transducer will generate one short chime to announce that the hardwired input from the park brake switch and an electronic **vehicle speed** message received over the CAN data bus indicate that the park brake is applied and the vehicle is moving. This chime will repeat each time the input conditions are met.
- **Sentry Key Customer Learn Mode Announcement** - The CCN transducer will generate one short chime to confirm that an electronic **Customer Learn** mode message has been received over the CAN data bus to indicate that the Wireless Ignition Node (WIN) is prepared for programming additional Sentry Key transponders. This chime feature is only active on vehicles sold in a market where Customer Learn programming is an allowed feature.
- **Turn Signal/Hazard Warning Flasher Emulation** - The CCN relay will generate repetitive clicks at a slow rate to emulate an electromechanical flasher when the turn signal or hazard warning system are operating. The relay will generate repetitive clicks at a fast rate to indicate that the right or left turn signals are operating with one or more bulbs ineffective. In either case, the clicks will continue until the turn signal and hazard warning systems are turned OFF.
- **Turn Signal On Warning** - The CCN transducer will generate repetitive chimes at a slow rate to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). Vehicles built for markets other than the United States and Canada have a revised distance threshold of 4 kilometers (2.49 miles) for this feature. The chime will continue until the turn signal input becomes inactive or until the electronic **vehicle speed** message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first. The hazard warning flashers will not activate this chime feature.
- **Warning Indicator Announcement** - The CCN transducer will generate one short chime each time the Malfunction Indicator Lamp (MIL) lamp or certain other indicators are illuminated by the instrument cluster circuitry. The MIL and certain other indicators may be illuminated when any critical engine or transmission systems are operating outside of their normal parameters. The instrument cluster monitors

electronic messages received over the CAN data bus to determine when to illuminate these indicators.

The CCN provides chime service for all available features in the chime warning system. The CCN relies upon its internal programming, numerous hardwired inputs, and electronic message inputs received from other modules over the CAN and the Local Interface Network (LIN) data buses to provide the chime warning system features. The internal programming of the CCN determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hardwired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls or communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient, and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PARK ASSIST SYSTEM

The park assist system is active only when the ignition switch is in the ON or START positions, the parking brake is released, the transmission gear selector lever is in either the REVERSE position and the vehicle speed is less than 16 kph (10 mph) or, the DRIVE position and the vehicle speed is less than 14 kph (8 mph) on deceleration, or 18 kph (12 mph) on acceleration. The park assist system is enabled from the factory as a default but can be disabled or enabled using either the manual cut-off switch, integral to the instrument panel switch pod, or by using the personal settings menu of the Electronic Vehicle Information Center (EVIC), if equipped. For more information on EVIC operation, refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, OPERATION** .

Reasons for disabling the system include trailer towing, off road use and driving conditions where the tailgate is in the down position. With a trailer attached to the vehicle the audible and visible park assist alerts would be incessant whenever the gear selector lever was in the REVERSE position due to the proximity of the trailer to the rear of the vehicle, as well as operating the vehicle at low speeds with the tailgate in the down position and the gear selector in the DRIVE position. Similarly, operating the vehicle off road may cause the park assist alerts to become distracting due to the proximity of large trees or boulders and the extreme rear approach angles that may be encountered while maneuvering on off road trails or terrain. When the system is disabled, a **PARK ASSIST OFF** textual message will appear in the Electronic Vehicle Information Center (EVIC) display, if equipped whenever the gear selector lever is in the REVERSE position.

The microprocessor based park assist module is the central component of the park assist system. It supplies voltage to the park assist sensors, receives and analyzes data from the sensors, calculates and communicates the proper display information to the Cab Compartment Node (CCN), performs system diagnostics, and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The module operates on battery voltage received through a fuse in the Junction Block (JB), and is grounded through a take out and eyelet terminal of the body wire harness that is secured by a screw to the left inner D-pillar.

Four ultrasonic park assist sensors in the rear bumper allow the park assist system to locate and identify the proximity of nearby obstacles. These sensors each generate ultrasonic sound pulses when triggered by the park assist module, then signal the module when an echo of the reflected sound pulses is received. The detection distance range from the rear of the vehicle is about 0.3 meters (11.8 inches) to about 2.0 meters (80 inches), and the detection height range from the ground is about 0.2 meters (7.8 inches) to about 0.8 meters (31 inches). The detection area extends somewhat around both rear sides (corners) of the vehicle.

The park assist display, located within the EVIC unit, provides the vehicle operator with a visual and audible warning if the vehicle comes to within about 40 centimeters (31 inches) of a detected object, when the "Sound and Display" are ON. The display is visible to the vehicle operator only when looking forward and an object is detected within the detection zone. The system will also emit a series of short, intermittent, audible beeps and automatically mute the audio system while the park assist audible warning is being generated. The audible warning changes from intermittent beeps to a continuous tone as the vehicle comes to within 30.5 centimeters (12 inches) of a detected object.

When the park assist module monitors a problem in any of the park assist system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and, sends an electronic message to the EVIC. When a message from the park assist module is received by the EVIC for a fault condition, a **SERVICE PARK ASSIST SYSTEM** textual message is displayed within the EVIC display.

The hardwired circuits between components related to the park assist system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist system or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist system or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

CHIME WARNING SYSTEM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

The following textual messages May appear in the Electronic Vehicle Information Center (EVIC):

1. **SERVICE PARK ASSIST -** If a service park assist textual message appears in the EVIC display, be certain to confirm the following:
   - The parking brake is not applied.
   - The rear bumper is free of ice, snow, mud or other obstructions that will prevent the system from operating properly.

     The park assist system is self correcting, please verify that the area of the rear bumper where the sensors are located is not blocked by ice, snow, mud or other obstructions. If the area is blocked, remove the blockage, shift the transmission selector lever into reverse and verify the message is no longer present in the EVIC display. The system may also be corrected when the vehicle is driven at a speed greater than 14 kph (8 mph).

     NOTE: **The presence of jackhammers, large trucks, and other vibrations in the vicinity of the vehicle could impact the performance of the system.**

2. **PARK ASSIST OFF -** If a park assist off textual message appears in the EVIC display, the system may either be manually cut-off or have a hard fault. If the manual cut-off switch is not illuminated further investigation may be needed.

DISPLAY, PARK ASSIST

DESCRIPTION

DESCRIPTION

The Park Assist display is an integral part of the Electronic Vehicle Information Center (EVIC). The park assist **ICON** , for image information, is only displayed when an object is detected. Refer to **INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS, DESCRIPTION** . An electronic message is sent to the Cab Compartment Node (CCN) from the park assist module, over the Controller Area Network (CAN) Data Bus when an object is within the detection area. The CCN then displays the object detection icon with the corresponding alert bar for the distance and location of the object within the EVIC display.

Depending on market and system capabilities, the display icon has as many as 24 different variations with the corresponding alert bars, depending on size, location and distance of the object being detected. The image will display three solid bars followed by a single tone for maximum distance then will flash and reduce the amount of bars as the proximity to the object is reduced followed by a repetitive tone, down to a single bar with a continuous tone.

The EVIC display is only serviced as a complete unit with the instrument cluster. It cannot be adjusted or repaired. If ineffective or damaged, the entire display unit must be replaced, For more information, refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .

OPERATION

OPERATION

The Park Assist system for this vehicle is only available on vehicles equipped with an Electronic Vehicle Information Center (EVIC). The park assist display is an integrated part of the EVIC and receives battery current and ground from, and is completely controlled by, the Cab Compartment Node (CCN). The CCN will display the park assist **ICON** whenever an object is detected and a signal is received from the park assist module, over the Controller Area Network (CAN) data bus. The icon image displayed has as many as 24 different variations depending on size, distance and location of the object being detected. The microprocessor in the park assist module continually monitors the display status, and will store a Diagnostic Trouble Code (DTC) in memory for any monitored fault it detects in the park assist display.

The hard-wired circuits between components related to the park assist display may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness

routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist display or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist display or the electronic controls and communication related to park assist display operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

MODULE, PARK ASSIST

DESCRIPTION

DESCRIPTION

Fig. 3: Park Assist Module, Connectors & Fasteners
Courtesy of CHRYSLER GROUP, LLC

The Park Assist Module (1) is secured to a mounting bracket (2) that is bonded to the upper side of the vehicles headliner (3) above the right sun visor and secured by two fasteners (4). Concealed within the molded plastic park assist module housing is a microprocessor and the other electronic circuitry of the module. The module housing is sealed to enclose and protect the internal electronic circuitry. The module software is flash programmable.

Two connector receptacles (5) containing terminal pins are integral to the forward-facing side of the housing. The module is connected to the vehicle electrical system through two dedicated take outs and connectors of the body wire harness.

The park assist module cannot be adjusted or repaired and, if damaged or inoperative, it must be replaced.

OPERATION

OPERATION

The microprocessor in the park assist module contains the park assist system logic circuits. The module uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is also used for park assist system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The module provides voltage to the four park assist sensors located behind the rear bumper fascia. The park assist display is integral to the Electronic Vehicle Information Center (EVIC) and is provided voltage from the Cab Compartment Node (CCN). The module monitors return inputs from each of the sensors on dedicated hard wired data communication circuits and from the CCN over the CAN data bus. The sensor inputs allow the module to determine when an obstacle is in the rear path of the vehicle and enables the module to calculate the relative location of the obstacle, and whether the distance to that obstacle is increasing or decreasing.

Pre-programmed decision algorithms and calibrations allow the module microprocessor to determine the appropriate park assist system outputs based upon the inputs received from the park assist sensors and electronic messages received from other modules in the vehicle over the CAN data bus. When the programmed conditions are met the module sends electronic messages to the CCN over the CAN data bus to obtain the proper park assist system visual and audible outputs. The module also broadcasts electronic messages over the CAN data bus to enable the other electronic features of the park assist system.

The park assist module microprocessor continuously monitors all of the park assist system electrical circuits and components to determine the system readiness. If the module detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and sends the appropriate electronic messages to the CCN over the CAN data bus to control operation of certain park assist system audible warnings and textual messages displayed in the Electronic Vehicle Information Center (EVIC) of the instrument cluster.

The park assist module receives battery current on a fused ignition switch output (run-start) circuit through a fuse in the Totally Integrated Power Module (TIPM). The module receives ground through a ground circuit and take out of the body wire harness connected to the body sheet metal. These connections allow the module to be operational whenever the ignition switch is in the START or ON positions.

The hard wired circuits between components related to the park assist module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist module or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist module or the electronic controls and communication related to park assist module operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

1. Position the park assist module (1) at the mounting bracket (2) bonded to the back of the headliner (3).

2. Secure the module to the bracket with two fasteners (4).
3. Reconnect the two body wire harness connectors (5) to the module connector receptacles.
4. Reinstall the vehicle headliner. Refer to **HEADLINER, INSTALLATION** .
5. Reconnect the battery negative cable.

SENSOR, PARK ASSIST

DESCRIPTION

DESCRIPTION

Fig. 6: Park Assist Sensor
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the park assist system have four park assist sensors (1) installed on the rear bumper. Only the membrane (3) of each sensor is visible through a hole in the outer vertical surface of the bumper. The remainder of each sensor including the sensor mounting bracket, the sensor spacer and the sensor wiring connection is concealed behind the bumper. A sensor wire harness behind the bumper connects the sensors to the vehicle electrical system.

Each of the four sensors is identical in construction and is interchangeable. The electronic circuitry and a communication chip for each sensor is enclosed and protected within the molded black plastic sensor housing. The housing includes an integral connector receptacle (4) and two integral latch tabs (2). The sensor membrane extends from the surface of the sensor housing, and is finished to match or contrast with the outer surface of the bumper.

Fig. 7: Numbering System For Park Assist Sensors
Courtesy of CHRYSLER GROUP, LLC

The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since this vehicle uses only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

Fig. 8: Rear Park Assist Sensors
Courtesy of CHRYSLER GROUP, LLC

A resilient O-ring spacer around the circumference of each of the four sensor membranes (2) isolates the membrane from the openings in the fascia (1). Each sensor is snapped into its own dedicated molded plastic mounting bracket.

The park assist sensors cannot be adjusted or repaired. If inoperative or damaged they must be replaced. The

sensors and the spacers are each available for individual service replacement.

OPERATION

OPERATION

The park assist sensors are ultrasonic transceivers that are completely controlled by the park assist module. The sensors transmit and receive ultrasonic signals. The sensors each receive battery current and ground in parallel from the module, but are each connected to individual dedicated serial bus communication circuits to the module.

Each sensor membrane is oscillated, then quieted by the module in a pulsing fashion. While the sensor membrane oscillates, it emits an ultrasonic signal. This signal will bounce or echo off of objects in the path of the vehicle. While quieted, each membrane receives the echoes of the ultrasonic signals it and the other sensors have transmitted. The sensors then communicate this echo data over the serial bus lines back to the module. The microprocessor in the module uses the intervals between the ultrasonic transmission and reception data from the sensors to calculate the distance to any obstacles identified by the ultrasonic echoes.

The hard wired circuits between components related to the park assist sensors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist sensors or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist sensors or the electronic controls and communication related to park assist sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 9: Park Assist Sensor, Connector & Latch Features
Courtesy of CHRYSLER GROUP, LLC

NOTE: The park assist sensors (3) and the sensor spacers (O-rings) are each available for separate service replacement.

1. Disconnect and isolate the battery negative cable.
2. From the back of the bumper (2), disconnect the wire harness connector (4) from the park assist sensor (3) connector receptacle.
3. Carefully pry the sensor bracket (5) latch features (1) away from the top and bottom latch tabs of the sensor far enough to disengage the sensor from the bracket.
4. Disengage the O-ring spacer from around the circumference of the sensor membrane protrusion.
5. If required, depress the four locking tabs and remove the sensor brackets from the bumper.

INSTALLATION

INSTALLATION

Fig. 10: Park Assist Sensor, Connector & Latch Features
Courtesy of CHRYSLER GROUP, LLC

NOTE: The park assist sensors (3) and the sensor spacers (O-rings) are each available for separate service replacement.

1. If removed, insert the sensor mounting bracket into the opening in the bumper face, until all locking tabs engage.
2. Engage the O-ring spacer around the circumference of the sensor membrane protrusion.

   NOTE: Production and all service replacement O-ring spacers are tapered. The wide side (base) of the O-ring should be seated against the sensor housing and the narrow side should be oriented toward the outer surface of the sensor membrane and the rear bumper.

3. Align and insert the sensor (3) into the sensor bracket (5) on the back of the rear bumper (2) until the bracket latch features (1) are fully engaged over the top and bottom latch tabs of the sensor. Be certain that the sensor membrane is flush with the outer surface of the bumper.

   NOTE: Be certain that each sensor membrane is properly centered in the openings of the rear fascia and that the O-ring spacers are not pinched. Improper centering or pinched O-rings can be detrimental to proper park assist sensor operation.

4. From the back of the bumper, reconnect the wire harness connector (4) to the sensor connector receptacle.
5. Reconnect the battery negative cable.

DIAGNOSIS AND TESTING

DIAGNOSTIC TEST

1. **CHECK THE STATUS OF THE ERROR MESSAGE**

   NOTE: Make sure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

   NOTE: Make sure the scan tool is updated to the latest software.

   1. With the scan tool, record the error message.
   2. Disconnect the scan tool from the DLC.
   3. Cycle the ignition from on to off three times.
   4. Reconnect the scan tool.
   5. Turn the ignition on.

   Does the scan tool display this same error message?

   Yes

   - Go To 2.

   No

   - The conditions that caused this error message to set are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
2. **(D72) DIAGNOSTIC CAN C (+) CIRCUIT OPEN**

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C7 harness connector.
3. Disconnect the scan tool from the DLC.

NOTE: Check the connectors at both the DLC and the TIPM.

4. Measure the resistance of the (D72) Diagnostic CAN C (+) circuit between the TIPM C7 harness connector and the DLC.

   Is the resistance below 5.0 Ohms?

   Yes

- Go To 3.

No

- Repair the open in the (D72) Diagnostic CAN C (+) circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

3. **(D71) DIAGNOSTIC CAN C (-) CIRCUIT OPEN**

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the TIPM for any active CAN C hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

1. Turn the ignition on.
2. Using a 12-volt test light connected to ground, check the (F941) Ignition Run/Start Control Output circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 5.

No

- Repair the open or short in the (F941) Ignition Run/Start Control Output circuit.
- Refer to **STANDARD PROCEDURE** for 1500, 2500 & 3500 or **STANDARD PROCEDURE** for 3500 Cab & Chassis, 4500 & 5500 and perform the ABS VERIFICATION TEST.

5. **(D52) CAN C BUS (+) CIRCUIT OPEN**

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C7 harness connector.

3. Measure the resistance of the (D52) CAN C Bus (+) circuit between the TIPM C7 harness connector and the Antilock Brake Module connector.

   Is resistance below 5.0 Ohms?

   Yes

   - Go To 6.

   No

   - Repair the open in the (D52) CAN C Bus (+) circuit.
   - Refer to **STANDARD PROCEDURE** for 1500, 2500 & 3500 or **STANDARD PROCEDURE** for 3500 Cab & Chassis, 4500 & 5500 and perform the ABS VERIFICATION TEST.

6. **(D51) CAN C BUS (-) CIRCUIT OPEN**

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D51) CAN C Bus (-) circuit between the TIPM C1 harness connector and the Antilock Brake Module connector.

Is resistance below 5.0 Ohms?

Yes

- Replace the Antilock Brake Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Refer to **STANDARD PROCEDURE** for 1500, 2500 & 3500 or **STANDARD PROCEDURE** for 3500 Cab & Chassis, 4500 & 5500 and perform the ABS VERIFICATION TEST.

No

- Repair the open in the (D51) CAN C Bus (-) circuit.
- Refer to **STANDARD PROCEDURE** for 1500, 2500 & 3500 or **STANDARD PROCEDURE** for 3500 Cab & Chassis, 4500 & 5500 and perform the ABS VERIFICATION TEST.

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the TIPM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      No

      - Go To 2.

2. **CHECK THE (A116) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**

Fig. 23: Checking The Fused B(+) Circuit For An Open Or Short
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Radio Amplifier C1 harness connector.
3. Using a 12-volt test light connected to ground, check the (A116) Fused B(+) circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 3.

   No

- Repair the open or short in the (A116) Fused B(+) circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

3. **CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN**

Fig. 24: Checking Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12-volts, check the (Z912) ground circuit.

   Does the test light illuminate brightly for each circuit?

   Yes

   - Go To 4.

   No

- Repair the open in the (Z912) Ground circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

4. **CHECK THE (D265) AND (D264) CAN INTERIOR BUS (125K) CIRCUITS FOR AN OPEN**

Fig. 25: Checking CAN Interior Bus Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D264) CAN Interior Bus (125K) (-) circuit between the TIPM C7 harness connector and the Radio Amplifier C1 harness connector.
2. Measure the resistance of the (D265) CAN Interior Bus (125K) (+) circuit between the TIPM C7 harness connector and the Radio Amplifier C1 harness connector.

Are the resistances below 5.0 Ohms?

Yes

- Replace the Radio Amplifier in accordance with the Service Information. Refer to **AMPLIFIER, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Repair the open in the (D265) or (D264) CAN Interior Bus (125K) circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

1. Turn the ignition off.
2. Disconnect the Cluster C1 and C3 harness connectors.
3. Using a 12-volt test light connected to ground, check the (A909) and (A412) Fused B(+) circuit.

   Does the test light illuminate brightly for each circuit?

   Yes

   - Go To 3.

No

- Repair the open or short in the Fused B(+) circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

3. **CHECK THE (Z911) GROUND CIRCUITS FOR AN OPEN**

1. Measure the resistance of the (D264) CAN Interior Bus (125K) (-) circuit between the TIPM C7 harness connector and the Cluster C3 harness connector.
2. Measure the resistance of the (D265) CAN Interior Bus (125K) (+) circuit between the TIPM C7 harness connector and the Cluster C3 harness connector.

   Are the resistances below 5.0 Ohms?

   Yes

   - Replace the Cluster in accordance with the Service Information. Refer to **REMOVAL** .

- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Repair the open in the (D265) or (D264) CAN Interior Bus (125K) circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

      NOTE: Make sure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the TIPM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      No

      - Go To 2.

2. **CHECK THE (F930) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT FOR AN OPEN OR SHORT**

Fig. 51: Checking Fused Ignition Run Control Output Circuit For An Open Or Short
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Heated Seat Module C1 harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F930) Fused Ignition Run Control Output circuit.

   Does the test light illuminate brightly?

   Yes

- Go To 3.

No

- Repair the open or short in the (F930) Fused Ignition Run Control Output circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

3. **CHECK THE (Z909) GROUND CIRCUIT FOR AN OPEN**

Fig. 52: Checking Ground Circuit For An Open

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Using a 12-volt test light connected to 12-volts, check the (Z909) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 4.

   No

   - Repair the open in the (Z909) Ground circuit.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

4. **CHECK THE (D265) AND (D264) CAN INTERIOR BUS (125K) CIRCUITS FOR AN OPEN**

Fig. 53: Checking CAN Interior BUS Circuits For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the TIPM C7 harness connector.
2. Measure the resistance of the (D264) CAN Interior Bus (125K) (-) circuit between the TIPM C7 harness connector and the Heated Seat Module C1 harness connector.
3. Measure the resistance of the (D265) CAN Interior Bus (125K) (+) circuit between the TIPM C7 harness connector and the Heated Seat Module C1 harness connector.

   Are the resistances below 5.0 Ohms?

Yes

- Replace the Heated Seat Module in accordance with the Service Information. Refer to **MODULE, HEATED SEAT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Repair the open in the (D265) or (D264) CAN Interior Bus (125K) circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the TIPM for any active CAN hardware DTCs, perform DTC before proceeding.

1. Turn the ignition off.
2. Disconnect the A/C Heater Control harness connector.
3. Using a 12-volt test light connected to ground, check the (A417) Fused B(+) circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 3.

No

- Repair the open or short in the (A417) Fused B(+) circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

3. **CHECK THE (Z911) GROUND CIRCUIT FOR AN OPEN**

Fig. 56: Checking Ground Circuit For An Open

1. Measure the resistance of the (D264) CAN Interior Bus (125K) (-) circuit between the TIPM C7 harness connector and the A/C Heater Control harness connector.
2. Measure the resistance of the (D265) CAN Interior Bus (125K) (+) circuit between the TIPM C7 harness connector and the A/C Heater Control harness connector.

   Are the resistances below 5.0 Ohms?

   Yes

- Replace the A/C Heater Control Module in accordance with the Service Information. Refer to **CONTROL, A/C AND HEATER, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Repair the open in the (D265) or (D264) CAN Interior Bus (125K) circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

1. Turn the ignition off.
2. Disconnect the ITBM C1 harness connector.
3. Using a 12-volt test light connected to ground, check the (A115) Fused B(+) circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 3.

   No

- Repair the open or short in the (A115) Fused B(+) circuit.
- Refer to **STANDARD PROCEDURE** for 1500, 2500 & 3500 or **STANDARD PROCEDURE** for 3500 Cab & Chassis, 4500 & 5500 and perform the ITBM VERIFICATION TEST.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      No

      - Go To 2.

2. **CHECK THE (A209) FUSED B(+) CIRCUITS FOR AN OPEN OR SHORT**

Fig. 75: Checking Fused B(+) Circuits For An Open Or Short
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C1 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

3. Using a 12-volt test light connected to ground, check the (A209) Fused B(+) circuits.

   Does the test light illuminate brightly for each circuit?

Yes

- Go To 3.

No

- Repair the open or short in the (A209) Fused B(+) circuit.
- Refer to **1500 & 2500 - 3.7L, 4.7L & 5.7L - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **2500 & 3500 - POWERTRAIN VERIFICATION TEST - 6.7L** and perform the POWERTRAIN VERIFICATION TEST.

3. **CHECK THE (Z908) GROUND CIRCUITS FOR AN OPEN**

Fig. 76: Checking Ground Circuits For An Open

1. Disconnect the PCM C4 harness connector.
2. Using a 12-volt test light connected to 12-volts, check the (Z908) Ground circuits in PCM C1 harness connector.
3. Using a 12-volt test light connected to 12-volts, check the (Z908) Ground circuits in PCM C4 harness connector.

   Does the test light illuminate brightly for each circuit?

Yes

- Go To 4.

No

- Repair the open in the (Z908) Ground circuit.
- Refer to **1500 & 2500 - 3.7L, 4.7L & 5.7L - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **2500 & 3500 - POWERTRAIN VERIFICATION TEST - 6.7L** and perform the POWERTRAIN VERIFICATION TEST.

4. **CHECK THE (F202) IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN OR SHORT**

Fig. 77: Checking Fused Ignition Switch Output Circuit For Open Or Short
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Using a 12-volt test light connected to ground, check the (F202) Ignition Run/Start Control Output circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 5.

   No

   - Repair the open or short in the (F202) Ignition Run/Start Control Output circuit.
   - Refer to **1500 & 2500 - 3.7L, 4.7L & 5.7L - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **2500 & 3500 - POWERTRAIN VERIFICATION TEST - 6.7L** and perform the POWERTRAIN VERIFICATION TEST.

5. **CHECK THE (F1) FUSED IGNITION OFF/RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN OR SHORT**

Fig. 78: Checking Fused Ignition Switch (Off/Run/Start) Output Circuit For Open Or Short
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to ground, check the (F1) Fused Ignition Off/Run/Start Control Output Circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 6.

   No

   - Repair the open or short in the (F1) Fused Ignition Off/Run/Start Control Output Circuit.

- Refer to **1500 & 2500 - 3.7L, 4.7L & 5.7L - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **2500 & 3500 - POWERTRAIN VERIFICATION TEST - 6.7L** and perform the POWERTRAIN VERIFICATION TEST.

6. **CHECK THE (F342) FUSED ASD RELAY OUTPUT CIRCUIT FOR AN OPEN OR SHORT**

Fig. 79: Checking Fused ASD Relay Output Circuit For An Open

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the TIPM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      No

      - Go To 2.

2. **(A910/A118) FUSED B(+) CIRCUITS OPEN OR SHORTED**

Fig. 83: Checking Fused B(+) Circuits For Open Or Short
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Using a 12-volt test light connected to ground, check the (A910/A118) Fused B(+) circuits.

   Does the test light illuminate brightly for each circuit?

   Yes

   - Go To 3.

   No

   - Repair the open or short in the (A910/A118) Fused B(+) circuit.
   - Refer to **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500**

CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L and perform the POWERTRAIN VERIFICATION TEST.

1. Using a 12-volt test light connected to 12-volts, check the (Z915) Ground circuits.

   Does the test light illuminate brightly for each circuit?

   Yes

   - Go To 4.

   No

   - Repair the open in the (Z915) Ground circuit.

- Refer to **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** and perform the POWERTRAIN VERIFICATION TEST - 6.7L.

4. **(F202) IGNITION RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED**

1. Turn the ignition on.
2. Using a 12-volt test light connected to ground, check the (F202) Ignition Run/Start Control Output circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 5.

No

- Repair the open or short in the (F202) Ignition Run/Start Control Output circuit.
- Refer to **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** and perform the POWERTRAIN VERIFICATION TEST - 6.7L.

5. **(F1) IGNITION SWITCH OUTPUT (OFF-RUN-START) CIRCUIT OPEN OR SHORTED**

1. Using a 12-volt test light connected to ground, check the (F1) Ignition Switch Output (Off-Run-Start) circuit.

   Does the test light illuminate brightly?

   Yes

- Go To 6.

No

- Repair the open or short in the (F1) Ignition Switch Output (Off-Run-Start) circuit.
- Refer to **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** and perform the POWERTRAIN VERIFICATION TEST - 6.7L.

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the TIPM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      No

      - Go To 2.

2. **(A910/A118) FUSED B(+) CIRCUITS OPEN OR SHORTED**

Fig. 109: Checking Fused B(+) Circuits For Open Or Short
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Using a 12-volt test light connected to ground, check the (A910/A118) Fused B(+) circuits.

   Does the test light illuminate brightly for each circuit?

   Yes

   - Go To 3.

   No

   - Repair the open or short in the (A910/A118) Fused B(+) circuit.
   - Refer to **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500**

CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L and perform the POWERTRAIN VERIFICATION TEST - 6.7L.

3. **(Z915) GROUND CIRCUITS OPEN**

Fig. 110: Checking Ground Circuits For Open
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12-volts, check the (Z915) Ground circuits.

   Does the test light illuminate brightly for each circuit?

   Yes

   - Go To 4.

   No

   - Repair the open in the (Z915) Ground circuit.

- Refer to **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** and perform the POWERTRAIN VERIFICATION TEST - 6.7L.

4. **(F202) IGNITION RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED**

Fig. 111: Checking Ignition Run/Start Control Output Circuit For Open Or Short
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Using a 12-volt test light connected to ground, check the (F202) Ignition Run/Start Control Output circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 5.

No

- Repair the open or short in the (F202) Ignition Run/Start Control Output circuit.
- Refer to **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** and perform the POWERTRAIN VERIFICATION TEST - 6.7L.

5. **(F1) IGNITION SWITCH OUTPUT (OFF-RUN-START) CIRCUIT OPEN OR SHORTED**

1. Using a 12-volt test light connected to ground, check the (F1) Ignition Switch Output (Off-Run-Start) circuit.

   Does the test light illuminate brightly?

   Yes

- Go To 6.

No

- Repair the open or short in the (F1) Ignition Switch Output (Off-Run-Start) circuit.
- Refer to **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** and perform the POWERTRAIN VERIFICATION TEST - 6.7L.

6. **(D65) CAN C BUS (+) CIRCUIT OPEN**

Fig. 113: Checking CAN C BUS (+) Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C1 harness connector.

3. Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C1 harness connector and the PCM C2 harness connector.

   Is resistance below 5.0 Ohms?

   Yes

   - Go To 7.

   No

   - Repair the open in the (D65) CAN C Bus (+) circuit.
   - Refer to **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** and perform the POWERTRAIN VERIFICATION TEST - 6.7L.

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.

      NOTE: Make sure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

NOTE: **Make sure the scan tool is updated to the latest software.**

NOTE: **If the scan tool displays any error messages involving the Diagnostic CAN C circuits, diagnose and repair the error message before proceeding.**

2. With the scan tool, attempt to communicate with the TIPM.

   Does the scan tool communicate with the TIPM?

   Yes

   - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

   No

   - Go To 2.

2. **FUSED B(+) CIRCUITS OPEN AT TIPM**
   1. Disconnect the scan tool from the DLC.
   2. Using a 12-volt test light connected to ground, and using the wiring diagram as a guide, check all Fused B(+) circuits at the TIPM.

      Does the test light illuminate brightly for each circuit?

STORED LOST COMMUNICATION DTCS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORT
CAN INTERIOR BUS CIRCUITS OPEN OR SHORT
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
POWER OR GROUND FROM THE REPORTING MODULE
MODULE THAT SET THIS DTC
PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT)
LOW BATTERY/JUMP START CONDITION
IOD FUSE WAS REMOVED DURING SHIPPING
CHECK FOR RELATED TSBS

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS STORED**

NOTE: Stored faults may indicate a customer perceived intermittent condition.

NOTE: **Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

1. Turn the ignition on.
2. With the scan tool, read stored DTCs.

   Is this DTC stored?

   Yes

   - Go To 2.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

2. **CHECK THE ENVIRONMENTAL DATA**
   1. With the scan tool, read the loss of communication environmental data.

      Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are there any stored CAN C hardware electrical, battery, ignition voltage, VIN missing/mismatch, or TIPM configuration DTCs present with matching environmental data?

      Yes

      - These DTCs may have been the result of other service procedures performed. Clear the DTCs.
      - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

      No

      - Go To 3.

3. **VERIFY INTERMITTENT LOST COMMUNICATION DTC - WIRING CONCERNS**
   1. With the scan tool, read all DTCs.

      Is there more than one ECU with stored DTCs "Logged Against" the module and one or more lost communication DTCs stored in the offending module?

      Yes

      - Verify if the vehicle was recently in for this type of service. Otherwise, using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. Repair as necessary.

      No

- Go To 4.

4. **VERIFY INTERMITTENT LOST COMMUNICATION DTC - OFFENDING MODULE**
    1. With the scan tool, read all DTCs.

       Is there more than one ECU with stored DTCs "Logged Against" the module and NO lost communication DTCs stored in the offending module?

       Yes

       - Check for a TSB related to this offending module.

       No

       - Go To 5.

5. **VERIFY INTERMITTENT LOST COMMUNICATION DTC - REPORTING MODULE**
    1. With the scan tool, read all DTCs.

       Is there ONLY ONE ECU with stored DTCs "Logged Against" the module?

       Yes

       - Check for a TSB related to the module that set this DTC.

       No

       - Verify if the vehicle was recently in for this type of service. Otherwise, using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. Repair as necessary.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses a short low on the (P501) Driver Mirror Turn Signal Driver circuit for more than two seconds with the turn signal switched on.

POSSIBLE CAUSES

Possible Causes
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO GROUND
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (C160) DRIVER MIRROR HEATER RETURN CIRCUIT
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P593) DRIVER MIRROR TURN SIGNAL RETURN CIRCUIT
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P69) DRIVER MIRROR SENSOR GROUND CIRCUIT
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P591) DRIVER PUDDLE LAMP RETURN CIRCUIT
DRIVER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTC's.
    3. Turn the turn signal on.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Does the scan tool display B164A-11-DRIVER MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO GROUND?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, go to 2.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 2: Checking Driver Mirror Turn Signal Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C2 (Component Side) harness connector from the Door Module.
3. Measure the resistance between ground and the (P501) Driver Mirror Turn Signal Driver circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (P501) Driver Mirror Turn Signal Driver circuit. If the wiring harness and harness connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT, (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT, OR TO THE (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 3: Checking Driver Mirror Turn Signal Driver Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (P71) Driver Mirror Vertical Driver circuit in the Driver Outside Rearview Mirror C2 (Component Side) harness connector.

2. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (P73) Driver Mirror Common Driver circuit in the Driver Outside Rearview Mirror C2 (Component Side) harness connector.
3. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (P75) Driver Mirror Horizontal Driver circuit in the Driver Outside Rearview Mirror C2 (Component Side) harness connector.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (P501) Driver Mirror Turn Signal Driver circuit. If the wiring harness and harness connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No, with Heated Mirror

   - Go To 4.

   No, without Heated Mirror

   - Go To 5.

4. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (C160) DRIVER MIRROR HEATER RETURN CIRCUIT**

Fig. 4: Checking Driver Mirror Turn Signal Driver Circuit For A Short To The Driver Mirror Heater Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (C160) Driver Mirror Heater Return circuit in the Driver Outside Rearview Mirror C2 (Component Side) harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P501) Driver Mirror Turn Signal Driver circuit for a short to the (C160) Driver Mirror Heater Return circuit. If the wiring harness and harness connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P593) DRIVER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 5: Checking Driver Mirror Turn Signal Driver Circuit For A Short To The Driver Mirror Turn Signal Return Circuit
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Ohmmeter positive lead must be connected to the (P593) Driver Mirror Turn Signal Return circuit and the negative lead to the (P501) Driver Mirror Turn Signal Driver circuit for the test results to be valid.**

1. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (P593) Driver Mirror Turn Signal Return circuit in the Driver Outside Rearview Mirror C2 (Component Side) harness connector.

   Is there any resistance present?

   Yes

   - Repair the (P501) Driver Mirror Turn Signal Driver circuit for a short to the (P593) Driver Mirror Turn Signal Return circuit. If the wiring harness and harness connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 6.

6. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P69) DRIVER MIRROR SENSOR GROUND CIRCUIT**

Fig. 6: Checking Driver Mirror Turn Signal Driver Circuit For A Short To The Driver Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Driver Outside Rearview Mirror C1 (Component Side) harness connector from the Door Module.
2. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (P69) Driver Mirror Sensor Ground circuit in the Driver Outside Rearview Mirror C2 and C1 (Component Side) harness connectors.

Is the resistance below 10K Ohms?

Yes

- Repair the (P501) Driver Mirror Turn Signal Driver circuit for a short to the (P69) Driver Mirror Sensor Ground circuit. If the wiring harness and harness connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No, with Puddle Lamp Mirror

- Go To 7.

No, without Puddle Lamp Mirror

- Inspect the wiring harness and harness connectors for damage and repair as necessary. If the wiring harness and harness connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P591) DRIVER PUDDLE LAMP RETURN CIRCUIT**

Fig. 7: Checking Driver Mirror Turn Signal Driver Circuit For A Short To The Driver Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (P591) Driver Puddle Lamp Return circuit in the Driver Outside Rearview Mirror C2 and C1 (Component Side) harness connectors.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P501) Driver Mirror Turn Signal Driver circuit for a short to the (P591) Driver

Puddle Lamp Return circuit. If the wiring harness and harness connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Inspect the wiring harness and harness connectors for damage and repair as necessary. If the wiring harness and harness connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses current greater than 100 mA or an open on the (P501) Driver Mirror Turn Signal Driver circuit for more than two seconds with the turn signal switched on.

POSSIBLE CAUSES

Possible Causes
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO VOLTAGE
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR AN OPEN
(P593) DRIVER MIRROR TURN SIGNAL RETURN CIRCUIT FOR AN OPEN
(P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT
DRIVER OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

    NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

    Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, go to 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 9: Checking Driver Mirror Turn Signal Driver Circuit For A Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
3. Turn the ignition on.
4. Measure the voltage of the (P501) Driver Mirror Turn Signal Driver circuit between the Driver Outside Rearview Mirror C2 (Component Side) connector and ground.

   Is there any voltage present?

   Yes

   - Repair the (P501) Driver Mirror Turn Signal Driver circuit for a short to voltage. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT, (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT, OR TO THE (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 10: Checking Driver Mirror Turn Signal Driver Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (P71) Driver Mirror Vertical Driver circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.
3. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (P73) Driver Mirror Common Driver circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.
4. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (P75) Driver Mirror Horizontal Driver circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P501) Driver Mirror Turn Signal Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No, with Heated Mirror

- Go To 4.

No, without Heated Mirror

- Go To 5.

4. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT**

Fig. 11: Checking Driver Mirror Turn Signal Driver Circuit For A Short To The Driver Mirror Heater Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (C16) Driver Mirror Heater Driver circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P501) Driver Mirror Turn Signal Driver circuit for a short to the (C16) Driver Mirror Heater Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT AND (P593) DRIVER MIRROR TURN SIGNAL RETURN CIRCUIT FOR AN OPEN**

Fig. 12: Checking Driver Mirror Turn Signal Driver Circuit And Driver Mirror Turn Signal Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Ohmmeter positive lead must be connected to the (P501) Driver Mirror Turn Signal Driver circuit and the negative lead to the (P593) Driver Mirror Turn Signal Return circuit for the test results to be valid.**

1. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (P593) Driver Mirror Turn Signal Return circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance above 1K Ohm?

   Yes

   - Repair the (P501) Driver Mirror Turn Signal Driver circuit or the (P593) Driver Mirror Turn Signal Return circuit for an open. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No, with Puddle Lamp Mirror

   - Go To 6.

   No, without Puddle Lamp Mirror

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT**

Fig. 13: Checking Driver Mirror Turn Signal Driver Circuit For A Short To The Driver Puddle Lamp Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Driver Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
2. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (M41) Driver Puddle Lamp Driver circuit at the Driver Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

Yes

- Repair the (P501) Driver Mirror Turn Signal Driver circuit for a short to the (M41) Driver Puddle Lamp Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1800-2A-DRIVER DOOR LOCK/UNLOCK SWITCH - SIGNAL STUCK IN RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

SET CONDITION:

When the Door Lock/Unlock Switch is stuck for over 30 seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
OBSTRUCTION IN SWITCH
DOOR LOCK SWITCH

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTC's.
    2. Operate the Driver Door Lock Switch in all positions several times.
    3. Cycle the ignition from on to off.
    4. Turn the ignition on.
    5. With the scan tool, read the DTC's.

    Does the scan tool display B1800-2A-DRIVER DOOR LOCK/UNLOCK SWITCH - SIGNAL STUCK IN RANGE?

    Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **DOOR LOCK SWITCH**
   1. Check the switch for any objects that could cause a sticking condition.

      Was anything found that could cause a sticking condition?

      Yes

      - Clean or remove the object as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

      No

      - Replace the Door Lock Switch.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

SET CONDITION:

When both Driver Window Driver circuits (Up and Down) are grounded during a window movement command, this code will set.

POSSIBLE CAUSES

Possible Causes
(Q21) DRIVER WINDOW DRIVER (DOWN) CIRCUIT FOR A SHORT TO GROUND
(Q11) DRIVER WINDOW DRIVER (UP) CIRCUIT FOR A SHORT TO GROUND
(Q21) DRIVER WINDOW DRIVER (DOWN) CIRCUIT FOR A SHORT TO THE (Q11) DRIVER WINDOW DRIVER (UP) CIRCUIT
WINDOW MOTOR SHORTED
DRIVER DOOR MODULE (DDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the DTC's
    3. Try to operate the Driver Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTC's.

    Does the scan tool display B1853-11-DRIVER WINDOW CONTROL - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2.

    No

    - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **WINDOW MOTOR SHORTED**

1. With the scan tool, erase the DTC's.
2. Turn the ignition off.
3. Disconnect the Driver Window Motor connector.
4. Turn the ignition on.
5. Operate the driver window switch up and down several times.

6. With the scan tool, read the DTC's.

   Does the scan tool display B1853-11-DRIVER WINDOW CONTROL - CIRCUIT SHORT TO GROUND?

   No

   - Replace the Driver Window Motor in accordances with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   Yes

   - Go To 3.

3. **(Q21) DRIVER WINDOW DRIVER (DOWN) CIRCUIT FOR A SHORT TO GROUND**

1. Turn the ignition off.
2. Disconnect the Driver Door Module C4 connector.
3. Measure the resistance between Ground and the (Q21) Driver Window Driver Down circuit.

   Is the resistance below 10, 000 Ohms?

   Yes

   - Repair the (Q21) Driver Window Driver Down circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **(Q11) DRIVER WINDOW DRIVER (UP) CIRCUIT FOR A SHORT TO GROUND**

    3. Operate the Driver Window switch up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTC's.

    Does the scan tool display B1853-13-DRIVER WINDOW CONTROL - CIRCUIT FOR AN OPEN?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **WINDOW MOTOR OR CIRCUIT FOR AN OPEN**

1. Turn the ignition off.
2. Disconnect the Driver Window Motor harness connector.
3. Connect a test light between the (Q11) Driver Window Driver (Up) circuit and the (Q21) Driver Window Driver (Down) circuit.
4. Turn the ignition on.
5. Trip the driver door latch to the closed position.
6. Operate the driver window switch up and down several times while observing the test light.

   Does the test light illuminate brightly when the switch is pressed in both directions? With the express up window, the test light will only flash momentarily each time the switch is activated.

Yes

- Replace the Driver Window Motor (regulator) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **(Q21) DRIVER WINDOW DRIVER (DOWN) CIRCUIT FOR AN OPEN**

Fig. 21: Checking Driver Window Driver (Down) Circuit For An Open

1. Turn the ignition off.
2. Disconnect the Driver Door Module C4 harness connector.
3. Measure the resistance of the (Q21) Driver Window Driver (Down) circuit between the Driver Door Module C4 harness connector and the Driver Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q21) Driver Window Driver (Down) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **(Q11) DRIVER WINDOW DRIVER (UP) CIRCUIT FOR AN OPEN**

1. Measure the resistance of the (Q11) Driver Window Driver (Up) circuit between the Driver Door Module C4 harness connector and the Driver Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q11) Driver Window Driver (Up) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Driver Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

SET CONDITION:

When the Driver Window Hall Sensor Supply circuit falls below 0.8 of a Volt for over 480 ms.

POSSIBLE CAUSES

Possible Causes
(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND
WINDOW MOTOR SHORTED
DRIVER DOOR MODULE (DDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTC's.
    3. Operate the Driver Window switch up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTC's.

2. Disconnect the Driver Door Module C4 harness connector.
3. Measure the resistance between ground and the (Q305) Driver Window Hall Sensor Supply circuit.

   Is the resistance below 10, 000 Ohms?

   Yes

   - Repair the short to ground in the (Q305) Driver Window Hall Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Driver Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 27: Checking Driver Window Hall Sensor Supply Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Door Module C4 harness connector.
3. Disconnect the Driver Window Motor harness connector.
4. Turn the ignition on.
5. Measure the voltage between ground and the (Q305) Driver Window Hall Sensor Supply circuit in the Driver Window Motor harness connector and ground.

Is there any voltage present?

Yes

- Repair the short to voltage in the (Q305) Driver Window Hall Sensor Supply circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Fig. 28: Checking Driver Window Hall Sensor Supply Circuit For An Open

1. Turn the ignition off.
2. Measure the resistance of the (Q305) Driver Window Hall Sensor Supply circuit from the Driver Door Module C4 harness connector to the Driver Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q305) Driver Window Hall Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **(Q991) DRIVER WINDOW HALL SENSOR RETURN CIRCUIT FOR AN OPEN**

1. Measure the resistance of the (Q991) Driver Window Hall Sensor Return circuit from the Driver Door Module C4 harness connector to the Driver Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q991) Driver Window Hall Sensor Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **DRIVER WINDOW HALL SENSOR OPEN**

Fig. 30: Checking Driver Window Hall Sensor For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the Drive Window Motor harness connector.
2. Measure the resistance between the (Q991) Driver Window Hall Sensor Return circuit and the (Q305) Driver Window Hall Sensor Supply circuit in the Driver Door Module C4 harness connector.

NOTE: **If the Ohmmeter displays "OL", reconnect the Driver Door Module C4 harness connector and move the motor to a different position.**

Disconnect the Driver Door Module C4 harness connector and check the resistance again. If the Ohmmeter still displays "OL", re-try moving the motor again and re-check.

Is the resistance between 500, 000 and 650, 000 (500k and 650k) Ohms?

Yes

- Replace the Door Module in accordance with the Service Information
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Window Motor in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

1. Measure the resistance between the (Q301) Driver Window Hall Sensor A Signal circuit and the (Q991) Driver Window Hall Sensor Return circuit in the Driver Window Motor harness connector.

   Is the resistance below 10, 000 Ohms?

   Yes

- Repair the (Q301) Driver Window Hall Sensor A Signal circuit for a short to the (Q991) Driver Window Hall Sensor Return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Window Motor in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

SET CONDITION:

Whenever the module detects a Front Left Window signal from the master power window switch, for over 30 seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
MASTER POWER WINDOW SWITCH

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the DTC's.
    3. Operate the Front Left Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTC's.

    Does the scan tool display B18B5-00-MASTER SWITCH-FRONT LEFT WINDOW SWITCH as active?

    Yes

    - Go To 2.

    No

- The conditions that caused this code to set are not present at this time. Operate the switch several more times. If the switch ever sticks, replace it.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **MASTER POWER WINDOW/DOOR LOCK SWITCH**

NOTE: Anytime this code is active, the switch must be replaced.

Repair

- Replace the Driver Window/Door Lock Switch in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the DTC's.
    3. Operate the Rear Left Window, from the master switch, up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTC's.

    Does the scan tool display B18B7-00-MASTER SWITCH-REAR LEFT WINDOW SWITCH as active?

    Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. Operate the switch several more times. If the switch ever sticks, replace it.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **MASTER POWER WINDOW/DOOR LOCK SWITCH**

NOTE: Anytime this code is active, the switch must be replaced.

Repair

- Replace the Driver Window/Door Lock Switch in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1D00-2A-MIRROR FOLD SWITCH INPUT STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

When the mirror fold operation is requested.

SET CONDITION:

If the Driver Door Module detects that the Mirror Switch is stuck in the same position for more than 30 seconds.

POSSIBLE CAUSES

Possible Causes
MIRROR SWITCH

DIAGNOSTIC TEST

1. **VERIFY IF DTC B1D00-2A MIRROR FOLD SWITCH INPUT STUCK IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, erase the DTC's.
    3. Press the Mirror Fold Switch in both directions several times.
    4. Cycle the ignition from on to off three times.
    5. Turn the ignition on.
    6. With the scan tool, read the active DTC's.

Does the scan tool display active: B1D00-2A MIRROR FOLD SWITCH INPUT STUCK?

Yes

- Replace the Drivers Door Window/Mirror Switch Assembly in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit. Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses the Mirror Adjust switch input for more than 30 seconds.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING MIRROR ADJUST SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING MIRROR ADJUST SWITCH TO GET STUCK IN A PUSHED POSITION
DRIVER DOOR SWITCH ASSEMBLY

DIAGNOSTIC TEST

1. **INSPECT DRIVER DOOR SWITCH ASSEMBLY FOR DAMAGE**

   NOTE: Diagnose and repair all LIN Bus related Diagnostic Trouble Codes (DTC's) before performing this test procedure.

   1. Turn the ignition off.
   2. Inspect the Driver Door switch assembly for damage.

      Is the switch assembly damaged?

      Yes

      - Replace the Driver Door switch assembly in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

      No

      - Go To 2.
2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING MIRROR ADJUST SWITCH TO STAY OR STICK IN A PUSHED POSITION**
   1. Inspect the Mirror Adjust switch for anything that would cause it to stay or stick in a pushed position.

      Is anything present that would cause the Mirror Adjust switch to stay or stick in a pushed position?

      Yes

      - Repair as necessary.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. Using a scan tool, record and erase DTC's.
   3. Press and release either Mirror Select switch.
   4. Operate the Mirror Adjust switch in all positions several times and then wait 30 seconds.
   5. Using a scan tool, read DTC's.

   Is the same DTC active?

   Yes

   - Replace the Driver Door switch assembly in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - The conditions that caused this code to set are not present at this time.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1D08-11-DRIVER MIRROR POSITION SENSOR POWER SUPPLY - CIRCUIT SHORT TO GROUND

Fig. 37: Driver Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses a short low on the (A856) 5-Volt Supply circuit for more than two seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
(A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND
(A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P69) DRIVER MIRROR SENSOR GROUND CIRCUIT
(A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P591) DRIVER PUDDLE LAMP RETURN CIRCUIT
(A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT
(A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT
(A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT
(A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (C160) DRIVER MIRROR HEATER RETURN CIRCUIT
(A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P593) DRIVER MIRROR TURN SIGNAL RETURN CIRCUIT
DRIVER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, go to 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 38: Checking 5-Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
3. Measure the resistance of the (A856) 5-Volt Supply circuit between ground and the Driver Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (A856) 5-Volt Supply circuit for a short to ground. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (P69) DRIVER MIRROR SENSOR GROUND CIRCUIT**

Fig. 39: Checking 5-Volt Supply Circuit For A Short To Driver Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the residence between the (A856) 5-Volt Supply circuit and the (P69) Driver Mirror Sensor Ground circuit at the Driver Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 1.0 Ohm?

   Yes

   - Repair the (A856) 5-Volt Supply circuit for a short to the (P69) Driver Mirror Sensor Ground circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No, with Puddle Lamp Mirror

- Go To 4.

No, without Puddle Lamp Mirror

- Go To 5.

4. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (P591) DRIVER PUDDLE LAMP RETURN CIRCUIT**

Fig. 40: Checking 5-Volt Supply Circuit For A Short To Driver Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the residence between the (A856) 5-Volt Supply circuit and the (P591) Driver Puddle Lamp Return circuit at the Driver Outside Rearview Mirror C1 (Component Side) connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (A856) 5-Volt Supply circuit for a short to the (P591) Driver Puddle Lamp Return circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT, (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT, OR TO (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT**

1. Disconnect the Driver Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
2. Measure the resistance between the (A856) 5-Volt Supply circuit and the (P71) Driver Mirror Vertical Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (A856) 5-Volt Supply circuit and the (P73) Driver Mirror Common Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

4. Measure the resistance between the (A856) 5-Volt Supply circuit and the (P75) Driver Mirror Horizontal Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (A856) 5-Volt Supply circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No, with Heated/Turn Signal Mirror

   - Go To 6.

   No, without Heated/Turn Signal Mirror

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (C160) DRIVER MIRROR HEATER RETURN CIRCUIT OR TO (P593) DRIVER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 42: Checking 5-Volt Supply Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (A856) 5-Volt Supply circuit and the (C160) Driver Mirror Heater Return circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (A856) 5-Volt Supply circuit and the (P593) Driver Mirror Turn Signal Return circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (A856) 5-Volt Supply circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

    NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, go to 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (P67) DRIVER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 44: Checking Driver Mirror Vertical Position Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
3. Measure the resistance of the (P67) Driver Mirror Vertical Position Signal circuit between ground and the Driver Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P67) Driver Mirror Vertical Position Signal circuit for a short to ground. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in

accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK (P67) DRIVER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (P69) DRIVER MIRROR SENSOR GROUND CIRCUIT**

Fig. 45: Checking Driver Mirror Vertical Position Signal Circuit For A Short To Driver Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the residence between the (P67) Driver Mirror Vertical Position Signal circuit and the (P69) Driver Mirror Sensor Ground circuit at the Driver Outside Rearview Mirror C1 (Component

Side) connector.

Is the resistance below 1.0 Ohm?

Yes

- Repair the (P67) Driver Mirror Vertical Position Signal circuit for a short to the (P69) Driver Mirror Sensor Ground circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

1. Measure the residence between the (P67) Driver Mirror Vertical Position Signal circuit and the (P591) Driver Puddle Lamp Return circuit at the Driver Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P67) Driver Mirror Vertical Position Signal circuit for a short to the (P591) Driver Puddle Lamp Return circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

1. Disconnect the Driver Outside Rearview Mirror C2 (Component Side) connector from the Door

Module C2 connector.

2. Measure the resistance between the (P67) Driver Mirror Vertical Position Signal circuit and the (P71) Driver Mirror Vertical Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (P67) Driver Mirror Vertical Position Signal circuit and the (P73) Driver Mirror Common Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
4. Measure the resistance between the (P67) Driver Mirror Vertical Position Signal circuit and the (P75) Driver Mirror Horizontal Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P67) Driver Mirror Vertical Position Signal circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No, with Heated/Turn Signal Mirror

- Go To 6.

No, without Heated/Turn Signal Mirror

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. **CHECK (P67) DRIVER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (C160) DRIVER MIRROR HEATER RETURN CIRCUIT OR TO (P593) DRIVER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 48: Checking Driver Mirror Vertical Position Signal Circuit For A Short To Other Circuits

1. For Heated Mirror, measure the resistance between the (P65) Driver Mirror Horizontal Position Signal circuit and the (C160) Driver Mirror Heater Return circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (P65) Driver Mirror Horizontal Position Signal circuit and the (P593) Driver Mirror Turn Signal Return circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P65) Driver Mirror Horizontal Position Signal circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
3. Turn the turn signal on, if equipped with turn signal mirror.
4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
5. Turn the rear defogger on, if equipped with heated mirror.
6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, go to 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (P65) DRIVER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT AND (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 64: Checking Driver Mirror Horizontal Position Signal Circuit And 5-Volt Supply Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
3. Turn the ignition on.
4. Measure the Voltage of the (P65) Driver Mirror Horizontal Position Signal circuit between the Driver Outside Rearview Mirror C1 (Component Side) connector and ground.
5. Measure the voltage of the (A856) 5-volt Supply circuit between the Driver Outside Rearview Mirror C1 (Component Side) connector and ground.

   Is there any Voltage present on either circuit?

Yes

- Repair all circuits with Voltage present for a short to Voltage. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No, with Puddle Lamp Mirror

- Go To 3.

No, without Puddle Lamp Mirror

- Go To 4.

3. **CHECK (P65) DRIVER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT AND (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT**

Fig. 65: Checking Driver Mirror Horizontal Position Signal Circuit And 5-Volt Supply Circuit For A Short To Driver Puddle Lamp Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (M41) Driver Puddle Lamp Driver circuit and the (P65) Driver Mirror Horizontal Position Signal circuit at the Driver Outside Rearview Mirror C1 (Component Side) connector.
3. Measure the resistance between the (M41) Driver Puddle Lamp Driver circuit and the (A856) 5-volt Supply circuit at the Driver Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms for either measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (M41) Driver Puddle

Lamp Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK (P65) DRIVER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT AND (P69) DRIVER MIRROR SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 66: Checking Driver Mirror Horizontal Position Signal Circuit And Driver Mirror Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. If not done previously, turn the ignition off.
2. Measure the resistance between the (P65) Driver Mirror Horizontal Position Signal circuit and the

(P69) Driver Mirror Sensor Ground circuit at the Driver Outside Rearview Mirror C1 (Component Side) connector.

Is the resistance below 3.0 Ohms?

Yes

- Go To 5.

No

- Repair the (P65) Driver Mirror Horizontal Position Signal circuit or the (P69) Driver Mirror Sensor Ground circuit for an open. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **CHECK (P65) DRIVER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT, (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT, OR TO (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 67: Checking Driver Mirror Horizontal Position Signal Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Driver Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
2. Measure the resistance between the (P65) Driver Mirror Horizontal Position Signal circuit and the (P71) Driver Mirror Vertical Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (P65) Driver Mirror Horizontal Position Signal circuit and the (P73) Driver Mirror Common Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
4. Measure the resistance between the (P65) Driver Mirror Horizontal Position Signal circuit and the

(P75) Driver Mirror Horizontal Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P65) Driver Mirror Horizontal Position Signal circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No, with Heated/Turn Signal Mirror

- Go To 6.

No, without Heated/Turn Signal Mirror

- Go To 7.

6. **CHECK (P65) DRIVER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT OR TO (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT**

Fig. 68: Checking Driver Mirror Horizontal Position Signal Circuit For A Short To Driver Mirror Heater Driver Circuit Or To Driver Mirror Turn Signal Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (P65) Driver Mirror Horizontal Position Signal circuit and the (C16) Driver Mirror Heater Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (P65) Driver Mirror Horizontal Position Signal circuit and the (P501) Driver Mirror Turn Signal Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P65) Driver Mirror Horizontal Position Signal circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 7.

7. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT, (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT, OR TO (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 69: Checking 5-Volt Supply Circuit For A Short To Other Circuits

1. Measure the resistance between the (A856) 5-volt Supply circuit and the (P71) Driver Mirror Vertical Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. Measure the resistance between the (A856) 5-volt Supply circuit and the (P73) Driver Mirror Common Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (A856) 5-volt Supply circuit and the (P75) Driver Mirror Horizontal Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (A856) 5-volt Supply circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No, with Heated/Turn Signal Mirror

- Go To 8.

No, without Heated/Turn Signal Mirror

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

8. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT OR TO (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT**

Fig. 70: Checking 5-Volt Supply Circuit For A Short To Driver Mirror Heater Driver Circuit Or To Driver Mirror Turn Signal Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (A856) 5-volt Supply circuit and the (C16) Driver Mirror Heater Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (A856) 5-volt Supply circuit and the (P501) Driver Mirror Turn Signal Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (A856) 5-volt Supply circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
3. Measure the resistance of the (P71) Driver Mirror Vertical Driver circuit between ground and the Driver Outside Rearview Mirror C2 (Component Side) connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (P71) Driver Mirror Vertical Driver circuit for a short to ground. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.

1. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (P75) Driver Mirror Horizontal Driver circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.
2. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (P71) Driver Mirror Vertical Driver circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.
3. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (P73) Driver Mirror Common Driver circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (C16) Driver Mirror Heater Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No, with Turn Signal Mirror

- Go To 4.

No, without Turn Signal Mirror

- Go To 5.

4. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (P593) DRIVER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 84: Checking Driver Mirror Heater Driver Circuit For A Short To Driver Mirror Turn Signal Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (P593) Driver Mirror Turn Signal Return circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (C16) Driver Mirror Heater Driver circuit for a short to the (P593) Driver Mirror Turn Signal Return circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (C160) DRIVER MIRROR HEATER RETURN CIRCUIT**

Fig. 85: Checking Driver Mirror Heater Driver Circuit For A Short To Driver Mirror Heater Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (C160) Driver Mirror Heater Return circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 1.0 Ohm?

   Yes

   - Repair the (C16) Driver Mirror Heater Driver circuit for a short to the (C160) Driver Mirror Heater Return circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 6.

6. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (69) DRIVER MIRROR SENSOR GROUND CIRCUIT**

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Driver Outside Rearview Mirror C1 (Component Side) connector from the Door

Module C1 connector.

2. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (P69) Driver Mirror Sensor Ground circuit at the Driver Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (C16) Driver Mirror Heater Driver circuit for a short to the (P69) Driver Mirror Sensor Ground circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No, with Puddle Lamp Mirror

   - Go To 7.

   No, without Puddle Lamp Mirror

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (P591) DRIVER PUDDLE LAMP RETURN CIRCUIT**

Fig. 87: Checking Driver Mirror Heater Driver Circuit For A Short To Driver Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (P591) Driver Puddle Lamp Return circuit at the Driver Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

   Yes

- Repair the (C16) Driver Mirror Heater Driver circuit for a short to the (P591) Driver Puddle Lamp Return circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses an open or a short high on the (C16) Driver Mirror Heater Driver circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
(C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO VOLTAGE
(C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR AN OPEN
(C160) DRIVER MIRROR HEATER RETURN CIRCUIT FOR AN OPEN
(C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT
(C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT
(C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT
(C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT
(C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT
DRIVER OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION - HEATER OFF**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    6. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

    NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

    Is the DTC active?

    Yes

- Go To 3.

No

- Go To 2.

2. **TEST FOR INTERMITTENT CONDITION - HEATER ON**
   1. Turn the rear defogger on.
   2. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 3.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, go to 3. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 89: Checking Driver Mirror Heater Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
3. Turn the ignition on.
4. Measure the voltage of the (C16) Driver Mirror Heater Driver circuit between the Driver Outside Rearview Mirror C2 (Component Side) connector and ground.

   Is there any voltage present?

   Yes

   - Repair the (C16) Driver Mirror Heater Driver circuit for a short to voltage. If the wiring

harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT AND (C160) DRIVER MIRROR HEATER RETURN CIRCUIT FOR AN OPEN**

Fig. 90: Checking Driver Mirror Heater Driver Circuit And Driver Mirror Heater Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (C160) Driver Mirror Heater Return circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 9.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the (C16) Driver Mirror Heater Driver circuit or the (C160) Driver Mirror Heater Return circuit for an open. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT, (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT, OR TO (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT**

Fig. 91: Checking Driver Mirror Heater Driver Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (P75) Driver Mirror Horizontal Driver circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.
2. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (P71) Driver Mirror Vertical Driver circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.
3. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (P73) Driver Mirror Common Driver circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (C16) Driver Mirror Heater Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No, with Turn Signal Mirror

- Go To 6.

No, without Turn Signal Mirror

- Go To 7.

6. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT**

Fig. 92: Checking Driver Mirror Heater Driver Circuit For A Short To Driver Mirror Turn Signal Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (P501) Driver Mirror Turn Signal Driver circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (C16) Driver Mirror Heater Driver circuit for a short to the (P501) Driver Mirror Turn Signal Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No, with Puddle Lamp Mirror

- Go To 7.

No, without Puddle Lamp Mirror

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT**

Fig. 93: Checking Driver Mirror Heater Driver Circuit For A Short To Driver Puddle Lamp Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Driver Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
2. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (M41) Driver Puddle Lamp Driver circuit at the Driver Outside Rearview Mirror C2 and C1 (Component Side) connectors.

Is the resistance below 10K Ohms?

Yes

- Repair the (C16) Driver Mirror Heater Driver circuit for a short to the (M41) Driver Puddle Lamp Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module receives a conflicting input from the (G200) Memory Select Switch Mux circuit for more than 30 seconds.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING MEMORY SET SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING MEMORY SET SWITCH TO GET STUCK IN A PUSHED POSITION
(G200) MEMORY SELECT SWITCH MUX CIRCUIT FOR A SHORT TO GROUND
(G200) MEMORY SELECT SWITCH MUX CIRCUIT FOR A SHORT TO THE (G920) MEMORY SELECT SWITCH MUX RETURN CIRCUIT
MEMORY SET SWITCH
DOOR MODULE

DIAGNOSTIC TEST

1. **INSPECT MEMORY SET SWITCH FOR DAMAGE**
    1. Turn the ignition off.
    2. Inspect the Memory Set switch for damage.

       Is the switch damaged?

       Yes

       - Replace the Memory Set switch in accordance with the Service Information.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

       No

       - Go To 2.
2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING MEMORY SET SWITCH TO STAY OR STICK IN A PUSHED POSITION**
    1. Inspect the Memory Set switch for anything that would cause it to stay or stick in a pushed position.

Is anything present that would cause the Memory Set switch to stay or stick in a pushed position?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
   3. Press the Memory Set switch several times in all positions.
   4. Cycle the ignition from on to off three times.
   5. Turn the ignition on then wait 30 seconds.
   6. Using a scan tool, read DTC's.

   Is the DTC active?

   Yes

   - Go To 4.

   No

   - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Attempt to reproduce condition by adjusting the seat.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
4. **CHECK MEMORY SET SWITCH FOR A SHORT TO GROUND**

Fig. 95: Memory Set Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Using a scan tool, erase DTC's.
2. Turn the ignition off.
3. Disconnect the Memory Set switch connector.
4. Cycle the ignition three times.
5. Turn the ignition on and then wait 30 seconds.
6. Using a scan tool, read DTC's.

Is the same DTC active?

Yes

- Go To 5.

No

- Replace the Memory Set switch in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **CHECK (G200) MEMORY SELECT SWITCH MUX CIRCUIT FOR A SHORT TO GROUND**

Fig. 96: Checking Memory Select Switch MUX Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Door Module C5 connector.
2. Measure the resistance between ground and the (G200) Memory Select Switch Mux circuit at the Memory Set switch connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (G200) Memory Select Switch Mux circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 6.

6. **CHECK (G200) MEMORY SELECT SWITCH MUX CIRCUIT FOR A SHORT TO THE (G920) MEMORY SELECT SWITCH RETURN CIRCUIT**

Fig. 97: Checking Memory Select Switch MUX Circuit For A Short To The Memory Select Switch Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G200) Memory Select Switch Mux circuit and the (G920) Memory Select Switch Return circuit at the Memory Set switch connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (G200) Memory Select Switch Mux circuit for a short to the (G920) Memory Select Switch return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

SET CONDITION:

The Door Module senses the Left Mirror Select switch input for more than 30 seconds.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING LEFT MIRROR SELECT SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING LEFT MIRROR SELECT SWITCH TO GET STUCK IN A PUSHED POSITION
DRIVER DOOR SWITCH ASSEMBLY

DIAGNOSTIC TEST

1. **INSPECT DRIVER DOOR SWITCH ASSEMBLY FOR DAMAGE**

   NOTE: Diagnose and repair all LIN Bus related Diagnostic Trouble Codes (DTC's) before performing this test procedure.

   1. Turn the ignition off.
   2. Inspect the Driver Door switch assembly for damage.

      Is the switch assembly damaged?

      Yes

      - Replace the Driver Door switch assembly in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

      No

      - Go To 2.
2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING LEFT MIRROR SELECT SWITCH TO STAY OR STICK IN A PUSHED POSITION**
   1. Inspect the Left Mirror Select switch for anything that would cause it to stay or stick in a pushed position.

      Is anything present that would cause the Left Mirror Select switch to stay or stick in a pushed position?

      Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. Using a scan tool, record and erase DTC's.
   3. Press and release the Left Mirror Select switch several times and then wait 30 seconds.
   4. Using a scan tool, read DTC's.

   Is the same DTC active?

   Yes

   - Replace the Driver Door switch assembly in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - The conditions that caused this code to set are not present at this time.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DRIVER DOOR SWITCH ASSEMBLY

DIAGNOSTIC TEST

1. **INSPECT DRIVER DOOR SWITCH ASSEMBLY FOR DAMAGE**

   NOTE: Diagnose and repair all LIN Bus related Diagnostic Trouble Codes (DTC's) before performing this test procedure.

   1. Turn the ignition off.
   2. Inspect the Driver Door switch assembly for damage.

      Is the switch assembly damaged?

      Yes

      - Replace the Driver Door switch assembly in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

      No

      - Go To 2.
2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING RIGHT MIRROR SELECT SWITCH TO STAY OR STICK IN A PUSHED POSITION**
   1. Inspect the Right Mirror Select switch for anything that would cause it to stay or stick in a pushed position.

      Is anything present that would cause the Right Mirror Select switch to stay or stick in a pushed position?

      Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1E66-11-DRIVER MIRROR FOLD CONTROL CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

When one of the Mirror Fold or Unfold driver circuits are shorted to ground for approximately 30 seconds.

POSSIBLE CAUSES

Possible Causes
DRIVER FOLDING MIRROR ASSEMBLY
DRIVER DOOR MODULE (DDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

1. Turn the ignition on.
2. With the scan tool, erase the DTC's.
3. Cycle the ignition from on to off three times.
4. Turn the ignition on.
5. Operate the Mirror Fold switch in both directions three times.
6. Wait 30 seconds.
7. With the scan tool, read the active DTC's.

   Does the scan tool display: B1E66-11-DRIVER MIRROR FOLD CONTROL CIRCUIT SHORT TO GROUND as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit. Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **INSPECT MIRROR CONNECTIONS**

Fig. 100: Driver Outside Rearview Mirror Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror connector at the Drivers Door Module C2 harness connector.
3. Inspect the wiring and connectors between the mirror and the Drivers Door Module.

   Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **MIRROR ASSEMBLY**
   1. Turn the ignition on
   2. With the scan tool, erase the DTC's.
   3. Cycle the ignition from on to off three times.
   4. Turn the ignition on.
   5. Operate the Mirror Fold switch in both directions three times.
   6. Wait 30 seconds.
   7. With the scan tool, read the active DTC's.

   Does the scan tool display: B1E66-11-DRIVER MIRROR FOLD CONTROL CIRCUIT SHORT TO GROUND as active?

   Yes

   - Replace the Drivers Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Drivers Folding Mirror assembly in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, erase the DTC's.
    3. Operate the Mirror Fold switch in both directions three times.
    4. Cycle the ignition from on to off three times.
    5. Turn the ignition on.
    6. With the scan tool, read the active DTC's.

    Does the scan tool display: B1E66-15-DRIVER MIRROR FOLD CONTROL CIRCUIT SHORT TO BATTERY OR OPEN as active?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit. Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **INSPECT MIRROR CONNECTIONS**

Fig. 101: Driver Outside Rearview Mirror Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror connector at the Drivers Door Module C2 harness connector.
3. Inspect the wiring and connectors between the mirror and the Drivers Door Module.

   Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **MIRROR ASSEMBLY**
    1. Turn the ignition off.
    2. Replace the Drivers Power Folding Mirror Assembly.
    3. Turn the ignition on
    4. With the scan tool, erase the DTC's.
    5. Cycle the ignition from on to off three times.
    6. Turn the ignition on.
    7. Operate the Mirror Fold switch in both directions three times.
    8. Wait 30 seconds.
    9. With the scan tool, read the active DTC's.

    Does the scan tool display: B1E66-15-DRIVER MIRROR FOLD CONTROL CIRCUIT SHORT TO BATTERY OR OPEN as active?

    Yes

    - Replace the Drivers Door Module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

    - Test Complete.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW VOLTAGE ENGINE DTC (A215) FUSED B(+) CIRCUIT HAS HIGH RESISTANCE (Z905) GROUND CIRCUIT HAS HIGH RESISTANCE DRIVER DOOR MODULE (DDM)

DIAGNOSTIC TEST

1. **CHECK ENGINE DTC's**
    1. With the scan tool, read the Powertrain Control Module DTC's

       Are there any Charging or Battery DTC's present?

       No

       - Go To 2.

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate charging system or battery DTC diagnostic procedures.
2. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTC's.
    2. Start the engine and run for two minutes.
    3. With the scan tool, read the active DTC's in the Door Module.

       Does the scan tool display B210C-16-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD?

       Yes

       - Go To 3.

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this

time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **(A215) FUSED B(+) OR (Z905) GROUND CIRCUITS RESISTED**

1. Turn the ignition off.
2. Disconnect the Driver Door Module C3 connector.
3. Turn the ignition on.
4. Test the (A215) Fused B(+) circuits by connecting a 12-volt test light between the Fused B(+) circuit and the (Z905) Ground circuits in the door module C3 connector. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Driver Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Test the (A215) Fused B(+) and the (Z905) Ground circuits to determine which one has the high resistance. Repair the necessary circuit for high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

LOW VOLTAGE ENGINE DTC (A215) FUSED B(+) CIRCUIT HAS HIGH RESISTANCE (Z905) GROUND CIRCUIT HAS HIGH RESISTANCE DRIVER DOOR MODULE (DDM)

DIAGNOSTIC TEST

1. **CHECK ENGINE DTC's**
    1. With the scan tool, read the Powertrain Control Module DTC's

       Are there any Charging or Battery DTC's present?

       No

       - Go To 2.

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate charging system or battery DTC diagnostic procedures.
2. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTC's.
    2. Start the engine and run for two minutes.
    3. With the scan tool, read the active DTC's in the Door Module.

       Does the scan tool display; B210C-16-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD?

       Yes

       - Go To 3.

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this

time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **(A215) FUSED B(+) OR (Z905) GROUND CIRCUITS RESISTED**

B2598-54-DOOR MODULE FRONT LEFT - MISSING CALIBRATION - QUAD/CREW CAB ONLY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This code can set anytime the battery or the door module connector is disconnected.

WHEN MONITORED:

Whenever the window motor is operating.

SET CONDITION:

When the Door Module has lost the parameters for window travel.

POSSIBLE CAUSES

Possible Causes
MODULE NOT CALIBRATED
EXPRESS WINDOW SWITCH
DRIVER DOOR MODULE (DDM)

NOTE: If there are any other Power Window DTC's, repair them before continuing.

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTC's.
    3. Operate the Driver Window switch up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTC's.

    Does the scan tool display B2598-54-DOOR MODULE FRONT LEFT - MISSING CALIBRATION?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **WINDOW MODULE NOT CALIBRATED**
   1. Activate the window to the full up position and continue to hold the switch for an additional two seconds.
   2. Activate the window to the full down position and continue to hold the switch for an additional two seconds.
   3. Again activate the window to the full up position and continue to hold the switch for an additional two seconds.
   4. Lower the window all the way down then press and release the switch to the express up position.

   Did the window move to the full up position?

   Yes

   - Test complete.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.
3. **EXPRESS WINDOW SWITCH**
   1. Turn the ignition off.
   2. Move the Driver Express Window Switch from the idle position to the up position and then to the express up position.

   Is there two definite detent positions felt?

   Yes

   - Replace the Driver Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Driver Express Window Switch.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the DTC's.
    3. Operate the Driver Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTC's.

    Does the scan tool display B2598-96-DOOR MODULE FRONT LEFT - COMPONENT INTERNAL FAILURE?

    Yes

    - Replace the Door Module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

    - The conditions that caused this code to set are not present at this time. If this code ever repeats, replace the door module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

SET CONDITION:

The Door Module senses a short low on the (M41) Driver Puddle Lamp Driver circuit for more than two seconds with the lamp switched on.

POSSIBLE CAUSES

Possible Causes
(M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND
(M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P69) DRIVER MIRROR SENSOR GROUND CIRCUIT
(M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P591) DRIVER PUDDLE LAMP RETURN CIRCUIT
(M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT

(M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P593) DRIVER MIRROR TURN SIGNAL RETURN CIRCUIT
DRIVER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on.

    NOTE: Verify the panel lamps dimmer switch is not in the defeat (off) position.

    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, go to 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 109: Checking Driver Puddle Lamp Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
3. Measure the resistance of the (M41) Driver Puddle Lamp Driver circuit between ground and the Driver Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (M41) Driver Puddle Lamp Driver circuit for a short to ground. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance

with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P69) DRIVER MIRROR SENSOR GROUND CIRCUIT**

Fig. 110: Checking Driver Puddle Lamp Driver Circuit For A Short To The Driver Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (M41) Driver Puddle Lamp Driver circuit and the (P69) Driver Mirror Sensor Ground circuit at the Driver Outside Rearview Mirror C1 (Component Side)

connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (M41) Driver Puddle Lamp Driver circuit for a short to the (P69) Driver Mirror Sensor Ground circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P591) DRIVER PUDDLE LAMP RETURN CIRCUIT**

Fig. 111: Checking Driver Puddle Lamp Driver Circuit For A Short To The Driver Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Ohmmeter positive lead must be connected to the (P591) Driver Puddle Lamp Return circuit and the negative lead to the (M41) Driver Puddle Lamp Driver circuit for the test results to be valid.**

1. Measure the resistance between the (M41) Driver Puddle Lamp Driver circuit and the (P591) Driver Puddle Lamp Return circuit at the Driver Outside Rearview Mirror C1 (Component Side) connector.

   Is there any resistance present?

   Yes

- Repair the (M41) Driver Puddle Lamp Driver circuit for a short to the (P591) Driver Puddle Lamp Return circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **CHECK (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT, (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT, OR TO (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 112: Checking Driver Puddle Lamp Driver Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Driver Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
2. Measure the resistance between the (M41) Driver Puddle Lamp Driver circuit and the (P71) Driver Mirror Vertical Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (M41) Driver Puddle Lamp Driver circuit and the (P73) Driver Mirror Common Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

4. Measure the resistance between the (M41) Driver Puddle Lamp Driver circuit and the (P75) Driver Mirror Horizontal Driver circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (M41) Driver Puddle Lamp Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No, with Heated/Turn Signal Mirror

   - Go To 6.

   No, without Heated/Turn Signal Mirror

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. **CHECK (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (C160) DRIVER MIRROR HEATER RETURN CIRCUIT OR TO THE (P593) DRIVER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 113: Checking Driver Puddle Lamp Driver Circuit For A Short To The Driver Mirror Heater Return Circuit Or To The Driver Mirror Turn Signal Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (M41) Driver Puddle Lamp Driver circuit and the (C160) Driver Mirror Heater Return circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (M41) Driver Puddle Lamp Driver circuit and the (P593) Driver Mirror Turn Signal Return circuit at the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (M41) Driver Puddle Lamp Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on.

    NOTE: Verify the panel lamps dimmer switch is not in the defeat (off) position.

    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow

time for an active fault to set if present.

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, go to 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 115: Checking Driver Puddle Lamp Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect Driver Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
3. Turn the ignition on.
4. Measure the voltage of the (M41) Driver Puddle Lamp Driver circuit between the Driver Outside Rearview Mirror C1 (Component Side) connector and ground.

   Is there any voltage present?

   Yes

   - Repair the (M41) Driver Puddle Lamp Driver circuit for a short to voltage. If the wiring

harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT AND (P591) DRIVER PUDDLE LAMP RETURN CIRCUIT FOR AN OPEN**

1. Turn the ignition off.

NOTE: **The Ohmmeter positive lead must be connected to the (M41) Driver Puddle Lamp Driver circuit and the negative lead to the (P591) Driver Puddle Lamp Return circuit for the test results to be valid.**

2. Measure the resistance between the (M41) Driver Puddle Lamp Driver circuit and the (P591) Driver Puddle Lamp Return circuit at the Driver Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance above 1000 Ohms?

   Yes

   - Repair the (M41) Driver Puddle Lamp Driver circuit or the (P591) Driver Puddle Lamp Return circuit for an open. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **CHECK (M41) DRIVER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO (P71) DRIVER MIRROR VERTICAL DRIVER CIRCUIT, (P73) DRIVER MIRROR COMMON DRIVER CIRCUIT, OR TO (P75) DRIVER MIRROR HORIZONTAL DRIVER CIRCUIT**

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: **Make sure the IOD fuse is installed and the battery is fully charged before proceeding.**

1. Turn the ignition on.
2. With the scan tool, read active DTC's.

   Is this DTC active?

   Yes

   - **Refer to U0010-CAN INTERIOR BUS** and perform the diagnostic procedure.

   No

   - **Refer to STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

DRIVER DOOR MODULE (DDM)

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read the active DTC's.

    Does the scan tool display U0037-11-LIN BUS - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2.

    No

    - **Refer to STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.
2. **CHECK THE LIN BUS CIRCUIT**

1. Turn the ignition off.
2. Disconnect the Driver Window/Door Lock Switch C1 harness connector.
3. Turn the ignition on.
4. Measure the voltage between the (D500) LIN Bus circuit and the (D501) LIN Bus Return circuit.

   Is the voltage below 7.0 Volts?

   Yes

   - Go To 3.

   No

- Replace the Driver Window/Door Lock Switch.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **(D500) LIN BUS CIRCUIT FOR A SHORT TO GROUND**

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Door Module C5 harness connector.
3. Measure the resistance between ground and the (D500) LIN Bus circuit in the Door Module C5 harness connector.

   Is the resistance below 10, 000 Ohms?

Yes

- Repair the short to ground in the (D500) LIN Bus circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **(D500) LIN BUS CIRCUIT FOR A SHORT TO THE (D501) LIN BUS RETURN CIRCUIT**

1. Measure the resistance between the (D500) LIN Bus circuit and the (D501) LIN Bus Return circuit in the Door Module C5 harness connector.

   Is the resistance below 10, 000 Ohms?

Yes

- Repair the (D500) LIN Bus circuit for a short to the (D501) LIN Bus Return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Driver Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Make sure the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTC's
   3. Operate the Front Window switches up and down several times.
   4. Wait 30 seconds.
   5. With the scan tool, read the active DTC's.

      Does the scan tool display U113D-LOST COMMUNICATION WITH MASTER POWER WINDOW SWITCH?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **(A855) FUSED B(+) CIRCUIT FOR AN OPEN**

NOTE: Make sure Fuse M25 in the TIPM is good before proceeding.

1. With the scan tool, erase DTC's.
2. Turn the ignition off.
3. Disconnect the Driver Window/Door Lock Switch C1 harness connector.
4. Turn the ignition on.
5. Using a 12-volt test light connected to Ground, check the (A855) Fused B(+) circuit.

   Does the test light illuminate brightly?

   Yes

- Go To 3.

No

- Repair the open in the (A855) Fused B(+) circuit. If the fuse is open, make sure to check for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK THE LIN BUS CIRCUIT**

STANDARD PROCEDURE - MODULE PROGRAMMING

The Wireless Ignition Node (WIN) controls the Vehicle Theft Security System (VTSS), Remote Keyless Entry (RKE). When a Powertrain Control Module (PCM) is in need of replacement, perform the following steps in order:

NOTE: The PCM and the WIN should never be replaced at the same time. They should be replaced independently of each other.

1. If applicable, first replace the PCM with the original WIN still connected to the vehicle.
2. Using a scan tool program the new PCM. (This will ensure the transfer of the Secret Key data from the original WIN into the new PCM).
3. Replace the WIN, using the scan tool program the new WIN module. This will transfer the Secret Key data from the PCM into the new WIN.
4. With the scan tool reprogram the key FOBIK to the new WIN.
5. Ensure all the customer's keys have been programmed to the new module.

NOTE: If the original keys do not successfully program to the new WIN after the proper procedures are followed correctly, programming new keys will be necessary.

PROGRAMMING THE SECRET KEY TO THE WIN

The secret key is an ID code that is unique to each WIN. This code is programmed and stored in the WIN, the PCM, and each ignition key transponder chip. When the PCM or WIN is replaced, it is necessary to program the Secret Key Code into the new module using a diagnostic scan tool. Follow the programming steps outlined in the diagnostic scan tool for **PCM REPLACED** , **WIN REPLACED** , or **TIPM REPLACED** under **MISCELLANEOUS FUNCTIONS** for the **WIRELESS CONTROL MODULE** menu item as appropriate.

NOTE: Programming the PCM or WIN is done using a diagnostic scan tool and a PIN to enter secure access mode. If three attempts are made to enter secure access mode using an incorrect PIN, secure access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour and then enter the correct PIN. Be certain that all accessories are turned

OFF. Also, monitor the battery state and connect a battery charger if necessary.

PCM/WIN PROGRAMMING

When an PCM and the WIN are replaced at the same time, perform the following steps in order:

1. Program the new WIN.
2. Replace all ignition keys and program them to the new WIN.

PROGRAMMING THE WIN

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. Connect the scan tool.

NOTE: Have a unique vehicle PIN readily available before running the routine

CAUTION: If the PCM and WIN are replaced at the same time, the PCM MUST be programmed before the WIN.

3. Select "ECU View."
4. Select "WIN".
5. Select "Miscellaneous Functions."
6. Select "WIN Replaced".
7. Enter the PIN when prompted.
8. Cycle ignition key after the successful routine completion.

NOTE: If the PCM and the WIN are replaced at the same time, all vehicle keys will need to be replaced and programmed to the new WIN.

PROGRAMMING IGNITION KEYS TO THE WIN

Each FOBIK has a unique ID code that is assigned at the time the key is manufactured. When a key is programmed into the WIN, the module learns the transponder ID code and the transponder acquires the unique Secret Key ID code from the WIN.

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.

2. Connect the scan tool.
3. Have a unique vehicle PIN readily available before running the routine.
4. Ignition key should be in RUN position.
5. Select "ECU View".
6. Select "WIN Wireless Control".
7. Select "Miscellaneous Functions."
8. Select "Program Ignition Keys or Key FOBs", Start
9. Enter the PIN when prompted.
10. Verify the correct information.
11. Cycle ignition key after the successful routine completion.

NOTE: **If the original keys do not successfully program to the new WIN after the proper procedures are followed correctly, programming new keys will be necessary.**

NOTE: **A maximum of eight keys can be learned by the WIN. Once a key is learned by a WIN, that key has acquired the Secret Key for that WIN and cannot be transferred to any other WIN or vehicle.**

PROGRAMMING THE PCM

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. Connect the scan tool.
3. Have a unique vehicle PIN readily available before running the routine.
4. Ignition key should be in RUN position.

CAUTION: If the PCM and WIN are replaced at the same time, the PCM MUST be programmed before the WIN.

5. Select "ECU View".
6. Select "WIN Wireless Control".
7. Select "Miscellaneous Functions."
8. Select "PCM Replaced".
9. Enter the PIN when prompted.
10. Verify the correct information.
11. Cycle ignition key after the successful routine completion.

COMMUNICATION

DESCRIPTION

DESCRIPTION

The primary on-board communication network between microprocessor-based electronic control modules in this vehicle is the Controller Area Network (CAN) data bus system. A data bus network minimizes redundant wiring connections; and, at the same time, reduces wire harness complexity, sensor current loads and controller hardware by allowing each sensing device to be connected to only one module (also referred to as a node). Each node reads, then broadcasts its sensor data over the bus for use by all other nodes requiring that data. Each node ignores the messages on the bus that it cannot use.

The CAN bus is a two-wire multiplex system. Multiplexing is any system that enables the transmission of multiple messages over a single channel or circuit. The CAN bus is used for communication between most vehicle nodes. However, in addition to the CAN bus network, certain nodes may also be equipped with a Local Interface Network (LIN) data bus. The LIN data bus is a single wire low-speed (9.6 Kbps) serial link bus used to provide direct communication between a LIN master module and certain switch or sensor inputs.

There are actually three separate CAN bus systems used in the vehicle. They are designated: the CAN-Interior (also known as CAN Interior High Speed/IHS), the CAN-C and the Diagnostic CAN-C. The CAN-Interior and CAN-C systems provide on-board communication between all nodes in the vehicle. The CAN-C is the faster of the two systems providing near real-time communication (500 Kbps). The CAN-C is used typically for communications between more critical nodes, while the slower (125 Kbps) CAN-Interior system is used for communications between less critical nodes.

The added speed of the CAN data bus is many times faster than previous data bus systems. This added speed facilitates the addition of more electronic control modules or nodes and the incorporation of many new electrical and electronic features in the vehicle.

The Diagnostic CAN-C bus is also capable of 500 Kbps communication, and is sometimes informally referred to as the CAN-D system to differentiate it from the other high speed CAN-C bus. The Diagnostic CAN-C is used exclusively for the transmission of diagnostic information between the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) and a diagnostic scan tool connected to the industry-standard 16-way Data Link Connector (DLC) located beneath the instrument panel on the driver side of the vehicle.

The TIPM is located in the engine compartment near the battery. The central CAN gateway or hub module integral to the TIPM is connected to all three CAN buses. This gateway physically and electrically isolates the CAN buses from each other and coordinates the bi-directional transfer of messages between them.

OPERATION

OPERATION

The Controller Area Network (CAN) data bus allows all electronic modules or nodes connected to the bus to share information with each other. Regardless of whether a message originates from a module on the lower speed CAN-Interior (also known as CAN Interior High Speed/IHS) bus or on the higher speed CAN-C or CAN-D bus, the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores a Diagnostic Trouble Code (DTC) for certain bus network faults.

All modules (also referred to as nodes) transmit and receive messages over one of these buses. Data exchange between nodes is achieved by serial transmission of encoded data messages. Each node can both send and receive serial data simultaneously. Each digital bit of a CAN bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each node uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time.

The Cluster (also known as the Cabin Compartment Node/CCN) is the Local Interface Network (LIN) master module in this vehicle and it gathers information from the compass module, the instrument panel switch bank, the Steering Control Module (SCM), and the Heated Seat Module (HSM) through the LIN data bus. There is also LIN bus communication between the individual Tire Pressure Monitor (TPM) transponders and the Wireless Ignition Node (WIN). Both the EMIC and the WIN either act directly upon the information received through the LIN data bus, relay the information to other nodes in the vehicle using electronic messages placed on the CAN bus, or both.

The voltage network used to transmit messages requires biasing and termination. Each module on the CAN bus network provides its own biasing and termination. There are two types of nodes used in the CAN bus network. On the CAN-C or the IHS bus, a dominant node has a 120 ohm termination resistance while a non-dominant (or recessive) node has about a 2500 to 3000 ohm (2.5 to 3.0 kilohm) termination resistance. The dominant nodes on the CAN-C bus are the WIN and the Powertrain Control Module (PCM). The dominant nodes on the IHS bus are the Cluster and the TIPM.

The termination resistance of two dominant nodes is combined in parallel to provide a total of about 60 ohms. This resistance value may vary somewhat by application, depending upon the number of non-dominant nodes on the bus. On the CAN-D bus (or Diagnostic CAN-C) all of the 60 ohm termination resistance is present in the Central GateWay (TIPMCGW).

NOTE: All measurement of termination resistance is done with the vehicle battery disconnected.

The communication protocol being used for the CAN data bus is a non-proprietary, open standard adopted from the Bosch CAN Specification 2.0b. The CAN-C is the faster of the two primary buses in the CAN bus system, providing near real-time communication (500 Kbps).

The CAN bus nodes are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. The twisted pairs have between 33 and 50 twists per meter (yard). While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire. Refer to the CAN Bus Voltages table.

CAN-H (+)	0.0 V		2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
Notes								
All measurements taken between node ground and CAN terminal with a standard DVOM. DVOM will display average network voltage. Total resistance of CAN-C network can also be measured (60 ohms). Total resistance of CAN-Interior network varies, depending upon the number of optional non-dominant nodes on the bus. CAN-Interior total resistance should range between about 60 ohms with the minimal number of nodes, to about 42 ohms with the maximum number of nodes.								

In order to minimize the potential effects of Ignition-OFF Draw (IOD), the CAN-Interior network employs a sleep strategy. However, a network sleep strategy should not be confused with the sleep strategy of the individual nodes on that network, as they may differ. For example: The CAN-C bus network is awake only when the ignition switch is in the ON or START positions; however, the TIPM, which is on the CAN-C bus, may still be awake with the ignition switch in the ACCESSORY or UNLOCK positions. The integrated circuitry of an individual node may be capable of processing certain sensor inputs and outputs without the need to utilize network resources.

The CAN-Interior bus network remains active until all nodes on that network are ready for sleep. This is determined by the network using tokens in a manner similar to polling. When the last node that is active on the network is ready for sleep, and it has already received a token indicating that all other nodes on the bus are ready for sleep, it broadcasts a **bus sleep acknowledgment** message that causes the network to sleep. Once the CAN-Interior bus network is asleep, any node on the bus can awaken it by transmitting a message on the network. The TIPM will keep either the CAN-Interior or the CAN-C bus awake for a timed interval after it receives a diagnostic message for that bus over the Diagnostic CAN-C bus.

In the CAN system, available options are configured into the TIPM at the assembly plant, but additional options can be added in the field using the diagnostic scan tool. The configuration settings are stored in non-volatile memory. The TIPM also has two 64-bit registers, which track each of the **as-built** and **currently responding** nodes on the CAN-Interior and CAN-C buses. The TIPM stores a Diagnostic Trouble Code (DTC) in one of two caches for any detected active or stored faults in the order in which they occur. One cache stores powertrain (P-Code), chassis (C-Code) and body (B-Code) DTCs, while the second cache is dedicated to storing network

(U-Code) DTCs.

If there are intermittent or active faults in the CAN network, a diagnostic scan tool connected to the Diagnostic CAN-C bus through the 16-way Data Link Connector (DLC) may only be able to communicate with the TIPM. To aid in CAN network diagnosis, the TIPM will provide CAN-Interior and CAN-C network status information to the scan tool using certain diagnostic signals. In addition, the transceiver in each node on the CAN-C bus will identify a **bus off hardware failure** , while the transceiver in each node on the CAN-Interior bus will identify a **general bus hardware failure** . The transceivers for some CAN-Interior nodes will also identify certain failures for both CAN-Interior bus signal wires.

CONNECTOR, DATA LINK

DESCRIPTION

DESCRIPTION

The Data Link Connector (DLC) (3) is a 16-way molded plastic connector insulator on a dedicated take out of the instrument panel wire harness. This connector is located at the lower edge of the instrument panel, outboard of the steering column. The connector insulator is retained by integral snap features within a rectangular cutout in the lower instrument panel reinforcement (2), just below the lower edge of the instrument panel steering column opening cover (1).

OPERATION

OPERATION

The Data Link Connector (DLC) is an industry-standard 16-way connector that permits the connection of a diagnostic scan tool to the Controller Area Network (CAN) data bus for interfacing with, configuring, and

retrieving Diagnostic Trouble Code (DTC) data from the electronic modules that reside on the data bus network of the vehicle.

The Antilock Brake Module (ABM) (2) is mounted to the Hydraulic Control Unit (HCU) (3) and operates the ABS system.

OPERATION

OPERATION

The ABM voltage source is through the ignition switch in the RUN position. The ABM contains a self check program that illuminates the ABS warning light when a system fault is detected. Faults are stored in a diagnostic program memory and are accessible with the scan tool. ABS faults remain in memory until cleared, or until after the vehicle is started approximately 50 times. Stored faults are **not** erased if the battery is disconnected.

NOTE: If the ABM is being replaced with a new ABM is must be reprogrammed with the use of a scan tool.

REMOVAL

REMOVAL

CAUTION: When removing ABM from HCU, be sure to completely separate the two components (approximately 38 mm (1.5 in.) before removing ABM. Otherwise, damage to the pressure sensor or Pump Motor connection may result requiring HCU replacement. Do not to touch the sensor terminals on the HCU side or the contact pads on the ABM side as this may result in contamination and issues in the future.

1. Remove the negative battery cable from the battery.
2. Pull up on the ABM harness connector release and remove connector.
3. Remove the ABM mounting bolts.
4. Remove the pump connector from the ABM.
5. Remove the ABM from the HCU.

INSTALLATION

INSTALLATION

CAUTION: When removing ABM from HCU, be sure to completely separate the two components (approximately 38 mm (1.5 in.) before removing ABM. Otherwise, damage to the pressure sensor or Pump Motor connection may result requiring HCU replacement. Do not to touch the sensor terminals on the HCU side or the contact pads on the ABM side as this may result in contamination and issues in the future.

NOTE: If the ABM is being replaced with a new ABM is must be reprogrammed with the use of a scan tool.

1. Install ABM to the HCU.
2. Install the pump connector to the ABM.
3. Install mounting bolts. Tighten to 2 N.m (16 in. lbs.).
4. Install the wiring harness connector to the ABM and push down on the release to secure the connector.
5. Install negative battery cable to the battery.
6. Connect the scan tool and initialize the ABM by performing the ABS Verification Test. Refer to **ABS VERIFICATION TEST** . .

The Remote Compass Module (RCM) (2) is a separate stand alone module located within the overhead console (1). The RCM can be accessed by removing the overhead console from the vehicle. Some vehicles are equipped with a Universal Garage Door Opener (UGDO) also known as a HomeLink® transceiver. Both the RCM and the HomeLink® transceiver for this vehicle are one in the same and sometimes referred to as the Electronic Overhead Module (EOM).

The HomeLink® transceiver or UGDO is equipped with three push buttons switches that are visible from the front face of the overhead console. The buttons are marked with one, two or three dash marks, respectively, for identification of each channel. For more information on the HomeLink® transceiver. Refer to **DESCRIPTION** .

The RCM or the HomeLink® transceiver cannot be repaired. If either the compass position sensor or the HomeLink® transceiver are inoperative and require replacement, the EOM must be replaced as a complete assembly. For more information on servicing the EOM go to the message center section for the appropriate procedure.

MODULE, DOOR

DESCRIPTION

DESCRIPTION

Fig. 6: Front Door Control Module
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with two electronic front door control modules (1) (also known as a Driver Door Module/DDM, a Passenger Door Module/PDM or Front Door Multiplex/MUX Modules), one each on both the driver and passenger front doors. Each door control module is concealed behind the front door trim panel where it is secured through two integral mounting tabs (2) to the door hardware module carrier by two screws. The front door control modules are located in the upper front corner of the front door hardware carriers, just below the mirror flag area of the front door.

Each door control module contains a microprocessor and is connected to the various switches on that door. In the case of the driver side module, it communicates with some switches over a Local Interface Network (LIN) data bus. Both the driver and passenger side module also receive various hard wired switch inputs and provide

numerous hard wired outputs to various devices located on their respective doors. In addition, both front door control modules communicate with each other and with other electronic modules in the vehicle over the Controller Area Network (CAN) Interior High Speed (IHS) data bus system.

Concealed and protected within the molded plastic door control module housing is the printed circuit board and the other electronic circuitry of the module. The front door control modules are connected to the vehicle electrical system through up to eight connector receptacles that are integral to the module housing.

A door control module cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced. The door control module software is flash programmable.

OPERATION

OPERATION

The microprocessor-based electronic front door control modules (also known as a Driver Door Module/DDM, a Passenger Door Module/PDM or Front Door Multiplex/MUX Modules) contain logic circuits that monitor various hard wired low current, multiplexed inputs from the power window, power lock, power mirror and memory switches on their respective door. They also receive Controller Area Network (CAN) Interior High Speed (IHS) data bus electronic message-based external inputs from the opposing front door control module as well as from other electronic modules in the vehicle. The front door control modules also monitor hard wired power window motor Hall effect sensors and memory mirror position sensor inputs.

In addition, the front door control module on the driver side front door receives electronic message inputs from the driver side front door switch module over the Local Interface Network (LIN) data bus network. The program logic within the front door control module allows the microprocessor to prioritize all of these inputs and determine the tasks it needs to perform. These tasks are then completed either by controlling hard wired outputs to the various motors, actuators or lamps on its own or the rear doors, or by sending electronic message requests over the CAN-IHS bus to the appropriate electronic module in the vehicle.

The front door control modules are powered by a fused B(+) circuit and are grounded at all times so that they can operate regardless of the ignition switch position. Both driver and passenger door control modules provide active and stored Diagnostic Trouble Codes (DTC) through On-Board Diagnostics (OBD) and communicate with a diagnostic scan tool using the CAN data bus.

The hard wired inputs and outputs of the front door control module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between modules and other devices that provide some features of the power window, power lock, memory, interior lighting or exterior lighting system features the front door control modules provide. The most reliable, efficient and accurate means to diagnose the front door control modules or the electronic controls and communication related to operation of these systems requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - DOOR MODULES

Any diagnosis of the door modules should begin with the use of a scan tool and the appropriate Diagnostic information. Refer to DIAGNOSIS AND TESTING .

3. Reconnect each of the electrical connectors to the connector receptacles of the door control module.
4. Reinstall the trim panel to the inside of the front door. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
5. Reconnect the battery negative cable.
6. The Clear/Relearn procedure should be performed following service of a door control module so that the module can learn the correct hard stops of the power window regulator. Refer to **STANDARD PROCEDURE** .

MODULE, DRIVETRAIN CONTROL

DESCRIPTION

DESCRIPTION

The Drivetrain Control Module (DTCM) controls the 4X4 transfer case shift functions via the actuation of a shift motor and utilizing the feedback of a mode sensor assembly. Communication is handled through the CAN bus. The user selectable transfer case modes include the following: 2WD, 4WD AUTO, 4WD LOCK, 4WD LOW, and Neutral (selections vary with the specific transfer case).

The DTCM is located in the passenger footwell, below the HVAC blower.

OPERATION

OPERATION

During normal operation of an active transfer case the Drive Train Control Module (DTCM) control module learns and remembers the Clutch Engagement Point (Kiss Point), the position in the motor actuator's travel where torque begins to be transferred to the front wheels. The position is read out using the encoder as a 0 to 5 volt signal. This information is written into the module's EEPROM area at Ignition OFF. Over time the clutch pack wears and the Kiss Point changes in one direction (going from a lower voltage to a higher value).

POWER UP/DOWN

The DTCM will power up with an OFF/ON transition of the hard wired ignition switch input.

The DTCM will power down when the vehicle ignition switch transitions from ON to OFF, or there are no system requirements that dictate the controller to remain active

START-UP DIAGNOSTICS

When the DTCM is activated, the internal circuitry will undergo a diagnostic procedure. The controller will examine all inputs and outputs for short circuits to ground, short circuits to battery and open circuits and will also verify proper CPU and memory operation. If a fault is detected, a message will be sent out over the CAN C bus to the Cluster indicating that service is recommended.

After passing all diagnostic tests, the controller will receive and process inputs and produce the appropriate outputs. Proper monitoring of the controller inputs and outputs performance will continue.

INPUTS/OUTPUTS

The following are inputs to the DTCM:

- Transfer Case Mode Sensor Signal
- 1 Direct Battery Feed
- Ignition RUN Sense
- Sensor Ground
- Module Ground
- CAN C Bus

The following are outputs of the DTCM:

- Transfer Case Motor Brake Control
- 5V Sensor Supply
- Transfer Case Bi-directional Motor Control (A AND B)
- Switched B+ Solenoid Supply
- Transfer Case Motor Brake Control

TRANSFER CASE RANGE SELECT SWITCH INPUT (2WD, 4WD AUTO, 4WD LOCK, AND 4WD LOW SELECT SWITCH)

The transfer case range select switch is hardwired directly to the Cluster (CCN). The switch position is read by the CCN and is communicated to the TIPM (Gateway) via the CAN-B bus. The TIPM then rebroadcasts this

information onto the CAN-C bus where the DTCM is a receiver.

The Cluster (CCN) will support circuitry which interfaces to the system's Transfer Case Range Select Switch, including a Transfer Case Range Select Switch voltage supply and a Transfer Case Range Select Switch input. The purpose of this circuitry is to determine the mode currently being requested by the operator via the resistance ladder network in the shifter assembly, where the Transfer Case Range Select Switch is packaged.

The NEUTRAL Select Switch Input will provide the operator with the ability to place the Transfer Case in Neutral. The Transfer Case Range Switch input will provide the operator with the ability to place the transfer case in 2WD, 4WD AUTO, 4WD LOCK, and 4WD LOW. The NEUTRAL Select Switch is a momentary pushpin switch; the Transfer Case Range Select Switch is a 4-position rotary contact switch; both of these switches are provided through a resistor network for diagnostic purposes. The input will have an internal 1.0K +/- 1% pull-up resistor to 5V.

As the selected position in the switch varies and/or the NEUTRAL Switch is depressed or not, the resistance between the Cluster (CCN) voltage supply and Transfer Case Range Select Switches input will vary. Hardware, software, and calibrations within the Cluster will be provided that interpret the external resistance between the module's Transfer Case Range Select Switches voltage supply and Transfer Case Range Select Switches inputs as given in the table below:

NOTE: There is no requirement for the DTCM to distinguish between a neutral request from the 4WD AUTO or the 4WD LOW position. Resistances in these ranges will be represented as a Neutral Switch Activation.

TRANSFER CASE MODE SENSOR SIGNAL

The Transfer Case Mode Sensor Signal Input will provide the DTCM feedback about the position of the transfer case. The mode sensor is a linear analog position sensor with a 1.4K +/- 20% potentiometer and a 1 K +/- 20% wiper resistor that converts the motor shaft position into a multiplexed voltage. The mode sensor (on the active transfer case) is an active device where the sensor's current changes as the motor shaft position changes

TRANSFER CASE BI-DIRECTIONAL MOTOR CONTROL (A AND B)

This output will control a Bi-directional DC motor that controls a clutch pack in the Transfer Case that varies the torque transfer between the front and rear axles.

MODES OF OPERATION

NORMAL OPERATION

This mode is achieved by the ignition being switched in the RUN position, which powers up the 5V regulator and generates the appropriate RESET for the microprocessor. This mode also includes any required power-up system checks.

SHUT DOWN MODE

This mode is activated when the ignition switch turned to the off position. The DTCM will perform any required Shut Down tasks prior to turning off the 5V regulator.

LIMP-IN MODE

This mode is entered when the DTCM has detected an error condition that prevents the system from performing its required task. The DTCM operation will vary depending from modified operation to total system shut down based on the failure that has occurred.

2. Connect the electrical connectors (2).
3. Install cover back onto the DTCM by snapping into place.
4. Install carpeting back into its proper location.
5. Connect the battery negative cable.

MODULE, HEATED SEAT

DESCRIPTION

DESCRIPTION

Fig. 11: Heated Seat Module
Courtesy of CHRYSLER GROUP, LLC

The Heated Seat Module (HSM), also referred to as the Comfort Seat Wheel Module (CSWM), is a time based controller for all the functions of the vented seats, heated seats and the heated steering wheel, as equipped. The HSM is black in color, rectangular in shape and has a total of five electrical connectors based on the number of components being controlled. The HSM is attached to the bottom of the driver seat.

OPERATION

OPERATION

The Heated Seat Module (HSM) is used to control the functions of the following systems:

- Vented Seats. Refer to **VENTED SEATS** .
- Heated Seats. Refer to **OPERATION** .
- Heated Steering Wheel. Refer to **OPERATION** .

CAUTION: When equipped with a leather wrapped heated steering wheel and replacement of a Heated Seat Module (HSM) is required, the new HSM must be manually configured with a scan tool. Refer to STANDARD PROCEDURE . Failure to follow these instruction may result in damage to the heated steering wheel.

The HSM will automatically configure itself to the heated and vented systems that are installed on the vehicle, with one exception. When equipped with a leather wrapped heated steering wheel, the HSM must be manually configured to the leather steering wheel option, using a scan tool. Refer to **STANDARD PROCEDURE** .

The HSM will only be on with the engine running. Therefore the heated seats, vented seats, and heated steering wheel will only operate with the engine running. Seat heating and seat venting are independent systems; however, they cannot be actuated at the same time. Turning the vented seats on when the heated seat are already

on will turn off the heated seats and vice versa. The heated steering wheel can be on at the same time as either the heated or the vented seats.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED SEAT MODULE

CAUTION: When equipped with a leather wrapped heated steering wheel and replacement of a Heated Seat Module (HSM) is required, the new HSM must be manually configured with a scan tool. Refer to STANDARD PROCEDURE . Failure to follow these instruction may result in damage to the heated steering wheel.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7 volts or above 15.5 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated seat system appears inoperative.

NOTE: If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, sit in the seat in question and move around the heating elements within the seat while testing continuity. also wiggle the heated seat wire harness and electrical connectors while testing continuity.

NOTE: For complete circuit diagrams, refer to appropriate Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

1. Check the ignition switch fuse in the Totally Integrated Power Module. Repair as necessary.
2. Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the heated seat or heated steering wheel system.
3. Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM). If any DTCs are found, repair as necessary. Refer to **DIAGNOSIS AND TESTING** .
4. If there are no DTCs and the heated seat, vented seat or heated steering wheel system does not operate, refer to appropriate wiring information and repair as necessary.
5. If wiring is OK, replace the HSM.
6. When equipped with a leather wrapped heated steering wheel, verify the HSM is configured to the leather steering wheel option with a scan tool. Refer to **STANDARD PROCEDURE** .

MODULE, INTEGRATED TRAILER BRAKE (ITBM)

DESCRIPTION

DESCRIPTION

Fig. 16: Integrated Trailer Brake Module (ITBM)
Courtesy of CHRYSLER GROUP, LLC

The Integrated Trailer Brake Module (ITBM) (1) is located in the instrument panel to the left of the steering column above the park brake release handle. Near the center of the ITBM is a numerical LED and trailer icon (2) which illuminate for three seconds when the ignition switch is placed in the RUN position. There is also an adjustment switch (4) and a trailer manual sliding brake lever/switch (3) on the face of the ITBM.

OPERATION

OPERATION

NOTE: The Integrated Trailer Brake Module (ITBM) does not control the trailer lights or the vehicle lights.

Automatic Braking

The Integrated Trailer Brake Module (ITBM) is powered with an ignition ON voltage source and has a single ground connection. The ITBM communicates on the CAN Bus for vehicle speed signal, Electronic Stability Control (ESC) active signal and the VIN information. There is also a hard wired brake switch input into the ITBM. The ITBM uses this information along with an internal accelerometer to determine how much braking to

apply to the trailer brakes. The output is a Pulse Width Modulated (PWM) circuit for control of trailer braking intensity during stops. The ratio between vehicle braking and trailer braking is adjusted by the user with the plus/minus (±) switch on the face of the module. The ITBM is used to control the trailer brakes based on the deceleration reading of the vehicle and will send the output to control the trailer brakes only when a trailer connection is recognized. If a trailer is not connected to the vehicle, the ITBM output will be disabled.

Manual Trailer Braking

In addition to automatic trailer braking, the user can manually apply the trailer brakes prior to or without the vehicle brakes by sliding the ITBM manual sliding brake lever/switch to the right at any time. In this circumstance the accelerometer and other trailer braking inputs are ignored and trailer braking intensity is controlled by the user.

MODULE, MEMORY

DESCRIPTION

DESCRIPTION

Fig. 27: Memory Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: The scan tool standardization process must be performed on the Memory Module (1) any time a new module is installed or the existing module is reflashed.

The Memory Seat Module (MSM), also know as Memory Module (MM) (1) is located underneath the driver seat. It is used in conjunction with the other modules in the memory system to recall the driver seat to one of two preset seat positions (horizontal, vertical, and recliner). The switch for the memory seat programming and selection mounts on the side of the driver seat. The memory system is able to store and recall all driver side power seat positions except for lumber, outside mirror positions and power adjustable pedal position. The system can be set for two different drivers. On vehicles with a factory installed radio connected to the Controller Area Network (CAN) data bus network, the memory system is also able to store and recall up to twelve radio station presets (six AM and six FM), also for two drivers. The memory system will also store and recall the last station listened to for each driver, even if it is not one of the twelve preset stations.

Fig. 28: Locating Memory Module
Courtesy of CHRYSLER GROUP, LLC

The memory system will automatically recall all of these settings when a button of the memory switch is depressed, or when the doors are unlocked using the FOBIK (if the "FOBIK Linked to Memory" feature is enabled). If the vehicle has more than two drivers the FOBIK transmitter recall of memory features can be disabled. This is a customer programmable feature of the Electronic Vehicle Information Center (EVIC).

OPERATION

OPERATION

The Memory Seat Module (MSM), also referred to as Memory Module (MM) receives battery current through a 25 amp Max Fuse in the Totally Integrated Power Module (TIPM) so that the memory system remains operational, regardless of the ignition switch position. When the driver memory switch button is pushed, a

resistance signal is sent to the MSM via the Controller Area Network (CAN) bus circuit. The MSM is responsible for the 12v battery feed and ground path to the power seat adjuster motor and other memory system components.

The MSM receives memory set/position switch input through the CAN bus circuit. The MSM also receives hard wired input from the hall effect sensors, mounted on each of the driver power seat adjuster motors, the driver side view mirror motor, and adjustable pedals. The programmed software in the module allows it to know where the seat and adjustable pedals are located in its designed travel by a pulse count generated from the hall effect sensors. This way, when the memory switch is depressed the module will power these components until the correct preset location is achieved. The module will prevent the seat memory recall function from being initiated, if the transmission gear selector lever is not in the Park position, or if the vehicle is moving. These inputs are monitored over the Controller Area Network (CAN) bus circuit by the MSM.

A memory setting is saved by pressing the "set" button, then pressing either the memory "1" or "2" button within 5 seconds of pressing the "set" button.

A memory setting is recalled by pressing either the memory "1" or "2" button, or by pressing the unlock button on a "linked" FOBIK transmitter.

For driver safety, memorized settings can not be recalled if the transmission is in a position other than Park.

The MSM performs the following functions:

- Positions the driver power seat (vertical, horizontal, and recliner positions).
- Positions the power adjustable pedals.
- Sends the memory save or recall (number 1 or number 2) command over the CAN data bus circuit to the other memory system components, radio station pre-sets and power mirror positions.
- Provides for the easy entry/exit feature.

When a memory button is pressed (number 1 or number 2) on the memory switch, it provides resistive signal/input to the MSM. The MSM will then position the memory system components to the preprogramming location/setting. FOBIK Transmitter button is pressed, depending on which transmitter (number 1 or number 2), the WIN/SKIM Receiver sends the recall request and FOBIK number (number 1 or number 2) data message. This FOBIK transmitter function depends on if the MSM is programmed to trigger the recall (linked FOBIKs).

A FOBIK is "linked" to a memory setting by pressing the "set" button and then pressing either the memory "1" or "2" button within 5 seconds of pressing the set button, then by pressing the "lock" button on the selected FOBIK.

The memory system "Easy Entry and /Exit" feature provides the driver with more room to enter or exit the vehicle. When the seat is in a memorized position, it will move rearward 55 millimeters or to the end of its travel, whichever occurs first, when the key is removed from the ignition switch lock cylinder. This is a customer programmable feature in the EVIC. The seat will return to the memory position when the driver turns the vehicle's ignition switch out of the LOCK position.

The memory system "learns" the seat and adjustable pedal motor maximum end positions when the motor reaches the limit of travel in any direction and stalls. Subsequently, movement will stop just short of that

position to avoid extra stress on the motors and mechanisms. If the system learned a maximum position as a result of an obstruction, as for instance if a large object was placed on the floor behind the seat, the system can relearn the "true" maximum position through manually operating the power seat after the obstruction is removed.

NOTE: **It is normal for the power accessories contained in the memory system to stop at the maximum "learned" position and then continue to the "true" maximum position when the control switch is released and then applied in the same direction a second time.**

Certain functions and features of the memory system rely upon resources shared with other electronic modules in the vehicle over the Controller Area Network (CAN) bus. The CAN bus allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware, and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities. For diagnosis of these electronic modules or of the CAN bus, the use of a scan tool and the proper diagnostic information are needed.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MEMORY SEAT MODULE (MSM)

In order to obtain conclusive testing of the memory system, the Controller Area Network (CAN) data bus, and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked. **Any diagnosis of the memory system/module should begin with, the use of a scan tool and the appropriate diagnostic service information.** . Refer to **DIAGNOSIS AND TESTING** .

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: **Vehicles equipped with the memory/heated seat option utilize a low voltage cut-off feature. This feature turns off the 12v power to the power seat system anytime vehicle voltage is below 11.7v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.**

Before any testing of the power seat system is attempted, the battery should be fully-charged.

PICK UP MODELS

Two different six-wire Oxygen (O2) sensors are used. These sensors are titled 1/1 upstream, and 1/2 downstream. A separate O2 sensor module (1) is also used.

The engine aftertreatment system monitors the O2 content in the diesel engine exhaust. The Powertrain Control Module (PCM) monitors the exhaust gases for oxygen content and varies the rich/lean fuel mixture of the intake air fuel mixture to adjust the system. This diagnostic monitors the status message broadcast by the O2 Sensor Module (1) for the upstream O2 sensor's internal heater circuit. The PCM will set the fault if it receives a Failure Mode Indicator (FMI) message from the O2 Sensor Module. The PCM will illuminate the MIL lamp immediately when the diagnostic runs and fails. The PCM will turn off the MIL lamp diagnostic runs and passes in four consecutive drive cycles.

The Park Assist Module (1) is secured to a mounting bracket (2) that is bonded to the upper side of the vehicles headliner (3) above the right sun visor and secured by two fasteners (4). Concealed within the molded plastic park assist module housing is a microprocessor and the other electronic circuitry of the module. The module housing is sealed to enclose and protect the internal electronic circuitry. The module software is flash programmable.

Two connector receptacles (5) containing terminal pins are integral to the forward-facing side of the housing. The module is connected to the vehicle electrical system through two dedicated take outs and connectors of the body wire harness.

The park assist module cannot be adjusted or repaired and, if damaged or inoperative, it must be replaced. For more information on the park assist module and operation, refer to **MODULE, PARK ASSIST, OPERATION** .

MODULE, POWERTRAIN CONTROL

DESCRIPTION

POWERTRAIN CONTROL MODULE (PCM)

Fig. 38: Powertrain Control Module & Connectors
Courtesy of CHRYSLER GROUP, LLC

The Powertrain Control Module (PCM) is located in the right-rear section of the engine compartment under the cowl.

MODES OF OPERATION

As input signals to the Powertrain Control Module (PCM) change, the PCM adjusts its response to the output devices. For example, the PCM must calculate different injector pulse width and ignition timing for idle than it does for wide open throttle (WOT).

The PCM will operate in two different modes: **Open Loop and Closed Loop** .

During Open Loop modes, the PCM receives input signals and responds only according to preset PCM programming. Input from the oxygen (O2S) sensors is not monitored during Open Loop modes.

During Closed Loop modes, the PCM will monitor the oxygen (O2S) sensors input. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio. This ratio is 14.7 parts air-to-1 part fuel. By monitoring the exhaust oxygen content through the O2S sensor, the PCM can fine tune the injector pulse width. This is done to achieve optimum fuel economy combined with low emission engine performance.

The fuel injection system has the following modes of operation:

- Ignition switch ON
- Engine start-up (crank)
- Engine warm-up

- Idle
- Cruise
- Acceleration
- Deceleration
- Wide open throttle (WOT)
- Ignition switch OFF

The ignition switch On, engine start-up (crank), engine warm-up, acceleration, deceleration and wide open throttle modes are Open Loop modes. The idle and cruise modes, (with the engine at operating temperature) are Closed Loop modes.

IGNITION SWITCH (KEY-ON) MODE

This is an Open Loop mode. When the fuel system is activated by the ignition switch, the following actions occur:

- The PCM pre-positions the idle air control (IAC) motor.
- The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
- The PCM monitors the engine coolant temperature sensor input. The PCM modifies fuel strategy based on this input.
- Intake manifold air temperature sensor input is monitored.
- Throttle position sensor (TPS) is monitored.
- The auto shutdown (ASD) relay is energized by the PCM for approximately three seconds.
- The fuel pump is energized through the fuel pump relay by the PCM. The fuel pump will operate for approximately three seconds unless the engine is operating or the starter motor is engaged.
- The O2S sensor heater element is energized via the ASD or O2S heater relay. The O2S sensor input is not used by the PCM to calibrate air-fuel ratio during this mode of operation.

ENGINE START-UP MODE

This is an Open Loop mode. The following actions occur when the starter motor is engaged.

The PCM receives inputs from:

- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal

The PCM monitors the crankshaft position sensor. If the PCM does not receive a crankshaft position sensor signal within 3 seconds of cranking the engine, it will shut down the fuel injection system.

The fuel pump is activated by the PCM through the fuel pump relay.

Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.

The PCM determines the proper ignition timing according to input received from the crankshaft position sensor.

ENGINE WARM-UP MODE

This is an Open Loop mode. During engine warm-up, the PCM receives inputs from:

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal-auto. trans. only)
- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)

Based on these inputs the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM adjusts engine idle speed through the idle air control (IAC) motor and adjusts ignition timing.
- The PCM operates the A/C compressor clutch through the A/C compressor clutch relay. This is done if A/C has been selected by the vehicle operator and specified pressures are met at the high and low-pressure A/C switches. For additional information, refer to **OPERATION** .
- When the heating element has reached operating temperature located in the O2S, the PCM will begin monitoring O2 sensor output readings. The system will then leave the warm-up (open loop) mode and go into closed loop operation.

IDLE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At idle speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)

- Air conditioning request signal (if equipped)
- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Battery voltage
- Park/neutral switch (gear indicator signal-auto. trans. only)
- Oxygen sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio by varying injector pulse width. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by increasing and decreasing spark advance.
- The PCM operates the A/C compressor clutch through the A/C compressor clutch relay. This is done if A/C has been selected by the vehicle operator and specified pressures are met at the high and low-pressure A/C switches. For additional information, refer to **OPERATION** .

CRUISE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At cruising speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal-auto. trans. only)
- Oxygen (O2S) sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then adjust the injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by turning the ground path to the coil(s) on and off.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

ACCELERATION MODE

This is an Open Loop mode. The PCM recognizes an abrupt increase in throttle position or MAP pressure as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased throttle opening.

DECELERATION MODE

When the engine is at operating temperature, this is an Open Loop mode. During hard deceleration, the PCM receives the following inputs.

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal-auto. trans. only)
- Vehicle speed

If the vehicle is under hard deceleration with the proper rpm and closed throttle conditions, the PCM will ignore the oxygen sensor input signal. The PCM will enter a fuel cut-off strategy in which it will not supply a ground to the injectors. If a hard deceleration does not exist, the PCM will determine the proper injector pulse width and continue injection.

Based on the above inputs, the PCM will adjust engine idle speed through the idle air control (IAC) motor.

The PCM adjusts ignition timing by turning the ground path to the coil on and off.

WIDE OPEN THROTTLE MODE

This is an Open Loop mode. During wide open throttle operation, the PCM receives the following inputs.

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal

During wide open throttle conditions, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off. The PCM ignores the oxygen sensor input signal and provides a predetermined amount of additional fuel. This is done by adjusting injector pulse width.
- The PCM adjusts ignition timing by turning the ground path to the coil(s) on and off.

IGNITION SWITCH OFF MODE

When ignition switch is turned to OFF position, the PCM stops operating the injectors, ignition coil, ASD relay and fuel pump relay.

5 VOLT SUPPLIES

Two different Powertrain Control Module (PCM) five volt supply circuits are used; primary and secondary.

IGNITION CIRCUIT SENSE

This circuit ties the ignition switch to the Powertrain Control Module (PCM).

POWER GROUNDS

The Powertrain Control Module (PCM) has 2 main grounds. Both of these grounds are referred to as power grounds. All of the high-current, noisy, electrical devices are connected to these grounds as well as all of the sensor returns. The sensor return comes into the sensor return circuit, passes through noise suppression, and is then connected to the power ground.

The power ground is used to control ground circuits for the following PCM loads:

- Generator field winding
- Fuel injectors
- Ignition coil(s)
- Certain relays/solenoids
- Certain sensors

SENSOR RETURN

The Sensor Return circuits are internal to the Powertrain Control Module (PCM).

Sensor Return provides a low-noise ground reference for all engine control system sensors. For more information, refer to the appropriate diagnostic information.

OPERATION

POWERTRAIN CONTROL MODULE (PCM)

The PCM operates the fuel system. The PCM is a pre-programmed, triple microprocessor digital computer. It regulates ignition timing, air-fuel ratio, emission control devices, charging system, certain transmission features, speed control, air conditioning compressor clutch engagement and idle speed. The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as Powertrain Control Module (PCM) Outputs. The sensors and switches that provide inputs to the PCM are considered Powertrain Control Module (PCM) Inputs.

The PCM adjusts ignition timing based upon inputs it receives from sensors that react to: engine rpm, manifold absolute pressure, engine coolant temperature, throttle position, transmission gear selection (automatic transmission), vehicle speed, power steering pump pressure, and the brake switch.

The PCM adjusts idle speed based on inputs it receives from sensors that react to: throttle position, vehicle speed, transmission gear selection, engine coolant temperature and from inputs it receives from the air conditioning clutch switch and brake switch.

Based on inputs that it receives, the PCM adjusts ignition coil dwell. The PCM also adjusts the generator charge rate through control of the generator field and provides speed control operation.

NOTE: PCM Inputs:

- ABS module (if equipped)
- A/C request (if equipped with factory A/C)
- A/C select (if equipped with factory A/C)
- A/C pressure transducer
- Auto shutdown (ASD) sense
- Battery temperature sensor
- Battery voltage
- Brake switch
- CAN C BUS (+) circuits
- CAN C BUS (-) circuits
- Camshaft position sensor signal
- Crankshaft position sensor

- Data link connection for a scan tool
- EATX module (if equipped)
- Engine coolant temperature sensor
- Fuel level
- Generator (battery voltage) output
- Ignition circuit sense (ignition switch in on/off/crank/run position)
- Intake manifold air temperature sensor
- Knock sensors (2 on 3.7L engine)
- Leak detection pump (switch) sense (if equipped)
- Manifold absolute pressure (MAP) sensor
- Oil pressure
- Oxygen sensors
- Park/neutral switch (auto. trans. only)
- Power ground
- Power steering pressure switch (if equipped)
- Sensor return
- Signal ground
- Speed control multiplexed single wire input
- Throttle position sensor
- Transfer case switch (4WD range position)
- Vehicle speed signal

NOTE: PCM Outputs:

- A/C clutch relay
- Auto shutdown (ASD) relay
- CAN C BUS (+/-) circuits for: speedometer, voltmeter, fuel gauge, oil pressure gauge/lamp, engine temp. gauge and speed control warn. lamp
- Data link connection for diagnostic scan tool
- EGR valve control solenoid (if equipped)
- EVAP canister purge solenoid
- Five volt sensor supply (primary)
- Five volt sensor supply (secondary)
- Fuel injectors
- Fuel pump relay
- Generator field driver (-)
- Generator field driver (+)
- Idle air control (IAC) motor

- Ignition coil(s)
- Leak detection pump (if equipped)
- Malfunction indicator lamp (Check engine lamp).
- Oxygen sensor heater relays
- Oxygen sensors (pulse width modulated)
- Radiator cooling fan relay (pulse width modulated)
- Speed control vacuum solenoid
- Speed control vent solenoid
- Tachometer (if equipped).
- Transmission convertor clutch circuit.

5 VOLT SUPPLIES

Primary 5-volt supply:

- supplies the required 5 volt power source to the Crankshaft Position (CKP) sensor.
- supplies the required 5 volt power source to the Camshaft Position (CMP) sensor.
- supplies a reference voltage for the Manifold Absolute Pressure (MAP) sensor.
- supplies a reference voltage for the Throttle Position Sensor (TPS) sensor.

Secondary 5-volt supply:

- supplies the required 5 volt power source to the oil pressure sensor.
- supplies the required 5 volt power source for the Vehicle Speed Sensor (VSS) (if equipped).
- supplies the 5 volt power source to the transmission pressure sensor (certain automatic transmissions).

IGNITION CIRCUIT SENSE

The ignition circuit sense input tells the PCM the ignition switch has energized the ignition circuit.

Battery voltage is also supplied to the PCM through the ignition switch when the ignition is in the RUN or START position. This is referred to as the "ignition sense" circuit and is used to "wake up" the PCM. Voltage on the ignition input can be as low as 6 volts and the PCM will still function. Voltage is supplied to this circuit to power the PCM's 8-volt regulator and to allow the PCM to perform fuel, ignition and emissions control functions.

STANDARD PROCEDURE

STANDARD PROCEDURE - PCM/ECM REPROGRAMMING - GAS

Perform the PCM/TCM PROGRAMMING procedure. Refer to appropriate Electrical Diagnostic article. .

REMOVAL

REMOVAL

CAUTION: Certain ABS systems rely on having the Powertrain Control Module (PCM) broadcast the Vehicle Identification Number (VIN) over the bus network. To prevent problems of DTCs and other items related to the VIN broadcast, it is recommend that you disconnect the ABS CAB (controller) temporarily when replacing the PCM. Once the PCM is replaced, write the VIN to the PCM using a scan tool. This is done from the engine main menu. Arrow over to the second page to "1. Miscellaneous". Select "Check VIN" from the choices. Make sure it has the correct VIN entered before continuing. When the VIN is complete, turn off the ignition key and reconnect the ABS module connector. This will prevent the setting of DTCs and other items associated with the lack of a VIN detected when you turn the key ON after replacing the PCM.

CAUTION: Use the scan tool to reprogram the new PCM with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

The PCM (2) is located in the engine compartment attached to the passenger side dash panel.

To avoid possible voltage spike damage to the PCM, ignition key must be off, and negative battery cable must be disconnected before unplugging PCM connectors.

1. Disconnect and isolator the negative battery cable.

2. Carefully unplug the four 38-way connectors from the PCM (1).
3. Remove the four PCM mounting bolts and remove the PCM (2) from vehicle.

1. Install the PCM (2) and 4 mounting bolts to vehicle.

2. Check pin connectors in the PCM and the three 32-way connectors (four 38-way connectors if equipped with NGC) for corrosion or damage. Also, the pin heights in connectors should all be same. Repair as necessary before installing connectors.
3. Install the three 32-way connectors (four 38-way connectors if equipped with NGC).
4. **The 5.7L V-8 engine is equipped with a fully electronic accelerator pedal position sensor. If equipped with a 5.7L, also perform the following 3 steps:**
    1. Connect the negative battery cable.
    2. Turn the ignition switch ON, but do not crank the engine.
    3. Leave the ignition switch ON for a minimum of 10 seconds. This will allow the PCM to learn the electrical parameters.
    4. The scan tool may also be used to learn electrical parameters. Go to the Miscellaneous menu, and then select ETC Learn.
5. If the previous step is not performed, a Diagnostic Trouble Code (DTC) will be set.
6. If necessary, use a scan tool to erase any Diagnostic Trouble Codes (DTC's) from PCM. Also use the scan tool to reprogram new PCM with vehicles original Vehicle Identification Number (VIN) and original vehicle mileage.

MODULE, POWERTRAIN CONTROL, 6.7L DIESEL

DESCRIPTION

DESCRIPTION

The Powertrain Control Module (PCM) is used to control the functions of the engine and transmission. The PCM is bolted to the left side of the engine below the intake manifold.

OPERATION

OPERATION

The main function of the Powertrain Control Module (PCM) is to electrically control the fuel system. The PCM also controls the functions of transmission.

The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as **PCM Outputs.** The sensors and switches that provide inputs to the PCM are considered **PCM Inputs.**

NOTE: PCM Inputs:

- Accelerator Pedal Position Sensor (APPS) Signals No. 1 and No. 2
- AC system pressure
- Auto shutdown (ASD) sense

- Battery voltage
- Brake switch
- Camshaft Position Sensor (CMP)
- Crankshaft Position Sensor (CKP)
- Data link connection for a scan tool
- EGR Air Flow Control
- EGR Valve
- Engine Coolant Temperature (ECT) sensor
- Exhaust Gas Temperature sensor
- EATX module (if equipped)
- Fuel level
- Fuel pressure sensor
- Fan speed (engine cooling fan)
- Generator (battery voltage) output
- Governor pressure (Auto. trans.)
- Ground circuits
- Inlet air temperature sensor/pressure sensor
- Intake air temperature sensor/MAP sensor
- CAN C BUS (+) circuits
- CAN C BUS (-) circuits
- Key switch (ignition)
- Oil Pressure switch
- Overdrive switch (automatic transmission only)
- Park/neutral switch (auto. trans. only)
- Power ground
- SCI datalink bus (+) circuits
- SCI datalink bus (-) circuits
- Sensor return
- Signal ground
- Speed control multiplexed single wire input
- Transfer case switch (4WD range position)
- Transmission governor psi (automatic transmission only)
- Transmission OSS (automatic transmission only)
- Transmission oil pressure (automatic transmission only)
- Transmission oil temperature (automatic transmission only)
- Transmission throttle valve position (automatic transmission only)
- Vehicle speed signal
- Water-In-Fuel (WIF) sensor

NOTE: PCM Outputs:

After inputs are received by the PCM, certain sensors, switches and components are controlled or regulated by the PCM. These are considered **PCM Outputs.** These outputs are for:

- A/C clutch relay
- Auto shutdown (ASD) relay
- Data link connection for diagnostic scan tool
- EGR air flow control
- EGR valve
- Fan clutch PWM
- Five volt sensor supply (primary)
- Five volt sensor supply (secondary)
- Fuel control actuator
- Fuel injector driver circuits
- Fuel transfer (lift) pump
- Generator field driver (-)
- Generator field driver (+)
- Governor pressure (VFS solenoid)
- Intake manifold air heater relays No. 1 and No. 2 control circuits
- CAN C BUS (+/-) circuits for: speedometer, voltmeter, fuel gauge, oil pressure gauge/lamp, engine temp. gauge and speed control warn. lamp
- Malfunction indicator lamp (Check engine lamp). Driven through J1850 circuits.
- Oil pressure switch/warning lamp (databus)
- Overdrive/3-4 shift solenoid (automatic transmission only)
- SC source
- SCI datalink bus (+) circuits
- SCI datalink bus (-) circuits
- Speed control vacuum solenoid
- Speed control vent solenoid
- Tachometer (if equipped). Driven through J1850 circuits.
- TCC solenoid (automatic transmission only)
- Transmission battery relay (automatic transmission only)
- Transmission throttle valve actuator (automatic transmission only)
- Transmission governor solenoid (automatic transmission only)
- Wait-to-start warning lamp (databus)
- Turbo wastegate solenoid
- Water-In-Fuel (WIF) warning lamp (databus)

REMOVAL

REMOVAL

NOTE: **To avoid possible voltage spike damage to the Powertrain Control Module (PCM), ignition key must be off, and both negative battery cables must be disconnected before unplugging PCM harness connectors.**

1. Record any Diagnostic Trouble Codes (DTC's) found in the (PCM).

   NOTE: **For automatic transmission vehicles, disconnecting the battery before the 10 minute power down will result in the Fault Code P2509. This fault code will need to be cleared before returning to the customer. Also, same for manual transmissions but the time limit is 75 seconds.**

2. Disconnect both negative battery cables.

NOTE: **Do not apply paint to Powertrain Control Module (PCM) or a poor ground will result.**

1. Install PCM (3) to the engine block. Tighten bolts (1 and 2). to 24 N.m (18 ft. lbs.).

Fig. 44: PCM, Harness Connectors & Harness Retainer
Courtesy of CHRYSLER GROUP, LLC

2. Check pins in electrical connectors for corrosion, damage or dirt intrusion. Also, check all the PCM pins for being bent. Repair as necessary. **Damaged, dirty, bent or corroded pins could result in poor conductivity, causing intermittent electrical issues or DTC's.**
3. Clean pins in electrical connectors with an electrical contact cleaner.
4. Install PCM harness connectors (3) and harness retainer (1) to PCM (4).
5. Connect both negative battery cables.
6. Program the PCM. Refer to **STANDARD PROCEDURE**.
7. After programming the PCM, allow the module to fully power down. This process will require 10 minutes for automatic transmission vehicles, or 75 seconds for manual transmission vehicles.

NOTE: **Vehicles having 6.7L diesel engine with automatic transmissions will require a transmission quick learn after programming the PCM.**

8. Use a diagnostic scan tool to erase any Diagnostic Trouble Codes (DTC's) from PCM.

FUEL INJECTOR ID CORRECTION CODES:

Fig. 45: Fuel Injector ID Correction Code
Courtesy of CHRYSLER GROUP, LLC

Each fuel injector has a six-digit alphanumeric correction code. The correction code is printed on the intake side of the fuel injector (1) and is used to identify injector calibration. When replacing any fuel injectors, this code must be entered into the vehicles Powertrain Control Module (PCM) using a diagnostic scan tool. In addition, if a new PCM is installed, use a diagnostic scan tool to program all six of the injector codes from the original fuel injectors into the new PCM.

MODULE, STEERING COLUMN

DESCRIPTION

DESCRIPTION

Fig. 46: Steering Control Module
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a Steering Control Module (SCM), which is an electronic circuit board with a microprocessor that is internal to the multi-function switch (1) housing. The SCM is a Local Interface Network (LIN) slave and communicates over a dedicated LIN bus circuit with the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), which is the LIN master and also provides a gateway to the Controller Area Network (CAN) data bus.

The multi-function switch is located on the left side of the steering column, just below the steering wheel. The multi-function switch provides the primary controls for the front wiper and washer systems, the turn signals and for headlamp beam selection. The only visible component of the switch is the control stalk, which includes a control knob that extends through the shrouds on the left side of the steering column. The remainder of the switch including its mounting provisions, its electrical connection and a turn signal cancel actuator are concealed beneath the shrouds.

The switch housing and controls are constructed of molded black plastic. A single integral latch feature and slide tabs on the switch housing engage channels and a striker that are integral to the left side of the mounting bracket that is integral to the clockspring (3) to secure the switch to the steering column. Each of the switches within the multi-function switch is internally connected to the SCM. A single connector receptacle integral to the back of the switch housing connects the SCM to the vehicle electrical system through a dedicated takeout and connector of the instrument panel wire harness.

The SCM cannot be adjusted or repaired, and is not flash update capable. If ineffective or damaged the entire multi-function switch must be replaced. Refer to **SWITCH, MULTIFUNCTION, REMOVAL** . The clockspring (with the multi-function switch mounting bracket) and the multi-function switch (with the SCM) are each available for separate service replacement.

OPERATION

OPERATION

The microprocessor-based Steering Control Module (SCM) utilizes integrated circuitry to monitor hard wired analog and multiplexed inputs from the individual switches within the multi-function switch. In response to those inputs, the internal circuitry of the SCM allows it to transmit electronic message outputs to the

ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the Local Interface Network (LIN) data bus.

In response to those LIN messages the internal circuitry and programming of the EMIC, which is also the LIN master module in the vehicle, allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, DESCRIPTION**.

The SCM is connected to both a fused B(+) circuit and a fused ignition switch output (run-start) circuit. It receives a path to ground at all times. These connections allow it to remain functional regardless of the ignition switch position. Any input to the SCM that controls a vehicle system function that does not require that the ignition switch be in the ON position such as flashing the high beam headlamps, prompts the SCM to wake up and transmit on the LIN data bus.

The hard wired circuits between components related to the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SCM or the electronic controls or communication between modules and other devices that provide some features of the SCM. The most reliable, efficient, and accurate means to diagnose the SCM or the electronic controls and communication related to SCM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STEERING CONTROL MODULE

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

On gasoline vehicles the Transmission Control Module (TCM) (2) may be sub-module within the Powertrain Control Module (PCM) (3).

Fig. 48: AS68RC TCM Location
Courtesy of CHRYSLER GROUP, LLC

On Cab Chassis models equipped with the AS68RC transmission, the Transmission Control Module (TCM) has three electrical connectors and is located in the passenger compartment, underneath the left side of the dash panel.

On models equipped with the 68RFE transmission, the TCM is incorporated into the Powertrain Control Module (PCM).

OPERATION

OPERATION

RLE AND RFE TRANSMISSIONS

The Transmission Control Module (TCM) controls all electronic operations of the transmission. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and selects the operational mode of the transmission. Direct inputs are hard wired to, and used specifically by the TCM. Indirect inputs are shared with the TCM via the vehicle communication bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition "ON" voltage
- Transmission Control Relay (Switched B+) (if equipped)
- Throttle Position Sensor
- Crankshaft Position Sensor
- Transmission Range Sensor
- Pressure Switches
- Transmission Temperature Sensor
- Input Shaft Speed Sensor
- Output Shaft Speed Sensor
- Line Pressure Sensor

Some examples of **indirect inputs** to the TCM are:

- Target Idle
- Torque Reduction Confirmation
- Engine Coolant Temperature
- Ambient/Battery Temperature
- Scan Tool Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

- Transmission Control Relay
- Solenoids
- Torque Reduction Request

Some examples of TCM **indirect outputs** are:

- Transmission Temperature (to PCM)
- PRNDL Position (to cluster/CCN)

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

- Storing and maintaining Clutch Volume Indexes (CVI)
- Storing and selecting appropriate Shift Schedules
- System self-diagnostics
- Diagnostic capabilities (with scan tool)

NOTE: If the TCM has been replaced, the "Quick Learn Procedure" must be performed. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE.

BATTERY FEED

A fused, direct battery feed to the TCM is used for continuous power. This battery voltage is necessary to retain memory in the TCM. When the battery (B+) is disconnected, this memory is lost. When the battery (B+) is restored, this memory loss is detected by the TCM and a Diagnostic Trouble Code (DTC) is set.

CLUTCH VOLUME INDEXES (CVI)

1 - OUTPUT SPEED SENSOR
2 - OUTPUT SHAFT

3 - CLUTCH PACK
4 - SEPARATOR PLATE
5 - FRICTION DISCS
6 - INPUT SHAFT
7 - INPUT SPEED SENSOR
8 - PISTON AND SEAL

An important function of the TCM is to monitor Clutch Volume Indexes (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The TCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the TCM that represents input shaft rpm. The Output Speed Sensor provides the TCM with output shaft speed information.

By comparing the two inputs, the TCM can determine transmission gear position. This is important to the CVI calculation because the TCM determines CVIs by monitoring how long it takes for a gear change to occur.

Gear ratios can be determined by using the Scan Tool and reading the Input/Output Speed Sensor values in the "Monitors" display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.

For example, if the input shaft is rotating at 1000 rpm and the output shaft is rotating at 500 rpm, then the TCM can determine that the gear ratio is 2:1. In direct drive (3rd gear), the gear ratio changes to 1:1. The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the TCM can determine the volume of fluid used to apply or release a friction element.

The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical problems within the input clutch assembly can cause inadequate or out-of-range element volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following charts identifies the appropriate clutch volumes and when they are monitored/updated:

42RLE

CLUTCH VOLUMES				
Clutch	When Updated			**Proper Clutch Volume**
	Shift Sequence	**Oil Temperature**	**Throttle Angle**	
L/R	2-1 or 3-1 coast downshift	> 21° C (70° F)	< 5°	35 to 83
2/4	1-2 shift	> 43° C (110° F)	5 - 54°	20 to 77
OD	2-3 shift			48 to 150
UD	4-3 or 4-2 shift		> 5°	24 to 70

545RFE

CLUTCH VOLUMES		
Clutch	**When Updated**	**Proper Clutch Volume**
L/R	2-1 or 3-1 downshift	45 to 134
2C	3-2 kickdown shift	25 to 85
2C Alternate	4-4 prime upshift	25 to 85
OD	2-3 upshift	30 to 100
4C	3-4 upshift	30 to 85
4C Alternate	2-2 prime upshift	30 to 85
UD	4-3 kickdown shift	30 to 100

SHIFT SCHEDULES

As mentioned earlier, the TCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position
- Engine load
- Fluid temperature
- Software level

As driving conditions change, the TCM appropriately adjusts the shift schedule. Refer to the following chart to determine the appropriate operation expected, depending on driving conditions.

Schedule	Condition	Expected Operation
Extreme Cold	Oil temperature below -27° C (16° F)	-Park, Reverse, Neutral and 1st and 3rd gear only in D position, 2nd gear only in Manual 2 or L -No EMCC
Super Cold	Oil temperature between -24° C (-12° F) and -12° C (10° F)	- Delayed 2-3 upshift - Delayed 3-4 upshift - Early 4-3 coastdown shift - High speed 4-2, 3-2, 2-1 kickdown shifts are prevented -Shifts at high throttle openings willl be early. - No EMCC
Cold	Oil temperature between -12° C (10° F) and 2° C (36° F)	-Shift schedule is the same as Super Cold except that the 2-3 upshifts are not delayed.
Warm	Oil temperature between 4° C (40° F) and 27° C (80° F)	- Normal operation (upshift, kickdowns, and coastdowns) - No EMCC

Hot	Oil temperature between 27° C (80° F) and 115° C (240° F)	- Normal operation (upshift, kickdowns, and coastdowns) - Normal EMCC operation
Overheat	Oil temperature above 115° C (240° F) or engine coolant temperature above 118° C (244° F)	- Delayed 2-3 upshift - Delayed 3-4 upshift - 3rd gear FEMCC from 30-48 mph - 3rd gear PEMCC above 35 mph - Above 25 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made

AISIN AS68RC TRANSMISSION

The Transmission Control Module (TCM) controls all electronic operations of the transmission. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and selects the operational mode of the transmission. Direct inputs are hard wired to, and used specifically by the TCM. Indirect inputs are shared with the TCM via the vehicle communication bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition "ON" voltage
- Transmission Range Sensor
- Pressure Switches
- Transmission Temperature Sensor
- Input Speed Sensor
- Output Speed Sensor

Some examples of **indirect inputs** to the TCM are:

- Engine/Body Identification
- Manifold Pressure
- Throttle position
- Torque Reduction Confirmation
- Engine Coolant Temperature
- Exhaust Brake Status (if equipped)
- PTO Request (if equipped)
- Scan Tool Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule

and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

- Exhaust Brake Cut Request (if equipped).
- Solenoids.
- Torque Reduction Request.

Some examples of TCM.**indirect outputs** are:

- Transmission Temperature (to PCM).
- PRNDL Position (to cluster/CCN).
- PTO Status.

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

- Storing and maintaining Clutch Volume Indexes (CVI).
- Storing and selecting appropriate Shift Schedules.
- System self-diagnostics.
- Diagnostic capabilities (with scan tool).

Clutch filling time is continuously maintained when the vehicle is running.

TRANSMISSION SHIFT FUNCTION		
Temperature	Sump	Action
Extreme Cold	Below -20°C (-4°F)	Park, Reverse, Neutral, 3rd Gear (no lock-up)
Super Cold	Below -10°C (14°F)	Park, Reverse, Neutral, up to 4th gear (No Over drive and No lock-up)
Cold	Below 5°C (41°F)	Park, Reverse, Neutral, up to 4th gear (No Over drive and No lock-up)
Warm	Below 25°C (77°F)	No lock-up, up to 6th gear
Hot	Between 25°C - 140C (77 - 284°F)	Normal operation
Overheat	Above 140°C (284°F)	Enlarge the lock-up area to reduce the heat generation.

STANDARD PROCEDURE

TCM QUICK LEARN - AS68RC TRANSMISSION

NOTE: **The ignition switch must be cycled to the OFF position after the AS68RC TCM quick learn procedure in order to initialize the TCM.**

The quick learn procedure requires the use of the scan tool. Always check for and clear any codes after a quick learn is preformed. For scan tool step by step instructions, reference the ECM/PCM/TCM Programming. Refer to the appropriate Electrical Diagnostic article.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement.
- Transmission Control Module Replacement.
- Clutch Plate and/or Seal Replacement.
- Valve Body / Oil Pump Replacement.

To perform the Quick Learn Procedure, the following conditions must be met:

- Turn off any electrical loads to insure the engine is at idle speed.
- The transmission fluid temperature must be at or above 104°F (40°C).
- Shift the lever from NEUTRAL to DRIVE and NEUTRAL to REVERSE three to five times to bleed off trapped in the transmission clutches and brakes.
- The shift lever position must stay in PARK until prompted to shift to another gear.
- The parking brake must be applied and chock the rear wheels.
- Both feet on the brake pedal.
- PTO is inactive.

TCM QUICK LEARN - RLE AND RFE TRANSMISSIONS

The quick learn procedure requires the use of the scan tool. For scan tool step by step instructions, reference the ECM/PCM/TCM Programming. Refer to the appropriate Electrical Diagnostic article.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement.
- Transmission Control Module Replacement.
- Engine Control Module Replacement or Reprogramming.
- Solenoid Pack Replacement.
- Clutch Plate and/or Seal Replacement.
- Valve Body Replacement or Recondition.

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied.
- The engine speed must be above 500 rpm.

- The throttle angle (TPS) must be less than 3 degrees.
- The shift lever position must stay in PARK until prompted to shift to overdrive.
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the scan tool indicates the procedure is complete.
- The calculated oil temperature must be above 60° and below 200°.

DRIVE LEARN - RFE TRANSMISSIONS

When a transmission is repaired and a Quick Learn procedure has been performed on the Transmission Control Module (TCM), the following Drive Learn procedure can be performed to fine tune any shifts which are particularly objectionable.

NOTE: It is not necessary to perform the complete Drive Learn procedure every time the TCM is Quick Learned. Perform only the portions which target the objectionable shift.

LEARN A SMOOTH 1ST NEUTRAL TO DRIVE SHIFT

Perform this procedure only if the complaint is for a delayed or harsh shift the first time the transmission is put into gear after the vehicle is allowed to set with the engine not running for at least 10 minutes. Use the following steps to have the TCM learn the 1st N-D UD CVI.

NOTE: The transmission oil temperature must be between 80 - 110°F (27 - 43°C).

1. Start the engine only when the engine and ignition have been off for at least ten (10) minutes.
2. With the vehicle at a stop and the service brake applied, record the 1st N-D UD CVI while performing a Neutral to Drive shift. The 1st N-D UD CVI accounts for air entrapment in the UD clutch that may occur after the engine has been off for a period of time.
3. Repeat until the recorded 1st N-D UD CVI value stabilizes. Refer to 1 and 2.

NOTE: It is important that this procedure be performed when the transmission temperature is between 80 - 110°F (27 - 43°C). If this procedure takes too long to complete fully for the allowed transmission oil temperature, the vehicle may be returned to the customer with an explanation that the shift will improve daily during normal vehicle usage. The TCM also learns at higher oil temperatures, but these values (line pressure correction values) are not available for viewing on the scan tool.

LEARN A SMOOTH NEUTRAL TO DRIVE GARAGE SHIFT

Perform this procedure if the complaint is for a delayed or harsh shift when the transmission is put into gear after the vehicle has had its first shift. Use the following steps to have the TCM learn the Norm N-D UD CVI.

NOTE: The transmission oil temperature must be between 80 - 110°F (27 - 43°C) to learn the UD CVI. Additional learning occurs at temperatures as low as 0°F and

as high as 200°F. This procedure may be performed at any temperature that experiences poor shift quality. Although the UD CVI may not change, shift quality should improve.

1. Start the vehicle engine and shift to drive.
2. Move the vehicle forward to a speed of at least 16 km/h (10 MPH) and come to a stop. This ensures no air is present in the UD hydraulic circuit.
3. Perform repeated N-D shifts at a stop while pausing in Neutral for at least 2-3 seconds and monitor Norm N-D UD CVI volume until the value stabilizes. The value will change during the N-D shift. This is normal since the UD value is different for the N-D shift then the normal value shown which is used for 4-3 coastdown and kickdowns. Perform repeated shifts in this temperature range until the Norm N-D UD CVI value stabilizes and the N-D shifts become smooth.

LEARN THE 1ST 2-3 SHIFT AFTER A RESTART OR SHIFT TO REVERSE

Use the following steps to have the TCM learn the 1st 2-3 shift OD CVI.

NOTE: The transmission oil temperature must be above 80°F (27°C).

1. With the vehicle engine running, select reverse gear for over 2 seconds.
2. Shift the transmission to Drive and accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform a 2-3 shift while noting the 1st 2-3 OD CVI.
3. Repeat until the 1st 2-3 upshift becomes smooth and the 1st 2-3 OD CVI stabilizes. Refer to 1 and 2.

LEARN A SMOOTH 2-3 AND 3-4 UPSHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the OD and 4C CVI's.

1. Accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform multiple 1-2, 2-3, and 3-4 upshifts. The 2nd 2-3 shift following a restart or shift to reverse will be shown during the shift as a value between the 1st 2-3 OD CVI and the normal OD CVI. Updates to the normal OD CVI will occur after the 2nd shift into 3rd gear, following a restart or shift to reverse.
2. Repeat until the 2-3 and 3-4 shifts become smooth and the OD and 4C CVI become stable. Refer to 1.

LEARN A SMOOTH 4-3 COASTDOWN AND PART THROTTLE 4-3 KICKDOWN

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the UD shift volume.

1. At a vehicle speed between 64-97 km/h (40-60 MPH), perform repeated 4-3 kickdown shifts.
2. Repeat until the UD volume becomes somewhat stable and the shift becomes smooth. Refer to 1.

LEARN A SMOOTH 1-2 UPSHIFT AND 3-2 KICKDOWN

Use the following steps to have the TCM learn the 2C shift volume.

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With a vehicle speed below 48 km/h (30 MPH) and the transmission in 3rd gear, perform multiple 3-2 kickdowns.
2. Repeat until the 3-2 kickdowns become smooth and the 2C CVI becomes stable. Refer to 1.

LEARN A SMOOTH MANUAL 2-1 PULLDOWN SHIFT AS WELL AS A NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the LR volume.

1. With the vehicle speed around 40-48 km/h (25-30 MPH) in Manual 2nd, perform manual pulldowns to Low or 1st gear at closed throttle.
2. Repeat until the LR CVI becomes stable and the manual 2-1 becomes smooth. Refer to 1.

LEARN A SMOOTH NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With the vehicle at a stop, perform Neutral to Reverse shifts until the shift is smooth. An unlearned Neutral to Reverse shift may be harsh or exhibit a double bump.
2. If any of the shifts are still not smooth after the clutch volume stabilizes, an internal transmission problem may be present.

LEARN A SMOOTH 4-5 UPSHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the Alt 2C CVI.

1. Accelerate the vehicle through 88 km/h (55mph) at a steady 10-15 degree throttle opening and perform multiple 4-5 upshifts.
2. Repeat until the 4-5 shift become smooth and the Alt 2C CVI become stable. Refer to 1. There is a separate 2C volume used and learned for 4-5 shifts, 2CA. It is independent of the 2C CVI learned on 3-2 kickdowns.

RECEIVER, WIRELESS IGNITION NODE

DESCRIPTION

DESCRIPTION

Fig. 51: Wireless Ignition Node Receiver
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a Wireless Ignition Node (WIN). The WIN and the FOB with Integrated Key (FOBIK) are the primary components of the keyless ignition system. The only visible component of the WIN is the ignition switch located on the face of the instrument panel just to the inboard side of the steering column.

The WIN housing is constructed of molded black plastic and it includes four integral mounting bosses, which are secured to the instrument panel structure with screws. Two connector receptacles are integral to the back of the switch housing. One connects the WIN to the vehicle electrical system through a dedicated takeout and connector of the instrument panel wire harness. The other is a dedicated connector for the coaxial cable input from the optional remote start system external antenna module.

The WIN is an integrated electronic receiver that replaces the ignition switch. The WIN communicates with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The WIN interfaces with the Remote Keyless Entry (RKE) FOBIK and the Tire Pressure Monitor (TPM) sensors (if equipped) using Radio Frequency (RF) communication. It also communicates with the TPM trigger transponders (if equipped) and steering column lock module (if equipped) using a Local Interface Network (LIN) data bus connection.

The WIN provides a switched 12-volt source through an isolated switch for the steering column lock module required for certain export market vehicles. It also contains a key removal inhibit solenoid, an electronic Brake Transmission Shift Interlock (BTSI) solenoid, a key-in warning contact and it serves as the real time vehicle clock by transmitting the clock information to other electronic modules over the CAN data bus.

The WIN cannot be adjusted or repaired, but is flash update capable. If ineffective or damaged, the entire WIN

must be replaced. When replacing the WIN, you must also replace the steering column lock module (if equipped).

OPERATION

OPERATION

Following are brief descriptions of the systems that the WIN controls.

IGNITION SWITCH

The Wireless Ignition Node (WIN) incorporates an integral ignition switch that consists of four rotary positions with three detent positions and one spring-loaded position. The one extreme clockwise position is a spring-loaded momentary contact **"START"** position. When released from the **"START"** position, the switch will automatically return to the detent **"ON"** position. The other position includes a detent **"ACCESSORY"** position and a detent **"LOCK"** position.

The WIN reads the position of the ignition switch and transmits the data via the CAN data bus. These positions include **"LOCK"** with ignition key-out, **"LOCK"** with ignition key-in, **"ACCESSORY," "RUN,"** and **"START."**

SENTRY KEY IMMOBILIZER SYSTEM (SKIS)

Upon failure of proper Sentry Key Immobilizer (SKIS) communication to the Powertrain Control Module, (PCM), the PCM will not allow the vehicle to crank. The engine will not re-crank on the key cycle that the failure occurred, a full key down sequence must be performed for the engine to crank again. Refer to **OPERATION** .

REMOTE KEYLESS ENTRY (RKE)

The Remote Keyless Entry (RKE), transmitter uses Radio Frequency (RF) signals to communicate with the WIN, and the WIN relays the RKE requests to other modules in the vehicle over the CAN data bus. Refer to **OPERATION** .

TIRE PRESSURE MONITORING (TPM)

The Tire Pressure Monitoring (TPM) system uses radio and sensor technology to monitor tire air pressure levels. Refer to **TIRE PRESSURE MONITORING, OPERATION** .

REMOTE START WITH/EXTENDED RANGE ANTENNA

Further information concerning the Remote Start System, refer to **OPERATION** .

BRAKE TRANSMISSION SHIFTER INTERLOCK (BTSI)

The Brake Transmission Shifter/Ignition Interlock (BTSI) is controlled by the WIN. The BTSI prevents the transmission gear shifter from being moved out of PARK without a driver in place. For more information view the Brake Transmission Shift Interlock Mechanism for the related transmission.

PARK SHIFT INTERLOCK

The key removal inhibit solenoid internal to the WIN prevents the FOB with Integrated KEY (FOBIK) from being rotated in the ignition switch to the LOCK position for all vehicles with an automatic transmission unless the transmission shift lever is in the PARK position. The WIN module monitors a hard wired input from a switch integral to the automatic transmission shifter module to control this feature. The key removal inhibit solenoid is electronically disabled internally by the WIN on vehicles with a manual transmission.

REMOVAL

REMOVAL

Fig. 52: WIN Module & Retainers
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the steering column cover opening. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
3. Remove the four Wireless Ignition Node (WIN) retainers (1).
4. Disconnect the WIN electrical connector.
5. If equipped, remove the WIN antenna connector.

6. Remove the WIN from the instrument panel opening.

INSTALLATION

INSTALLATION

1. Connect the WIN electrical connector.
2. If equipped, connect the antenna connector to the WIN.
3. Install the WIN (2) into the to instrument panel.
4. Install the steering column cover opening. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
5. Connect the negative battery cable.
6. Program the WIN following the Module/Programming Order Replacement Guide and Module Programming procedures. Refer to **STANDARD PROCEDURE**.

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

   NOTE: Verify the connection of the Rearview Mirror harness connector.

   1. Turn the ignition on.
   2. With the scan tool, read the active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2.

      No

      - If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **INSIDE REARVIEW MIRROR**

DESCRIPTION

HEATED STEERING WHEEL

Fig. 1: Heated Steering Wheel Switch
Courtesy of CHRYSLER GROUP, LLC

The heated steering wheel system is designed to enhance the thermal comfort of the driver by heating the steering wheel.

The heated steering wheel is an option only available on vehicles that have heated seats.

The heating element is made of copper wire and located between the covering and substrate material of the steering wheel.

A vehicle with a heated steering wheel can easily be identified by the heated steering wheel switch (3) located on the switch pod in the instrument panel center bezel. The heated steering wheel switch has one Light-Emitting Diode (LED) indicator lamp that illuminates when the heated steering wheel system is on.

The heated steering wheel system consists of the following major components

- Heated Steering Wheel Switch. Refer to **SWITCH, HEATED STEERING WHEEL, DESCRIPTION**.
- Heated Seat Module (HSM). Refer to **MODULE, HEATED SEAT, DESCRIPTION** .
- Heated Steering Wheel. Refer to **OPERATION**.

VENTED SEATS

Fig. 2: Vented Seat Switches
Courtesy of CHRYSLER GROUP, LLC

The vented seat system is designed to enhance the thermal comfort of the seat occupant.

The front vented seats are an option only available on vehicles that have heated seats.

A vehicle with vented seats can easily be identified by the vented seat switches (2) located on the switch pod in the instrument panel center bezel. Each vented seat switch has two Light-Emitting Diode (LED) indicator lamps that illuminate when the vented seat system is on, depending on the operating speed selected.

The vented seat system consist of the following major components:

- Vented Seat Switches. Refer to **SWITCH, VENTED SEAT, DESCRIPTION**.
- Heated Seat Module (HSM). Refer to **MODULE, HEATED SEAT, DESCRIPTION** .
- Vented Seat Motors. Refer to **MOTOR, VENTED SEAT, DESCRIPTION**.
- Vented Seat Pads. Refer to **PAD, VENTED SEAT, DESCRIPTION**.

OPERATION

HEATED STEERING WHEEL

The heated steering wheel has two selectable settings, On and Off. The heated steering wheel only operates with the vehicle ignition is in the Run position, and will always stay in the off setting unless the heated seat switch is pressed. Once the switch is pressed the Light Emitting Diode (LED) on the face of the switch will illuminate, indicating that the heating element in the steering wheel is operating. Pressing the switch while the heated steering wheel is on, will turn the heating steering wheel and the LED on the switch off.

CAUTION: When equipped with a leather wrapped heated steering wheel and replacement of a Heated Seat Module (HSM) is required, the new HSM must be manually configured with a scan tool. Refer to STANDARD

PROCEDURE . Failure to follow these instruction may result in damage to the heated steering wheel.

Normal heating of the steering wheel will last a minimum of 52 minutes, unless the switch is pressed or a system fault has been set. Heating of the element is controlled by the Heated Seat Module (HSM), also know as the Comfort Seat Wheel Module (CSWM), and a temperature sensor integrated into the steering wheel heating element. The integrated temperature sensor sends the temperature of the steering wheel to the HSM, which adjusts the internal heat setting accordingly.

The heated steering wheel will automatically shut off if the heating element reaches a temperature greater than 50 degrees Celsius (122 degrees Fahrenheit).

The steering wheel heating element is not serviced separately from the steering wheel. if a heated steering wheel becomes inoperative, the steering wheel assembly must be replaced. Refer to **WHEEL, STEERING, REMOVAL** .

VENTED SEATS

The Vented Seat assembly is located internally to the front seats and are intended to enhance the thermal comfort of the seat occupant by ventilating seat to occupant interface. Occupant comfort is achieved by pulling air from the seat surface to the back and underside under side of the seat.

The vented seats are controlled by the heated seat module (HSM) (also know as the Comfort Seat Wheel Module or CSWM) which provides variable analog voltages driving the 12V vented seat motors in the seats. The vented seats have 2 selectable speeds with a hidden intermediate speed for the fans. For seat venting, each press of the vented seat switch will cause the vented seat to change venting modes. From OFF to HI, from HI to LO and from LO to OFF. The HSM shall turn on the vented seats only with the engine running. Both vented seats operate separately from each other, and will not operate at the same time as the heated seats.

DIAGNOSIS AND TESTING

HEATED STEERING WHEEL

CAUTION: When equipped with a leather wrapped heated steering wheel and replacement of a Heated Seat Module (HSM) is required, the new HSM must be manually configured with a scan tool. Refer to STANDARD PROCEDURE . Failure to follow these instruction may result in damage to the heated steering wheel.

NOTE: Vehicles equipped with the heated steering wheel option utilize a low voltage cut-off feature. This feature turns off power to the heated steering wheel anytime vehicle voltage is below 11.7 volts or above 15.5 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated steering wheel appears inoperative.

NOTE: If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication

that an INTERMITTENT fault condition may be present. To help find an intermittent problem, move the steering wheel around while testing continuity. also wiggle the heated steering wheel wire harness and electrical connectors while testing continuity.

NOTE: **For complete circuit diagrams, refer to appropriate wiring information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

Before testing any individual components in the heated steering wheel system, check the following:

1. Check the fuse located in the Totally Integrated Power Module (TIPM). The fuse must be OK and tight in the receptacle.
2. Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM) and the heated steering wheel switch. Refer to **DIAGNOSIS AND TESTING** . If any DTCs are found, repair as necessary.
3. When equipped with a leather wrapped heated steering wheel, verify the HSM is configured to the leather steering wheel option using a scan tool. Refer to **STANDARD PROCEDURE** .
4. Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the heated steering wheel system.
5. If there are no DTCs and the heated steering wheel system functions properly, but the Light Emitting Diode (LED) indicator in the switch does not illuminate, replace the instrument panel switch pod. Refer to **SWITCH, HEATED STEERING WHEEL, REMOVAL**.

VENTED SEATS

Diagnosis of the vented seat system requires the use of a scan tool. If a fault is present in the vented seat system a DTC will be set and the vented seat switch will illuminate for 2 seconds and then go out. For further diagnosis, refer to the appropriate diagnostic information.

MOTOR, VENTED SEAT

DESCRIPTION

DESCRIPTION

Fig. 3: Vented Seat Motor
Courtesy of CHRYSLER GROUP, LLC

The vented seat motor assemblies are black with a metal support bracket and are mounted inside of the seat assemblies. The motors can be easily be seen once the seat cushions and covers have been removed.

The vented seat motors are located within the front seat assemblies. There are two vented seat motors per seat on vehicles equipped with the vented seat option. One vented seat motors is mounted to the seat back frame and the second motor is mounted to the seat bottom frame. Each motor is secured by 4 retaining clips and have a vented seat pad that attaches to it for seat ventilation.

OPERATION

OPERATION

The vented seat motors will only operate with the engine running and will not operate at the same time as the heated seats are operating. The vented seat motors are controlled by the Heated Seat Module (HSM) (also know as the Comfort Seat Wheel Module or CSWM). The HSM provides the vented seat motors with variable analog voltages giving the motors 2 selectable speeds. These speeds are selected by the driver and/or front passenger by pressing the vented seat switches. Switching the vented seats on while the heated seats are already operating will disable the heating of the seat and start the venting of the seat. Both front vented seats work independently from each other, meaning that the driver and front passenger can choose there own settings for seat venting.

PAD, VENTED SEAT

DESCRIPTION

DESCRIPTION

The vented seat pads and heated seat pads are a one piece assembly on vehicles equipped with vented seats. The vented pads are located between the seat bottom and seat back covers and cushions. The vented seat pads are adhered to the seat bottom and seat back foam cushions, and have a flange that is routed through an opening in the seat back and seat bottom cushions. The vented seat pad flange attaches the vented pad to the vented seat motor, for seat ventilation.

SWITCH, HEATED STEERING WHEEL

DESCRIPTION

DESCRIPTION

Fig. 14: Heated Steering Wheel Switch
Courtesy of CHRYSLER GROUP, LLC

The heated steering wheel switch (3) is a momentary contact push button switch mounted in the instrument panel center bezel that operates the heated steering wheel system. The heated steering wheel switch has one Light-Emitting Diode (LED) indicator lamps, which indicate when the heated steering wheel is on or off.

OPERATION

OPERATION

The heated steering wheel switch allows the driver to turn on and off the heated steering wheel. The heated steering wheel will remain off until the driver presses the switch. Once the switch is pressed the Light Emitting Diode (LED) on the face of the switch will illuminate, indicating that the heating element in the steering wheel is operating. Pressing the switch while the heated steering wheel is on, will turn the heating steering wheel and the LED on the switch off.

The heated steering wheel switch also functions as a visual indicator for a fault with the heated steering wheel system. When the heated seat switch is pressed and a fault is present in the heated steering wheel system the LED on the switch will illuminate for 2 seconds, and then immediately turn off.

SWITCH, VENTED SEAT

DESCRIPTION

DESCRIPTION

Fig. 17: Vented Seat Switches
Courtesy of CHRYSLER GROUP, LLC

The Vented Seat Switches (2) are momentary contact push button switches mounted in the instrument panel center bezel that operate the vented seat system. Each vented seat switch has two Light-Emitting Diode (LED) indicator lamps, which indicate the selected level (Low or High) of the vented seats.

The LED indicator lamps in each vented seat switch cannot be repaired. If the LED lamps are faulty or damaged, or the switch is inoperative or damaged the switch pod assembly must be replaced. for the switch pod replacement procedure. Refer to **SWITCH, VENTED SEAT, REMOVAL**.

OPERATION

OPERATION

The vented seat switches are a momentary push button type switch used to control the vented seat settings.

There are 3 settings for the vented seats, OFF, HI, and LO. The vented seats start in the OFF setting, where none of the LEDs on the switch are illuminated. Pressing the switch once will change the setting from the OFF setting to the HI setting, and will illuminate both LEDs on the switch. Pressing the vented seat switch again will change the setting from the HI setting to the LO setting and only one LED on the switch will be lit. Pressing the switch once again will change the setting from the LO setting to the OFF setting again.

If the switch LED illuminates and shuts off again after only 2 seconds of being lit, a fault with the vented seat system is present and diagnosis of the vented seat system will be necessary. Refer to **DIAGNOSIS AND TESTING**.

Heated Glass - Service Information - Ram Pickup

DESCRIPTION

DESCRIPTION

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken when cleaning or removing foreign materials, decals or stickers from the rear glass. Normal glass cleaning solvents or hot water used with soft toweling is recommended.

Fig. 1: Rear Window, Bus Bars & Grid Lines
Courtesy of CHRYSLER GROUP, LLC

The optional rear window defogger system, also known as electric backlight (EBL), consists of two vertical bus bars (1) linked by a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned on or off by a switch located in the A/C-heater control at the center of the instrument panel.

OPERATION

OPERATION

Fig. 2: ATC Control
Courtesy of CHRYSLER GROUP, LLC

NOTE: ATC control shown in illustration. MTC control similar.

When equipped, the electric backlight (EBL) system is controlled by a momentary switch (2) located in the A/C-heater control (1) in the instrument panel. When the rear window defogger switch is pressed to ON with the ignition switch in RUN, the switch sends a request signal over the CAN Bus to the totally integrated power module (TIPM) to energize the internal EBL high side driver. When energized, the EBL high side driver provides battery current to the rear window defogger grid lines and/or the heated side view mirrors, as equipped. The grid lines heat the glass to help clear the rear window and side mirror surfaces of fog or frost.

An amber indicator (3) in the rear window defogger switch will illuminate to indicate when the EBL system is turned on.

NOTE: The EBL system turns off automatically after 15 minutes of initial operation. Each following activation cycle of the EBL system will last 10 minutes.

The EBL system will automatically turn off after an initial programmed time interval of about 15 minutes, as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to ON again during the same ignition cycle, the EBL system will automatically turn off after about 10 minutes. The EBL system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the rear window defogger switch a second time.

Repair of the rear window defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent. Refer to **GRID, DEFOGGER, REAR, STANDARD PROCEDURE**.

The EBL control system is diagnosed using a scan tool. Refer to appropriate Electrical Diagnostic article. .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRIC BACKLIGHT (EBL) AND HEATED MIRROR SYSTEM

NOTE: **Illumination of the defogger switch indicator lamp does not necessarily mean that electrical current is reaching the rear window glass and/or the outside rear view mirror heating grids.**

NOTE: **Refer to appropriate Wiring Information for circuit descriptions and diagrams of the rear window defogger (EBL) and heated mirror systems.**

Operation of the Electrical Back Light (EBL) and heated mirror systems can be confirmed by the following:

Fig. 3: Testing EBL Grid Lines
Courtesy of CHRYSLER GROUP, LLC

1. Use a scan tool and check for Diagnostic Trouble Codes (DTCs) related to the A/C-heater control and the Totally Integrated Power Module (TIPM). If no DTCs are found, refer to 2. If any DTCs are found, repair as required, then refer to 2.
2. Turn the ignition switch to RUN. Set the rear window defogger switch to ON. Rear window defogger operation can be checked by feeling the rear window glass, or the heated outside rear view mirror glass. A distinct difference in temperature between the grid lines (1) and the adjacent clear glass (2) or the heated mirror glass should be detected within 3 to 4 minutes of operation.
3. If a rear window glass temperature difference is not detected, use a 12-volt DC voltmeter (4) and contact the rear glass heating grid power feed terminal A (3) with the positive lead, and the ground terminal B (5) with the negative lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:
   - Confirm the ignition switch is in RUN.
   - Confirm the rear window defogger switch is ON.
   - Confirm the EBL feed wire is connected to the heating grid positive terminal and that there is continuity between the TIPM and the heating grid.

- Confirm the EBL ground wire is connected to the heating grid negative terminal and that there is continuity to ground.
- When diagnosing a heated mirror concern, check the heated mirror circuit fuse located in the TIPM. The fuse must be tight in the receptacle and all electrical connections must be secure.

4. If broken defogger grid lines or bus bars are suspected, use a 12-volt DC voltmeter and contact the rear glass heating grid ground terminal B with the negative lead and each rear glass heating grid line at its mid-point with the positive lead. The voltmeter should read approximately 6 volts at each grid line mid-point. If the voltmeter does not read approximately 6 volts, repair the open grid line(s) or bus bar(s). Refer to **GRID, DEFOGGER, REAR, STANDARD PROCEDURE**.
5. If the operation of the EBL system and/or the heated mirror system has been verified but the defogger LED indicator does not illuminate, replace the A/C-heater control. Refer to **CONTROL, A/C AND HEATER, REMOVAL** .

GRID, DEFOGGER, REAR

STANDARD PROCEDURE

STANDARD PROCEDURE - GRID LINE AND TERMINAL REPAIR

WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow these instructions may result in serious or fatal injury.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

Fig. 4: Grid Line Repair
Courtesy of CHRYSLER GROUP, LLC

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).
5. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
6. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
7. Carefully remove the masking tape or template.

CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.

8. Allow the epoxy to cure 24 hours at room temperature or carefully use a heat gun for 15 minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).
9. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
10. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

SWITCH, DEFOGGER, REAR

DESCRIPTION

DESCRIPTION

Fig. 5: ATC Control
Courtesy of CHRYSLER GROUP, LLC

The switch for the rear window defogger (Electric Back Light) (EBL) system (2) is integrated into the A/C-heater control (1), located in the center of the instrument panel. When the rear window defogger switch is pressed to ON, a request signal is sent on the CAN Bus to the Totally Integrated Power Module (TIPM) to operate the EBL system.

When the high side driver in the TIPM is energized, current is directed to the rear defogger grid lines and to the heated side view mirrors, as equipped. An amber indicator (3) illuminates in the switch to indicate when the EBL system is turned on. The grid lines heat the glass to help clear the surface of fog or frost.

OPERATION

OPERATION

An amber indicator will illuminate when the rear window defogger switch is activated. When activated, the switch sends a request signal to the to the Totally Integrated Power Module (TIPM) to energize the internal EBL high side driver to provide battery current to the rear window defogger grid lines and to the heated side view mirrors, as equipped.

NOTE: The EBL system turns off automatically after 15 minutes of initial operation. Each following activation cycle of the EBL system will last 10 minutes.

The EBL system will be automatically turned off after an initial programmed time interval of about 15 minutes, as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to ON again during the same ignition cycle, the EBL system will automatically turn off after about 10 minutes. The EBL system will automatically shut off if the ignition switch is turned to any position other than RUN, or it can be turned off manually by pressing the rear window defogger switch a second time.

The rear window defogger switch is diagnosed using a scan tool. Refer to appropriate Electrical Diagnostic article. .

The rear window defogger switch and the rear window defogger indicator cannot be repaired and the A/C-heater control must be replaced if inoperative or damaged. Refer to **CONTROL, A/C AND HEATER, REMOVAL** .

Heated Mirrors - Service Information - Ram Pickup

DESCRIPTION

DESCRIPTION

Fig. 1: Window Defogger Icon
Courtesy of CHRYSLER GROUP, LLC

Electrically heated outside rear view mirrors (1) are optional on some models. Vehicles with this option can be visually identified by the International Control and Display Symbol icon for rear window defogger (2), which appears on the lower inboard corner of each outside rear view mirror glass.

The heated mirror system operates in concert with the rear window defogger (EBL) system and is controlled by the rear window defogger switch located on the A/C-heater control in the instrument panel. An amber indicator lamp in the rear window defogger switch will illuminate to indicate when the system is ON.

The heated mirror system will automatically turn off after an initial programmed time interval of about 15 minutes, as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to ON again during the same ignition cycle, the heated mirror system will automatically turn off after about 10 minutes. The heated mirror system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the rear window defogger switch a second time.

Circuit protection for the heated mirror system is provided by a fuse located in the totally integrated power module (TIPM).

OPERATION

OPERATION

When equipped, the heated mirror system is activated when the rear window defogger (EBL) system is turned on. Refer to **OPERATION** . When the heated mirror system is activated, an electric heater grid located behind the glass of each of the outside rear view mirror becomes energized and produces heat to help clear the mirror of ice, snow, or fog.

If the outside mirror heating grids are both inoperative, refer to **DIAGNOSIS AND TESTING** . If only one of the outside mirror heating grid is inoperative. Refer to **DIAGNOSIS AND TESTING** .

The heating grid behind each outside mirror glass cannot be repaired and the mirror glass must be replaced if inoperative or damaged. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

B10C4-11-HEATED STEERING WHEEL CONTROL - CIRCUIT SHORT TO GROUND

<u>Fig. 1: Heated Steering Wheel Control Wiring Diagram</u>
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the engine running.

SET CONDITION:

The Heated Seat Module (HSM) detects voltage below threshold on the (C91) Heated Steering Wheel Feed circuit for more than two seconds when the output is turned on.

POSSIBLE CAUSES

Possible Causes
(C91) HEATED STEERING WHEEL FEED CIRCUIT SHORTED TO GROUND
(C91) HEATED STEERING WHEEL FEED CIRCUIT SHORTED TO THE (C986) HEATED STEERING WHEEL RETURN CIRCUIT
HEATED STEERING WHEEL (HSW)
CLOCKSPRING
HEATED SEAT MODULE (HSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Make sure the battery is fully charged and the charging system is operating properly before proceeding.**

1. Turn the ignition on.
2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).
3. Turn the ignition off.
4. Start the engine and let it run.
5. Turn the HSW on.
6. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly to the HSM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by rotating the steering wheel. Attempt to reproduce condition by adjusting the seat.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK FOR SHORTED (C91) HEATED STEERING WHEEL FEED CIRCUIT BETWEEN CLOCKSPRING AND HSM**

Fig. 2: Check For Shorted Heated Steering Wheel Feed Circuit Between Clockspring And HSM
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Clockspring C5 harness connector.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait**

two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, erase DTCs.
3. Start the engine and let it run.
4. Turn the HSW on.
5. With the scan tool, read DTCs.

   Is the same DTC active?

   Yes

   - Go To 3.

   No

   - Go To 5.

3. **CHECK (C91) HEATED STEERING WHEEL FEED CIRCUIT FOR A SHORT TO GROUND**

Fig. 3: Check Heated Steering Wheel Feed Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the HSM C4 harness connector.

   NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance of the (C91) Heated Steering Wheel Feed circuit between ground and the Clockspring C5 harness connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (C91) Heated Steering Wheel Feed circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

- Go To 4.

4. **CHECK (C91) HEATED STEERING WHEEL FEED CIRCUIT FOR A SHORT TO THE (C986) HEATED STEERING WHEEL RETURN CIRCUIT**

Fig. 4: Check Heated Steering Wheel Feed Circuit For A Short To The Heated Steering Wheel Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C91) Heated Steering Wheel Feed circuit and the (C986) Heated Steering Wheel Return circuit at the Clockspring C5 harness connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short between the (C91) Heated Steering Wheel Feed circuit and the (C986) Heated Steering Wheel Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

- Replace the Heated Seat Module (HSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **CHECK FOR A SHORTED HSW**

Fig. 5: Checking HSW For Short
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Remove the Driver Airbag in accordance with the Service Information.
2. Disconnect the CLOCKSPRING C5 connector.

NOTE: **Before proceeding, thoroughly inspect the wiring harness and connectors between the HSW and the Clockspring. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.**

3. Reconnect the CLOCKSPRING C5 harness connector.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

4. With the scan tool, erase DTCs.
5. Turn the ignition off.
6. Start the engine and let it run.
7. Turn the HSW on.
8. With the scan tool, read DTCs.

Is the same DTC active?

Yes

- Replace the Clockspring in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Heated Steering Wheel (HSW) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).
   3. Turn the ignition off.
   4. Start the engine and let it run.
   5. With the scan tool, read DTCs.

   Is the DTC active?

   Yes

   - Go To 2.

   No

   - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly to the HSM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by operating all HSM functions one at a time, except for the HSW. Attempt to reproduce condition by rotating the steering wheel. Attempt to reproduce condition by adjusting the seat.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK FOR SHORTED (C91) HEATED STEERING WHEEL FEED CIRCUIT BETWEEN**

CLOCKSPRING AND HSM

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Clockspring C5 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

2. Measure the voltage between ground and the (C91) Heated Steering Wheel Feed circuit at the Clockspring C5 harness connector.

   Is there any voltage present?

Yes

1. Turn the ignition off.
2. Disconnect the HSM C4 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance between the (C91) Heated Steering Wheel Feed circuit and the (F931) Fused Ignition Run Control Output circuit at the HSM C4 harness connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short between the (C91) Heated Steering Wheel Feed circuit and the (F931) Fused Ignition Run Control Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **CHECK (C91) HEATED STEERING WHEEL FEED CIRCUIT FOR A SHORT TO VOLTAGE**

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (C91) Heated Steering Wheel Feed circuit between the HSM C4 harness connector and ground.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (C91) Heated Steering Wheel Feed circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

- Replace the Heated Seat Module (HSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **CHECK FOR A SHORTED CLOCKSPRING**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Remove the Driver Airbag in accordance with the Service Information.
2. Disconnect the Steering Wheel Heater connector.

NOTE: **Before proceeding, thoroughly inspect the wiring harness and connectors between the HSW and the Clockspring. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.**

3. Reconnect the Clockspring C5 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Turn the ignition on.
5. Measure the voltage of the (C91) Heated Steering Wheel Feed circuit between the Steering Wheel Heater connector and ground.

   Is there any voltage present?

   Yes

   - Replace the Clockspring in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Heated Steering Wheel (HSW) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

1. Turn the ignition off.
2. Disconnect the Left Seat Back Heater harness connector.

3. Disconnect the Left Seat Cushion Heater harness connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Turn the ignition on.
5. Using a scan tool, erase DTCs.
6. Turn the ignition off.
7. Start the engine and let it run.
8. Turn the Heated Seat on and operate in all modes.
9. Using a scan tool, read DTCs.

Is the same DTC active?

Yes

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the HSM C2 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance between ground and the (P187) Left Front Seat Heater Control circuit at the Left Seat Cushion Heater harness connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (P187) Left Front Seat Heater Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK (P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO THE (Z909) GROUND CIRCUIT OR TO (P968) HEATED SEAT SENSOR RETURN CIRCUIT**

Fig. 32: Check Left Front Seat Heater Control Circuit For A Short To The Ground Circuit Or To Heated Seat Sensor Return Circuit

1. Measure the resistance between the (P187) Left Front Seat Heater Control circuit and the (Z909) Ground circuit at the Left Seat Cushion Heater connector (harness side).

2. Measure the resistance between the (P187) Left Front Seat Heater Control circuit and the (P968) Heated Seat Sensor Return circuit at the Left Seat Cushion Heater connector (harness side).

   Is the resistance below 10K Ohms for either measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (P187) Left Front Seat Heater Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Heated Seat Module (HSM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **CHECK (P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT IN PIGTAIL HARNESS AND LEFT SEAT BACK HEATER ELEMENT FOR A SHORT TO GROUND**

3. Turn the ignition on.
4. Using a scan tool, erase DTCs.

5. Turn the ignition off.
6. Start the engine and let it run.
7. Turn the Heated Seat on and operate in all modes.
8. Using a scan tool, read DTCs.

   Is the same DTC active?

   Yes

   - Repair or replace the pigtail harness for a short to ground or replace the shorted Seat Back Heater Element in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Seat Cushion Heater Element in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

WHEN MONITORED:

With the engine running.

SET CONDITION:

The Heated Seat Module (HSM) detects Voltage above 5.0 volts on the (P187) Left Front Seat Heater Control circuit for more than two seconds with the output turned off.

POSSIBLE CAUSES

Possible Causes
(P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE
(P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT SHORTED TO THE (P188) RIGHT FRONT SEAT HEATER CONTROL CIRCUIT
HEATED SEAT MODULE (HSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
   3. Turn the ignition off.
   4. Start the engine and let it run.
   5. Using a scan tool, read DTCs.

   Is the DTC active?

   Yes

   - Go To 2.

   No

   - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly to the HSM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by operating all HSM functions one at a time, except for the Left Front Heated Seat. Attempt to reproduce condition by adjusting the seat.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 35: Checking Left Front Seat Heater Control Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the HSM C2 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Start the engine and let it run.
4. Measure the voltage of the (P187) Left Front Seat Heater Control circuit between the HSM C2 harness connector and ground.

   Is there any voltage present?

   Yes

- Repair the (P187) Left Front Seat Heater Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK (P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO VOLTAGE DURING SEAT ADJUSTMENT**

1. Measure the voltage of the (P187) Left Front Seat Heater Control circuit between the HSM C2 harness connector and ground while adjusting the seat in all positions.

Is there any voltage present during the seat adjustment?

Yes

- Repair the (P187) Left Front Seat Heater Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK (P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO THE (P188) RIGHT FRONT SEAT HEATER CONTROL CIRCUIT**

1. Turn the ignition off.
2. Disconnect the C214 and C213 in-line harness connectors.
3. Disconnect the Left Seat Cushion Heater harness connector.
4. Measure the resistance between the (P187) Left Front Seat Heater Control circuit and the (P188) Right Front Seat Heater Control circuit at HSM C2 harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P187) Left Front Seat Heater Control circuit for a short to the (P188) Right Front Seat Heater Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Heated Seat Module (HSM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Before proceeding, verify the battery is fully charged, the charging system is operating properly, no Battery or System Voltage Diagnostic Trouble Codes (DTCs) are set, and the HSM Power and Ground circuits are clean and tight.**

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
3. Turn the ignition off.
4. Start the engine and let it run.
5. Turn the Heated Seat on and operate in all modes.
6. Using a scan tool, read DTCs.

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly to the HSM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by adjusting the seat.

SET CONDITION:

The Heated Seat Module (HSM) detects Voltage below 1.0 volt or current above 10.0 amps on the (P177) Left Rear Seat Heater Control circuit for more than two seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
(P177) LEFT REAR SEAT HEATER CONTROL CIRCUIT SHORTED TO GROUND
(P177) LEFT REAR SEAT HEATER CONTROL CIRCUIT SHORTED TO THE (P968) HEATED SEAT SENSOR RETURN CIRCUIT
(P177) LEFT REAR SEAT HEATER CONTROL CIRCUIT SHORTED TO THE (Z909) GROUND CIRCUIT
SEAT CUSHION HEATER ELEMENT SHORTED

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Make sure the battery is fully charged and the charging system is operating properly before proceeding.**

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
3. Turn the ignition off.
4. Start the engine and let it run.
5. Turn the Heated Seat on and operate in all modes.
6. Using a scan tool, read DTCs.

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly to the HSM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by adjusting the front seat.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (P177) LEFT REAR SEAT HEATER CONTROL CIRCUIT IN BODY HARNESS FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Left Rear Seat Cushion Heater harness connector.

      NOTE: Check connectors. Clean and repair as necessary.

   3. Turn the ignition on.
   4. Using a scan tool, erase DTCs.
   5. Turn the ignition off.
   6. Start the engine and let it run.
   7. Turn the Heated Seat on and operate in all modes.
   8. Using a scan tool, read DTCs.

   Is the same DTC active?

   Yes

   - Go To 3.

   No

   - Replace the shorted Rear Seat Cushion Heater Element in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK (P177) LEFT REAR SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO GROUND**

NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance of the (P177) Left Rear Seat Heater Control circuit between ground and the HSM C3 harness connector.

   Is the resistance below 10K Ohms?

   Yes

- Repair the (P177) Left Rear Seat Heater Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK (P177) LEFT REAR SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO THE (P968) HEATED SEAT SENSOR RETURN CIRCUIT OR TO (Z909) GROUND CIRCUIT**

2. Measure the resistance between the (P177) Left Rear Seat Heater Control circuit and the (Z909) Ground circuit at the Left Rear Seat Cushion Heater harness connector.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P177) Left Rear Seat Heater Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Heated Seat Module (HSM) in accordance with the Service Information.

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (Z909) Ground circuit between ground and the Left Rear Seat Cushion Heater harness connector (harness side).

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Heated Seat Module (HSM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the (Z909) Ground circuit for an open.

WHEN MONITORED:

With the engine running.

SET CONDITION:

The Heated Seat Module (HSM) detects impedance above threshold on the (P177) Left Rear Seat Heater Control circuit for more than two seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
(P177) LEFT REAR SEAT HEATER CONTROL CIRCUIT RESISTANCE HIGH
(Z909) GROUND CIRCUIT RESISTANCE HIGH
SEAT CUSHION HEATER ELEMENT
HEATED SEAT MODULE (HSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Before proceeding, verify the battery is fully charged, the charging system is operating properly, no Battery or System voltage Diagnostic Trouble Codes (DTCs) are set and the HSM Power and Ground circuits are clean and tight.**

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
3. Turn the ignition off.
4. Start the engine and let it run.
5. Turn the Heated Seat on and operate in all modes.
6. Using a scan tool, read DTCs.

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly to the HSM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched or partially broken wires and broken, bent, pushed out, spread, corroded or contaminated terminals. Attempt to reproduce condition by adjusting the front seat.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK LEFT REAR SEAT CUSHION HEATER ELEMENT RESISTANCE**

Fig. 80: Checking For An Open Left Rear Seat Cushion Heater Element
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Left Rear Seat Cushion Heater harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance between the (P177) Left Rear Seat Heater Control circuit and the (Z909) Ground circuit at the Left Rear Seat Cushion Heater harness connector (seat side).

   Is the resistance above 4.8 Ohms?

   Yes

   - Replace the Rear Seat Cushion Heater Element in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **CHECK (P177) LEFT REAR SEAT HEATER CONTROL CIRCUIT FOR HIGH RESISTANCE IN BODY HARNESS**

2. Measure the resistance of the (P177) Left Rear Seat Heater Control circuit between the HSM C3 harness connector and the Left Rear Seat Cushion Heater harness connector (harness side).

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4.

   No

   - Repair the (P177) Left Rear Seat Heater Control circuit for high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK (Z909) GROUND CIRCUIT FOR HIGH RESISTANCE**

   Yes

   - Replace the Heated Seat Module (HSM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the (Z909) Ground circuit for high resistance.

2. **CHECK (P178) RIGHT REAR SEAT HEATER CONTROL CIRCUIT IN BODY HARNESS FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Right Rear Seat Cushion Heater harness connector.

      NOTE: Check connectors. Clean and repair as necessary.

   3. Turn the ignition on.
   4. Using a scan tool, erase DTCs.
   5. Turn the ignition off.
   6. Start the engine and let it run.
   7. Turn the Heated Seat on and operate in all modes.
   8. Using a scan tool, read DTCs.

   Is the same DTC active?

   Yes

   - Go To 3.

   No

   - Replace the shorted Rear Seat Cushion Heater Element in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK (P178) RIGHT REAR SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO GROUND**

1. Turn the ignition off.
2. Disconnect the HSM C3 harness connector.

   NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance of the (P178) Right Rear Seat Heater Control circuit between ground and the HSM C3 harness connector.

   Is the resistance below 10K Ohms?

   Yes

- Repair the (P178) Right Rear Seat Heater Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK (P178) RIGHT REAR SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO THE (P968) HEATED SEAT SENSOR RETURN CIRCUIT OR TO (Z909) GROUND CIRCUIT**

2. Measure the resistance between the (P178) Right Rear Seat Heater Control circuit and the (Z909) Ground circuit at the Right Rear Seat Cushion Heater harness connector.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P178) Right Rear Seat Heater Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Heated Seat Module (HSM) in accordance with the Service Information.

WHEN MONITORED:

With the engine running.

SET CONDITION:

The Heated Seat Module (HSM) detects impedance above threshold on the (P178) Right Rear Seat Heater Control circuit for more than two seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
(P178) RIGHT REAR SEAT HEATER CONTROL CIRCUIT RESISTANCE HIGH
(Z909) GROUND CIRCUIT RESISTANCE HIGH
SEAT CUSHION HEATER ELEMENT
HEATED SEAT MODULE (HSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Before proceeding, verify the battery is fully charged, the charging system is operating properly, no Battery or System Voltage Diagnostic Trouble Codes (DTCs) are set, and the HSM Power and Ground circuits are clean and tight.**

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
3. Turn the ignition off.
4. Start the engine and let it run.
5. Turn the Heated Seat on and operate in all modes.
6. Using a scan tool, read DTCs.

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by adjusting the front seat.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK REAR SEAT CUSHION HEATER ELEMENT RESISTANCE**

Fig. 96: Checking For Open Right Rear Seat Cushion Heater Element
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Right Rear Seat Cushion Heater harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance between the (P178) Right Rear Seat Heater Control circuit and the (Z909) Ground circuit at the Right Rear Seat Cushion Heater Connector (seat side).

   Is the resistance above 4.8 Ohms?

   Yes

   - Replace the Rear Seat Cushion Heater Element in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **CHECK (P178) RIGHT REAR SEAT HEATER CONTROL CIRCUIT FOR HIGH RESISTANCE IN BODY HARNESS**

2. Measure the resistance of the (P178) Right Rear Seat Heater Control circuit between the HSM C3 harness connector and the Right Rear Seat Cushion Heater harness connector (harness side).

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4.

   No

   - Repair the (P178) Right Rear Seat Heater Control circuit for high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK (Z909) GROUND CIRCUIT FOR HIGH RESISTANCE**

Fig. 98: Checking Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (Z909) Ground circuit between ground and the Right Rear Seat Cushion Heater harness connector (harness side).

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Heated Seat Module (HSM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the (Z909) Ground circuit for high resistance.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

1. Turn the ignition off.
2. Disconnect the HSM C5 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Connect an ammeter between the (P921) Left Seat Vent Return circuit and ground at the HSM C5 harness connector.
4. Connect one end a fused jumper wire to Battery voltage and the other end to the (P421) Left Seat Vent Feed circuit at the HSM C5 harness connector.

NOTE: Both vent motors should be operational and the ammeter should read 720 to 880 ma.

Does the ammeter read 720 ma to 1.2 amps?

Yes

- Disconnect the fused jumper wire and ammeter. Replace the Heated Seat Module (HSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Disconnect the fused jumper wire. Go To 3.

1. Disconnect the Left Seat Cushion Vent harness connector.
2. Disconnect the Left Seat Back Vent harness connector.
3. Measure the resistance of the (P421) Left Seat Vent Feed circuit between ground at the HSM C5 harness connector.

   Is the resistance below 10K Ohms?

Yes

- Repair the (P421) Left Seat Vent Feed circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **CHECK (P421) LEFT SEAT VENT FEED CIRCUIT FOR A SHORT TO THE (P921) LEFT SEAT VENT RETURN CIRCUIT**

1. Measure the resistance between the (P422) Right Seat Vent Feed circuit and the (P922) Right Seat Vent Return circuit at the HSM C5 harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P422) Right Seat Vent Feed circuit for a short to the (P922) Right Seat Vent Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair or replace the pigtail harness for a short to ground or replace the shorted Seat Back Vent Motor in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the engine running.

SET CONDITION:

The Heated Seat Module (HSM) detects Voltage above 5.0 Volts on the (P422) Right Seat Vent Feed circuit for more than two seconds with the output turned off.

POSSIBLE CAUSES

Possible Causes
(P422) RIGHT SEAT VENT FEED CIRCUIT SHORTED TO VOLTAGE
HEATED SEAT MODULE (HSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
   3. Turn the ignition off.
   4. Start the engine and let it run.
   5. Using a scan tool, read DTCs.

   Is the DTC active?

   Yes

   - Go To 2.

   No

   - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly to the HSM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by operating all HSM functions one at a time, except for the Right Front Vented Seat. Attempt to reproduce condition by adjusting the seat.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (P422) RIGHT SEAT VENT FEED CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 123: Checking Right Seat Vent Feed Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the HSM C5 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Start the engine and let it run.
4. Measure the voltage between ground and the (P422) Right Seat Vent Feed circuit at the HSM C5

harness connector.

Is there any voltage present?

Yes

- Repair the (P422) Right Seat Vent Feed circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK (P422) RIGHT SEAT VENT FEED CIRCUIT FOR A SHORT TO VOLTAGE DURING SEAT ADJUSTMENT**

Fig. 124: Checking Right Seat Vent Feed Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (P422) Right Seat Vent Feed circuit between the HSM C5 harness connector and ground while adjusting the seat in all positions.

   Is there any voltage present during the seat adjustment?

   Yes

   - Repair the (P422) Right Seat Vent Feed circuit for a short to voltage.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Heated Seat Module (HSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

WHEN MONITORED:

When Heated Seat Module (HSM) is powered.

SET CONDITION:

The Heated Seat Module (HSM) detects that the (P687) Left Front Heated Seat Temp Sense circuit NTC is below threshold for more than two seconds.

POSSIBLE CAUSES

Possible Causes
(P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT SHORTED TO GROUND
(P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT SHORTED TO THE (Z909) GROUND CIRCUIT
(P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT SHORTED TO THE (P968) HEATED SEAT SENSOR RETURN CIRCUIT
SEAT CUSHION HEATER ELEMENT SHORTED
HEATED SEAT MODULE (HSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
   3. Turn the ignition off.
   4. Start the engine and let it run.

   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT IN BODY HARNESS FOR A SHORT TO GROUND**

Fig. 126: Checking Left Front Heated Seat Temp Sense Circuit In Body Harness For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Left Seat Cushion Heater harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Turn the ignition on.
4. Using a scan tool, erase DTCs.
5. Turn the ignition off.

6. Start the engine and let it run.
7. Using a scan tool, read DTCs.

   Is the same DTC active?

   Yes

   - Go To 3.

   No

   - Replace the Seat Cushion Heater Element in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK (P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 127: Checking Left Front Heated Seat Temp Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the HSM C2 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance of the (P687) Left Front Heated Seat Temp Sense circuit between ground and the Left Seat Cushion Heater connector (harness side).

   Is the resistance below 10K Ohms?

   Yes

- Repair the (P687) Left Front Heated Seat Temp Sense circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK (P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO THE (Z909) GROUND CIRCUIT OR TO (P968) HEATED SEAT SENSOR RETURN CIRCUIT**

Fig. 128: Checking Left Front Heated Seat Temp Sense Circuit For A Short To The Ground Circuit Or To Heated Seat Sensor Return Circuit

1. Measure the resistance between the (P687) Left Front Heated Seat Temp Sense circuit and the (Z909) Ground circuit at the Left Seat Cushion Heater harness connector.
2. Measure the resistance between the (P687) Left Front Heated Seat Temp Sense circuit and the (P968) Heated Seat Sensor Return circuit at the Left Seat Cushion Heater harness connector.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P687) Left Front Heated Seat Temp Sense circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Seat Cushion Heater Element in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

1. Measure the voltage of the (P687) Left Front Heated Seat Temp Sense circuit between the HSM C2 harness connector and ground while adjusting the seat in all positions.

   Is there any voltage present during the seat adjustment?

   Yes

   - Repair the (P687) Left Front Heated Seat Temp Sense circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **CHECK (P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO THE (P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT OR TO (P188) RIGHT FRONT SEAT HEATER CONTROL CIRCUIT**

2. Disconnect the Left Seat Cushion Heater connector.
3. Disconnect the Right Seat Cushion Heater connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Measure the resistance between the (P687) Left Front Heated Seat Temp Sense circuit and the (P187) Left Front Seat Heater Control circuit at the HSM C2 harness connector.
5. Measure the resistance between the (P687) Left Front Heated Seat Temp Sense circuit and the (P188) Right Front Seat Heater Control circuit at the HSM C2 harness connector.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P687) Left Front Heated Seat Temp Sense circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **CHECK (P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT VOLTAGE TO LEFT SEAT CUSHION HEATER**

Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the HSM C2 harness connector.
2. Start the engine and let it run.
3. Measure the voltage between the (P687) Left Front Heated Seat Temp Sense circuit and the (P968) Heated Seat Sensor Return circuit at the Left Seat Cushion Heater harness connector.

   Is the Voltage above 4.5 volts?

   Yes

- Replace the Seat Cushion Heater Element in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 6.

6. **CHECK (P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT OR AN OPEN**

(P672) LEFT REAR HEATED SEAT TEMP SENSE CIRCUIT SHORTED TO THE (P968) HEATED SEAT SENSOR RETURN CIRCUIT
SEAT CUSHION HEATER ELEMENT SHORTED
HEATED SEAT MODULE (HSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Make sure the battery is fully charged and the charging system is operating properly before proceeding.**

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
3. Turn the ignition off.
4. Start the engine and let it run.
5. Using a scan tool, read DTCs.

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly to the HSM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by adjusting the front seat.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (P672) LEFT REAR HEATED SEAT TEMP SENSE CIRCUIT IN BODY HARNESS FOR A SHORT TO GROUND**

Fig. 148: Checking Left Rear Heated Seat Temp Sense Circuit In Body Harness For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Left Rear Seat Cushion Heater connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Turn the ignition on.
4. Using a scan tool, erase DTCs.
5. Turn the ignition off.
6. Start the engine and let it run.
7. Using a scan tool, read DTCs.

Is the same DTC active?

Yes

- Go To 3.

No

- Replace the Seat Cushion Heater Element in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK (P672) LEFT REAR HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 149: Checking Left Rear Heated Seat Temp Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the HSM C3 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance of the (P672) Left Rear Heated Seat Temp Sense circuit between ground and the Left Rear Seat Cushion Heater harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P672) Left Rear Heated Seat Temp Sense circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK (P672) LEFT REAR HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO THE (Z909) GROUND CIRCUIT OR TO (P968) HEATED SEAT SENSOR RETURN CIRCUIT**

Fig. 150: Checking Left Rear Heated Seat Temp Sense Circuit For A Short To The Ground Circuit Or To Heated Seat Sensor Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P672) Left Rear Heated Seat Temp Sense circuit and the (Z909) Ground circuit at the Left Rear Seat Cushion Heater connector (harness side).
2. Measure the resistance between the (P672) Left Rear Heated Seat Temp Sense circuit and the (P968) Heated Seat Sensor Return circuit at the Left Rear Seat Cushion Heater connector (harness side).

   Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P672) Left Rear Heated Seat Temp Sense circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Heated Seat Module (HSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (P672) LEFT REAR HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 152: Checking Left Rear Heated Seat Temp Sense Circuit For A Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the HSM C3 harness connector.

   NOTE: Check connectors. Clean and repair as necessary.

3. Start the engine and let it run.
4. Measure the voltage of the (P672) Left Rear Heated Seat Temp Sense circuit between the HSM C3 harness connector and ground.

   Is there any voltage present?

   Yes

   - Go To 3.

   No

   - Go To 4.

3. **CHECK (P672) LEFT REAR HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO THE (F931) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT**

Fig. 153: Checking Left Rear Heated Seat Temp Sense Circuit For A Short To The Fused Ignition Run Control Output Circuit

1. Turn the ignition off.
2. Measure the resistance between the (P672) Left Rear Heated Seat Temp Sense circuit and the (F931) Fused Ignition Run Control Output circuit at HSM C3 harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P672) Left Rear Heated Seat Temp Sense circuit for a short to the (F931) Fused Ignition Run Control Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repair the (P672) Left Rear Heated Seat Temp Sense circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK (P672) LEFT REAR HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO VOLTAGE DURING SEAT ADJUSTMENT**

Fig. 154: Checking Left Rear Heated Seat Temp Sense Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (P672) Left Rear Heated Seat Temp Sense circuit between the HSM C3 harness connector and ground while adjusting the front seat.

   Is there any voltage present during the seat adjustment?

   Yes

- Repair the (P672) Left Rear Heated Seat Temp Sense circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **CHECK (P672) LEFT REAR HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO THE (P177) LEFT REAR SEAT HEATER CONTROL CIRCUIT OR TO (P178) RIGHT REAR SEAT HEATER CONTROL CIRCUIT**

Fig. 155: Checking Left Rear Heated Seat Temp Sense Circuit For A Short To The Left Rear Seat Heater Control Circuit Or To Right Rear Seat Heater Control Circuit

1. Turn the ignition off.

2. Disconnect the Left Rear Seat Cushion Heater harness connector.
3. Disconnect the Right Rear Seat Cushion Heater harness connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Measure the resistance between the (P672) Left Rear Heated Seat Temp Sense circuit and the (P177) Left Rear Seat Heater Control circuit at the HSM C3 harness connector.
5. Measure the resistance between the (P672) Left Rear Heated Seat Temp Sense circuit and the (P178) Right Rear Seat Heater Control circuit at the HSM C3 harness connector.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P672) Left Rear Heated Seat Temp Sense circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 6.

6. **CHECK (P672) LEFT REAR HEATED SEAT TEMP SENSE CIRCUIT VOLTAGE TO LEFT REAR SEAT CUSHION HEATER**

Fig. 156: Checking Left Rear Heated Seat Temp Sense Circuit Voltage To Left Rear Seat Cushion Heater
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the HSM C3 harness connector.
2. Start the engine and let it run.
3. Measure the voltage between the (P672) Left Rear Heated Seat Temp Sense circuit and the (P968) Heated Seat Sensor Return circuit at the Left Rear Seat Cushion Heater connector (harness side).

   Is the voltage above 4.5-volts?

   Yes

   - Replace the Seat Cushion Heater Element in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

- Go To 7.

7. **CHECK (P672) LEFT REAR HEATED SEAT TEMP SENSE CIRCUIT OR AN OPEN**

Fig. 157: Checking Left Rear Heated Seat Temp Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the HSM C3 harness connector.
3. Measure the resistance of the (P672) Left Rear Heated Seat Temp Sense circuit between the HSM C3 harness connector and the Left Rear Seat Cushion Heater harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 8.

   No

   - Repair the (P672) Left Rear Heated Seat Temp Sense circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

8. **CHECK (P968) HEATED SEAT SENSOR RETURN CIRCUIT FOR AN OPEN**

Fig. 158: Checking Heated Seat Sensor Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (P968) Heated Seat Sensor Return circuit between the HSM C3 connector and the Left Rear Seat Cushion Heater connector (harness side).

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Heated Seat Module (HSM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the (P968) Heated Seat Sensor Return circuit for an open.

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly to the HSM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by operating all HSM functions one at a time. Attempt to reproduce condition by adjusting the front seat.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK (P673) RIGHT REAR HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 164: Checking Right Rear Heated Seat Temp Sense Circuit For A Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the HSM C3 harness connector.

   NOTE: Check connectors. Clean and repair as necessary.

3. Start the engine and let it run.
4. Measure the voltage of the (P673) Right Rear Heated Seat Temp Sense circuit between the HSM C3 harness connector and ground.

   Is there any voltage present?

   Yes

   - Go To 3.

   No

   - Go To 4.

1. Turn the ignition off.
2. Measure the resistance between the (P673) Right Rear Heated Seat Temp Sense circuit and the (F931) Fused Ignition Run Control Output circuit at HSM C3 harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P673) Right Rear Heated Seat Temp Sense circuit for a short to the (F931) Fused Ignition Run Control Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repair the (P673) Right Rear Heated Seat Temp Sense circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK (P673) RIGHT REAR HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO VOLTAGE DURING SEAT ADJUSTMENT**

1. Turn the ignition off.
2. Disconnect the Right Rear Seat Cushion Heater connector.
3. Disconnect the Left Rear Seat Cushion Heater connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Measure the resistance between the (P673) Right Rear Heated Seat Temp Sense circuit and the (P178) Right Rear Seat Heater Control circuit at the HSM C3 harness connector.
5. Measure the resistance between the (P673) Right Rear Heated Seat Temp Sense circuit and the (P177) Left Rear Seat Heater Control circuit at the HSM C3 harness connector.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P673) Right Rear Heated Seat Temp Sense circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 6.

6. **CHECK (P673) RIGHT REAR HEATED SEAT TEMP SENSE CIRCUIT VOLTAGE TO RIGHT REAR SEAT CUSHION HEATER**

Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the HSM C3 harness connector.
2. Start the engine and let it run.
3. Measure the voltage between the (P673) Right Rear Heated Seat Temp Sense circuit and the (P968) Heated Seat Sensor Return circuit at the Right Rear Seat Cushion Heater connector (harness side).

   Is the voltage above 4.5 Volts?

   Yes

   - Replace the Rear Seat Cushion Heater Element in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the engine running.

SET CONDITION:

If the Heated Seat Module (HSM) detects Voltage above 16.0 volts on the (F930) Fused Ignition Run Control Output circuit.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH
FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT
HEATED SEAT MODULE (HSM)

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DIAGNOSTIC TROUBLE CODES (DTCs)**
    1. Turn the ignition on.
    2. Using a scan tool, read Powertrain Control Module (PCM) DTCs.

    Are there any Charging System DTCs set in the PCM?

    Yes

    - Refer to **CHARGING SYSTEM - DIAGNOSIS AND TESTING** for Charging System diagnostic procedures.

    No

    - Go To 2.
2. **VERIFY DTC IS ACTIVE**
    1. Using a scan tool, record and erase DTCs.
    2. Turn the ignition off.
    3. Start the engine and let run for one minute.
    4. Using a scan tool, read DTCs.

    Is the DTC active?

    Yes

    - Go To 3.

    No

    - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly to the HSM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT VOLTAGE**

Fig. 172: Measuring Fused Ignition Run Control Output Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the HSM C1 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Start the engine and let idle.
4. Measure the voltage of the Fused Ignition Run Control Output circuit between the HSM C1 harness

connector and ground and compare it to the voltage at the vehicle battery.

Is the Voltage measured at the HSM C1 connector the same as the voltage measured at the battery?

Yes

- Replace the Heated Seat Module (HSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repair the Fused Ignition Run Control Output circuit for the cause of the high voltage condition at the HSM.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DIAGNOSTIC TROUBLE CODES (DTCs)**
    1. Turn the ignition on.
    2. Using a scan tool, read Powertrain Control Module (PCM) DTCs.

    Are there any Charging System DTCs set in the PCM?

    Yes

    - Refer to **CHARGING SYSTEM - DIAGNOSIS AND TESTING** for Charging System diagnostic procedures.

    No

    - Go To 2.
2. **VERIFY DTC IS ACTIVE**
    1. Using a scan tool, record and erase DTCs.
    2. Turn the ignition off.

    4. Using a scan tool, read DTCs.

    Is the DTC active?

    Yes

    - Go To 3.

    No

    - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly to the HSM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and

broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by adjusting the seat.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK (F930) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT VOLTAGE**

Fig. 174: Measuring Fused Ignition Run Control Output Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the HSM C1 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Start the engine and let idle.
4. Measure the voltage of the (F930) Fused Ignition Run Control Output circuit between the HSM C1

harness connector and ground and compare it to the voltage at the vehicle battery.

Is the voltage measured at the HSM C1 connector the same as the voltage measured at the battery?

Yes

- Replace the Heated Seat Module (HSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repair the fused Ignition Run Control Output circuit for the cause of the low voltage condition at the HSM.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DTCs**

NOTE: **If present, diagnose and repair DTC U0141-00 Lost Communication With IPM (FCM/TIPM) before proceeding with this diagnostic procedure.**

1. Turn the ignition on.
2. Using a scan tool, read Powertrain Control Module (PCM) DTCs.

Are there any Charging System DTCs set in the PCM?

Yes

- Refer to **CHARGING SYSTEM - DIAGNOSIS AND TESTING** for Charging System diagnostic procedures.

No

- Go To 2.

2. **CHECK FOR DTCs IN TIPM**
   1. Using a scan tool, read TIPM DTCs.

      Are there any DTCs set in the TIPM?

      Yes

      - Diagnose and repair the DTC(s). Refer to **TIPM - DIAGNOSIS AND TESTING** .

      No

      - Go To 3.

3. **CHECK FOR ACTIVE DTC B210C-18-BATTERY VOLTAGE INPUT - CIRCUIT BELOW THRESHOLD IN HSM**
   1. Using a scan tool, read HSM DTCs.

      Is DTC B210C-18-BATTERY VOLTAGE INPUT - CIRCUIT BELOW THRESHOLD active?

      - Diagnose and repair the DTC. Refer to **DIAGNOSIS AND TESTING**.

      No

      - Go To 4.

4. **VERIFY THIS DTC IS ACTIVE**

NOTE:

- **Make sure the Battery is in good condition. Using a suitable Battery Tester, test the Battery before continuing.**
- **Make sure system voltage is in the normal operating range of approximately 12 to 14 volts before continuing.**
- **Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.**
- **Make sure the generator drive belt is in good operating condition.**

- **Inspect the fuses. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.**

1. Using a scan tool, record and erase DTCs.
2. Turn the ignition off.
3. Start the engine and let it run for one minute.
4. Using a scan tool, read DTCs.

      - Go To 2.

      No

      - **Refer to <u>STORED LOST COMMUNICATION DTCS</u>** and perform the diagnostic procedure.
2. **VERIFY TIPM IS COMMUNICATING WITH OTHER MODULES**
   1. Using a scan tool, read DTCs in all modules.

Is any other module reporting a loss of communication with the TIPM?

Yes

- **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response from TIPM diagnostic procedure.

No

- Replace the Heated Seat Module (HSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Heated Steering Wheel (HSW) Temperature Sensor is connected to the Right Steering Switch. The sensor

data is transferred from the Right Steering Switch to the Cluster (CCN) by way of the LIN bus, a serial sub-bus.

WHEN MONITORED:

With the engine running.

SET CONDITION:

The Heated Seat Module (HSM) does not receive the Heated Steering Wheel (HSW) Temperature Sensor Fault Signal from the Cluster (CCN) for more than two seconds.

POSSIBLE CAUSES

Possible Causes

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Diagnose and repair all active Bus related Diagnostic Trouble Codes (DTCs) including Lost Communication DTCs before diagnosing this DTC.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase DTCs.
   3. Turn the ignition off.
   4. Start the engine and let it run.
   5. Using a scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Go To 2.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by rotating the steering wheel.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK FOR AN OPEN OR SHORTED HSW TEMPERATURE SENSOR**

Fig. 178: Checking HSW Temperature Sensor For An Open Or Short
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Remove the Driver Airbag in accordance with the Service Information.
2. Disconnect the Steering Wheel Heater Sensor connector.

NOTE: **Before proceeding, thoroughly inspect the wiring harness and connectors between the HSW and the Right Steering Wheel Switch. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.**

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

3. Measure the Voltage between the (G110) HSW Temperature Sensor Signal circuit and the (G907) EVIC MUX Return circuit at the Steering Wheel Heater Sensor connector.

   Is the Voltage above 3.5-volts?

   Yes

   - Replace the Heated Steering Wheel (HSW) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **CHECK (G110) HSW TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 179: Checking HSW Temperature Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Right Steering Wheel Switch connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance of the (G110) HSW Temperature Sensor Signal circuit between the Steering Wheel Heater Sensor connector and the Right Steering Wheel Switch connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 4.

Yes

- Repair the (G110) HSW Temperature Sensor Signal circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK (G110) HSW TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 180: Checking HSW Temperature Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G110) HSW Temperature Sensor Signal circuit between ground and

the Right Steering Wheel Switch connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (G110) HSW Temperature Sensor Signal circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **CHECK (G110) HSW TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO (G902) SWITCH MUX RETURN CIRCUIT, (G907) EVIC MUX RETURN CIRCUIT, AND (Z911) GROUND CIRCUIT**

Fig. 181: Checking HSW Temperature Sensor Signal Circuit For A Short To Switch MUX Return Circuit, EVIC MUX Return Circuit, & Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G110) HSW Temperature Sensor Signal circuit and the (G902) Switch MUX Return circuit at the Right Steering Wheel Switch connector.
2. Measure the resistance between the (G110) HSW Temperature Sensor Signal circuit and the (G907) EVIC MUX Return circuit at the Right Steering Wheel Switch connector.
3. Measure the resistance between the (G110) HSW Temperature Sensor Signal circuit and the (Z911) Ground circuit at the Right Steering Wheel Switch connector.

   Is the resistance below 10K Ohms between the (G110) HSW Temperature Sensor Signal circuit and any of the other circuits?

   Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (G110) HSW Temperature Sensor Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 6.

6. **CHECK (G907) EVIC MUX RETURN CIRCUIT FOR AN OPEN**

Fig. 182: Checking EVIC MUX Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G907) EVIC MUX Return circuit between the Steering Wheel Heater Sensor connector and the Right Steering Wheel Switch connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7.

   No

   - Repair the (G907) EVIC MUX Return circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK FOR AN OPEN OR SHORTED RIGHT STEERING WHEEL SWITCH**
   1. Replace the Right Steering Wheel Switch in accordance with the Service Information.
   2. Reconnect the Steering Wheel Heater Sensor connector.
   3. Turn the ignition on.
   4. Using a scan tool, erase DTCs.
   5. Turn the ignition off.
   6. Start the engine and let it run.
   7. Using a scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Replace the Steering Control Module (SCM) in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

      No

      - Test complete.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

STANDARD PROCEDURE

HEATED STEERING WHEEL CONFIGURATION

DIAGNOSTIC TEST

1. **PERFORMING HEATED STEERING WHEEL CONFIGURATION PROCEDURE**
   1. Using the scan tool, perform the HEATED STEERING CONFIGURATION procedure under Misc Functions.

2. With the scan tool, select View DTCs in the HSM.

   Are there any DTCs present?

   Yes

   - Perform the appropriate diagnostic procedure(s).

   No

   - Test Complete

DESCRIPTION

DESCRIPTION

WARNING: **The front passenger seat assembly contains critical components that affect the front passenger airbag deployment. Correctly functioning front passenger seat components are critical for the Occupant Classification System (OCS) to properly classify the front passenger and calculate the proper airbag deployment. Unapproved modifications or service procedures to the front passenger seat assembly, its related components, or trim cover may inadvertently change the airbag deployment in case of a frontal crash. This could result in death or serious injury to the front seat passenger if the vehicle is involved in an accident. Refer to WARNING . The following requirements must be strictly adhered to:**

- **Do not modify the front passenger seat assembly or components in any way.**
- **Do not modify the front seat center console or center position seat in any way.**
- **Do not use prior or future model year seat trim covers not designated for the specific model being repaired. Always use the correct seat trim cover specified for the vehicle.**
- **Do not replace the seat trim cover with an aftermarket trim cover.**
- **Do not add a secondary trim cover other than those approved by Chrysler/Mopar.**
- **At no time should any Supplemental Restraint System (SRS) component or SRS related component or fastener be modified or replaced with any part except those which are approved by Chrysler/Mopar.**

Fig. 1: Heated Seat Switches
Courtesy of CHRYSLER GROUP, LLC

Vehicles with the heated seat option can be visually identified by the two heated seat switches located in the center stack of the instrument panel, and the two heated seat switches located at the rear of the floor center console. The heated seat system allows the seat passenger to select from two different levels of electrical seat heating (HI/LO). The heated seat system for this vehicle includes the following major components:

- **Heated Seat Switches** - Up to four heated seat switches are used per vehicle, including two Light-Emitting Diode (LED) indicator lamps for heat level indication. Two switches for the front seats and two switches for the rear seats if equipped with rear heated seats. The front heated seat switches are mounted in the switchbank located on the instrument panel center bezel under the HVAC controls. If equipped the rear heated seat switches are located on the back side of the floor center console.
- **Heated Seat Elements** - Up to eight heated seat elements are used per vehicle, two for each seat. The elements are integral to the individual seat and seat back cushions.
- **Heated Seat Control Module (HSCM)** - One module located under the drivers front seat. The HSCM controls the functions of all the heated seats and if equipped the heated steering wheel and vented seats.

OPERATION

OPERATION

The heated seat system operates on battery current received through a fuse in the Totally Integrated Power Module (TIPM). Fused ignition switch output (run) circuits are used, so that the heated seat system will only operate when the ignition switch is in the On position. The heated seat system will turn Off automatically whenever the ignition switch is turned to any position except On.

A Heated Seat Control Module (HSCM) is used to control the heated seat system. The HSCM responds to heated seat switch input and ignition switch status inputs by controlling the 12v output to the seat heating elements through integral solid-state relays.

When any of the heated seat switches are depressed the heating elements for the selected seat are energized. Light Emitting Diodes (LEDS) on the switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The HSCM energizes an integral solid-state relay, which supplies battery current to the heating elements. When high-temperature heating is selected, the heaters provide a boosted heat level during the first four minutes of operation after heating is activated. The heat output then drops to the normal high-temperature level. If high-level heating is selected, the control system will automatically switch to the low level after two hours of continuous operation. At that time, the number of illuminated LEDs changes from two to one, indicating the change. Operation on the low setting will continue indefinitely until the switch/module button is pushed to turn the system off.

The system will automatically turn off the heating elements if it detects an OPEN or LOW short in the heating element circuit.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED SEAT SYSTEM

NOTE: **Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7 volts or above 15.5 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated seat system appears inoperative.**

NOTE: **If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, sit in the seat in question and move around the heating elements within the seat while testing continuity. also wiggle the heated seat wire harness and electrical connectors while testing continuity.**

NOTE: **For complete circuit diagrams, refer to appropriate Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

Before testing any individual components in the heated seat system, check the following:

- Check to see if the concern is isolated to only one seat. Operate the other heated seat.
- Check the ignition fuse in the Totally integrated Power Module (TIPM). Repair as necessary.
- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM), If any DTCs are found, repair as necessary. Refer to **DIAGNOSIS AND TESTING** .
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the heated seat system.

- If there are no DTCs and the front heated seat system functions properly, but a heated seat switch indicator does not illuminate, the switch pod assembly in the instrument panel must be replaced. Refer to **SWITCH, HEATED SEAT, REMOVAL**.
- If there are no DTCs and the rear heated seat system functions properly, but one or both of the indicator lamps in a rear heated seat switch do not illuminate, check the rear heated switch circuits and repair as necessary. Refer to appropriate Wiring information. If the wiring is OK, replace the inoperative second row heated seat switch. Refer to **SWITCH, HEATED SEAT, REMOVAL**.

PAD, HEATER

DESCRIPTION

DESCRIPTION

Vehicles equipped with the optional heated seat system have up to four heated seats with two heated seat elements, located in each seat. One heating element is used for each seat cushion and another for each seat back.

Each of the heated seat elements consists of multiple heating circuits operating in parallel throughout the element. The heated seat elements are captured between the seat trim cover and the seat cushion assembly. If a malfunction occurs in one or more of the individual circuits, the others will continue to provide heat.

The heated seat elements cannot be repaired. If found to be damaged or inoperative, a new heating element assembly must be installed.

OPERATION

OPERATION

One end of the heated seat element is connected to ground at all times through a splice under the seat. Battery current is directed to the other end of the heated seat element by the Heated Seat Control Module (HSCM). The heated seat switch/module will energize the heated seat element when the heated seat switch/module button is depressed in the Low or High position.

As electrical current passes through the heated seat element, the resistance of the wire used in the element disperses some of the electrical current in the form of heat. The heat produced by the heated seat element then radiates through the underside of the seat cushion and seat back trim covers, warming the seat cover and its occupant.

The wire harness connectors (2 and 3) for the heating elements are located under the seat (1).

NOTE: **When testing the heated seat elements for resistance, be certain to sit in the seat in question and move around the heating elements within the seat while testing. Moving the heating elements will help eliminate the possibility of an intermittent open in the element, which would only be evident in a certain position.**

1. Locate and disconnect the seat electrical connector.
2. Check the resistance between the circuits leading in and out of the suspect heated seat element. The resistance should be between the specifications listed in the following Heated Seat Element Resistance chart. If OK, refer to **DIAGNOSIS AND TESTING**. If not OK, replace the inoperative heated seat element. Refer to **PAD, HEATER, REMOVAL**.

NOTE: **The factory installed heating elements (3) can be removed from the seat or seat back cushions by carefully peeling the element off along the adhesive lines.**

NOTE: **Some vehicles come equipped with vented and heated seats front seats. The front seat elements of these vehicles have a one piece vented/heated pad assembly.**

NOTE: **On vehicles quipped with vented seats, the vented/heated pad will have to be routed through the seat cushion prior to removing the element.**

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate seat cushion or seat back cover.
3. Disconnect the inoperative heated seat cushion or seat back element electrical connectors (2).
4. Remove the heated seat element from the foam pad by peeling the element away from the cushion. Be careful not to remove excessive foam in the process.

INSTALLATION

INSTALLATION

CAUTION: **During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.**

NOTE: **Some model vehicles come equipped with both heated and vented seats front seats.**

Fig. 4: Installing Heating Element
Courtesy of CHRYSLER GROUP, LLC

NOTE: **On vehicles equipped with vented seats, the vented seat pad will have to be routed through the seat cushion prior to installation of the seat cushion**

1. Peel off the adhesive backing from the replacement heater element (2) and stick on foam pad directly where the original heater element was positioned (1). There will be adhesive marks on the cushion outlining the factory installed location.

Fig. 5: Heating Element Electrical Connectors

NOTE: **Make certain the seat wire harness is correctly routed through the seat and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the rear seat cover flap.**

2. Connect the heater element electrical connectors (3 and 4).
3. Reconnect the negative battery cable.
4. Verify heated seat system operation.
5. Install the appropriate seat cushion or seat back cover.

SWITCH, HEATED SEAT

DESCRIPTION

FRONT

Fig. 6: Heated Seat Switches
Courtesy of CHRYSLER GROUP, LLC

The Heated Seat Switches (1) are momentary contact push button switches mounted in the instrument panel center bezel that operate the heated seat system. Each heated seat switch has two Light-Emitting Diode (LED) indicator lamps, which indicate the selected level (Low or High) of the seat heater. Pressing the switch initiates heat. Heat remains on until switched off or until the ignition is turned off. If switched off by the ignition, a switch must be pressed to restart heating.

The LED indicator lamps in each heated seat switch cannot be repaired. If the LED lamps are faulty or damaged, or the switch is inoperative or damaged the switchbank assembly must be replaced. for the switchbank replacement procedure. Refer to **SWITCH, HEATED SEAT, REMOVAL**.

REAR

Fig. 7: Rear Center Floor Console & Heated Seat Switches
Courtesy of CHRYSLER GROUP, LLC

The heated seat switches (1) for the 2nd row seats are located in the rear center floor console (2). These switches allow the 2nd row seat passengers to select from two different levels of electrical seat heating (HI/LO). Amber Light Emitting Diodes (LEDS) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off. The 2nd row heated seat switches are available individually for service. If the switches are inoperative or damaged in any way they should be replaced. Refer to **SWITCH, HEATED SEAT, REMOVAL**.

The two momentary, push button-type heated seat switches provide a hardwired resistance signal to the Instrument Cluster (also known as the Cab Compartment Node/CCN). The instrument cluster then sends a message via the Controller Area Network (CAN) data bus network to the heated seat module, signaling the module to energize the heating element for the selected seat. Light Emitting Diodes (LED) in each switch indicate the level of heat in use. The switch LEDs are controlled by the instrument cluster.

The two LED indicator lamps and the incandescent bulb in each heated seat switch cannot be repaired. If the indicator lamps or back lighting bulb are inoperative or damaged, the individual heated seat switch must be replaced.

OPERATION

FRONT

A Heated Seat Control Module (HSCM) is used to control the heated seat system. The HSCM responds to heated seat switch input and ignition switch status inputs by controlling the 12v output to the seat heating elements through integral solid-state relays.

When any of the heated seat switches are depressed the heating elements for the selected seat are energized. Light Emitting Diodes (LEDS) on the switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The HSCM energizes an integral solid-state relay, which supplies battery current to the heating elements. When high-temperature heating is selected, the heaters provide a boosted heat level during the first four minutes of operation after heating is activated. The heat output then drops to the normal high-temperature level. If high-level heating is selected, the control system will automatically switch to the low level after two hours of continuous operation. At that time, the number of illuminated LEDs changes from two to one, indicating the change. Operation on the low setting will continue indefinitely until the switch/module button is pushed to turn the system off.

The system will automatically turn off the heating elements if it detects an OPEN or LOW short in the heating element circuit.

REAR

The heated seat switches for the 2nd row seats are located in the rear center floor console. Amber Light Emitting Diodes (LEDS) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once will select high-level heating.

Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

When either of the 2nd row heated seat switches are depressed a hardwired resistance signal is sent to the Instrument Cluster (also known as the Cab Compartment Node/CCN). The instrument cluster then sends a message via the Controller Area Network (CAN) data bus network to the heated seat module, signaling the module to energize the heating element for the selected seat. Light Emitting Diodes (LED) in each switch indicate the level of heat in use. The switch LEDs are controlled by the instrument cluster.

REMOVAL

3. Align the trim panel (3) to the console and insert the bottom tabs into the mounting slots.
4. Tilt the upper edge of the trim panel (1) forward and apply hand pressure to seat all retaining clips.

5. Connect the battery negative cable.
6. Verify 2nd row heated seat system operation.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRIC BACKLIGHT (EBL) AND HEATED MIRROR SYSTEM

NOTE: **Illumination of the defogger switch indicator lamp does not necessarily mean that electrical current is reaching the rear window glass and/or the outside rear view mirror heating grids.**

NOTE: **See APPROPRIATE Wiring Information for circuit descriptions and diagrams of the rear window defogger (EBL) and heated mirror systems,**

Operation of the Electrical Back Light (EBL) and heated mirror systems can be confirmed by the following:

Fig. 1: Testing EBL Grid Lines
Courtesy of CHRYSLER GROUP, LLC

1. Use a scan tool and check for Diagnostic Trouble Codes (DTCs) related to the A/C-heater control and the Totally Integrated Power Module (TIPM). If no DTCs are found, go to 2. If any DTCs are found, repair as required, then proceed to 2.
2. Turn the ignition switch to RUN. Set the rear window defogger switch to ON. Rear window defogger operation can be checked by feeling the rear window glass, or the heated outside rear view mirror glass. A distinct difference in temperature between the grid lines (1) and the adjacent clear glass (2) or the heated mirror glass should be detected within 3 to 4 minutes of operation.
3. If a rear window glass temperature difference is not detected, use a 12-volt DC voltmeter (4) and contact the rear glass heating grid power feed terminal A (3) with the positive lead, and the ground terminal B (5)

with the negative lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:

- Confirm the ignition switch is in RUN.
- Confirm the rear window defogger switch is ON.
- Confirm the EBL feed wire is connected to the heating grid positive terminal and that there is continuity between the TIPM and the heating grid.
- Confirm the EBL ground wire is connected to the heating grid negative terminal and that there is continuity to ground.
- When diagnosing a heated mirror concern, check the heated mirror circuit fuse located in the TIPM. The fuse must be tight in the receptacle and all electrical connections must be secure.

4. If broken defogger grid lines or bus bars are suspected, use a 12-volt DC voltmeter and contact the rear glass heating grid ground terminal B with the negative lead and each rear glass heating grid line at its mid-point with the positive lead. The voltmeter should read approximately 6 volts at each grid line mid-point. If the voltmeter does not read approximately 6 volts, repair the open grid line(s) or bus bar(s). Refer to **GRID, DEFOGGER, REAR, STANDARD PROCEDURE** .
5. If the operation of the EBL system and/or the heated mirror system has been verified but the defogger LED indicator does not illuminate, replace the A/C-heater control. Refer to **CONTROL, A/C AND HEATER, REMOVAL** .

HEATED SEAT ELEMENT

The wire harness connectors (2 and 3) for the heating elements are located under the seat (1).

NOTE: **When testing the heated seat elements for resistance, be certain to sit in the seat in question and move around the heating elements within the seat while testing. Moving the heating elements will help eliminate the possibility of an intermittent open in the element, which would only be evident in a certain position.**

1. Locate and disconnect the seat electrical connector.
2. Check the resistance between the circuits leading in and out of the suspect heated seat element. The resistance should be between the specifications listed in the following Heated Seat Element Resistance chart. If OK, refer to **HEATED SEATS - DIAGNOSIS AND TESTING** . If not OK, replace the inoperative heated seat element. Refer to **PAD, HEATER, REMOVAL** .

HEATED SEAT ELEMENT RESISTANCE

Element Location	Acceptable Resistance Value
Seat Bottom Cushion	10.6 - 7.1 ohms
Seat Back Cushion	12.6 - 8.4 ohms

DIAGNOSIS AND TESTING - HEATED SEAT SYSTEM

NOTE: **Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7 volts or above 15.5 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated seat system appears inoperative.**

NOTE: **If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, sit in the seat in question and move around the heating elements within the seat while testing continuity. also wiggle the heated seat wire harness and electrical connectors while testing continuity.**

NOTE: **For complete circuit diagrams, see APPROPRIATE Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

Before testing any individual components in the heated seat system, check the following:

- Check to see if the concern is isolated to only one seat. Operate the other heated seat.
- Check the ignition fuse in the Totally integrated Power Module (TIPM). Repair as necessary.

- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM), If any DTCs are found, repair as necessary. Refer to **HSM - DIAGNOSIS AND TESTING** .
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the heated seat system.
- If there are no DTCs and the front heated seat system functions properly, but a heated seat switch indicator does not illuminate, the switch pod assembly in the instrument panel must be replaced. Refer to **SWITCH, HEATED SEAT, REMOVAL** .
- If there are no DTCs and the rear heated seat system functions properly, but one or both of the indicator lamps in a rear heated seat switch do not illuminate, check the rear heated switch circuits and repair as necessary. See appropriate Wiring information. If the wiring is OK, replace the inoperative second row heated seat switch. Refer to **SWITCH, HEATED SEAT, REMOVAL** .

HEATED STEERING WHEEL

CAUTION: When equipped with a leather wrapped heated steering wheel and replacement of a Heated Seat Module (HSM) is required, the new HSM must be manually configured with a scan tool. Refer to STANDARD PROCEDURE . Failure to follow these instruction may result in damage to the heated steering wheel.

NOTE: Vehicles equipped with the heated steering wheel option utilize a low voltage cut-off feature. This feature turns off power to the heated steering wheel anytime vehicle voltage is below 11.7 volts or above 15.5 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated steering wheel appears inoperative.

NOTE: If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, move the steering wheel around while testing continuity. also wiggle the heated steering wheel wire harness and electrical connectors while testing continuity.

NOTE: For complete circuit diagrams, see appropriate Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

Before testing any individual components in the heated steering wheel system, check the following:

1. Check the fuse located in the Totally Integrated Power Module (TIPM). The fuse must be OK and tight in the receptacle.
2. Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM) and the heated steering wheel switch. Refer to **HSM - DIAGNOSIS AND TESTING** . If any DTCs are found, repair as necessary.

3. When equipped with a leather wrapped heated steering wheel, verify the HSM is configured to the leather steering wheel option, using a scan tool. Refer to **STANDARD PROCEDURE** .
4. Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the heated steering wheel system.
5. If there are no DTCs and the heated steering wheel system functions properly, but the Light Emitting Diode (LED) indicator in the switch does not illuminate, replace the instrument panel switch pod. Refer to **SWITCH, HEATED STEERING WHEEL, REMOVAL** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN SYSTEM

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

Refer to the appropriate wiring information.

In most cases, any problem involving continually sounding horns can be quickly alleviated by removing the horn fuse from the Totally Integrated Power Module (TIPM).

WARNING: **Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.**

Horn System - Service Information - Ram Pickup

DESCRIPTION

DESCRIPTION

This vehicle comes equipped with either a single or a dual-note horn system that features one or two electromagnetic horn units. The horn system includes the following major components:

- **Horn(s) -** The horn(s) are located on the upper radiator cross member at the front of the engine compartment, below the upper splash shield. The splash shield must be removed to gain access to the horns for removal.
- **Horn Fuse(s) -** The horn fuse(s) are located in the Totally Integrated Power Module (TIPM).
- **Horn Switch -** The horn switch consists of four individual buttons that are mounted to the steering wheel armature beneath the driver airbag unit. The four button style switches are only serviced as a unit.

On vehicles with an optional Electronic Vehicle Information Center (EVIC), the horn switch shares the same circuit as the right EVIC switch. This switch is also a LIN bus slave, sharing a LIN input circuit to the CCN (LIN master) with the Steering Control Module (SCM), which is also a LIN bus slave. The right EVIC switch also shares an IOD feed and a ground feed in common with the SCM.

Vehicles with an optional EVIC and steering wheel mounted switches (except LX) have a unique horn switch electrical architecture. For more information on the EVIC, refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .

OPERATION

OPERATION

The horn system operates on battery current received through a fuse in the Totally Integrated Power Module (TIPM). The horn system circuit is designed so that the system will remain operational, regardless of the ignition switch position.

DIAGNOSTIC TEST

1. **DTC PRESENT**

NOTE: **Make sure that the correct Cluster is installed and is correctly configured for the vehicle.**

NOTE: **Make sure that there is communication between the Cluster and PCM before proceeding with this test.**

NOTE: **Diagnose and repair any DTCs before proceeding with this test.**

NOTE: **Make sure that the PCM passes the Shift Lever Test with the scan tool before proceeding with this test.**

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display any Cluster or PCM DTCs?

   Yes

   - Cluster DTCs. Refer to **DIAGNOSIS AND TESTING** .
   - PCM DTCs. Refer to **DTC INDEX** .

   No

   - Go To 2.

2. **CLUSTER**
    1. Perform the Instrument Cluster Self Test.
    2. Turn the ignition off.
    3. Press and hold the Trip/Reset button.
    4. Turn the ignition on.
    5. Observe the PRNDL display during the Self Test.

    Did any part of the VF display fail to illuminate?

    Yes

    - Replace and program the Cluster in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

    No

    - The condition is not present at this time. Monitor scan tool parameters while wiggling the related wiring harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

The instrument cluster (2) is located in the instrument panel (1) above the steering column opening and includes the hardware and software necessary to serve as the electronic body control module also known as the Cab Compartment Node (CCN). The remainder of the instrument cluster, including the mounts and the electrical connections, are concealed within the instrument panel behind the cluster bezel. Besides analog gauges and indicators, the CCN module incorporates a single unit for displaying odometer/trip odometer information, engine hours, several warning or reminder indications and certain diagnostic information. The instrument cluster for this vehicle also.

Fig. 2: Instrument Cluster Housing, Rear Cover & Hood Unit

The instrument cluster gauges and indicators are visible through a dedicated opening in the cluster bezel on the instrument panel and are protected by a clear plastic cluster lens that is integral to a cluster lens and hood unit (2). Just behind the cluster lens is the cluster hood. The cluster hood serves as a visor and shields the face of the cluster from ambient light and reflections to reduce glare. A black plastic odometer/trip odometer switch button protrudes through dedicated holes in the cluster lens, located near the lower edge of the cluster just to the left of the speedometer. The molded plastic lens and hood unit has three integral mounting tabs, one each on the lower outboard corners and one on the upper center of the unit. These mounting tabs are used to secure the CCN to the molded plastic instrument panel cluster carrier with three screws.

The rear of the cluster housing and the CCN electronic circuitry are protected by a molded plastic rear cover (1), which is secured to the cluster housing with molded plastic clips, while eight similar clips around the outside perimeter of the rear cover secure it to the cluster lens and hood unit. The rear cover includes clearance holes for the cluster connector receptacles. The connector receptacles on the back of the cluster electronic circuit board connect the CCN to the vehicle electrical system through three take outs with connectors from the instrument panel wire harness.

Sandwiched between the rear cover and the lens and hood unit is the cluster housing (3). The molded plastic cluster housing serves as the carrier for the cluster circuit board and circuitry, the cluster connector receptacles, the gauges, a Light Emitting Diode (LED) for each cluster indicator, an audible tone transducer, the cluster overlay, the gauge pointers, the odometer/trip odometer switch.

The cluster overlay is a laminated plastic unit. The dark, visible, outer surface of the overlay is marked with all of the gauge dial faces and graduations, but this layer is also translucent. The darkness of this outer layer prevents the cluster from appearing cluttered or busy by concealing the cluster indicators that are not illuminated, while the translucence of this layer allows those indicators and icons that are illuminated to be readily visible. The underlying layer of the overlay is opaque and allows light from the LED for each of the various indicators and the LED general illumination behind it to be visible through the outer layer of the overlay only through predetermined stencil-like cutouts. A rectangular opening in the overlay between the Tachometer and the Speedometer through which the Liquid Crystal Display (LCD) unit can be viewed.

Several versions of the CCN module are offered on this vehicle. These versions accommodate all of the variations of optional equipment and regulatory requirements for the various markets in which the vehicle will be offered. The microprocessor-based CCN utilizes integrated circuitry and information carried on the Controller Area Network (CAN) data bus along with several hard-wired analog and multiplexed inputs to monitor sensors and switches throughout the vehicle. In response to those inputs, the internal circuitry and programming of the CCN allow it to control and integrate many electronic functions and features of the vehicle through both hard-wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the CAN data bus. Refer to **COMMUNICATION, DESCRIPTION** .

VEHICLE SYSTEM SUPPORT

Besides typical instrument cluster gauge and indicator support, the electronic functions and features that the CCN supports or controls include the following:

- **Audible Warnings** - The CCN electronic circuit board is equipped with an audible tone transducer and programming that allows it to provide various audible alerts to the vehicle operator, including chime tones and beep tones and, emulates the sound of a conventional turn signal or hazard warning flasher. Refer to **DESCRIPTION** .
- **Brake Lamp Control** - The CCN provides electronic **brake lamp request** messages to the Totally Integrated Power Module (TIPM) located in the engine compartment near the battery for brake lamp control, excluding control of the Center High Mounted Stop Lamp (CHMSL), which remains controlled by a direct hard-wired output of the brake lamp switch.
- **Cargo Lamp Control** - The CCN provides direct control of cargo lamp operation with a load shedding (battery saver) feature which will automatically turn OFF the cargo lamp if it remains ON after a timed interval.
- **Electronic Transfer Case Interface** - On vehicles equipped with an electronic four-wheel drive transfer case, the CCN monitors a hard-wired multiplex input from the transfer case mode switch and then provides the appropriate electronic data bus messages to the TIPM for transfer case control. After the transfer case shift is completed, the TIPM provides an electronic message back to the CCN and the CCN responds by activating the appropriate 4WD indicators within the cluster or in the transfer case switch.
- **Electronic Vehicle Information Center Support** - The CCN provides support for the optional Electronic Vehicle Information Center (EVIC) by calculating average fuel economy, distance to empty and outside temperature values and storing trip odometer and elapsed ignition-ON time data.
- **Enhanced Accident Response Support** - The CCN monitors an input from the Occupant Restraint Controller (ORC) and, following an airbag deployment. The CCN monitors an input from the Powertrain Control Module (PCM) to automatically turn ON the interior lighting after an airbag deployment event, 10 seconds after the vehicle speed is zero. The interior lighting remains illuminated until the ignition switch is turned to the OFF position, at which time the interior lighting returns to normal operation and control. These Enhanced Accident Response System (EARS) features are each dependent upon a functional vehicle electrical system following the vehicle impact event.
- **Exterior Lighting Control** - The CCN provides electronic **head lamp** and **park lamp request** messages to the TIPM for the appropriate exterior lamp control of standard head and park lamps, as well as optional front fog lamps. This includes support for headlamp beam selection and the optical horn feature, also known as flash-to-pass.
- **Exterior Lighting Fail-Safe** - In the absence of a headlamp switch input, the CCN will turn ON the cluster general illumination lamps and provide electronic **headlamp low beam** and **park lamp request**

messages to the TIPM for default exterior lamp operation. The TIPM will also provide default park lamp and headlamp low beam operation and the CCN will turn ON the cluster general illumination lighting at full intensity if there is a failure of the electronic data bus communication between the CCN and the TIPM.

- **Fuel Level Data Support** - The TIPM provides a current source for and receives a Bus message input from the fuel level sending unit located on the fuel pump module in the fuel tank. The TIPM then sends electronic messages to the CCN over the Can Data bus to calculate the proper fuel gauge needle position and low fuel indicator operation. Based upon this input, the CCN also calculates fuel level, average fuel economy and distance to empty data, then uses electronic messaging to transmit this data over the CAN data bus for use by other electronic modules in the vehicle.
- **Heated Seat Control** - The CCN monitors inputs from the ignition switch and electronic **engine speed** messages from the Powertrain Control Module (PCM) to control a high side driver output to the heated seat switch Light Emitting Diode (LED) indicators. This input allows the heated seat switches to wake up the heated seat module if the switch is actuated. The CCN will de-energize the heated seat switch LED indicators, which deactivates the heated seat system, if the ignition switch is turned to any position except ON or START, or if the **engine speed** message indicates zero. Refer to **DESCRIPTION** .
- **Horn Control** - The CCN monitors an input from the horn switch and provides electronic **horn request** messages to the TIPM for horn control.
- **Instrument Panel Synchronization** - The CCN monitors hard-wired multiplexed inputs from the headlamp switch on the instrument panel, then transmits electronic **panel lamp dimming level** messages which allows all other electronic modules on the CAN data bus to coordinate their illumination intensity with that of the CCN. This includes a PARADE mode (also known as funeral mode) that allows all LCD units in the vehicle to be illuminated at full (daytime) intensity while driving during daylight hours with the exterior lamps turned ON.
- **Interior Lamp Load Shedding** - The CCN provides a battery saver feature which will automatically turn OFF all interior lamps and the cargo lamps if they remain ON after a timed interval of about five minutes.
- **Interior Lighting Control** - The CCN monitors inputs from the interior lighting switch, the door ajar switches, the cargo lamp switch, the reading lamp switches, and the Wireless Ignition Node (WIN) to provide courtesy lamp control. This includes support for timed illuminated entry with theater-style fade-to-OFF and courtesy illumination DEFEAT features.
- **Panel Lamps Dimming Control** - The CCN monitors hard-wired multiplexed inputs from the headlamp switch on the instrument panel, then provides a hard-wired 12-volt Pulse-Width Modulated (PWM) output that synchronizes the dimming level of all panel lamps dimmer controlled lamps with that of the cluster illumination lamps.
- **Remote Keyless Entry** - The CCN supports the optional Remote Keyless Entry (RKE) system features, including support for the RKE LOCK, UNLOCK (with optional driver-door-only unlock, and unlock-all-doors), PANIC, audible chirp, optical chirp, illuminated entry modes, an RKE programming mode, as well as optional Vehicle Theft Security System (VTSS) arming (when the proper VTSS arming conditions are met) and disarming.
- **Remote Radio Switch Interface** - The CCN monitors inputs from the optional remote radio switches and then provides the appropriate electronic data bus messages to the radio to select the radio or optional hands-free cellular system operating mode, volume control, preset station scan and station seek features.
- **Turn Signal and Hazard Warning Lamp Control** - The CCN monitors hard wired multiplexed inputs from the multi-function switch on the steering column, then provides electronic **turn** and **hazard lamp request** messages to the TIPM for turn and hazard lamp control. The CCN also provides an audible click

at one of two rates to emulate normal and bulb out turn or hazard flasher operation based upon electronic **lamp outage** messages from the TIPM, and provides an audible turn signal ON chime warning if a turn is signalled continuously for more than about 1.6 kilometers (one mile) and the vehicle speed remains greater than about 24 kilometers-per-hour (15 miles-per-hour).

- **Vehicle Theft Security System Control** - The CCN monitors inputs from the door ajar switches, the ignition switch, and the WIN, then provides electronic **horn** and **lighting request** messages to the TIPM for the appropriate VTSS alarm output features.
- **Wiper and Washer System Control** - The CCN monitors LIN Bus inputs from the wiper and washer switches in the multi-function switch on the steering column, then provides electronic **wiper** and **washer request** messages to the TIPM for the appropriate wiper and washer system features. Refer to **DESCRIPTION** .

LIQUID CRYSTAL DISPLAY

The instrument cluster includes the following Liquid Crystal Display (LCD) units:

- **EVIC Display (20)**
- **Odometer/Trip Odometer Display (20)**

An odometer and trip odometer are standard factory-installed equipment in all instrument clusters. The odometer, trip odometer, and engine hours information are displayed in a common electronic, blue-green LCD unit. This LCD unit is soldered onto the cluster electronic circuit board and is visible through a window with a smoked lens located on the lower edge of the speedometer gauge dial face of the cluster overlay. The dark lens over the LCD prevents the indicator from being clearly visible when it is not illuminated.

The odometer, trip odometer, and engine hours information are not displayed simultaneously. The trip odometer reset switch on the instrument cluster circuit board toggles the display between odometer and trip odometer modes by depressing the odometer/trip odometer switch button that extends through the lower edge of the cluster lens, just left of the tachometer. When the trip odometer information is displayed, the word **TRIP** is also illuminated in the lower right corner of the LCD in a blue-green color and at the same lighting level as the trip odometer information. The engine hours information replaces the selected odometer or trip odometer information whenever the ignition switch is in the ON position and the engine is not running.

The odometer, trip odometer, and engine hours information is stored in the instrument cluster memory. This information can be increased when the proper inputs are provided to the instrument cluster, but the information cannot be decreased. The odometer can display values up to 999, 999 kilometers (621, 000 miles). The odometer latches at these values, and will not roll over to zero. The trip odometer can display values up to 999.9 kilometers (621, 000 miles) before it rolls over to zero. Engine hours are displayed in the format, **hr 9999** . The cluster will accumulate values up to 65, 000 hours before the display rolls over to zero. The engine hours are displayed within the LCD odometer display on low line models and in the EVIC display on high line models.

The odometer display does not have a decimal point and will not show values less than a full unit (kilometer or mile), while the trip odometer display does have a decimal point and will show tenths of a unit (kilometer or mile). The unit of measure (kilometers or miles) for the odometer and trip odometer display is not shown in the LCD. The unit of measure for the instrument cluster odometer/trip odometer is selected at the time that it is manufactured, and cannot be changed. The odometer also has a RENTAL CAR mode, which will illuminate the odometer information in the LCD whenever the driver side front door is opened with the ignition switch in the OFF or ACCESSORY positions.

During daylight hours (exterior lamps are OFF) the odometer LCD is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the LCD lighting level is adjusted with the other cluster general illumination lamps using the panel lamps dimmer thumbwheel on the headlamp switch. However, a PARADE mode position of the panel lamps dimmer thumbwheel allows the LCD to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours.

The odometer/trip odometer LCD, the trip odometer switch, and the trip odometer switch button are serviced as a unit with the instrument cluster.

The CCN module for this vehicle is serviced only as a complete unit. The CCN module cannot be adjusted or repaired. If a gauge, an LED indicator, the LCD unit, the electronic circuit board, the circuit board hardware, the cluster overlay, or the CCN housing are damaged or ineffective, the entire CCN module must be replaced. The cluster lens, hood and mask unit are available for separate service replacement.

OPERATION

OPERATION

The instrument cluster includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or (CCN). The following information deals primarily with the instrument cluster functions of this unit. Additional details of the electronic body control functions of this unit may be found within the service information for the system or component that the CCN controls. For example: Additional details of the audible warning functions of the CCN are found within the Chime/Buzzer service information.

The CCN is designed to allow the vehicle operator to monitor the conditions of many of the vehicle components and operating systems. The gauges and indicators in the CCN provide valuable information about the various standard and optional powertrains, fuel and emissions systems, cooling systems, lighting systems, safety systems and many other convenience items. The CCN is installed in the instrument panel so that all of these monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access for service.

The microprocessor-based CCN hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. Some of these inputs are hard wired, but most are in the form of electronic messages that are transmitted by other electronic modules over the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, OPERATION** .

The CCN microprocessor smooths the input data using algorithms to provide gauge readings that are accurate, stable and responsive to operating conditions. These algorithms are designed to provide gauge readings during normal operation that are consistent with customer expectations. However, when abnormal conditions exist such as high coolant temperature, the algorithm can drive the gauge pointer to an extreme position and the microprocessor can sound a chime through the on-board audible tone transducer to provide distinct visual and audible indications of a problem to the vehicle operator. The CCN may also produce audible warnings for other electronic modules in the vehicle based upon electronic **tone request** messages received over the CAN data bus. Each audible warning is intended to provide the vehicle operator with an audible alert to supplement a visual indication.

The CCN circuitry operates on battery current received through a fused B(+) fuse on a non-switched fused B(+) circuit, and on battery current received through a fused ignition switch output (run-start) fuse on a fused ignition switch output (run-start) circuit. This arrangement allows the CCN to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the ON or START positions. The CCN circuitry is grounded through a ground circuit and take out of the instrument panel wire harness with an eyelet terminal connector that is secured by a ground screw to a ground location on the instrument panel structural support.

The CCN also has a self-diagnostic test capability, which will test each of the CAN bus message-controlled functions of the cluster by lighting the appropriate indicators, positioning the gauge needles at several predetermined calibration points across the gauge faces, and illuminating all segments of the odometer/trip odometer/gear selector indicator Liquid Crystal Display (LCD) Display unit. Refer to **DIAGNOSIS AND TESTING**.

LIQUID CRYSTAL DISPLAY

The Liquid Crystal Display (LCD) unit is attached to the CCN electronic circuit board. With the ignition switch in the OFF or ACCESSORY positions, the odometer display is activated when the driver door is opened (Rental Car mode) and is deactivated when the driver door is closed. Otherwise, the display unit is active when the ignition switch is in the ON or START positions, and inactive when the ignition switch is in the OFF or ACCESSORY positions.

The illumination intensity of the LCD unit is controlled by the CCN circuitry based upon an input from the headlamp switch and a dimming level input received from the panel dimmer switch. The CCN synchronizes the illumination intensity of other LCD units with that of the unit in the CCN by sending electronic **dimming level** messages to other electronic modules in the vehicle over the CAN data bus.

The instrument cluster LCD unit has several display capabilities including odometer, trip odometer, engine hours, fuel saver mode notification, gear selector indication (PRNDL) for vehicles with an automatic transmission, warning or reminder indications, as well as various diagnostic messages when certain fault conditions exist. An odometer/trip odometer switch on the CCN circuit board is used to control some of the display modes. This switch is actuated manually by depressing the odometer/trip odometer switch button that extends through the lower edge of the cluster lens, just left of the tachometer. Actuating this switch momentarily with the ignition switch in the ON position will toggle the LCD between the odometer and trip odometer modes. Depressing the switch button for about two seconds while the LCD is in the trip odometer mode will reset the trip odometer value to zero.

While in the odometer mode with the ignition switch in the ON position and the engine not running, depressing the odometer/trip odometer switch for about six seconds will display the engine hours information on vehicle not equipped with an EVIC. Holding this switch depressed while turning the ignition switch from the OFF position to the ON position will initiate the CCN self-diagnostic test for additional details on this cluster function. Refer to **DIAGNOSIS AND TESTING**. The CCN microprocessor remembers which display mode is active when the ignition switch is turned to the OFF position, and returns the LCD display to that mode when the ignition switch is turned ON again.

The LCD unit is diagnosed using the CCN self-diagnostic test. Refer to **DIAGNOSIS AND TESTING**. Proper testing of the CAN data bus and the electronic data bus message inputs to the CCN that control some of the LCD functions requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for the odometer, the trip odometer, the gear selector indicator and the various warning and reminder indicator functions of the LCD unit may be found elsewhere in this service information.

CLUSTER ILLUMINATION

The CCN has several illumination lamps that are illuminated whenever the ignition is turned to the ON position. The illumination intensity of these lamps is adjusted when the interior lighting thumbwheel on the headlamp switch is rotated (down to dim, up to brighten) to one of the available minor detent positions. The CCN monitors a resistor multiplexed input from the headlamp switch on a dimmer input circuit. In response to that input, the CCN electronic circuitry converts a fused 12-volt input it receives on a hardwired panel lamps dimmer switch signal circuit into a 12-volt Pulse Width Modulated (PWM) output.

The CCN uses this PWM output to control the illumination intensity of the cluster illumination lamps and the LCD unit on the CCN circuit board, then provides a synchronized PWM output on various hard wired fused panel lamps dimmer switch signal circuits to control and synchronize the illumination intensity of other incandescent illumination lamps in the vehicle. The CCN also transmits electronic **dimming level** messages

over the CAN data bus to other electronic modules in the vehicle to control and synchronize the illumination intensity of their LCD units to that of the CCN LCD unit.

In addition, the thumbwheel on the headlamp switch has a PARADE mode position to provide a PARADE (or funeral) mode. The CCN monitors the request for this mode from the headlamp switch, then transmits an electronic **dimming level** message to illuminate all LCD units in the vehicle at full (daytime) intensity for easier visibility when driving in daylight with the exterior lighting turned ON.

The hard wired headlamp switch and panel lamps dimmer inputs to and outputs from the CCN may be diagnosed using conventional diagnostic tools and procedures. However, proper testing of the PWM processing of the CCN and the electronic **dimming level** messages sent by the CCN over the CAN data bus requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INSTRUMENT CLUSTER

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

If all of the instrument cluster gauges and indicators are inoperative, be certain to check the instrument cluster fused B(+) fuse and the instrument cluster fused B(+) and ground circuits for shorts or opens. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If an individual hardwired gauge or indicator is inoperative, refer to the appropriate diagnostic information for that specific gauge or indicator. If an individual Controller Area Network (CAN) data bus message-controlled gauge or indicator is inoperative, perform the Self Test as follows:

CAUTION: **Instrument clusters used in this vehicle automatically configure themselves for compatibility with the features and optional equipment in the vehicle in which they are initially installed. The instrument cluster is programmed to do this by embedding the Vehicle Identification Number (VIN) and other information critical to proper cluster operation into electronic memory. This embedded information is learned through electronic messages received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus, and through certain hard wired inputs received when the cluster is connected to the vehicle electrically. Once configured, the instrument cluster memory may be**

irreparably damaged and certain irreversible configuration errors may occur if the cluster is connected electrically to another vehicle; or, if an electronic module from another vehicle is connected that provides data to the instrument cluster (including odometer values) that conflicts with that which was previously learned and stored. Therefore, the practice of exchanging (swapping) instrument clusters and other electronic modules in this vehicle with those removed from another vehicle must always be avoided. Failure to observe this caution may result in instrument cluster damage, which is not reimbursable under the terms of the product warranty. Service replacement instrument clusters are provided with the correct VIN, and the certified odometer and engine hours values embedded into cluster memory, but will otherwise be automatically configured for compatibility with the features and optional equipment in the vehicle in which they are initially installed.

NOTE: **Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. If the problem being diagnosed involves improper illumination of the cruise indicator, the electronic throttle control indicator, the fog lamp indicator, any of the four-wheel drive indicators, the overdrive OFF indicator, the tow/haul indicator, the transmission overtemp indicator, the security indicator or the gear selector indicator, disconnect and isolate the battery negative cable. After about five minutes, reconnect the battery negative cable and turn the ignition switch to the ON position. The instrument cluster should automatically relearn the equipment in the vehicle and properly configure the configurable indicators accordingly.**

SELF TEST

The instrument cluster self test will put the instrument cluster into its self-diagnostic mode. In this mode the instrument cluster can perform a self-diagnostic test that will confirm that the instrument cluster circuitry, the gauges, and the indicators are capable of operating as designed. During the self test the instrument cluster circuitry will position each of the gauge needles at various calibration points, illuminate all of the segments or portions in the Liquid Crystal Display (LCD) unit, and turn all of the indicators ON and OFF again.

Successful completion of the self test will confirm that the instrument cluster is operational. However, there may still be a problem with the CAN data bus, the Powertrain Control Module (PCM), the Totally Integrated Power Module (TIPM), the Transmission Control Module (TCM), the Occupant Restraint Controller (ORC), the Controller Anti-lock Brake (CAB), the Wireless Ignition Node (WIN) or the hardwired inputs to one of these electronic control modules. Use a diagnostic scan tool to diagnose these components. Refer to the appropriate diagnostic information.

1. Begin the test with the ignition switch in the OFF position.
2. Depress the odometer/trip odometer switch button.
3. While still holding the odometer/trip odometer switch button depressed, turn the ignition switch to the ON position, but do not start the engine.

4. Release the odometer/trip odometer switch button.
5. The instrument cluster will simultaneously begin to illuminate all of the operational segments in the LCD unit and perform a bulb check of each operational Light Emitting Diode (LED) indicator. The LCD segments and LED indicators remain illuminated as each gauge needle is swept to several calibration points and back. If a VFD segment or an LED indicator fails to illuminate, or if a gauge needle fails to sweep through the calibration points and back during this test, the instrument cluster must be replaced.
6. The self test is now completed. The instrument cluster will automatically exit the self-diagnostic mode and return to normal operation at the completion of the test. The self test will be aborted if the ignition switch is turned to the OFF position, or if a vehicle speed message indicating that the vehicle is moving is received from the PCM over the CAN data bus during the test.
7. Go back to repeat the test, if necessary. Refer to 1.

STANDARD PROCEDURE

STANDARD PROCEDURE - ENHANCED SEATBELT REMINDER PROGRAMMING

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or BELTMINDER feature that is enabled when the vehicle is shipped from the factory. This beltminder feature provides extended and modified visual seatbelt indicator and audible chime warning responses to an unbuckled driver side front seat belt. The BELTMINDER feature may be disabled or enabled by the customer using the programming sequence that follows, or by the dealer using a diagnostic scan tool.

CUSTOMER PROGRAMMING SEQUENCE

NOTE: The following sequence of events must occur within 60 seconds of the ignition switch being placed in the ON position in order for the programming to be completed successfully.

1. With all doors closed and the ignition switch in any position except ON or START, buckle the driver side front seat belt.
2. Turn the ignition switch to the ON position and wait for the seatbelt indicator reminder function to conclude (about six seconds).
3. Unbuckle and buckle the driver side front seat belt slowly three or more times, giving the indicator time to cycle on and off, ending with the belt buckled.
4. Turn the ignition switch to any position except ON or START to toggle the BELTMINDER feature from its current setting (from active to inactive, or from inactive to active). A single chime tone will provide an audible confirmation that the programming sequence has been successfully completed.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or

instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 14: SL Cluster (Gasoline Only)

The instrument cluster includes the following analog gauges:

- **Engine Temperature Gauge (4)**
- **Fuel Gauge (3) (17)** - On HEV vehicles the fuel gauge is located within the speedometer.
- **Oil Pressure Gauge (17) (3)** - All except base models. On HEV vehicles the oil pressure gauge is located next to the engine temperature gauge.
- **Speedometer (5)**
- **Tachometer (1)**
- **Voltage Gauge (24)** - All except base models.
- **Power Gauge (24)** - Hybrid Electric Vehicle (HEV) only.

Gauges are illuminated by LEDs that are soldered onto the CCN electronic circuit board. Cluster illumination is accomplished by dimmable LEDs soldered onto the CCN electronic circuit, which illuminate each of the gauges for visibility when the exterior lighting is turned ON. The gauges and LED units are not available for service replacement, and if damaged or inoperative, the entire CCN must be replaced.

ENGINE TEMPERATURE GAUGE

An engine coolant temperature gauge is standard equipment on all instrument clusters. The engine coolant temperature gauge is located in the upper right center quadrant of the instrument cluster, next to the fuel gauge. The gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from **C** (or Cold) to **H** (or Hot) for gasoline

engines. An International Control and Display Symbol icon for **Engine Coolant Temperature** is located on the cluster overlay, directly below the left end of the gauge scale.

The engine coolant temperature gauge graphics are white against a black field except for a single red graduation at the high end of the gauge scale making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned ON, the white gauge graphics appear amber on the low line and white on the high line, while the red graphics still appear red. The gauge needle has internal optical illumination. Gauge illumination is provided by Light Emitting Diode (LED) units located on the instrument cluster electronic circuit board.

FUEL GAUGE

A fuel gauge is standard equipment on all instrument clusters. This gauge is located in the upper center quadrant of the instrument cluster, left of the temperature gauge. This gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from **E** (or Empty) to **F** (or Full).

An International Control and Display Symbol icon for **Fuel** is located on the cluster overlay, directly below the gauge scale. An arrowhead pointed to the left side of the vehicle is imprinted on the cluster overlay next to the **Fuel** icon on the gauge to provide the driver with a reminder as to the location of the fuel filler access. On vehicles equipped with a diesel engine, text that specifies **DIESEL ONLY** is located across the fuel gauge below the gauge scale, but above the hub of the gauge needle.

The fuel gauge graphics are white against a black field except for a single red graduation at the low end of the gauge scale making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster general illumination lighting with the exterior lamps turned ON, the gauge graphics appear amber for low line models and white for high line models while the red graphics still appear red. The gauge needle has internal optical illumination. Gauge illumination is provided by an Light Emitting Diode (LED) located on the instrument cluster electronic circuit board.

OIL PRESSURE GAUGE

An oil pressure gauge is standard equipment on all **SLT** instrument clusters with a gasoline or diesel engine. This gauge is located in the lower center quadrant of the speedometer. On Hybrid Electric Vehicle (HEV) models the oil pressure gauge is located above the Electronic Vehicle Information Center (EVIC), just left of center. This gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from **L** (or Low) to **H** (or High).

An International Control and Display Symbol icon for **Engine Oil** is located on the cluster overlay, on **ST** instrument clusters and on the gauge face directly below the gauge scale on **SLT** instrument clusters. The oil pressure gauge graphics are white against a black field except for a single red graduation at the low end of the gauge scale making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster general illumination lighting with the exterior lamps turned ON, the white graphics appear white and the red graphics still appear red. The gauge needle has internal optical illumination. Gauge illumination is provided by Light Emitting Diode (LED) units located on the instrument cluster electronic circuit board.

POWER GAUGE

A power gauge is standard equipment on all high line HEV instrument clusters. This gauge is located in the lower portion of the tachometer below the gauge needle. This gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from **ECO** to **PWR** .

The power gauge graphics are white against a black field except for a green and white scale used to show the economy and power range of the vehicle, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster general illumination lighting with the exterior lamps turned ON, the white graphics appear white and the green graphics still appear green. The gauge needle has internal optical illumination. Gauge illumination is provided by a Light Emitting Diode (LED) located on the instrument cluster electronic circuit board.

SPEEDOMETER

A speedometer is standard equipment on all instrument clusters. The speedometer is located next to the tachometer, just to the right of center in the instrument cluster. The speedometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 210 degree primary scale on the gauge dial face.

The speedometer reads left-to-right either from **0** to **120** mph, or from **0** to **200** km/h, depending upon the market for which the vehicle is manufactured. Each version also has a secondary inner scale on the gauge dial face that provides the equivalent opposite units from the primary scale. Text appearing on the cluster overlay just below the hub of the speedometer needle abbreviates the unit of measure for the primary scale (either **mph** or **km/h**), followed by the unit of measure for the secondary scale.

The speedometer graphics are white (primary scale) and gray (secondary scale) against a black field making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster general illumination lighting, the primary scale graphics appear white and the secondary scale graphics appear light gray. The gauge needle has internal optical illumination. Gauge illumination is provided by Light Emitting Diode (LED) units located on the instrument cluster electronic circuit board.

TACHOMETER

A tachometer is standard equipment on all instrument clusters. The tachometer is located to the left of the speedometer, just to the left of center in the instrument cluster. The tachometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 210 degree scale on the gauge dial face. The tachometer reads left-to-right from **0** to **7** . The text **RPM X 1000** is imprinted on the cluster overlay directly below the hub of the tachometer needle. This text identifies that each number on the tachometer scale is to be multiplied by 1000 rpm.

The tachometer graphics are white against a black field making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster general illumination lighting, the scale graphics appear white and the red graphics still appear red. The gauge needle has internal optical illumination. Gauge illumination is provided by a Light Emitting Diode (LED) unit located on the instrument cluster electronic circuit board.

VOLTAGE GAUGE

A voltage gauge is standard equipment on all high line instrument clusters. This gauge is located in the lower portion of the tachometer below the gauge needle. This gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from **L** (or Low) to **H** (or High) and an International Control and Display Symbol icon for **Battery Charging Condition** is located within the gauge itself directly below the gauge scale. On low line models the symbol is near the left edge of the instrument cluster, on the cluster overlay next to the tachometer.

The voltage gauge graphics are white against a black field except for a single red graduation at each end of the gauge scale making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster general illumination lighting with the exterior lamps turned ON, the white graphics appear white and the red graphics still appear red. The gauge needle has internal optical illumination. Gauge illumination is provided by a Light Emitting Diode (LED) located on the instrument cluster electronic circuit board.

OPERATION

OPERATION

GAUGES

All gauges receive battery current through the CCN circuitry only when the ignition switch is in the ON or START positions. With the ignition switch in the OFF position battery current is not supplied to any gauges, and the CCN circuitry is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the ignition switch is in the ON or START positions.

All of the CCN gauges are driven by stepper motors. Multiple toothed electromagnets around a central gear-shaped piece of iron are located within each gauge. The electromagnets are energized by the CCN circuitry in response to messages received over the CAN data bus. To make the motor shaft turn, one electromagnet is given power, which makes the gears teeth magnetically attract to the electromagnets. As the second electromagnet is turned on the first is turned off and the gear rotates to align to the energized magnet, and the process is repeated. Each of those slight rotations is called at "step", this allows the motor to be turned to precise angles. The gauge needle moves as the magnets align to the changing magnetic fields created around it by the electromagnets.

The gauges are diagnosed using the CCN self-diagnostic test. Refer to **DIAGNOSIS AND TESTING**. Proper testing of the CAN data bus and the electronic data bus message inputs to the CCN that control each gauge require the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for each gauge may be found elsewhere in this service information.

ENGINE TEMPERATURE GAUGE

The engine coolant temperature gauge gives an indication to the vehicle operator of the engine coolant temperature. This gauge is controlled by the Cab Compartment Node (CCN) based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus. These electronic messages are received from the Powertrain Control Module (PCM) or Engine Control Module (ECM), depending on engine application.

The engine coolant temperature gauge is a stepper motor design unit that receives battery current on the CCN electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The CCN electronic circuitry controls the gauge needle position and provides the following features:

- **Engine Temperature Low Message -** Each time the CCN receives an electronic engine temperature message from the PCM or ECM indicating the temperature is below the low end of normal [about 54 °C (130 °F), the gauge needle is held at the graduation on the far left end of the gauge scale. The gauge needle remains at the low end of the gauge scale until the CCN receives a message from the PCM or ECM indicating the temperature is above about 54 °C (130 °F), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Engine Temperature Message -** Each time the CCN receives an electronic engine temperature message from the PCM or ECM indicating the temperature is between the low end of normal [about 54 °C (130 ° F) and the high end of normal [about 122 °C (252 °F), the gauge needle is moved to the actual relative temperature position on the gauge scale.
- **Engine Temperature High Message -** Each time the CCN receives three consecutive electronic engine temperature messages from the PCM or ECM indicating the temperature is above about 122 °C (252 °F), the gauge needle is moved to the red increment or zone at the far right end of gauge scale, the check gauges indicator is illuminated, and a single chime tone is sounded. The gauge needle remains at the high end of the gauge scale and the check gauges indicator remains illuminated until the cluster receives a message from the PCM or ECM indicating that the temperature is below about 122 °C (252 °F), or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the check gauges indicator is cycled OFF and then ON again by the appropriate messages from the PCM or ECM.
- **Communication Error -** If the CCN fails to receive an **engine temperature** message, it will hold the gauge needle at the last indication for about 10 seconds or until the ignition switch is turned to the OFF position, whichever occurs first. After 10 seconds, the CCN will move the gauge needle to the low end of the gauge scale.

The PCM or ECM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM or ECM then sends the proper messages to the CCN. For further diagnosis of the engine coolant temperature gauge or the electronic circuitry that controls the gauge, refer to **DIAGNOSIS AND TESTING**. If the instrument cluster turns ON the check gauges indicator due to a high engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service.

FUEL GAUGE

The fuel gauge gives an indication to the vehicle operator of the level of fuel in the fuel tank. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and a bus message received by the cluster. This bus message is based upon a hard-wired input received by the Total Integrated Power Module (TIPM) from the fuel level sending unit on the fuel pump module, located in the fuel tank.

The fuel gauge is a stepper motor design unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The CCN electronic circuitry controls the gauge needle

position and provides the following features:

- **Fuel Level Sending Unit Input** - The TIPM provides a constant current source to the fuel level sending unit and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level falls and decreases as the fuel level rises causing changes in the fuel level sense input voltage. The TIPM sends the fuel level voltage to the cluster over the Controller Area Network (CAN) bus. The cluster programming applies an algorithm to calculate the proper fuel gauge needle position based upon the fuel level bus input, then moves the gauge needle to the proper relative position on the gauge scale. This algorithm is used to dampen gauge needle movement against the negative effect that fuel sloshing within the fuel tank can have on accurate inputs from the fuel tank sending unit to the cluster.
- **Less Than 10 Percent Tank Full Input** - Each time the fuel level sense input to the cluster indicates the fuel tank is about 10 percent full or less for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, the gauge needle is moved to about the one-sixteenth graduation on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level sense input is greater than about 15 percent full for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled OFF and then ON again by the appropriate inputs from the fuel level sending unit.
- **Less Than Empty Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is less than the EMPTY gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is a short circuit.
- **More Than Full Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is more than the FULL gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is an open circuit.

The instrument cluster, also known as the Cab Compartment Node (CCN) continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The CCN then sends the proper electronic fuel level message to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. For further diagnosis of the fuel gauge or the instrument cluster circuitry that controls the gauge, refer to **DIAGNOSIS AND TESTING**.

OIL PRESSURE GAUGE

The oil pressure gauge gives an indication to the vehicle operator of the engine oil pressure. This gauge is controlled by the Cab Compartment Node (CCN) based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus. These electronic messages are received from the Powertrain Control Module (PCM) or Engine Control Module (ECM), depending on engine application.

The oil pressure gauge is a stepper motor design unit that receives battery current on the CCN electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The CCN electronic circuitry controls the gauge needle

position and provides the following features:

- **Engine Oil Pressure Message** - The CCN circuitry restricts the oil pressure gauge needle operation in order to provide readings that are consistent with customer expectations. Each time the cluster receives an electronic engine oil pressure message from the PCM or ECM indicating the pressure is above about 89 kPa (13 psi) the cluster holds the gauge needle at a point near the middle increment within the normal range on the gauge scale.
- **Engine Oil Pressure Low Message** - Each time the CCN receives three consecutive electronic engine oil pressure messages from the PCM or ECM indicating the pressure is below about 89 kPa (13 psi), the gauge needle is moved to the red graduation at the far left end of the gauge scale, the check gauges indicator is illuminated, and a single chime tone is generated. The gauge needle remains at the left end of the gauge scale and the check gauges indicator remains illuminated until the cluster receives a message from the PCM or ECM indicating that the pressure is above about 89 kPa (13 psi), or until the ignition switch is turned to the OFF position, whichever occurs first. The cluster will only turn ON the check gauges indicator in response to a low pressure message if the engine speed is greater than zero.
- **Communication Error** - If the CCN fails to receive an engine oil pressure message, it will hold the gauge needle at the last indication for about 10 seconds, or until the ignition switch is turned to the OFF position, whichever occurs first. After 10 seconds, the CCN will move the gauge needle to the low end of the gauge scale.

The PCM or ECM continually monitors the engine oil pressure sensor to determine the engine oil pressure. The PCM or ECM then sends the proper messages to the CCN. For further diagnosis of the oil pressure gauge or the instrument cluster circuitry that controls the gauge, refer to **DIAGNOSIS AND TESTING**. If the instrument cluster turns ON the check gauges indicator due to a low oil pressure gauge reading, it may indicate that the engine or the engine oiling system requires service.

POWER GAUGE

The power gauge gives an indication to the vehicle operator of how the Hybrid Electric Vehicle (HEV) is being operated in terms of the electric or gasoline modes and the relative gasoline fuel economy. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Hybrid Control Processor (HCP) integral to the Traction Power Inverter Module (TPIM) over the Controller Area Network (CAN) data bus.

The power gauge is a stepper motor design unit that receives battery current on the CCN electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The CCN electronic circuitry controls the gauge needle position and provides the following features:

- **Charging Position Message** - Each time the cluster receives electronic messages from the HCP indicating that there is electrical energy being generated by the Regenerative Brake System (RBS) and that the high voltage battery of the HEV system is being recharged it positions the gauge needle within the **Charging** range of the gauge scale. The gauge needle remains within the **Charging** range until the cluster receives a message from the HCP to reposition the gauge needle, or until the ignition switch turns to the OFF position, whichever occurs first.
- **Economy Position Message** - If the cluster receives electronic messages from the HCP indicating that

the vehicle is being operated in the fuel-saving hybrid electrical mode it positions the gauge needle to the appropriate relative position within the **Economy** range of the gauge scale. The closer the needle moves to the center of the **Economy** range indicates that the vehicle is achieving more fuel economy through reliance on the electrical mode of operation; while, the further the needle moves to the right of center indicates that the vehicle is achieving less fuel economy through additional reliance on the gasoline mode of operation. The gauge needle remains within the **Economy** range until the cluster receives a message from the HCP to reposition the gauge needle, or until the ignition switch turns to the OFF position, whichever occurs first.

- **Power Position Message -** Each time the cluster receives electronic messages from the HCP indicating that the vehicle is achieving the least fuel economy through reliance entirely on the gasoline mode of operation it positions the gauge needle to the appropriate relative position within the **Power** range of the gauge scale. The further the needle moves toward the right end of the scale, the greater the power being demanded from the gasoline engine and the lower the fuel economy being achieved. The gauge needle remains within the **Power** range until the cluster receives a message from the HCP to reposition the gauge needle, or until the ignition switch turns to the OFF position, whichever occurs first.
- **Communication Error -** If the cluster fails to receive a power gauge message, it holds the gauge needle at the last indication for about three seconds, or until the ignition switch turns to the OFF position, whichever occurs first. After three seconds, the gauge needle returns to the left end of the gauge scale.

The HCP continually monitors the HEV system circuits, sensors and components as well as inputs from the Powertrain Control Module (PCM) to determine the appropriate HEV operating mode and power gauge positioning strategies. The HCP then sends the proper electronic messages to the instrument cluster, also known as the Cab Compartment Node (CCN) to control the power gauge needle position. For further diagnosis of the power gauge or the instrument cluster circuitry that controls the gauge, refer to **DIAGNOSIS AND TESTING**.

Use a diagnostic scan tool for proper diagnosis of the HEV systems, the HCP, the PCM, the CCN, the CAN data bus or the electronic communication related to power gauge operation. Refer to the appropriate diagnostic information.

SPEEDOMETER

The speedometer gives an indication to the vehicle operator of the vehicle road speed. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) or Engine Control Module (ECM), depending on engine application, over the Controller Area Network (CAN) data bus.

The speedometer is a stepper motor design unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Vehicle Speed Message -** Each time the cluster receives an electronic vehicle speed message from the PCM it will calculate the correct vehicle speed reading and position the gauge needle at that relative speed position on the gauge scale. The cluster will receive a new message and reposition the gauge pointer accordingly about every 88 milliseconds. The gauge needle will continually be positioned at the relative vehicle speed position on the gauge scale until the vehicle stops moving, or until the ignition switch is turned to the OFF position, whichever occurs first.

- **Communication Error -** If the cluster fails to receive a speed message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the OFF position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.

The PCM continually monitors the Vehicle Speed Sensor (VSS) or electronic wheel speed messages from the Controller Anti-lock Brake (CAB) to determine the vehicle road speed. The PCM then sends the proper vehicle speed messages to the instrument cluster, also known as the Cab Compartment Node (CCN). For further diagnosis of the speedometer or the instrument cluster circuitry that controls the gauge, refer to **DIAGNOSIS AND TESTING**.

TACHOMETER

The tachometer gives an indication to the vehicle operator of the engine speed. This gauge is controlled by the Cab Compartment Node (CCN) based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus. These electronic messages are received from the Powertrain Control Module (PCM) or Engine Control Module (ECM), depending on engine application.

The tachometer is a stepper motor design unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The CCN electronic circuitry controls the gauge needle position and provides the following features:

- **Engine Speed Message -** Each time the CCN receives an electronic **engine speed** message from the PCM or ECM it will calculate the correct engine speed reading and position the gauge needle at that relative speed position on the gauge scale. The CCN will receive a new message and reposition the gauge pointer accordingly about every 88 milliseconds. The gauge needle will continually be repositioned at the relative engine speed position on the gauge scale until the engine stops running, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error -** If the CCN fails to receive a speed message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the OFF position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.

The PCM continually monitors the crankshaft position sensor to determine the engine speed. The ECM continually monitors the engine speed sensor to determine the engine speed. The PCM or ECM, depending on engine application, then sends the proper **engine speed** messages to the CCN. For further diagnosis of the tachometer or the instrument cluster circuitry that controls the gauge, refer to **DIAGNOSIS AND TESTING**.

VOLTAGE GAUGE

The voltage gauge gives an indication to the vehicle operator of the electrical system voltage. This gauge is controlled by the Cab Compartment Node (CCN) based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus. These electronic messages are received from the Powertrain Control Module (PCM) or Engine Control Module (ECM), depending on engine application.

The voltage gauge is a stepper motor design unit that receives battery current on the CCN electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the left end of the scale after

the ignition switch is turned to the OFF position. The CCN electronic circuitry controls the gauge needle position and provides the following features:

- **System Voltage Message** - Each time the CCN receives an electronic system voltage message from the PCM or ECM indicating the voltage is between about 9.5 volts and about 15 volts, the gauge needle is moved to the relative voltage position on the gauge scale.
- **System Voltage Low (Charge Fail) Message** - Each time the CCN receives three consecutive electronic system voltage messages from the PCM or ECM indicating the voltage is less than about 9 volts (charge fail condition) or that the battery temperature sensor input is an open circuit, the gauge needle is moved to the graduation on the far left end of the gauge scale and the check gauges indicator is illuminated. The gauge needle remains at the far left end of the gauge scale and the check gauges indicator remains illuminated until the cluster receives a single message from the PCM or ECM indicating the voltage is greater than about 9.5 volts (but less than about 15.5 volts), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **System Voltage High Message** - Each time the CCN receives 3 consecutive electronic system voltage messages from the PCM or ECM indicating the voltage is greater than about 15.5 volts, the gauge needle is moved to the graduation on the far right end of the gauge scale and the check gauges indicator is illuminated. The gauge needle remains at the right end of the gauge scale and the check gauges indicator remains illuminated until the cluster receives a message from the PCM or ECM indicating the voltage is less than about 15.0 volts (but greater than about 9.5 volts), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the CCN fails to receive a **system voltage** message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the OFF position, whichever occurs first. After three seconds, the CCN will move the gauge needle to the far left end of the gauge scale.

The PCM or ECM continually monitors the system voltage to control the generator output. The PCM then sends the proper system voltage message to the CCN. For further diagnosis of the voltage gauge or the instrument cluster circuitry that controls the gauge, refer to **DIAGNOSIS AND TESTING**. If the instrument cluster turns ON the check gauges indicator due to a charge fail or voltage high condition, it may indicate that the charging system requires service.

INDICATORS, INSTRUMENT CLUSTER

DESCRIPTION

DESCRIPTION

The CCN houses provisions for up to 28 indicators, as well as 6 analog gauges standard on all models, that are all controlled by the Cab Compartment Node (CCN). For more information on the gauges, refer to **GAUGE PACK, INSTRUMENT CLUSTER, DESCRIPTION**. Some of the CCN indicators are automatically configured when the CCN is connected to the vehicle electrical system for compatibility with certain optional equipment or equipment required for regulatory purposes in certain markets. While each CCN may have provisions for indicators to support every available option, the configurable indicators will not be functional in a vehicle that does not have the equipment that an indicator supports.

The instrument cluster includes provisions for the following indicators:

- **Airbag Indicator (30)**
- **Antilock Brake System (ABS) Indicator (31)**
- **Brake Indicator (26)**
- **Cargo Lamp Indicator (25)**
- **Change Oil Indicator (21)** - on domestic market vehicles only, a textual message in the Electronic Vehicle Information center (EVIC) if so equipped.
- **Charging Indicator (35)**
- **Cruise Indicator (21)** - Textual message in odometer LCD. Also in the EVIC if so equipped.
- **Diesel Exhaust Fluid (DEF) indicator (21)** - Textual message in the EVIC (diesel engines only).
- **Diesel Exhaust Brake indicator (15)**
- **Door Ajar Indicator (21)** - Textual message in odometer LCD. Also in the EVIC if so equipped.
- **Electronic Stability Control System Activation Indicator (14)**
- **Electronic Stability Control System OFF Indicator (36)** - Also in the EVIC if so equipped.
- **Fog Lamp Indicator (32)**
- **Four-Wheel Drive (4WD) Indicator (10)**
- **Four-Wheel Drive Auto (4WD Auto) Indicator (11)**
- **Four-Wheel Drive Low (4 LOW) Indicator (7)**

- **Four-Wheel Drive Low (4 LOCK) Indicator (8)**
- **Gas Cap Indicator (21) -** International Vehicle Control and Display Symbols (ICON) image in odometer LCD. Vehicle equipped with and EVIC a textual message with an ICON.
- **High Beam Indicator (23)**
- **Low Fuel Indicator (22) -** Also in the EVIC if so equipped.
- **Low Oil Pressure Indicator (27) -** Also in the EVIC if so equipped.
- **Malfunction Indicator Lamp (MIL) (29)**
- **No Bus Indicator (21) -** Textual message in odometer LCD. Also in the EVIC if so equipped.
- **No Fuse Indicator (21) -** Textual message in odometer LCD. Also in the EVIC if so equipped.
- **Regenerative Brake System (RBS) indicator (37)**
- **Seat Belt Indicator (34)**
- **Security Indicator (16)**
- **Service Four-Wheel Drive (Serv 4WD) Indicator (12) -** Also in the EVIC if so equipped.
- **Tire Pressure Monitor (TPM) Indicator (28)**
- **Tow/Haul Indicator (13)**
- **Transmission Overtemp Indicator (33) -** Also in the EVIC if so equipped.
- **Transmission Range Indicator (20)**
- **Electronic Throttle Control (9)** Also in the EVIC if so equipped.
- **Turn Signal (Right and Left) Indicators (2)**
- **Wait-To-Start Indicator (21) -** With diesel engine only
- **Washer Fluid Indicator (21) -** Textual message in odometer LCD. Also in the EVIC if so equipped.
- **Water-In-Fuel Indicator (21) -** With diesel engine only.

Each indicator in the CCN, except those located within the LCD unit, is illuminated by a dedicated LED that is soldered onto the CCN electronic circuit board. Cluster illumination is accomplished by dimmable LED back lighting, which illuminates each of the gauges for visibility when the exterior lighting is turned ON. The LED units are not available for service replacement and, if damaged or ineffective, the entire CCN must be replaced. For more information on the indicator ICON images, refer to **INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS, DESCRIPTION** .

OPERATION

OPERATION

Indicators are located in various positions within the CCN and are all connected to the CCN electronic circuit board. The door ajar indicator, high beam indicator, and turn signal indicators operate based upon CAN data bus messages. The cargo lamp indicator operates based upon hardwired inputs to the CCN. The brake indicator is controlled by CAN data bus messages from the Controller Antilock Brake (CAB) as well as by hardwired park brake switch inputs to the CCN. The seatbelt indicator is controlled by the CCN programming, CAN data bus messages from the Occupant Restraint Controller (ORC), and a hardwired seat belt switch input to the CCN. The Malfunction Indicator Lamp (MIL) is normally controlled by CAN data bus messages from the PCM; however, if the CCN loses CAN data bus communication, the CCN circuitry will automatically turn the MIL

ON until CAN data bus communication is restored. The CCN uses CAN data bus messages from the Totally Integrated Power Module (TIPM), the ORC, the CAB, and the Wireless Ignition Node (WIN) to control all of the remaining indicators.

The various CCN indicators are grounded through the CCN circuitry and have a switched battery feed. All indicators are completely controlled by the CCN microprocessor based upon various hard wired and electronic message inputs. The cruise, four-wheel drive, four-wheel drive auto, four-wheel drive low, overdrive OFF and tow/haul indicators and those located within the LCD unit are dimmable. All other indicators are illuminated at a fixed intensity, which is not affected by the selected illumination intensity of the CCN general illumination lamps. The illumination intensity of the dimmable indicators is synchronized with that of the CCN general illumination lamps.

In addition, certain indicators in this instrument cluster are automatically or self-configured. This feature allows the configurable indicators to be enabled by the CCN circuitry for compatibility with certain optional equipment. The CCN defaults for the ABS indicator and airbag indicator are enabled, and these configuration settings must be programmatically disabled in the CCN using a diagnostic scan tool for vehicles that do not have this equipment. The automatically or self-configured indicators remain latent in each CCN at all times and will be active only when the CCN receives the appropriate CAN bus message inputs for that optional system or equipment.

The hard wired indicator inputs may be diagnosed using conventional diagnostic tools and procedures. However, the CCN circuitry and CAN bus message controlled indicators are diagnosed using the CCN self-diagnostic test. Refer to **DIAGNOSIS AND TESTING**. Proper testing of the CAN data bus and the electronic data bus message inputs to the CCN that control an indicator requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific details of the operation for each indicator may be found elsewhere in this service information.

ABS INDICATOR

The ABS indicator gives an indication to the vehicle operator when the ABS system, or a circuit or component of the system is ineffective. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Antilock Brake Module (ABM) over the Controller Area Network (CAN) data bus.

The ABS indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. Each time the ignition switch is turned to the ON position the ABS indicator is illuminated for about four seconds as a bulb test. The instrument cluster will turn ON the ABS indicator for the following reasons:

- **ABS Indicator Lamp-On Message** - Each time the cluster receives an electronic ABS indicator lamp-ON message from the ABM, the ABS indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the ABM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster receives no lamp-ON or lamp-OFF messages from the CAB for five consecutive message cycles, the ABS indicator is illuminated. The indicator remains illuminated

until the cluster receives a valid message from the ABM, or until the ignition switch is turned to the OFF position, whichever occurs first.

- **ABS Diagnostic Test -** The ABS indicator is blinked ON and OFF by lamp-ON and lamp-OFF messages from the ABM during the performance of the ABS diagnostic tests.

The Antilock Brake Module (ABM) continually monitors the ABS circuits and sensors to decide whether the system is in good operating condition. The ABM then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the Cab Compartment Node (CCN). If the ABM sends a lamp-ON message after the bulb test, it indicates that the ABM has detected a system malfunction or that the ABS system has become ineffective. The ABM will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ABS indicator fails to light due to an open or short in the cluster ABS indicator circuit, the cluster sends a message notifying the ABM of the condition, then the instrument cluster and the ABM will each store a DTC.

AIRBAG INDICATOR

The airbag indicator gives an indication to the vehicle operator when the airbag system, or a circuit or component of the system is ineffective. The airbag indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Occupant Restraint Controller (ORC) over the Controller Area Network (CAN) data bus.

The airbag indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. Each time the ignition switch is turned to the ON position the airbag indicator is illuminated for about six to eight seconds. The entire bulb test is a function of the ORC. The instrument cluster will turn ON the airbag indicator for the following reasons:

- **Airbag Indicator Lamp-On Message -** Each time the cluster receives an electronic airbag indicator lamp-ON message from the ORC, the airbag indicator will be illuminated. The indicator remains illuminated for about twelve seconds or until the cluster receives a lamp-OFF message from the ORC, whichever is longer. This indicator will also be extinguished when the ignition switch is turned to the OFF position.
- **Communication Error -** If the cluster receives no lamp-ON or lamp-OFF messages from the ORC for 10 consecutive message cycles, the airbag indicator is illuminated. The indicator remains illuminated until the cluster receives a single lamp-OFF message from the ORC.

The ORC continually monitors the airbag system circuits and sensors to decide whether the system is in good operating condition. The ORC then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the Cab Compartment Node (CCN). If the ORC sends a lamp-ON message after the bulb test, it indicates that the ORC has detected a system malfunction or that the airbags and seat belt tensioners may not deploy when required, or may deploy when not required. The ORC will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the airbag indicator fails to illuminate due to an open or short in the cluster airbag indicator circuit, the cluster sends a message notifying the ORC of the condition, the instrument cluster and the ORC will each store a DTC, and the cluster will flash the seatbelt indicator ON and OFF as a backup to notify the vehicle operator.

BRAKE INDICATOR

The brake indicator gives an indication to the vehicle operator when the parking brake is applied, when there are certain brake hydraulic system malfunctions as indicated by a low brake hydraulic fluid level condition, or when the brake fluid level switch is disconnected. The brake indicator can also give an indication when certain faults are detected in the Antilock Brake System (ABS). This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus, and a hard wired input from the park brake switch.

The brake indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. Each time the ignition switch is turned to the ON position the brake indicator is illuminated for about four seconds as a bulb test. The instrument cluster will turn ON the brake indicator for the following reasons:

- **Brake Indicator Lamp-On Message -** Each time the cluster receives an electronic brake indicator lamp-ON message from the CAB, the brake indicator will be illuminated. The CAB may also send lamp-ON messages as feedback during ABS diagnostic procedures. The indicator remains illuminated until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Park Brake Switch Input -** Each time the cluster detects ground on the park brake switch sense circuit (park brake switch closed = park brake applied or not fully released) while the ignition switch is in the ON position, the brake indicator flashes ON and OFF. The indicator continues to flash until the park brake switch sense input to the cluster is an open circuit (park brake switch open = park brake fully released), or until the ignition switch is turned to the OFF position, whichever occurs first.

The park brake switch on the park brake pedal mechanism provides a hard wired ground input to the instrument cluster circuitry through the park brake switch sense circuit whenever the park brake is applied or not fully released. The CAB continually monitors the ABS system circuits and sensors, including the brake fluid level switch on the brake master cylinder reservoir, to decide whether the system is in good operating condition. The CAB then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the Cab Compartment Node (CCN). If the CAB sends a lamp-ON message after the bulb test, it indicates that the CAB has detected a brake hydraulic system malfunction or that the ABS system has become ineffective. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects.

CARGO LAMP INDICATOR

The cargo lamp indicator gives an indication to the vehicle operator when the exterior cargo lamp is illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, a hardwired multiplex input received by the cluster from the cargo lamp switch on the headlamp dimmer switch mux circuit.

The cargo lamp indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit and is only on when the cargo lamp is on. The cargo lamp indicator also remains active when the key is out of the ignition. The LED only illuminates when it is provided a path to ground by the instrument cluster

transistor. The instrument cluster will turn ON the cargo lamp indicator for the following reasons:

- **Cargo Lamp-On Input** - Each time the cluster detects a cargo lamp-ON input from the headlamp switch on the headlamp dimmer switch mux circuit, the cargo lamp and the cargo lamp indicator will be illuminated. The cargo lamp and indicator remain illuminated until the cluster receives a cargo lamp-OFF input from the headlamp switch, until the cluster has completed an exterior lamps load shed (about fifteen minutes).

The CCN continually monitors the headlamp dimmer switch circuit to determine the proper interior lamps features and panel lamps illumination levels to provide. The CCN then energizes and de-energizes a low side driver circuit to control the exterior cargo lamp. Each time the CCN energizes the cargo lamp driver and the ignition switch is in the ON or START positions, the CCN also turns ON the cargo lamp indicator. For further diagnosis of the cargo lamp indicator or the instrument cluster circuitry that controls the indicator, refer to **DIAGNOSIS AND TESTING**.

CHARGING INDICATOR

The charging indicator gives an indication to the vehicle operator when the electrical system voltage is too low or too high. This indicator is controlled by the CCN based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus. These electronic messages are received from the Powertrain Control Module (PCM) or Engine Control Module (ECM), depending on engine application.

The charging indicator Light Emitting Diode (LED) is completely controlled by the CCN logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by a transistor on the CCN circuit board. Each time the ignition switch is turned to the ON position the charging indicator is illuminated by the CCN for about two seconds as a bulb test. The charging indicator will be turned ON for the following reasons:

- **Voltage Low Message** - Each time the CCN receives an electronic **system voltage** message from the PCM or ECM indicating the voltage is low (less than about 11.5 volts is a charge fail condition), the charging indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the voltage is normal (greater than about 12.0 volts, but less than 16.0 volts), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Voltage High Message** - Each time the CCN receives an electronic **system voltage** message from the PCM or ECM indicating the voltage is high (greater than about 16.0 volts), the charging indicator will be illuminated. The indicator remains illuminated until the CCN receives a message from the PCM or ECM indicating the voltage is normal (less than about 15.5 volts, but greater than 11.5 volts), or until the ignition switch is turned to the OFF position, whichever occurs first.

The PCM or ECM continually monitors the electrical system voltage to control the generator output. The PCM or ECM then sends the proper messages to the CCN. If the charging indicator is turned ON due to a charge fail or voltage high condition, it may indicate that the charging system requires service. For further diagnosis of the charging indicator or the CCN circuitry that controls the indicator, refer to **DIAGNOSIS AND TESTING**.

CRUISE INDICATOR

The cruise indicator gives an indication to the vehicle operator when the electrical system voltage is too low or too high. This indicator is controlled by the CCN based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus. These electronic messages are received from the PCM or ECM, depending on engine application.

The cruise indicator Light Emitting Diode (LED) is completely controlled by the CCN logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by a transistor on the CCN circuit board. The cruise indicator will be turned ON for the following reasons:

- **Cruise Indicator Lamp-On Message -** Each time the CCN receives an electronic cruise indicator lamp-ON message from the PCM or ECM indicating the speed control system is ON, the cruise indicator is illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM or ECM or until the ignition switch is turned to the OFF position, whichever occurs first.

The PCM or ECM continually monitors the speed control switches to determine the proper outputs to the speed control servo. The PCM or ECM then sends the proper lamp-ON or lamp-OFF message to the CCN. For further diagnosis of the cruise indicator or the instrument cluster circuitry that controls the LED, refer to **DIAGNOSIS AND TESTING**.

DIESEL EXHAUST BRAKE INDICATOR

The Variable Geometry Turbocharger (VGT) works in conjunction with the engine and the transmission to provide an integrated braking system used to help slow the vehicle. This is commonly called exhaust braking. The diesel exhaust brake indicator gives an indication to the vehicle operator when the exhaust brake feature is active. This indicator is controlled by the CCN based upon cluster programming and electronic messages received from the PCM over the Controller Area Network (CAN) data bus. The exhaust brake feature will only function when the driver turns the exhaust brake switch to the ON position.

Once the switch is in the ON position and the vehicle is moving faster than 8 k/h (5 MPH); the exhaust brake will automatically operate when the driver removes pressure from the throttle pedal allowing the engine to see 0% throttle and 0 fuel delivery. Exhaust braking is most effective when the engine RPM is higher. The automatic transmission has been programmed to downshift more aggressively when the exhaust brake is enabled to increase exhaust brake assistance. Use of automatic transmission Tow/Haul Mode improves interaction between the engine and transmission. Inputs to the exhaust brake feature include:

- Coolant temperature
- Ambient air temperature
- Exhaust manifold pressure sensor
- Throttle pedal position sensor

The PCM continually monitors these sensors, and fault codes with any of these sensors will cause the exhaust brake feature to be disabled.

DIESEL EXHAUST FLUID (DEF) INDICATOR

The diesel exhaust fluid indicator gives an indication to the vehicle operator when the DEF fluid is low or a system malfunction is present. This indicator is controlled by the CCN based upon cluster programming and electronic messages received from the PCM over the Controller Area Network (CAN) data bus.

The diesel exhaust fluid indicator Light Emitting Diode (LED) is completely controlled by the CCN logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the CCN. Each time the ignition switch is turned to the ON position the water-in-fuel indicator is illuminated for about two seconds as a bulb test. The water-in-fuel indicator will be turned ON for the following reasons:

- **Diesel Exhaust fluid Indicator Lamp-On Message** - Each time the CCN receives an electronic **lamp-ON** message from the PCM indicating that the DEF fluid is low, the DEF indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF position, whichever occurs first.

The PCM continually monitors the DEF fluid level sensor to determine whether there is sufficient fluid in the tank. The PCM then sends the proper lamp-ON or lamp-OFF message to the CCN. For further diagnosis of the DEF indicator or the instrument cluster circuitry that controls the indicator, refer to **DIAGNOSIS AND TESTING**.

DOOR AJAR INDICATOR

The door ajar indicator gives an indication to the vehicle operator that one or more of the passenger compartment doors may be open or not completely latched. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and hard wired inputs received by the cluster from the door ajar switches located in each door latch unit.

The door ajar indicator function of the display is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the door ajar indicator will always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the door ajar indicator for the following reasons:

- **Door Ajar Switch Input** - Each time the cluster receives a door ajar indication from the Total Integrated Power Module (TPIM) sense circuits (door ajar switch closed = door is open or not completely latched) the door ajar indicator will be illuminated. The indicator remains illuminated until all of the door ajar switch sense inputs to the cluster are an open circuit (door ajar switch open = door fully closed), until the cluster has completed an interior lamps load shed (about five minutes), or until the ignition switch is turned to the OFF position, whichever occurs first.

The instrument cluster, also known as the CCN continually monitors the door ajar switches to determine the status of the doors. For further diagnosis of the door ajar indicator or the instrument cluster circuitry that controls the indicator, refer to **DIAGNOSIS AND TESTING**.

The hardwired door ajar switches and circuits related to door ajar indicator operation may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

ELECTRONIC STABILITY CONTROL (ESC) INDICATOR

The ESC indicator gives an indication to the vehicle operator when a problem has been detected in the Electronic Stability Control or when the system has been activated. The indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB), and the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The ESC indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. Each time the ignition switch is turned to the ON position the ESC indicator is illuminated for about four seconds as a bulb test. The instrument cluster will turn ON the ESC indicator for the following reasons:

- **ESC Indicator Lamp-On Message -** Each time the cluster receives an electronic **ESC indicator lamp-ON** message from the CAB or the TIPM, the ESC indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the CAB or TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.

The CAB and TIPM continually monitor the ESC system circuits and sensors to decide whether the system is in good operating condition and the proper outputs to the components of the system. The CAB or TIPM then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the Cab Compartment Node (CCN).

ETC INDICATOR

The Electronic Throttle Control (ETC) indicator gives an indication to the vehicle operator when the ETC system, or a circuit or component of the system is ineffective. The ETC indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the PCM over the Controller Area Network (CAN) data bus.

The ETC indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. Each time the ignition switch is turned to the ON position the ETC indicator is illuminated for about six seconds. The entire bulb test is a function of the PCM. The instrument cluster will turn ON the ETC indicator for the following reasons:

- **ETC Indicator Lamp-On Message -** Each time the cluster receives an electronic ETC indicator lamp-ON message from the PCM, the ETC indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or continues to flash for about 12 seconds or until the cluster receives a lamp-OFF message from the PCM, whichever is longer. If the indicator is illuminated solid with the engine running the vehicle will usually remain drivable. If the indicator is flashing with the engine running the vehicle may require towing. A flashing indicator means the ETC system requires immediate service. The indicator will be extinguished

when the ignition switch is turned to the OFF position.

- **Communication Error -** If the cluster receives no lamp-ON or lamp-OFF messages from the PCM for three consecutive seconds, the ETC indicator is illuminated. The indicator remains illuminated until the cluster receives a single lamp-OFF message from the PCM.

The PCM continually monitors the ETC system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the Cab Compartment Node (CCN). If the PCM sends a lamp-ON message after the bulb test, it indicates that the PCM has detected an ETC system malfunction or that the ETC system is ineffective. The PCM will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ETC indicator fails to illuminate due to an open or short in the cluster ETC indicator circuit, the cluster sends a message notifying the PCM of the condition, then the CCN and the PCM will each store a DTC.

FOG LAMP INDICATOR

The fog lamp indicator gives an indication to the vehicle operator whenever the optional fog lamps are illuminated. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The fog lamp indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch is in any position except ON or START. The indicator only illuminates when it is energized by the instrument cluster logic circuit. The instrument cluster will turn ON the fog lamp indicator for the following reasons:

- **Fog Indicator Lamp-On Message -** Each time the cluster receives an electronic **fog indicator lamp-ON** message from the TIPM indicating the fog lamp circuit is energized, the fog lamp indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, until the ignition switch is turned to the OFF position or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.

The TIPM continually monitors electronic **exterior lighting switch status** messages from the instrument cluster, also known as the CCN to determine the appropriate outputs to the fog lamps. The TIPM activates or deactivates the fog lamp circuit then sends the proper lamp-ON or lamp-OFF message back to the CCN. For further diagnosis of the fog lamp indicator or the instrument cluster circuitry that controls the indicator, refer to **DIAGNOSIS AND TESTING**.

GAS CAP INDICATOR

The gas cap indicator gives an indication to the vehicle operator when there is a gross leak detected in the on-board fuel vapor recovery system. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the PCM.

The gas cap indicator function is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the Liquid Crystal Display (LCD) gas cap indication will

always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the gas cap indicator for the following reasons:

- **Gas Cap Indicator Lamp-On Message -** Each time the cluster receives an electronic **gas cap indicator lamp-ON** message from the PCM indicating there is a gross leak in the vapor recovery system, the gas cap indicator will be illuminated. If the ignition switch is in the ON position and the vehicle is not moving when the message is received, the LCD will repeatedly and sequentially cycle the gas cap indication in two second intervals with the odometer/trip odometer information and any other active textual warnings. If the vehicle is moving, or once the cluster of a non-moving vehicle receives an electronic vehicle speed message from the PCM indicating a speed greater than zero, the warning sequence will consist of three complete display cycles with an audible single chime tone accompanying each cycle, then revert to only the visual gas cap indication and odometer/trip odometer display cycling until the cluster receives a message indicating there is no gross leak in the vapor recovery system, or until the ignition switch is turned to the OFF position, whichever occurs first. The LCD can be reverted to the odometer display and any currently displayed textual messages suspended by momentarily depressing and releasing the odometer/trip odometer reset switch button on the front of the cluster.

The PCM continually monitors the on board vapor recovery system to determine whether there are air leaks in the system. The PCM then sends the proper electronic messages to the instrument cluster, also known as the Cab Compartment Node (CCN). If the CCN turns ON the gas cap indicator due to a monitored gross leak in the vapor recovery system, it may indicate that the gas cap has been removed or is improperly installed.

HIGH BEAM INDICATOR

The high beam indicator gives an indication to the vehicle operator whenever the headlamp high beams are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and a hard wired multiplex input received by the cluster from the headlamp beam select switch circuitry of the multi-function switch on the washer/beam select switch mux circuit.

The high beam indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the high beam indicator for the following reasons:

- **High Beam Headlamps-On Input -** Each time the cluster detects a high beam headlamps-ON input from the headlamp beam select switch circuitry of the multi-function switch on the washer/beam select switch mux circuit, the headlamp high beams and the high beam indicator will be illuminated. The indicator remains illuminated until the cluster receives a high beam headlamps-OFF input from the multi-function switch, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.

The instrument cluster, also known as the CCN continually monitors the headlamp switch and the multi-function switch to determine the proper headlamp low beam and high beam control. The CCN then sends the proper electronic **low beam** and **high beam lamp-ON** and **lamp-OFF** messages to the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus and controls the high beam indicator operation accordingly. For further diagnosis of the high beam indicator or the instrument cluster circuitry that controls the indicator, refer to **DIAGNOSIS AND TESTING**.

LOW FUEL INDICATOR

The low fuel indicator gives an indication to the vehicle operator when the level of fuel in the fuel tank becomes low. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and a hardwired input received by the cluster from the fuel level sending unit on the fuel pump module in the fuel tank.

The low fuel indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. Each time the ignition switch is turned to the ON position the low fuel indicator is illuminated for about two seconds as a bulb test. The instrument cluster will turn ON the low fuel indicator for the following reasons:

- **Less Than 15 Percent Tank Full Input** - The cluster provides a constant current source to the fuel level sending unit and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level falls and decreases as the fuel level rises causing changes in the sense input voltage. Each time the fuel level sense input to the cluster indicates the fuel tank is about 10 percent full or less for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, the fuel gauge needle is moved to about the one-sixteenth graduation on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level sense input indicates that the fuel tank is greater than about 15 percent full for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled OFF and then ON again by the appropriate inputs from the fuel level sending unit.
- **Less Than Empty Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is less than the **E** (or Empty) gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is a short circuit.
- **More Than Full Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is more than the **F** (or Full) gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is an open circuit.

The instrument cluster, also known as the CCN continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The CCN then sends the proper electronic **fuel level** message to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. For further diagnosis of the low fuel indicator or the instrument cluster circuitry that controls the LED, refer to **DIAGNOSIS AND TESTING**.

LOW OIL PRESSURE INDICATOR

The low oil pressure indicator gives an indication to the vehicle operator when the engine oil pressure reading reflects a condition requiring immediate attention. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the PCM over the Controller Area Network (CAN) data bus.

The low oil pressure indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the low oil pressure indicator for the following reasons:

- **Engine Oil Pressure Low Message -** Each time the cluster receives an electronic **engine oil pressure** message from the PCM indicating the pressure is about 6.9 kPa (1 psi) or lower, the low oil pressure indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating that the pressure is above about 6.9 kPa (1 psi), or until the ignition switch is turned to the OFF position, whichever occurs first. The cluster will only turn the indicator ON in response to low engine oil pressure if the engine speed is greater than zero.

The PCM continually monitors the engine oil pressure sensor to determine the engine oil pressure. The PCM then sends the proper messages to the instrument cluster, also known as the CCN. For further diagnosis of the low oil pressure indicator or the instrument cluster circuitry that controls the LED, refer to **DIAGNOSIS AND TESTING**.

LOW TIRE PRESSURE

The Tire Pressure Monitor (TPM) indicator gives an indication to the vehicle operator of the status of the TPM system. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Wireless Ignition Node (WIN) over the Controller Area Network (CAN) data bus.

The TPM indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provide a path to ground by the instrument cluster transistor. Each time the ignition switch is turned to the ON position, the WIN sends an electronic TPM indicator lamp-ON message to the cluster to illuminate the TPM indicator for about three seconds as a bulb test. The instrument cluster will turn ON the TPM indicator for the following reasons:

- **TPM Indicator Lamp-On Message -** Each time the cluster receives an electronic TPM indicator lamp-ON message from the WIN, the TPM indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the WIN message. The indicator remains illuminated until the cluster receives a lamp-OFF message from the WIN or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error -** If the cluster receives no TPM lamp-ON or lamp-OFF messages from the WIN for six consecutive seconds, the TPM indicator is illuminated by the instrument cluster. The indicator remains controlled and illuminated by the cluster until a valid lamp-ON or lamp-OFF message is received from the WIN.

The WIN performs a self-test each time the ignition switch is turned to the ON position to decide whether the TPM system is in good operating condition and whether the tire inflation pressures are too high or too low. The WIN then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the CCN. If the instrument cluster turns ON the TPM indicator after the bulb test, it indicates that the inflation pressure of a

tire is too low or that a malfunction has occurred and the TPM system is ineffective.

MALFUNCTION INDICATOR

The MIL gives an indication to the vehicle operator when the PCM or the PCM has recorded a Diagnostic Trouble Code (DTC) for an On-Board Diagnostics II (OBDII) emissions-related circuit or component malfunction. The MIL is controlled by a transistor on the CCN circuit board based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus. These electronic messages are received from the PCM or PCM, depending on engine application.

The MIL Light Emitting Diode (LED) is completely controlled by the CCN logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by a transistor on the CCN circuit board. Each time the ignition switch is turned to the ON position the indicator is illuminated for about two seconds as a bulb test. The entire bulb test is a function of the PCM. The MIL will be turned ON for the following reasons:

- **MIL Lamp-On Message** - Each time the CCN receives an electronic **MIL lamp-ON** message from the PCM or ECM, the indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM. For some DTCs, if a problem does not recur, the PCM or ECM will send a lamp-OFF message automatically. Other DTCs may require that a fault be repaired and the PCM or ECM be reset before a lamp-OFF message will be sent. For more information on the PCM, the ECM, and the DTC set and reset parameters, refer to appropriate diagnostic information.
- **Communication Error** - If the CCN receives no lamp-ON or lamp-OFF messages from the PCM or ECM for about 10 seconds, the MIL is illuminated by the instrument cluster to indicate a loss of bus communication. The indicator remains controlled and illuminated by the cluster until a valid message is received from the PCM.

The PCM or ECM continually monitors the fuel and emissions system circuits and sensors to decide whether the system is in good operating condition. The PCM or ECM then sends the proper lamp-ON or lamp-OFF message to the CCN. For further diagnosis of the MIL or the instrument cluster circuitry that controls the LED, refer to **DIAGNOSIS AND TESTING**. If the CCN turns ON the MIL after the bulb test, it may indicate that a malfunction has occurred and that the fuel and emissions systems may require service.

NO BUS INDICATOR

The no-bus indicator gives an indication to the vehicle operator when the electronic communication data bus is ineffective. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages not being received over the Controller Area Network (CAN) data bus from the Front Control Module (FCM).

The no-bus indicator function of the odometer Liquid Crystal Display (LCD) unit is completely controlled by the instrument cluster logic circuit. This logic only allows the indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the odometer LCD no-bus indicator is always off when the ignition switch is in any position except ON or START. The instrument cluster turns ON the no bus indicator for the following reasons:

- **No Electronic Communication Messages -** Each time the ignition switch is turned to the ON position and the cluster does not receive electronic communication messages over the CAN data bus, the no-bus indicator illuminates. The indicator remains illuminated until CAN bus communication is restored or until the ignition switch turns to the OFF position, whichever occurs first.

The instrument cluster, also known as the CCN continually monitors the CAN data bus to determine the status of many sensors and systems throughout the vehicle. If bus communication is interrupted, the CCN cannot provide accurate displays and outputs.

NO FUSE INDICATOR

The no fuse indicator gives an indication to the vehicle operator when the Ignition Off Draw (IOD) fuse is ineffective or is not installed. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the Totally Integrated Power Module (TIPM).

The no fuse indicator function of the odometer Liquid Crystal Display (LCD) unit is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the odometer LCD no fuse indication will always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the no fuse indicator for the following reasons:

- **No Fuse Indicator Lamp-On Message -** Each time the ignition switch is turned to the ON position and the cluster receives an electronic no fuse indicator lamp-ON message from the TIPM indicating that the IOD fuse is missing or ineffective, the no fuse indicator will be illuminated. The indicator remains illuminated for about three seconds, until the IOD fuse is installed, until the trip odometer reset switch button is depressed or until the ignition switch is turned to the OFF position, whichever occurs first.

The TIPM continually monitors the IOD circuit to determine the status of the IOD fuse, then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the CCN over the CAN data bus.

OIL CHANGE INDICATOR

The change oil indicator gives an indication to the vehicle operator when a duty-cycle algorithm contained within the software of the PCM determines that a recommended oil change interval has been attained. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the PCM.

The change oil indicator function of the odometer display unit is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the odometer LCD change oil indication will always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the change oil indicator for the following reasons:

- **Change Oil Indicator Lamp-On Message -** Each time the ignition switch is turned to the ON position and the cluster receives an electronic change oil indicator lamp-ON message from the PCM indicating that a duty-cycle based recommended oil change interval has been attained, the change oil indicator will be illuminated for about three seconds, until the trip odometer reset switch button is depressed, or until

the ignition switch is turned to the OFF position, whichever occurs first.

- **Change Oil Indicator Reset Procedure -** Once an engine oil change has been completed, the PCM duty cycle counters can be reset using the following procedure. Turn the ignition switch to the ON position, but DO NOT start the engine. Slowly depress and release the accelerator pedal fully three times within ten seconds. Turn the ignition switch to the OFF position. If the change oil indicator illuminates the next time the engine is started, repeat this procedure.

The PCM continually monitors numerous sensor inputs to determine the duty-cycles to which the engine is being subjected. A pre-programmed algorithm within the PCM then determines when to send the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the Cab Compartment Node (CCN).

REGENERATIVE BRAKE SYSTEM (RBS)

The Regenerative Brake System indicator gives an indication to the vehicle operator when the RBS system, or a circuit or component of the system is ineffective. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Regenerative Brake Controller (RBC) over the CAN data bus.

The RBS indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit. This logic only allows the indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED is always off when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster turns on the RBS indicator for the following reasons:

- **RBS Indicator Lamp-On Message -** Each time the cluster receives an electronic RBS indicator lamp-on message from the RBC, the RBS indicator illuminates. The indicator remains illuminated until the cluster receives a lamp-off message from the RBC, or until the ignition switch turns to the OFF position, whichever occurs first.
- **Communication Error -** If the cluster receives no lamp-on or lamp-off messages from the RBC for five consecutive message cycles, the RBS indicator is illuminated. The indicator remains illuminated until the cluster receives a valid message from the RBC, or until the ignition switch is turned to the OFF position, whichever occurs first.

The RBC continually monitors the RBS circuits and sensors to decide whether the system is in good operating condition. The RBC then sends the proper lamp-on or lamp-off message to the instrument cluster, also known as the CCN. If the RBC sends a lamp-on message after the bulb test, it indicates that the RBC has detected a system malfunction or that the RBS system has become ineffective. The RBC stores a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the RBS indicator fails to light due to an open or short in the cluster RBS indicator circuit, the cluster sends a message notifying the RBC of the condition, then the instrument cluster and the RBC will each store a DTC.

Use a diagnostic scan tool for proper diagnosis of the regenerative brake system, the RBC, the CCN, the CAN data bus or the electronic communication related to RBS indicator operation. Refer to the appropriate diagnostic information.

SEATBELT INDICATOR

The seatbelt indicator gives an indication to the vehicle operator of the status of the driver side front seatbelt.

This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and a hard wired input from the seatbelt switch in the driver side front seatbelt buckle through the seat belt indicator driver circuit.

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or BELTMINDER feature that is enabled when the vehicle is shipped from the factory. This BELTMINDER feature can be disabled and enabled by the customer using a specific programming event sequence, or by the dealer using a diagnostic scan tool.

The seatbelt indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the seatbelt indicator for the following reasons:

- **Seatbelt Reminder Function -** Each time the cluster receives a battery current input on the fused ignition switch output (run-start) circuit, the indicator will be illuminated as a seatbelt reminder for about six seconds, or until the ignition switch is turned to the OFF position, whichever occurs first. This reminder function will occur regardless of the status of the seatbelt switch input to the cluster.
- **Driver Side Front Seatbelt Not Buckled - Beltminder Active -** Following the seatbelt reminder function, each time the cluster detects an open circuit on the seat belt indicator driver circuit (seatbelt switch open = seatbelt unbuckled) with the ignition switch in the START or ON positions, the indicator will be illuminated. In addition, if the driver side front seat belt remains unbuckled about 60 seconds after the conclusion of the seatbelt reminder function with the vehicle speed greater than about 8 kilometers-per-hour (5 miles-per-hour), the seatbelt indicator will begin to cycle between flashing ON and OFF for 3 seconds, then lighting solid for 2 seconds. The seatbelt indicator will continue to cycle between flashing and solid illumination for 13 complete cycles, until the seat belt indicator driver input to the cluster is closed to ground (seatbelt switch closed = seatbelt buckled), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Driver Side Front Seatbelt Not Buckled - Beltminder Inactive -** Following the seatbelt reminder function, each time the cluster detects an open circuit on the seat belt indicator driver circuit (seatbelt switch open = seatbelt unbuckled) with the ignition switch in the START or ON positions, the indicator will be illuminated. The seatbelt indicator remains illuminated until the seat belt indicator driver input to the cluster is closed to ground (seatbelt switch closed = seatbelt buckled), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Airbag Indicator Backup -** If the instrument cluster detects a fault in the airbag indicator circuit it will send an electronic message indicating the fault to the Occupant Restraint Controller (ORC), then flash the seatbelt indicator ON and OFF. The cluster will continue to flash the indicator until the airbag indicator circuit fault is resolved, or until the ignition switch is turned to the OFF position, whichever occurs first.

SECURITY SYSTEM INDICATOR

The security indicator gives an indication to the vehicle operator when the Vehicle Theft Security System (VTSS) is arming or is armed. On vehicles equipped with the Sentry Key Immobilizer System (SKIS), the security indicator also gives an indication to the vehicle operator of the status of the SKIS. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, hard wired

inputs to the cluster from the various security system components, and electronic messages received by the cluster from the Wireless Ignition Node (WIN) via the Totally Integrated Power Module (TPIM) over the Controller Area Network (CAN) data bus.

The security indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. Depending upon the programmed condition the indicator can be illuminated solid, flashed at a slow rate (0.5 Hertz, 12.5 percent duty cycle), or flashed at a fast rate (1 Hertz, 50 percent duty cycle). Each time the ignition switch is turned to the ON position the security indicator illuminates for about two seconds as a bulb test. The entire bulb test is a function of the WIN. The instrument cluster will turn ON the security indicator for the following reasons:

- **VTSS Indication** - During the 16 second VTSS arming function, the cluster will flash the security indicator ON and OFF repeatedly at a steady, fast rate to indicate that the VTSS is in the process of arming. Following successful VTSS arming, the cluster flashes the security indicator ON and OFF continuously at a slower rate to indicate that the VTSS is armed. The security indicator continues flashing at the slower rate until the VTSS is disarmed or triggered. If the VTSS has alarmed and rearmed, the cluster will flash the security indicator at a steady, slow rate for about 30 seconds after the VTSS is disarmed.
- **SKIS Indicator Lamp-On Message** - Each time the cluster receives an electronic SKIS indicator lamp-ON message from the WIN, the security indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the WIN message. The indicator remains illuminated solid or continues to flash until the cluster receives a lamp-OFF message from the WIN, or until the ignition switch is turned to the OFF position, whichever occurs first. For more information on the SKIS and the security indicator control parameters, refer to **OPERATION** .
- **Communication Error** - If the cluster receives no lamp-ON or lamp-OFF messages from the WIN for 10 consecutive message cycles, the security indicator is illuminated by the instrument cluster. The indicator remains controlled and illuminated by the cluster until a valid lamp-ON or lamp-OFF message is received from the WIN.

The instrument cluster circuitry controls the security indicator whenever the ignition switch is in the OFF position and the VTSS is arming, armed, or alarming. Whenever the ignition switch is in the ON or START positions, the WIN performs a self-test to decide whether the SKIS is in good operating condition and whether a valid key is present in the ignition lock cylinder. The WIN then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the Cab Compartment Node (CCN). If the cluster flashes the security indicator upon ignition ON, or turns ON the security indicator solid after the bulb test, it indicates that a SKIS malfunction has occurred or that the SKIS is ineffective.

SERVICE 4WD INDICATOR

The service 4WD indicator gives an indication to the vehicle operator when the Totally Integrated Power Module (TIPM) has recorded a Diagnostic Trouble Code (DTC) for an electronic transfer case circuit or component malfunction. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the TIPM over the Controller Area Network (CAN) data bus.

The service 4WD indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. Each time the ignition switch is turned to the ON position the service 4WD indicator is illuminated for about two seconds as a bulb test. The instrument cluster will turn ON the service 4WD indicator for the following reasons:

- **Service 4WD Indicator Lamp-On Message -** Each time the cluster receives an electronic service 4WD indicator lamp-ON message from the TIPM, the service 4WD indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error -** If the cluster receives no lamp-ON or lamp-OFF messages from the TIPM for 10 seconds the service 4WD indicator is illuminated by the cluster to indicate a loss of TIPM communication. The indicator remains controlled and illuminated by the cluster until a valid message is received from the TIPM.

The TIPM continually monitors the electronic transfer case control circuits and transfer case shift motor/mode sensor assembly to determine the condition of the system. The TIPM then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the CCN. For further diagnosis of the service 4WD indicator or the instrument cluster circuitry that controls the LED, refer to **DIAGNOSIS AND TESTING**.

4WD AUTO INDICATOR

The 4WD auto indicator gives an indication to the vehicle operator when the electronic transfer case has been shifted into the 4WD auto mode. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The 4WD auto indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the 4WD auto indicator for the following reasons:

- **4WD Auto Indicator Lamp-On Message -** Each time the cluster receives an electronic 4WD auto indicator lamp-ON message from the TIPM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.

The TIPM continually monitors the electronic transfer case through the transfer case shift motor/mode sensor assembly to determine when the 4WD auto mode is engaged. The TIPM then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the CCN. For further diagnosis of the 4WD auto indicator or the instrument cluster circuitry that controls the LED, refer to **DIAGNOSIS AND TESTING**.

4WD INDICATOR

The 4WD indicator gives an indication to the vehicle operator when the transfer case has been shifted into a 4WD mode. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The 4WD indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the 4WD indicator for the following reasons:

- **4WD Indicator Lamp-On Message** - Each time the cluster receives an electronic 4WD indicator lamp-ON message from the TIPM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.

The TIPM continually monitors the electronic transfer case through the transfer case shift motor/mode sensor assembly or the manual transfer case through the transfer case switch to determine when the 4WD mode is engaged. The TIPM then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the Cab Compartment Node (CCN). For further diagnosis of the 4WD indicator or the instrument cluster circuitry that controls the LED, refer to **DIAGNOSIS AND TESTING**.

4 LOW INDICATOR

The 4 low indicator gives an indication to the vehicle operator when the electronic transfer case has been shifted into the 4WD low mode. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The 4 low indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the 4 low indicator for the following reasons:

- **4 Low Indicator Lamp-On Message** - Each time the cluster receives an electronic 4 low indicator lamp-ON message from the TIPM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.

The TIPM continually monitors the electronic transfer case through the transfer case shift motor/mode sensor assembly to determine when the 4WD low mode is engaged. The TIPM then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the CCN. For further diagnosis of the 4 low indicator or the instrument cluster circuitry that controls the LED, refer to **DIAGNOSIS AND TESTING**.

TOW/HAUL INDICATOR

The tow/haul indicator gives an indication to the vehicle operator when the tow/haul function of the tow/haul switch has been selected, revising the shift schedule of the electronically controlled automatic transmission. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the PCM over the Controller Area Network (CAN) data bus.

The tow/haul indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the tow/haul indicator for the following reasons:

- **Tow/Haul Indicator Lamp-On Message -** Each time the cluster receives an electronic tow/haul indicator lamp-ON message from the PCM indicating that the tow/haul shift schedule has been selected, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF position, whichever occurs first.

The PCM continually monitors the tow/haul switch to determine the proper outputs to the automatic transmission. The PCM then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the Cab Compartment Node (CCN). For further diagnosis of the tow/haul indicator or the instrument cluster circuitry that controls the indicator, refer to **DIAGNOSIS AND TESTING**.

TRANSMISSION RANGE INDICATOR

The electronic gear selector indicator gives an indication to the vehicle operator of the transmission gear that has been selected with the automatic transmission gear selector lever. This indicator is controlled by the instrument cluster circuit board based upon cluster programming. The cluster circuitry automatically configures itself for the proper transmission type based upon the hard wired transmission range sensor mux circuit input to the cluster.

The gear selector indicator information is displayed by the odometer/trip odometer Liquid Crystal Display (LCD) unit soldered onto the instrument cluster electronic circuit board, and the LCD will not display the gear selector indicator information after the ignition switch is turned to the OFF position. Each time the cluster is disconnected from battery current for more than about five minutes, it must configure itself for the automatic transmission type that is in the vehicle once it is reconnected to battery current. The instrument cluster circuitry configures the gear selector indicator based upon the following inputs from the transmission range sensor:

- **Open Circuit -** If the cluster is configured for an automatic transmission and the transmission range sensor mux circuit is open, the cluster circuitry controls the gear selector indicator display based upon an electronic selected gear message received from the Transmission Control Module (TCM) over the Controller Area Network (CAN) data bus. If the Transmission Range Sensor (TRS) mux circuit is open and no electronic selected gear messages are received from the TCM within two seconds, the instrument cluster circuitry will not display any gear selector position until the condition is resolved or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Resolved Circuit -** If the transmission range sensor mux circuit is resolved, the cluster circuitry controls the gear selector indicator display based upon the resistance value of the hard wired input from the TRS. If the cluster is configured for an automatic transmission with a TRS input and detects a short to ground

or an open in the TRS mux input, the instrument cluster circuitry will not display any gear selector position in the LCD display. The short-to-ground and open circuit conditions for the LCD display will continue until the condition is resolved or until the ignition switch is turned to the OFF position, whichever occurs first.

On vehicles with a TCM, the TCM continually monitors the TRS, then sends the proper message to the instrument cluster, also known as the CCN. On vehicles without a TCM, the CCN continually monitors the hard wired TRS multiplexed input. For further diagnosis of the gear selector indicator or the instrument cluster circuitry that controls this function, refer to **DIAGNOSIS AND TESTING**. For further diagnosis of the TRS on vehicles without a TCM, refer to appropriate diagnostic information.

TRANSMISSION TEMPERATURE INDICATOR

The transmission over-temperature indicator gives an indication to the vehicle operator when the transmission fluid temperature is excessive, which may lead to accelerated transmission component wear or failure. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the PCM.

The transmission over-temperature indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. Each time the ignition switch is turned to the ON position the transmission over-temperature indicator is illuminated for about two seconds as a bulb test. The instrument cluster will turn ON the transmission over-temperature indicator for the following reasons:

- **Trans Over-Temp Indicator Lamp-On Message** - Each time the cluster receives an electronic trans over-temp indicator lamp-ON message from the PCM indicating that the transmission fluid temperature is 135 °C (275 °F) or higher, the indicator will be illuminated and a single chime tone is sounded. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the indicator is cycled OFF and then ON again by the appropriate lamp-ON and lamp-OFF messages from the PCM.

The PCM continually monitors the transmission temperature sensor to determine the transmission operating condition. The PCM then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the Cab Compartment Node (CCN). If the instrument cluster illuminates the transmission over-temperature indicator due to a high transmission oil temperature condition, it may indicate that the transmission or the transmission cooling system are being overloaded, or that they require service. For further diagnosis of the transmission over-temperature indicator or the instrument cluster circuitry that controls the LED, refer to **DIAGNOSIS AND TESTING**.

WAIT-TO-START INDICATOR

The wait-to-start indicator gives an indication to the vehicle operator when the air temperature within the diesel engine intake manifold is too cool for efficient and reliable engine starting, and that the intake air heater grids are energized in their pre-heat operating mode. This indicator is controlled by the CCN based upon cluster

programming and electronic messages received by the from the PCM over the Controller Area Network (CAN) data bus.

The wait-to-start indicator, Light Emitting Diode (LED) is completely controlled by the CCN logic circuit, that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the CCN. The wait-to-start indicator will be turned ON for the following reasons:

- **Wait-To-Start Indicator Lamp-On Message** - Each time the CCN receives an electronic wait-to-start indicator lamp-ON message from the ECM indicating that the air temperature within the intake manifold is too cool for efficient and reliable engine starting, the wait-to-start indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message, until the ECM detects that the engine is running or until the ignition switch is turned to the OFF position, whichever occurs first.

The ECM continually monitors the engine intake air temperature sensor to determine when the intake air heater grids should be energized in their pre-heat operating mode. The ECM then sends the proper lamp-ON or lamp-OFF message to the CCN. For further diagnosis of the wait-to-start indicator or the instrument cluster circuitry that controls the indicator, refer to **DIAGNOSIS AND TESTING**.

WASHER FLUID INDICATOR

The washer fluid indicator gives an indication to the vehicle operator that the fluid level in the washer reservoir is low. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The washer fluid indicator function of the Liquid Crystal Display (LCD) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LCD washer fluid indication will always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the washer fluid indicator for the following reasons:

- **Washer Fluid Indicator Lamp-On Message** - Each time the cluster receives an electronic washer fluid indicator lamp-ON message from the TIPM indicating that a low washer condition has been detected for 60 consecutive seconds, the washer fluid indicator is illuminated and a single chime tone is sounded. The indicator remains illuminated until the cluster receives lamp-OFF messages for 60 consecutive seconds from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the washer fluid indicator is cycled OFF and then ON again by the appropriate lamp-ON and lamp-OFF messages from the TIPM.

The TIPM continually monitors the washer fluid level switch in the washer reservoir to determine the level of the washer fluid. The TIPM then sends the proper lamp-ON or lamp-OFF message to the instrument cluster, also known as the Cab Compartment Node (CCN). For further diagnosis of the washer fluid indicator or the instrument cluster circuitry that controls the indicator, refer to **DIAGNOSIS AND TESTING**.

WATER-IN-FUEL INDICATOR

The water-in-fuel indicator gives an indication to the vehicle operator when there is excessive water in the fuel system. This indicator is controlled by the CCN based upon cluster programming and electronic messages received from the PCM over the Controller Area Network (CAN) data bus.

The water-in-fuel indicator Light Emitting Diode (LED) is completely controlled by the CCN logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the CCN. Each time the ignition switch is turned to the ON position the water-in-fuel indicator is illuminated for about two seconds as a bulb test. The water-in-fuel indicator will be turned ON for the following reasons:

- **Water-In-Fuel Indicator Lamp-On Message** - Each time the CCN receives an electronic **water-in-fuel lamp-ON** message from the ECM indicating that there is excessive water in the diesel fuel system, the water-in-fuel indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the ECM, or until the ignition switch is turned to the OFF position, whichever occurs first.

The ECM continually monitors the water-in-fuel sensor to determine whether there is excessive water in the diesel fuel system. The ECM then sends the proper lamp-ON or lamp-OFF message to the CCN. For further diagnosis of the water-in-fuel indicator or the instrument cluster circuitry that controls the indicator, refer to **DIAGNOSIS AND TESTING**.

TURN SIGNAL INDICATOR

The turn signal indicators give an indication to the vehicle operator that the turn signal (left or right indicator flashing) or hazard warning (both left and right indicators flashing) have been selected and are operating. These indicators are controlled by transistors on the instrument cluster electronic circuit board based upon cluster programming, a hard wired multiplex input received by the cluster from the turn signal and hazard warning switch circuitry of the multi-function switch on the turn/hazard switch mux circuit, and electronic messages received from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

Each turn signal indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, each LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the turn signal indicators for the following reasons:

- **Turn Signal-On Input** - Each time the cluster detects a turn signal-ON input from the turn signal switch circuitry of the multi-function switch on the turn/hazard switch mux circuit, it sends the appropriate electronic turn signal switch status messages to the TIPM over the CAN data bus. The TIPM responds to these messages by controlling a battery voltage output and the flash rate for either the right or left turn signal lamps. The TIPM also sends the appropriate electronic messages back to the cluster to control the flash rate of the turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the cluster electronic circuit board that emulates the sound emitted by a conventional turn signal flasher. The turn signal indicators continue to flash ON and OFF until the cluster receives a turn signal-OFF input from the multi-function switch, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Hazard Warning-On Input** - Each time the cluster detects a hazard warning-ON input from the hazard

warning switch circuitry of the multi-function switch on the turn/hazard switch mux circuit, it sends the appropriate electronic hazard switch status messages to the TIPM over the CAN data bus. The TIPM responds to these messages by controlling a battery voltage output and the flash rate for each of the right and left turn signal lamps. The TIPM also sends the appropriate electronic messages back to the cluster to control the flash rate of the turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the cluster electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher. The turn signal indicators continue to flash ON and OFF until the cluster receives a hazard warning-OFF input from the multi-function switch.

- **Lamp Out Mode -** If the TIPM detects an ineffective turn signal lamp or circuit, it increases the flash rate for the remaining operative turn signals and sends an electronic message to the instrument cluster. The instrument cluster then increases the flash rate of the turn signal indicators and the click rate of the electromechanical relay to provide an indication of the problem to the vehicle operator.

The instrument cluster, also known as the CCN continually monitors the multi-function switch and electronic messages from the TIPM to determine the proper turn signal and hazard warning indicator operation. For further diagnosis of the turn signal indicators or the instrument cluster circuitry that controls the indicators, refer to **DIAGNOSIS AND TESTING**.

POD, SWITCH

DESCRIPTION

DESCRIPTION

Fig. 18: Instrument Panel Switch Pod
Courtesy of CHRYSLER GROUP, LLC

The Instrument Panel Switch Pod includes push button controls for the Hazard Flashers (6), the Electronic Stability Control (ESC) Off switch (3), the Tow/Haul transmission control switch (2), the Park Assist off switch (4), a 115 volt power outlet off switch (5), and on vehicles equipped with a 6.7L diesel engine, an exhaust brake on switch. The switch pod is a single unit with one wire connector and two mounting tabs and cannot be taken apart or serviced. If one or more of the switches, or illumination is inoperative, the entire pod must be replaced.

The Instrument Panel Switch Pod is located in the instrument panel center bezel just below the radio, and above the A/C control head.

OPERATION

OPERATION

HAZARD WARNING SWITCH

A latching push-button hazard-warning switch is placed in the instrument panel switch pod. This is an ergonomic place for the switch where it can be conveniently reached.

ELECTRONIC STABILITY CONTROL (ESC) OFF SWITCH

A momentary contact, push-button ESC switch is placed in the instrument panel switch pod. For more information on the ESC system and ESC off switch, refer to **DESCRIPTION** and **OPERATION** .

TOW/HAUL SWITCH

A momentary contact Tow/Haul switch is placed in the instrument panel switch pod. For more information on the Tow/Haul switch function and transmission shifting characteristics in the Tow/Haul mode, refer to **SWITCH, OVERDRIVE LOCKOUT, TOW AND HAUL, OPERATION** .

PARK ASSIST OFF SWITCH

A momentary contact park assist off switch is placed in the instrument panel switch pod. For more information on the Park Assist system and other components within the system, refer to **DESCRIPTION** and **OPERATION** .

115 VOLT POWER POINT OFF SWITCH

A momentary contact power point off switch is placed in the instrument panel switch pod. For more information on the power outlet system and power outlet off switch, refer to **DESCRIPTION** and **OPERATION** . .

DIESEL EXHAUST BRAKE ON SWITCH

On vehicles equipped with a 6.7L diesel engine, a momentary contact exhaust brake on switch is placed in the instrument panel switch pod. For more information on the exhaust brake system, refer to **ACTUATOR, TURBOCHARGER, DESCRIPTION, 6.7L** and **INDICATORS, INSTRUMENT CLUSTER, OPERATION**.

REMOVAL

REMOVAL

Fig. 19: Switch Pod Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL** .
3. Disconnect the lower switch pod electrical connector.
4. Remove the upper switch pod fasteners (1) from the center bezel.
5. Separate the switch pod from the center bezel.

INSTALLATION

INSTALLATION

1. Align the switch pod to the instrument panel center bezel.
2. Install the upper switch pod fasteners (1) to the center bezel.
3. Connect the switch pod electrical connector.
4. Install the instrument panel center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, INSTALLATION** .
5. Connect the negative battery cable.

The odometer switch pod is located in the left spoke of the steering wheel spoke bezel. This switch has up to four push buttons. Two of the push buttons (7 and 8) are used on all vehicles not equipped with the Electronic Vehicle Information Center (EVIC). Two additional push buttons (1 and 2) are found on vehicles equipped with the optional Uconnect™ Hands-Free Communication System. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle integral to the inboard end of the switch pod housing connects the odometer switch pod to the vehicle electrical system through a dedicated take out and
