The controller is programmed during manufacturing with generic software to facilitate testing. However, generic software does not have the proper calibrations to control a transmission in a vehicle. The check for generic software is made at power-up. If generic software is found, the MIL will light immediately and the MIL will stay on even if the fault is cleared, until the proper software is installed. Note: Transmission will be placed in limp-in mode.

WHEN MONITORED:

Check for generic software is made at power-up

SET CONDITION:

If generic software is found, the MIL will light immediately. This DTC is designed to inform the technician that the controller still has generic software installed.

POSSIBLE CAUSES

Possible Causes
PCM - PROGRAMMING ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CONTROL MODULE PROGRAMMING ERROR**

   NOTE: Controller is programmed with generic software and will not allow the correct vehicle Powertrain management.

   1. With the scan tool.
   2. Record the vehicles controller part number.
   3. Select Use Controller Part Number under the Flash Tab.
   4. Flash the controller with the correct software. Refer to **MODULE, POWERTRAIN CONTROL, STANDARD PROCEDURE** .

      Verify the controller flashed successfully.

      Test Complete

      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0604-INTERNAL CONTROL MODULE RAM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the controller is reset (ignition turned to the RUN position), the microprocessor checks the integrity of each RAM location by writing to it and reading back from it. The read value should be same as value written.

WHEN MONITORED:

One time after the controller is reset (ignition turned to the RUN position).

SET CONDITION:

Whenever the Powertrain Control Module (PCM) detects an internal controller problem.

POSSIBLE CAUSES

Possible Causes
POWER OR GROUND CIRCUIT POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK WIRING AND CONNECTORS FOR INTERMITTENT OPERATION**
    1. Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.
    2. Wiggle the wires while checking for shorted and open circuits.
    3. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair the power and/or ground circuits to the PCM and Transmission Control Relay or TIPM (if equipped) as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0605-INTERNAL CONTROL MODULE ROM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the controller is reset (ignition turned to the RUN position) the microprocessor checks the integrity of the program memory (ROM). A checksum is calculated by adding all used bytes in the program memory. The sum

should be the same as a known constant stored in the program memory.

WHEN MONITORED:

One time after the controller is reset (ignition turned to the RUN position).

SET CONDITION:

Whenever the Powertrain Control Module (PCM) detects an internal controller problem.

POSSIBLE CAUSES

Possible Causes
POWER OR GROUND CIRCUIT POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK WIRING AND CONNECTORS FOR INTERMITTENT OPERATION**
    1. Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.
    2. Wiggle the wires while checking for shorted and open circuits.
    3. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair the power and/or ground circuits as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0613-INTERNAL TRANSMISSION PROCESSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The internal Watchdog (WD) is a separate hardware circuit that continuously monitors the microprocessor. To insure the proper operation of the Transmission controller the watchdog must receive a signal from the microprocessor within a specific time window (14 msec ± 1 msec) to prevent a system shutdown after a short delay (570 msec). The microprocessor periodically tests the WDs ability to provide this shutdown function using a three phase test;

1) Send the signal too late > 15 msec

2) Send the signal too early < 13 msec

3) Delay test < 590 msec

If the watchdog input signal arrives too early or too late, the Watchdog Fault line will go low and the watchdog delay will start to time out. The delay will be reset by the correct timing of watchdog signal sent during subsequent operations.

The Delay Test checks the delay time out. The Delay Monitor line is pulled low, which forces the delay to start timing out. At the end of the delay time the Transmission Relay will be turned off. The delay test, upon detection of the relay turning off, will immediately turn the relay back on before shutdown can occur.

WHEN MONITORED:

1) One time after the controller is reset (ignition turned to the RUN position) and every 60 seconds thereafter. The Delay Test is executed after a reset only.

2) Two seconds after an invalid test.

SET CONDITION:

If either of the following conditions occur three times:

1) The watchdog fault line remains high after the period has elapsed for the too early - too late watchdog test.

2) The Transmission Control Relay remains on after the watchdog delay expired.

POSSIBLE CAUSES

Possible Causes
POWER OR GROUND CIRCUIT POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK THE WIRING AND CONNECTORS**
    1. Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.
    2. Wiggle the wires while checking for shorted and open circuits.
    3. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair the power and/or ground circuits as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0706-TRANSMISSION RANGE SENSOR RATIONALITY

Fig. 5: Transmission Range Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The T41 (C1), T42 (C2), T3 (C3), T1 (C4), T2 (C5) Sense circuits communicate the shift lever position to the Transmission Control System. Each circuit is terminated at the transmission by a switch (TRS). Each switch can be either open or closed, depending on the shift lever position. The Powertrain Control Module (PCM) can decode this information and determine the shift lever position.

Each shift lever position has it own unique combination of closed and open switches. This is called a PRNDL code. There are five switches, therefore: there are many possible combinations of open and closed switches (codes). There are 12 valid codes: two for neutral, one for each other gear position (5), and five temporary (transition zone) codes. The remainder of the codes should never occur, these are called invalid codes.

WHEN MONITORED:

Continuously with the ignition on.

SET CONDITION:

The DTC will set if the controller detects an invalid PRNDL code which lasts for more than 0.042 of a second.

POSSIBLE CAUSES

Possible Causes
TRS SENSE CIRCUIT OPEN
TRS SENSE CIRCUIT SHORTED TO GROUND
TRS SENSE CIRCUIT SHORTED TO VOLTAGE
METAL DEBRIS IN OIL PAN
TRANSMISSION RANGE SENSOR (TRS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

SHIFT LEVER ERROR CODES

ERROR CODE	SWITCH STUCK	POSITION
1	T41 (C1)	OPEN
2	T41 (C1)	CLOSED
3	T42 (C2)	OPEN
4	T42 (C2)	CLOSED
5	T3 (C3)	OPEN
6	T3 (C3)	CLOSED
7	T1 (C4)	OPEN
8	T1 (C4)	CLOSED
9	T2 (C5)	OPEN
10	T2 (C5)	CLOSED
11	OD LOCKOUT	OPEN

12	OD LOCKOUT	CLOSED

T2 (C5)	CL	CL	OP	OP	OP	OP	OP	OP	OP	CL	CL	CL

Note:
CL indicates that CLOSED should appear on the scan tool
OP indicates that OPEN should appear on the scan tool

DIAGNOSTIC TEST

1. **CHECK TO SEE IF P0706 DTC IS CURRENT**
   1. With the scan tool, perform the Shift Lever Position Test.

      Select the test outcome from the following:

      Test passes:

      - Go To 6.

      Test fails with Error Code:

      - Go To 2.

      Test fails without Error Code:

      - Perform the Gearshift Adjustment Procedure in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.
2. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. Ignition on, engine not running.
5. With the scan tool, perform the Shift Lever Position Test.
6. When the scan tool instructs you to put the Gear Selector in a particular position, you must do so using the selector switch on the Transmission Simulator.
7. The LED for the gear position in question must be illuminated on the Transmission Simulator prior to pressing "ENTER" on the scan tool.

NOTE: When the scan tool requests the O/D off button be depressed, you must use the O/D OFF button in the vehicle or you will fail the Shift Lever Position Test with an error code 11 or OD-TOW/HALL STUCK OPEN.

NOTE: If the Shift Lever Position test fails, make sure to note the identification of the TRS Sense circuit for future reference.

Did the Shift Lever Position test pass?

Yes

- Remove the Oil Pan and Main Valve Body Assembly in accordance with the Service Information. Check for metal debris on top of the Solenoid/TRS Assembly and the manual valve code plate. If debris is present, determine the cause of the debris and repair the transmission as necessary. If no problems are found, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 3.

3. **TRS SENSE CIRCUIT OPEN**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   3. Disconnect the PCM harness connectors and install the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

   4. Measure the resistance of the identified (T1, T2, T3, T41, or T42) TRS Sense circuit, from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of the PCM

Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

Is the resistance above 5.0 Ohms?

Yes

- Repair the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Sense circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 4.

4. **TRS SENSE CIRCUIT SHORT TO GROUND**
   1. Measure the resistance between ground and the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Sense circuit.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Sense circuit for a short to ground.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 5.

5. **TRS SENSE CIRCUIT SHORT TO OTHER CIRCUITS**
   1. Measure the resistance between the identified (T1, T2, T3, T41, or T42) TRS Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

      Is the resistance below 100k Ohms between the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

      Yes

      - Repair the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Sense circuit for a short to other circuit(s).
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wiring and connectors while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0711-TRANSMISSION TEMPERATURE SENSOR PERFORMANCE

Fig. 6: Line Pressure Sensor Circuit
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermistor. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up, and when and/or if certain OBDII or

system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC will set when the desired transmission temperature does not reach a normal operating temperature within a given time frame. Time is variable due to ambient temperature. Approximate times are starting temperature to warm up time: (-40°C [-40°F] - 35 min) (-28°C [-20°F] - 25 min) (-6.6°C [20°F] - 20 min) (15.5°C [60°F] - 10 min)

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
TRANSMISSION TEMPERATURE SENSOR (TRS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, check Transmission DTCs.

       Are there any other related Transmission Temperature Sensor DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 3.

No

- Go To 4.

3. **TRANSMISSION TEMPERATURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Input/Output switch to OFF.
   6. With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
   7. Compare the scan tool readings to the voltage readings listed on the Transmission Simulator.

   Do the readings on the scan tool match the Transmission Simulator readings ± 0.2 of a volt?

   Yes

   - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P0712-TRANSMISSION TEMPERATURE SENSOR LOW

Fig. 7: Line Pressure Sensor Circuit
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermistor. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up, and when and/or if certain OBDII or

system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set when the monitored Temperature Sensor voltage drops below 0.078 of a volt for the period of 0.45 of a second.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
TRANSMISSION TEMPERATURE SENSOR (TRS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are there any line pressure sensor or throttle position sensor DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 3.

No

- Go To 5.

3. **TRANSMISSION TEMPERATURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Input/Output switch to OFF.
   6. With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
   7. Compare the scan tool readings with the numbers listed on the Transmission Simulator.

   Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 of a volt?

   Yes

   - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 8: Checking Transmission Temperature Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance between ground and the (T54) Transmission Temperature Sensor Signal circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0713-TRANSMISSION TEMPERATURE SENSOR HIGH

Fig. 9: Line Pressure Sensor Circuit
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermistor. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up, and when and/or if certain OBDII or

system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set when the monitored Temperature Sensor voltage rises above 4.94 volts for the period of 0.45 of a second.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO OTHER CIRCUITS
TRANSMISSION TEMPERATURE SENSOR (TRS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are there any line pressure sensor or throttle position sensor DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 3.

No

- Go To 5.

3. **TRANSMISSION TEMPERATURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Input/Output switch to OFF.
   6. With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
   7. Compare the scan tool readings with the numbers listed on the Transmission Simulator.

   Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 of a volt?

   Yes

   - Replace Transmission Solenoid/TRS assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **(T54) TRANSMISSION SENSOR SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUIT**

Fig. 10: Checking Transmission Sensor Signal Circuit For Short To Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM harness connectors.
4. Measure the resistance between the (T54) Transmission Temperature Sensor Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T54) Transmission Temperature Sensor Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the Transmission Temperature Sensor Signal circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0714-TRANSMISSION TEMPERATURE SENSOR INTERMITTENT

Fig. 11: Line Pressure Sensor Circuit
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermistor. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up, and when and/or if certain OBDII or

system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set when the monitored Temperature Sensor voltage fluctuates or changes abruptly within a predetermined period of time.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
TRANSMISSION TEMPERATURE SENSOR (TRS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are there any line pressure sensor or throttle position sensor DTCs present?

       Yes

       Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 3.

       No

- Go To 4.

3. **TRANSMISSION TEMPERATURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Input/Output switch to OFF.
   6. With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
   7. Compare the scan tool readings with the numbers listed on the Transmission Simulator.

      Do the readings on the Transmission Simulator match a non-fluctuating scan tool reading ± 0.2 of a volt?

      Yes

      - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P0716-INPUT SPEED SENSOR 1 CIRCUIT PERFORMANCE

Fig. 12: Line Pressure Sensor Circuit
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).

2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set when at a stop.

WHEN MONITORED:

The transmission gear ratio is monitored continuously while the transmission is in gear.

SET CONDITION:

If there is an excessive change in input rpm in any gear. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
INPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK TO SEE IF DTC P0716 IS CURRENT**
    1. Start the engine in park.
    2. With the scan tool, monitor the Input Speed Sensor rpm.

       Is the Input Speed Sensor rpm below 400 rpm?

       Yes

       - Go To 2.

No

- Go To 9.

2. **INPUT SPEED SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, set the selector switch to 3000/1000 and the Input/Output switch to ON.
   6. With the scan tool, monitor the Input and Output Speed Sensor rpm.

      Does the Input speed read 3, 000 rpm and the Output speed read 1, 000 rpm ± 50 rpm?

      Yes

      - Replace the Input Speed Sensor in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 3.

3. **(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 13: Checking Input Speed Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

NOTE: **Make sure to leave the Speed Sensor, Transmission Solenoid/TRS Assembly, and Line Pressure Sensor harness connectors disconnected.**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

3. Ignition on, engine not running.
4. With the scan tool in TIPM, actuate the TCM output.
5. Measure the voltage of the (T52) Input Speed Sensor Signal circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T52) Input Speed Sensor Signal circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **(T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE**

Fig. 14: Checking Speed Sensor Ground Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool in TIPM, actuate the TCM output.
2. Measure the voltage of the (T13) Speed Sensor Ground circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

- Go To 5.

5. **(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN**

Fig. 15: Checking Input Speed Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool in TIPM, stop the actuation the TCM output.
2. Turn the ignition off to the lock position.
3. Measure the resistance of the (T52) Input Speed Sensor Signal circuit between the Input Speed Sensor harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T52) Input Speed Sensor Signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 6.

6. **(T13) SPEED SENSOR GROUND CIRCUIT OPEN**

Fig. 16: Checking Speed Sensor Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T13) Speed Sensor Ground circuit between the Input Speed Sensor harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T13) Speed Sensor Ground circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

7. **(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND**

Fig. 17: Checking Input Speed Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the Input Speed Sensor Signal circuit.

   Is the resistance below 5.0 Ohms?

Yes

- Repair the (T52) Input Speed Sensor Signal circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND**

Fig. 18: Checking Speed Sensor Ground Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Test Complete.

P0721-OUTPUT SPEED SENSOR CIRCUIT PERFORMANCE

Fig. 19: Line Pressure Sensor Circuit
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1)When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36, P1736 and P1776).

2)An excessive change in input or output speeds indicating signal intermittent will result in codes P0716 and/or P0721 being set.

3)If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor has 60 teeth and the output speed sensor has 30 teeth, this results in a an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

The transmission gear ratio is monitored continuously while the transmission is in gear.

SET CONDITION:

If there is an excessive change in output rpm in any gear. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
OUTPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK TO SEE IF DTC P0721 IS CURRENT**
    1. Turn the ignition off to the lock position.

        CAUTION: Properly support the vehicle and raise all drive wheels off the ground.

    2. Release the parking brake.
    3. Start the engine in park.
    4. Place the transmission gear selector in drive, release foot from brake.

WARNING: Be sure to keep hands and feet clear of rotating wheels.

5. With the scan tool, monitor the Output Speed Sensor rpm.

   Is the Output Speed Sensor rpm below 100 rpm?

   Yes

   - Go To 2.

   No

   - Go To 9.

2. **OUTPUT SPEED SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, set the selector switch to 3000/1000 and the Input/Output switch to ON.
   6. With the scan tool, monitor the Input and Output Speed Sensor rpm

      Does the Input Speed read 3, 000 rpm and the Output Speed read 1, 000 rpm, ± 50 rpm?

      Yes

      - Replace the Output Speed Sensor in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 3.

3. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 20: Checking Output Speed Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM harness connectors and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T14) Output Speed Sensor Signal circuit from the Output Speed Sensor harness connector to the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T14) Output Speed Sensor Signal circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 21: Checking Output Speed Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T13) Speed Sensor Ground circuit from the Output Speed Sensor harness connector to the appropriate terminal in the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T13) Speed Sensor Ground circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 22: Checking Output Speed Sensor Signal Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T14) Output Speed Sensor Signal circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T14) Output Speed Sensor Signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 6.

6. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND**

Fig. 23: Checking Speed Sensor Ground Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

7. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE**

Fig. 24: Checking Output Speed Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. With the scan tool in TIPM, actuate the TCM output.
3. Measure the voltage of the (T14) Output Speed Sensor Signal circuit.

   Is the voltage above 0.5 of a volt?

   Yes

- Repair the (T14) Output Speed Sensor Signal circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 25: Checking Output Speed Sensor Ground Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool in TIPM, actuate the TCM output.

2. Measure the voltage of the (T13) Speed Sensor Ground circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Test Complete.

P0726-ENGINE SPEED INPUT CIRCUIT RANGE/PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System calculates the engine rpm by directly reading the engine crank position sensor. It compares the calculated value to the engine speed sensor signal transmitted from the Engine Control System over the controllers internal BUS. The calculated engine rpm is also compared to a minimum and a

maximum value. **Note: Due to the integration of the Powertrain Control Module (PCM) and Transmission Control Module (TCM), BUS communication between the modules is internal and unserviceable.**

WHEN MONITORED:

Continuously every 7 msec with the ignition on and engine running.

SET CONDITION:

This DTC will set when the calculated engine speed is less than 390 rpm with the engine running, or greater than 8000 rpm, for the period of 2.0 seconds. The PCM will place the Transmission in Limp-in when this DTC is set. **Note: This is not a Transmission Input Speed Sensor DTC.**

POSSIBLE CAUSES

Possible Causes
RELATED ENGINE DTCS PRESENT
CRANK POSITION SENSOR OR WIRING
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED ENGINE DTCS**

   NOTE: This is not a Transmission Input Speed Sensor DTC.

   1. Ignition on, engine not running.
   2. With the scan tool, read all Engine DTCs. This includes any active or stored or one trip DTCs.

      Are there any engine rpm related DTCs present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK IF DTC IS CURRENT**
   1. Ignition on, engine not running.
   2. With a scan tool, read and record all Event Data.
   3. With the scan tool, erase all active and stored transmission DTCs.

NOTE: **It may be necessary to perform a battery disconnect with the scan tool to clear Event Data.**

4. Using the Event Data, duplicate the conditions in which the original DTC set.
5. With the scan tool, read transmission and engine DTCs.

NOTE: **Refer to all engine DTCs first in the following question.**

Pick the answer below that best describes your findings, (this includes one trip failures).

Transmission DTC P0726 set

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Also check the Crank Position sensor and wiring. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

Engine DTC set

- Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No DTC set at all

- Go To 3.

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P0731-GEAR RATIO ERROR IN 1ST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).

2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
CUT UD PISTON SEAL
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
STUCK OR STICKING MAIN REGULATOR VALVE

FAILED OVERRUNNING CLUTCH
CUT UD ACCUMULATOR SEAL RING
BROKEN UD ACCUMULATOR PISTON
BROKEN REACTION SHAFT SUPPORT SEAL RING
LOW LINE PRESSURE
BROKEN / MISSING MAIN VALVE BODY BLEED ORIFICE
BROKEN / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
POOR MACHINING ON PUMP VALVE BODY FACE
INPUT OR OUTPUT SPEED SENSOR AND RELATED WIRING
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for other transmission DTCs.
    2. If any of these DTCs are present, perform their respective tests first.

    Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. If any of these DTCs are present, they may cause a Gear Ratio Error. Perform the test for P0944 first if it is present.

    No

    - Go To 2.
2. **CHECK IF DTC P0731 IS CURRENT**
    1. With the scan tool, perform the 1st Gear Clutch Test. Follow the instructions on the scan tool.
    2. Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

    CAUTION: Do not overheat the transmission.

    Did the Clutch Test pass, Input Speed remain at zero?

    Yes

- Go To 3.

No

- Go To 4.

3. **CHECK FOR INTERMITTENT OPERATION**
   1. The conditions to set this DTC are not currently present.
   2. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
      - If the Event Data shows fault P0731 was set in Park, Reverse, or Neutral, replace the Powertrain Control Module.
      - If the Event Data shows fault P0731 set with input rpm = zero, check the input speed sensor and related wiring.
      - If the Event Data shows fault P0731 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, mis-installed or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
      - If the Event Data shows fault P0731 set with the UD pressure switch open (but line pressure matches Desired Line Pressure), air check the UD hydraulic clutch circuit for leakage in accordance with the Service Information. If the UD hydraulic clutch circuit is OK, replace the solenoid/TRS assembly.
   3. Check the gearshift linkage adjustment.
   4. Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
   5. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   6. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   7. Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.
   8. Gear ratio DTCs can also be set under extreme temperature conditions.
   9. Verify if the problem is only experienced under extreme hot or cold conditions.

      Were there any problems found.

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION

VERIFICATION TEST.

No

- Test Complete.

4. **CHECK INTERNAL TRANSMISSION**
    1. Repair internal transmission as necessary. Refer to the Service Information.
    2. If there were any line pressure DTCs present along with this DTC, make sure to inspect the: Primary oil filter and seal, Transmission Oil Pump, and the Main regulator valve in accordance with the Service Information.
    3. If DTCs P0876 and/or P0875 were present in addition to the P0731, replace the Transmission Solenoid/TRS Assembly in addition to necessary internal repairs.
    4. Pay particular attention to the following list of possible causes when repairing the transmission:
        - Cut UD piston seal
        - Failed overrunning clutch
        - Cut UD accumulator seal ring
        - Burned UD clutch
        - Broken UD accumulator piston
        - Low line pressure
        - Broken/missing main valve body bleed orifice
        - Broken/missing dribbler orifice assembly in reaction shaft support
        - Poor machining on pump valve body face
        - Transmission Solenoid/TRS Assembly

Repair

NOTE: **If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, low line pressure in Event Data, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Repair internal transmission in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0732-GEAR RATIO ERROR IN 2ND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm.

These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).

2) An excessive change in input or output speeds indicating signal intermittent may result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
INPUT OR OUTPUT SPEED SENSOR OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR 2C CLUTCH
CUT 2C OR UD PISTON SEAL
BROKEN 2C PISTON CASTING
BROKEN OR MISSING 2C BLEED ORIFICE
BROKEN OR MISSING UD BLEED ORIFICE
CUT 2C OR UD ACCUMULATOR PISTON SEAL
CRACKED 2C OR UD ACCUMULATOR PISTON
CUT OR MISSING #5 OR #7 CHECK BALL
TRANSMISSION SOLENOID/TRS ASSEMBLY
BROKEN WELD - REACTION CARRIER TO REVERSE SUN GEAR
MISSING TEETH ON INPUT CLUTCH HUB TONE WHEEL

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD

PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
   1. Using the scan tool, read DTCs.

      Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. Perform the test for P0944-LOSS OF PRIME first if it is present.

      No

      - Go To 2.
2. **CHECK IF DTC IS CURRENT**
   1. Using the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for the DTC P0732?

      Yes

      - Go To 4.

      No

      - Go To 3.
3. **CHECK EVENT DATA**
   1. In the Event Data, identify the DTC that was recorded earlier.

      Does the Event Data display information for the DTC P1790, with target gear = 2nd, or with both 2C and UD clutches applying?

      Yes

      - Go To 4.

      No

      - Go To 7.

4. **CHECK RPM IN THE EVENT DATA**
    1. Refer to the Event Data recorded earlier.

       Does the Input rpm read zero?

       Yes

       - Check the input speed sensor and wiring. Refer to **P0716-INPUT SPEED SENSOR 1 CIRCUIT PERFORMANCE** and diagnose as if the DTC is current.

       No

       - Go To 5.
5. **CHECK LINE PRESSURE READING**
    1. Refer to the Event Data recorded earlier.

       Is the line pressure reading more than 10 psi below the desired line pressure?

       Yes

       - Go To 6.

       No

       - Go To 7.
6. **CHECK TRANSMISSION OIL FILTER**
    1. Turn the ignition off to the lock position.
    2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
    3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

       NOTE: Make sure the Primary Transmission Oil Filter and seal are properly installed and are not cracked or split.

       Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked, plugged or mis-installed?

       Yes

       - Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If excessive clutch debris is present, check the clutches for damage. Refer to the Service Information for the proper hydraulic clutch repair procedure.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Remove the Transmission Oil Pump in accordance with the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK IF THE DTC P0732 IS CURRENT**
   1. With the scan tool, perform the 2nd Gear Clutch Test. Follow the instructions on the scan tool.
   2. Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: If the 2C clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 2nd gear clutch test will not detect a faulty 2C clutch. However, it will detect a faulty UD clutch.

Did the clutch test pass, did the Input Speed remain at zero?

Yes

- Go To 8.

No

- Go To 10.

8. **CHECK FOR INTERMITTENT OPERATION**
   1. Check the Shifter adjustment in accordance with the Service Information.
   2. Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
   3. Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

Were there any problems found?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK FOR SLIPPAGE**
   1. Using the scan tool, erase Transmission DTCs.
   2. Road test the vehicle.

   Is there an obvious slippage noticed in 2nd gear, or runaway on the 1-2 shift?

   Yes

   - Go To 12.

   No

   - Go To 15.

10. **CHECK THE UD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove Transmission Oil Pan and check for excessive debris.
    2. Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) in accordance with the Service Information.

    NOTE: The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

    Were there any problems found, excessive debris and/or excessive air leakage in the UD clutch hydraulic circuit?

    Yes

    - Repair as necessary. Check the UD clutch piston seals, reaction shaft support seal rings and the dribbler assembly, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

      NOTE: If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 11.

11. **CHECK THE UD ACCUMULATOR PISTON**

1. Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

   Were there any problems found?

   Yes

   - Repair as necessary. Refer to the Service Information for proper repair procedures.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Remove the Transmission Oil Pan and check for excessive debris.
    2. If grey sludge is present, check for a improperly assembled 2C clutch with the thick reaction plate not against the case.
    3. Remove the valve body and air check the 2C hydraulic clutch circuit (in the 2C/4C clutch retainer) in accordance with the Service Information.

       NOTE: The 2C clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

       Were there any problems found, excessive debris, improperly assembled 2C clutch and/or excessive air leakage in the 2C hydraulic clutch circuit?

       Yes

       - Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the 2C piston seals and bleed orifice.

         NOTE: If the 2C clutch has failed but no obvious cause is found (such as a cut piston seal, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

- Go To 13.

13. **CHECK THE 2C ACCUMULATOR**
    1. Check the 2C Accumulator piston for cracks or a cut seal.
    2. Check for a cut or missing #7 or #5 check ball.
    3. Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

    Were there any problems found

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 14.

14. **CHECK FOR BROKEN REVERSE SUN GEAR WELD**
    1. Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:
       - Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
       - Rotate the Input Annulus gear and drive shell (the drum that encloses the two rearmost carriers).
       - Check to see if the reaction carrier (the front-most carrier, whose outer shell is splined to the 2C clutch) is rotating faster than the drive shell is being turned.

    Is the reaction carrier turning faster than the drive shell?

    Yes

    - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the reaction carrier in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK IF DTC RESETS**

    Did the DTC P0732 reset during the road test?

Yes

- Go To 16.

No

- Go To 17.

16. **LIST OF POSSIBLE CAUSES**
    1. If any other DTCs set during the road test, refer to **DIAGNOSIS AND TESTING**.
    2. If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those:
        - Check for excessive debris in the Transmission Oil pan, plugged, cracked, or misinstalled Primary Transmission Oil Filter and/or seal.
        - Check for cut and/or missing #7 and #5 check balls in the main valve body.
        - Check the 2C and UD accumulator pistons and seals, UD bleed orifice, and the Solenoid Switch Valve and Plugs in the main valve body.
        - Check the UD clutch piston seals, reaction shaft support seal rings and dribbler assembly.
        - Check the 2C clutch piston seals, and bleed orifice.
        - Check the main regulator valve for sticking in its bore and the flatness of the pump valve body and pump housing faces.
        - Check for a improperly assembled 2C clutch with the thick reaction plate not against the case.

    Repair

    - Repair as necessary. Refer to the Service Information for proper repair procedures.

    NOTE: **If the UD or 2C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

17. **INTERMITTENT DTC**
    1. The conditions to set this DTC are not currently present.
    2. Using the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
        - If the Event Data shows fault P0732 was set in Park, Reverse, or Neutral, replace the Powertrain Control Module.
        - If the Event Data shows fault P0732 set with input rpm = zero, check the input speed sensor and related wiring.
        - If the Event Data shows fault P0732 set with line pressure significantly below desired line

pressure, check for the cause of low line pressure (i.e., oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).

- If the Event Data shows fault P0732 set with the UD or 2C pressure switch open (but line pressure matches Desired Line Pressure), air check the UD and 2C hydraulic clutch circuits for leakage in accordance with the Service Information. If the UD and 2C hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.

3. Check the gearshift linkage adjustment.
4. Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
5. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

6. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
7. Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.
8. Gear ratio DTCs can also be set under extreme temperature conditions.
9. Verify if the problem is only experienced under extreme hot or cold conditions.

Were there any problems found.

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P0733-GEAR RATIO ERROR IN 3RD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).

2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
INPUT OR OUTPUT SPEED SENSOR ERRORS
INPUT SPEED SENSOR OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
BENT OR BROKEN ACCUMULATOR COVER ON MAIN VALVE BODY
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR OD CLUTCH
CUT OD OR UD PISTON SEAL
BROKEN OR MISSING UD OR OD BLEED ORIFICE IN MAIN VALVE BODY
BROKEN OR MISSING BLEED ORIFICE IN UD OR OD CLUTCH PISTON
CUT OD OR UD ACCUMULATOR PISTON SEAL
CRACKED OD OR UD ACCUMULATOR PISTON
CUT OR MISSING NO. 6 CHECK BALL
TRANSMISSION SOLENOID/TRS ASSEMBLY
BROKEN WELD - REVERSE CARRIER HUB TO CARRIER
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
    1. Using the scan tool, read DTCs

       Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the test for P0944-LOSS OF PRIME first if it is present.

       No

       - Go To 2.
2. **CHECK EVENT DATA**
    1. Using the scan tool, read and record the Event Data.

       NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

       Does the Event Data display information for the DTC P0733?

       Yes

       - Go To 4.

       No

       - Go To 3.
3. **CHECK THE TARGET GEAR IN THE EVENT DATA**
    1. In the Event Data, identify the DTC that was recorded earlier.

       Does the Event Data display information for the DTC P1790, with target gear = 3rd, or with both OD and UD clutches applying?

       Yes

       - Go To 4.

       No

       - Go To 7.
4. **CHECK THE INPUT RPM IN THE EVENT DATA**

1. Refer to the Event Data recorded earlier.

   Does the Input rpm read zero?

   Yes

   - Check the input speed sensor and wiring. Refer to test P0716 and diagnose as if the DTC is current.

   No

   - Go To 5.

5. **CHECK LINE PRESSURE READING**
   1. Refer to the Event Data recorded earlier.

      Is the line pressure reading more than 10 psi below the desired line pressure?

      Yes

      - Go To 6.

      No

      - Go To 7.

6. **CHECK TRANSMISSION OIL FILTER**
   1. Turn the ignition off to the lock position.
   2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
   3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

      NOTE: Make sure the Primary Transmission Oil Filter and seal are properly installed and are not cracked or split.

      Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked, plugged or mis-installed?

      Yes

      - Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If excessive clutch debris is present, check the clutches for damage. Refer to the Service Information for the proper hydraulic clutch repair procedure.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

- Remove the Transmission Oil Pump in accordance with the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK IF DTC P0733 IS CURRENT**
   1. With the scan tool, perform the 3rd Gear Clutch Test. Follow the instructions on the scan tool.
   2. Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: If the OD clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 3rd gear clutch test will not detect a faulty OD clutch. However, it will detect a faulty UD clutch.

Did the clutch test pass, did the Input Speed remain at zero?

Yes

- Go To 8.

No

- Go To 10.

8. **CHECK FOR INTERMITTENT OPERATION**
   1. Check the Shifter adjustment in accordance with the Service Information.
   2. Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
   3. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   4. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   5. Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

Were there any problems found?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK FOR SLIPPAGE**
   1. Using the scan tool, erase Transmission DTCs.
   2. Road test the vehicle. Check operation in 3rd gear, 4th gear, and Reverse.

   Is there an obvious slippage noticed in 3rd gear, or runaway on the 2-3 shift?

   Yes

   - Go To 12.

   No

   - Go To 16.

10. **CHECK THE UD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove Transmission Oil Pan and check for excessive debris.
    2. Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) in accordance with the Service Information.

    NOTE: The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

    Were there any problems found, excessive debris and/or excessive air leakage in the UD hydraulic clutch circuit?

    Yes

    - Repair as necessary. Check the UD clutch piston seals, reaction shaft support seal rings and dribbler assemblies, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

      NOTE: If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 11.

11. **CHECK UD ACCUMULATOR PISTON**
    1. Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

    Were there any problems found?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures.

    No

    - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Remove the Transmission Oil Pan and check for excessive debris.
    2. Remove the valve body and check if the accumulator cover is intact.
    3. Air check the OD hydraulic clutch circuit (in the case) in accordance with the Service Information.

    NOTE: The OD clutch passage contains a small bleed orifice which connects to the Reverse clutch hydraulic circuit, a small amount of air leakage into the Reverse clutch passage is normal.

    Were there any problems found, excessive debris, and/or excessive air leakage in the OD hydraulic clutch circuit?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the bleed orifice in the OD/Reverse clutch piston.

    NOTE: If the OD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 13.

13. **CHECK THE OD ACCUMULATOR**
    1. Check the OD Accumulator piston for cracks or a cut seal.
    2. Check for a cut or missing No. 6 check ball.
    3. Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

    Were there any problems found?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 14.

14. **CHECK FOR NO REVERSE**

    During the road test on a previous test, did the vehicle have no reverse and no 3rd gear, but 1st and 2nd gears were OK?

    Yes

    - Go To 15.

    No

    - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK FOR BROKEN REVERSE CARRIER WELD**
    1. Remove the Transmission in accordance with the Service Information and inspect the weld on the reverse carrier hub.

    Were there any problems found?

    Yes

- Repair as necessary.

No

- Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston). Check the OD hub and shaft. Repair as necessary. Refer to the Service Information for proper repair procedures.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

16. **CHECK IF DTC RESETS**

Did the DTC P0733 reset during the road test?

Yes

- Go To 17.

No

- Go To 18.

17. **LIST OF POSSIBLE CAUSES**
    1. If any other DTCs set during the road test, refer to **DIAGNOSIS AND TESTING**.
    2. If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those.
    3. Check for:
        - Excessive debris in the Transmission Oil pan, plugged, cracked, or mis-installed Primary Transmission Oil Filter and/or seal.
        - Cut or missing No. 6 check ball in the main valve body.
        - OD and UD accumulator pistons and seals and bleed orifices, and the Solenoid Switch Valve and Plugs in the main valve body.
        - OD and UD clutch piston seals, reaction shaft support seal rings and dribbler assemblies, and the flatness of the pump valve body and pump housing faces.
        - Main regulator valve for sticking in its bore.

Repair

- Repair as necessary. Refer to the Service Information for proper repair procedures.

NOTE: **If the OD or UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

18. **CHECK FOR INTERMITTENT OPERATION**
    1. The conditions to set this DTC are not currently present.
    2. Using the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
       - If the Event Data shows fault P0733 was set in the Park, Reverse, or Neutral, replace the Powertrain Control Module.
       - If the Event Data shows fault P0733 set with input rpm = zero, check the input speed sensor and related wiring.
       - If the Event Data shows fault P0733 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
       - If the Event Data shows fault P0733 set with the OD or UD pressure switch open (but line pressure matches Desired Line Pressure), air check the OD and UD hydraulic clutch circuits for leakage in accordance with the Service Information. If the OD and UD hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.
    3. Check the gearshift linkage adjustment.
    4. Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
    5. Remove the Ignition Switch Feed fuse from the TIPM.

       CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

       WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    6. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    7. Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.
    8. Gear ratio DTCs can also be set under extreme temperature conditions.
    9. Verify if the problem is only experienced under extreme hot or cold conditions.

       Were there any problems found.

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

- Test Complete.

P0734-GEAR RATIO ERROR IN 4TH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P01736).

2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
LOW FLUID LEVEL
INPUT SPEED SENSOR OR WIRING
VALVE BODY ACCUMULATOR COVER FAILED
CUT OD OR 4C ACCUMULATOR SEAL
CRACKED OD OR 4C ACCUMULATOR PISTON
BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY
CUT 4C TOWER SEAL
TRANSMISSION SOLENOID/TRS ASSEMBLY
CUT OR MISSING NO. 5 OR NO. 6 CHECK BALL
WORN SOLENOID SWITCH VALVE OR PLUGS
CUT OD OR 4C PISTON SEAL

STUCK MAIN REGULATOR VALVE
BURNED OD OR 4C CLUTCH
BROKEN OR MISSING 4C BLEED ORIFICE IN 2C/4C RETAINER
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE
LOOSE / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
CRACKED / LOOSE / MISSING OD/REVERSE PISTON BLEED ORIFICE
BROKEN REVERSE CARRIER HUB WELD
BROKEN REVERSE SUN GEAR WELD TO REACTION CARRIER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for other transmission DTCs
    2. If any of these DTCs are present, perform their respective tests first.

    Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

    Yes

    - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure. If any of these DTCs are present, they may cause a Gear Ratio Error. Perform the test for P0944 first if it is present.

    No

    - Go To 2.
2. **CHECK EVENT DATA**
    1. With the scan tool, read and record the Event Data.

    NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

    Does the Event Data display information for the DTC P0734?

    Yes

    - Go To 4.

    No

- Go To 3.

3. **CHECK FOR ANOTHER DTC**

   In the Event Data recorded earlier, does the Event Data show the DTC P1790, with Target Gear = 4th, or with both the 4C and OD clutches applying?

   Yes

   - Go To 4.

   No

   - Go To 6.

4. **CHECK INPUT RPM**

   In the Event Data recorded earlier, does the Input rpm read zero?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure for P0715 (Input Speed Sensor Error). Diagnose the DTC as if it is set and current.

   No

   - Go To 5.

5. **CHECK LINE PRESSURE READING**

   In the Event Data recorded earlier, is the line pressure reading more than 10 PSI below the desired line pressure reading?

   Yes

   - Remove the Transmission Oil pan and check the Transmission Oil filter for improper installation or plugged, if Primary oil filter is OK, check the main regulator valve in pump. If excessive debris is in the oil pan, check clutches and repair as necessary. Refer to **REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 6.

6. **CHECK TRANSMISSION FOR SLIPPAGE**
   1. Erase DTCs and road test the vehicle.
   2. Check the transmission operation in reverse and all forward gears.

During the road test, was there any obvious slippage noted in 4th gear or a runaway during the 3-4 shift?

Yes

- Go To 8.

No

- Go To 7.

7. **CHECK IF DTC RESETS**
   1. With the scan tool, check for Transmission DTCs after the road test.

      Did the DTC P0734 reset?

      Yes

      - Go To 8.

      No

      - Test Complete.

8. **CHECK INTERNAL TRANSMISSION**
   1. Remove the Transmission Oil Pan and Valve Body in accordance with the Service Information and check for the following:
      - Excessive debris in the oil pan.
      - Remove the Valve Body and check if the accumulator cover is intact and the 4C tower seal is not cut or split.
      - OD and 4C accumulator pistons for cracks and/or cut seals.
      - Solenoid Switch Valve and its plugs for stickiness or wear.
      - Cut or missing No. 5 and/or No. 6 check ball.
      - OD bleed orifice on top of the Valve Body
      - Air check the OD and 4C hydraulic clutch circuits for excessive leakage. Refer to the Service information.

      NOTE: **Both the OD and 4C hydraulic clutch circuits contain a small bleed orifice. A small amount of air leakage is considered normal. The OD hydraulic clutch circuit bleed orifice connects to the Reverse input clutch hydraulic cavity. A small amount of air leakage into the Reverse hydraulic clutch circuit is considered normal.**

      Were there any problems found?

      Yes

- Repair as necessary. Refer to **REMOVAL** .

NOTE: **If the OD or 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK REVERSE GEAR**

Was there no reverse gear during the road test?

Yes (no reverse)

- Go To 10.

No (reverse gear OK)

- Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

10. **CHECK ROAD TEST RESULTS**

During the road test, was there no 2nd gear and no 4th gear, but 3rd gear (limp-in) was OK?

Yes

- Go To 11.

No

- Go To 12.

11. **CHECK FOR BROKEN REVERSE SUN GEAR WELD**
    1. Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:

       Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.

       Rotate the Input Annulus gear and drive shell (the drum that encloses the two rearmost

carriers).

Check to see if the reaction carrier (the front most carrier, whose outer shell is splined to the 2C clutch) is rotating faster than the drive shell is being turned.

Is the reaction carrier turning faster than the drive shell?

Yes

- Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the reaction carrier in accordance with the Service Information. Refer to **REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

12. **CHECK REVERSE CARRIER HUB WELD**
    1. Remove the Transmission in accordance with the Service Information and inspect the weld on the reverse carrier hub.

       Were there any problems found?

       Yes

       - Repair as necessary. Refer to **REMOVAL** .
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston). Check the OD hub and shaft. Repair as necessary. Refer to **REMOVAL** .
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0735-GEAR RATIO ERROR IN 5TH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm.

These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).

2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
LOW FLUID LEVEL
INPUT SPEED SENSOR OR WIRING
VALVE BODY ACCUMULATOR COVER FAILED
CUT OD OR 2C ACCUMULATOR SEAL
CRACKED OD OR 2C ACCUMULATOR PISTON
BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY
CUT 2C TOWER SEAL
TRANSMISSION SOLENOID/TRS ASSEMBLY
CUT OR MISSING NO. 5, NO. 6, OR NO. 7 CHECK BALL
WORN SOLENOID SWITCH VALVE OR PLUGS
CUT OD OR 2C PISTON SEAL
STUCK MAIN REGULATOR VALVE
BURNED OD OR 2C CLUTCH
BROKEN OR MISSING 2C BLEED ORIFICE IN 2C/4C RETAINER
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE
LOOSE / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
CRACKED / LOOSE / MISSING OD/REVERSE PISTON BLEED ORIFICE
BROKEN REVERSE CARRIER HUB WELD

BROKEN REVERSE SUN GEAR WELD TO REACTION CARRIER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
   1. With the scan tool, check for other transmission DTCs.
   2. If any of these DTCs are present, perform their respective tests first.

      Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure. If any of these DTCs are present, they may cause a Gear Ratio Error. Perform the test for P0944 first if it is present.

      No

      - Go To 2.
2. **CHECK EVENT DATA**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for the DTC P0735?

      Yes

      - Go To 4.

      No

      - Go To 3.
3. **CHECK THE TARGET GEAR**

   In the Event Data recorded earlier, does the Event Data show the DTC P1790, with Target gear = 5th, or with both the 2C and OD clutches applying?

   Yes

- Go To 4.

No

- Go To 6.

4. **CHECK INPUT RPM**

   In the Event Data recorded earlier, does the Input rpm read zero?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure for P0716. Diagnose the DTC as if it is set and current.

   No

   - Go To 5.

5. **CHECK LINE PRESSURE READING**

   In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure reading?

   Yes

   - Remove the Transmission Oil pan and check the Transmission Oil filter for improper installation or plugged, if Primary oil filter is OK, check the main regulator valve in pump. If excessive debris is in the oil pan, check clutches and repair as necessary. Refer to **PUMP, TRANSMISSION OIL, DISASSEMBLY** .
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 6.

6. **CHECK TRANSMISSION FOR SLIPPAGE**
   1. Erase DTCs and road test the vehicle.
   2. Check the transmission operation in reverse and all forward gears.

      During the road test, was there any obvious slippage noted in 5th gear or a runaway during the 4-5 shift?

      Yes

      - Go To 8.

No

- Go To 7.

7. **CHECK IF DTC RESETS**
   1. With the scan tool, check for Transmission DTCs after the road test.

      Did the DTC P0735 reset?

      Yes

      - Go To 8.

      No

      - Test Complete.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

8. **CHECK INTERNAL TRANSMISSION**
   1. Remove the Transmission Oil Pan and Valve Body, in accordance with the Service Information, and check for the following:
      - Excessive clutch and or metal debris in the oil pan.
      - If the accumulator cover is intact and the 2C tower seal is not cut or split.
      - OD and 2C accumulator pistons for cracks or cut seals.
      - Solenoid Switch Valve and its plugs for stickiness or wear.
      - Cut or missing No. 5, No. 6, or No. 7 check ball.
      - OD bleed orifice on top of the valve body.
      - Air check the OD and 2C hydraulic clutch circuits for excessive leakage. Refer to the Service information.

      NOTE: Both the OD and 2C hydraulic clutch circuits contain a small bleed orifice. A small amount of air leakage is considered normal. The OD hydraulic clutch circuit bleed orifice connects to the Reverse input clutch hydraulic cavity. A small amount of air leakage into the Reverse hydraulic clutch circuit is considered normal.

      Were there any problems found?

      Yes

      - Repair as necessary. Refer to **REMOVAL** .

        NOTE: If the OD or 2C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission

Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0736-GEAR RATIO ERROR IN REVERSE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).

2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
INPUT OR OUTPUT SPEED SENSOR ERRORS
LOW FLUID LEVEL
CUT L/R TOWER SEAL ON MAIN VALVE BODY
CUT L/R CLUTCH PISTON SEALS
BROKEN OR MISSING L/R CLUTCH BLEED ORIFICE (IN L/R CLUTCH RETAINER)
CUT L/R ACCUMULATOR PISTON SEAL IN MAIN VALVE BODY
CRACKED L/R ACCUMULATOR PISTON IN MAIN VALVE BODY
CUT OD/REV PISTON SEALS
BROKEN OR MISSING OD/REV BLEED ORIFICE (IN OD/REV CLUTCH PISTON)
BROKEN REVERSE CARRIER HUB WELD
BROKEN REVERSE SUN GEAR WELD TO THE REACTION CARRIER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
   1. Using the scan tool, check for other transmission DTCs.

      Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. Perform the test for P0944-LOSS OF PRIME first if it is present.

      No

      - Go To 2.
2. **CHECK IF DTC IS CURRENT**
   1. Using the scan tool, perform the Reverse Gear Clutch test. Follow the instructions on the scan tool.
   2. Increase the throttle angle, TPS degree, to 30°, for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

Did the clutch test pass, input speed remain at zero?

Yes

- Go To 3.

No

- Go To 4.

3. **CHECK EVENT DATA**
   1. The conditions necessary to set this DTC are not currently present.
   2. Using the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Does the Event Data show an input speed reading of zero?

   Yes

   - Go To 8.

   No

   - Go To 4.

4. **POSSIBLE INTERNAL TRANSMISSION CAUSES**
   1. Remove the Transmission Oil Pan and Valve Body and check the following in accordance with the Service Information:
      - Clutch or metal debris in the pan
      - L/R clutch tower seal on the main valve body for cuts and the L/R accumulator piston and seals.
      - Air check the Reverse and L/R Hydraulic Clutch circuits (in the case) for excessive air leakage.

      NOTE: **Both Hydraulic Clutch circuits contain a small bleed orifice, a small amount of air leakage is normal. The Reverse hydraulic clutch circuit bleed orifice connects to the OD hydraulic clutch cavity. A small amount of air leakage into the OD hydraulic clutch circuit is considered normal.**

      Were there any problems found?

      Yes

      - Repair as necessary. If clutch debris is present, remove the transmission and inspect the Reverse and L/R clutches, and inspect the Transmission Oil Pump and Main Regulator Valve for damage or sticking in its bore.

NOTE: **If the L/R clutch has failed but no obvious cause is found (such as a cut piston seal, stuck regulator valve, low line pressure reading in the Event Data, or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 5.

5. **CLUTCH TEST FAILURE**

Did the clutch test fail in reverse?

Yes

- Go To 6.

No

- Test complete.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK FOR BROKEN REVERSE SUN GEAR WELD**
   1. Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:
      - Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
      - Rotate the Input Annulus gear and drive shell, (the drum that encloses the two rearmost carriers).
      - Check to see if the reaction carrier (the front-most carrier, whose outer shell is splined to the 2C clutch) is rotating faster than the drive shell is being turned.

   Is the reaction carrier turning faster than the drive shell?

   Yes

   - Go To 7.

   No

   - Replace the reaction carrier in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION

VERIFICATION TEST.

7. **CHECK REVERSE CARRIER HUB**
    1. Remove the Transmission in accordance with the Service Information and inspect the weld on the reverse carrier hub.

       Were there any problems found?

       Yes

       - Repair as necessary. Refer to the Service Information for proper repair procedures.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Disassemble and inspect the input clutch assembly. Check the Reverse clutch reaction plate snap ring. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston). Check the Reverse hub and shaft. Repair as necessary. Refer to the Service Information for proper repair procedures.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

8. **CHECK FOR INTERMITTENT OPERATION**
    1. Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

       CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

       WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    4. Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

       Were there any problems found?

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Test complete.

P0740-TCC OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When in 2nd, through 5th gear, the torque converter clutch (TCC) can be engaged when certain conditions are met. The L/R-TCC piston is electronically modulated by increasing the duty cycle of the L/R-TCC Solenoid until the torque converter slip difference (difference between engine and transmission input speed) is within 60 rpm. Then the L/R-TCC solenoid is fully energized (FEMCC - 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

WHEN MONITORED:

During Electronically Modulated Converter Clutch (EMCC) Operation.

SET CONDITION:

Transmission must be in EMCC, with input speed greater than 1750 rpm. L/R-TCC Solenoid achieves the maximum duty cycle and can not pull engine speed within 60 rpm of input speed. Also when the transmission is in FEMCC and the engine slips TCC more than 100 rpm for 10 seconds. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
RELATED DTC P0750 PRESENT
L/R-TCC SOLENOID
TCC SWITCH VALVE STUCK
TCC REGULATOR VALVE STUCK
INPUT SHAFT SEAL RING CUT
TORQUE CONVERTER AND/OR INTERNAL TRANSMISSION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTC P0750**
    1. With the scan tool, read transmission DTCs.

       Is the DTC P0750 present also?

Yes

- Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 2.

2. **CHECK IF DTC P0740 IS CURRENT**
   1. With the scan tool, Read and RECORD ALL Transmission DTCs. After recording DTCs, erase DTCs.
   2. Drive the vehicle until the transmission temperature is at least 43° C or 110° F and the engine temperature at least 49° C or 120° F.
   3. Perform the following steps 3 times.
   4. Drive the vehicle to the speed of at least 88 Kmh or 55 mph.
   5. Allow 4th or 5th gear to engage for at least 10 seconds.
   6. Close the throttle.
   7. Tip back into the throttle until the TPS angle is between 25 and 29 degrees.

   NOTE: If the throttle angle goes over 30 degrees, you must close the throttle and try again.

   Did the TCC engage during any of the attempts, Engine speed approximately equal to input speed?

   Yes

   - Go To 3.

   No

   - Go To 4.

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorts and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

4. **CHECK THE L/R-TCC SOLENOID**
   1. With the scan tool, check for other transmission DTCs.

      Are the DTCs P1775 and P0841 present also?

      Yes

      - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 5.

5. **CHECK THE TORQUE CONVERTER AND/OR INTERNAL TRANSMISSION**
   1. Repair internal transmission as necessary.
   2. Check for the following possible causes.
   3. Inspect the Transmission Oil Pump Assembly.
   4. Check the Torque Converter Switch Valve and the Torque Converter Clutch Control Valve for sticking in the bore.
   5. Check the Teflon seal rings on the input shaft.

      NOTE: If one of the seal rings is cut, the loose piece will often lodge in the TCC switch valve, causing it to stick in its bore.

   6. If no problems are found, replace the Transmission Solenoid/TRS Assembly.

      Repair

      - In all cases, replace the Torque Converter. Make sure to check all other possible causes in addition to the Torque Converter.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0750-LR SOLENOID CIRCUIT

Fig. 26: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System uses five electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three

consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

WHEN MONITORED:

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

SET CONDITION:

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: **This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement - do not replace the Valve Body.**

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T20) L/R SOLENOID CONTROL CIRCUIT SHORTED TO OTHER CIRCUITS
(T20) L/R SOLENOID CONTROL CIRCUIT OPEN
(T20) L/R SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK DTCS**
    1. With the scan tool, check DTCs.

       Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK TO SEE IF P0750 IS PRESENT**

1. Ignition on, engine not running.
2. With the scan tool, erase all Transmission DTCs.
3. Turn the ignition off to the lock position.
4. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

5. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
6. Ignition on, engine not running.
7. With the scan tool, actuate the L/R Solenoid.
8. Monitor the L/R Solenoid LED on the Transmission Simulator.

   Did the L/R Solenoid LED on the Transmission Simulator blink on and off?

   Yes

   - Go To 3.

   No

   - Go To 5.

3. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. With the Transmission simulator still connected, continue to actuate the L/R solenoid for two minutes.
   2. After two minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

      Did the DTC P0750 reset during the actuation test?

      Yes

      - Go To 5.

      No

      - Go To 4.

4. **WIGGLE TEST WITH TRANSMISSION SIMULATOR**
   1. With the Transmission simulator still connected, continue to actuate the L/R solenoid for another two minutes while wiggling the related wiring harness and connectors.

2. With the scan tool, stop the actuation and check for transmission DTCs.

   Did the DTC P0750 reset during the actuation test?

   Yes

   - Repair wiring harness or connectors as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. **Note: Do NOT replace the entire Valve Body.** . Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 27: Checking L/R Solenoid Control Circuit For Short To Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM harness connectors.
4. Measure the resistance between the (T20) L/R Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T20) L/R Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

- Repair the (T20) L/R Solenoid Control circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR AN OPEN**

Fig. 28: Checking L/R Solenoid Control Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

2. Measure the resistance of the (T20) L/R Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T20) L/R Solenoid Control circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 7.

7. **CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 29: Checking L/R Solenoid Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T20) L/R Solenoid Control circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T20) L/R Solenoid Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0755-2C SOLENOID CIRCUIT

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T259) 4C Solenoid Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0841-LR PRESSURE SWITCH RATIONALITY

Fig. 42: Pressure Switch Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set if the L/R Pressure Switch reads open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
LOSS OF PRIME AND/OR TIPM DTC PRESENT
LOW FLUID LEVEL
LOW LINE PRESSURE
REVERSE CARRIER SNAP RING DISLODGED
CRACKED OR IMPROPERLY INSTALLED PRIMARY OIL FILTER OR FILTER SEAL
STICKING MAIN REGULATOR VALVE IN PUMP VALVE BODY
NO. 1 CHECK BALL CUT OR DAMAGED
WIRING AND CONNECTORS
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

GEAR	L/R	2C	4C	UD	OD

2ND	OPEN	CLOSED	OPEN	CLOSED	OPEN
2ND PRIME	OPEN	OPEN	CLOSED	CLOSED	OPEN
3RD	OPEN	OPEN	OPEN	CLOSED	CLOSED
4TH	OPEN	OPEN	CLOSED	OPEN	CLOSED
5TH	OPEN	CLOSED	OPEN	OPEN	CLOSED
*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is closed in Manual 1.					
**May be open when rolling in Neutral or at low oil temperatures.					

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read DTCs.

    Are there any Loss of Prime and/or TIPM TCM Power Control Circuit DTCs present?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. If the DTC P0944 is present, perform its respective test first.

    No

    - Go To 2.
2. **CHECK IF THE CONDITION P0841 IS PRESENT**
    1. With the scan tool, check the Event Data for P0841.

    NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

    Does the Event Data show the DTC P0841?

    Yes

    - Go To 3.

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure for the DTC reported in the Event Data.
3. **CHECK IF THE DTC SET IN REVERSE**

    In the Event Data recorded earlier, does the Event Data show the DTC P0841 set while in Reverse?

    Yes

    - Go To 10.

    No

    - Go To 4.
4. **CHECK IF THE L/R PRESSURE SWITCH IS CLOSED**

In the Event Data recorded earlier, does the Event Data show the L/R Pressure Switch reading CLOSED when the DTC P0841 was set?

Yes

- Go To 5.

No

- Go To 14.

5. **CHECK THE PCM AND WIRING**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. Turn the Pressure Switch selector to L/R on the Transmission Simulator.
   6. With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

      Did the L/R Pressure Switch state change from open to closed while pressing the Pressure Switch Test button on the Transmission Simulator?

      Yes

      - Go To 6.

      No

      - Go To 10.

6. **CHECK FOR POOR WIRING AND CONNECTIONS**
   1. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   2. Wiggle the wires while checking for shorted and open circuits.

      Were there any problems found?

      Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

7. **CHECK IF THE DTC SET IN FIRST GEAR**

   In the Event Data recorded earlier, does the Event Data show the Present Gear as first gear when the DTC P0841 was set ?

   Yes

   - Go To 8.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

8. **CHECK IF THE NO. 1 CHECK BALL IS CUT OR DAMAGED**
   1. Turn the ignition off to the lock position.
   2. Remove the Transmission Valve Body in accordance with the Service Information.
   3. Check the No. 1 Check Ball for any possible cuts or damage.

      Is the No. 1 Check Ball cut or damaged?

      Yes

      - Replace the No. 1 Check Ball and check for clutch debris in the transmission oil pan. If there is excessive debris, perform internal repairs to the L/R Clutch assembly. Refer to the Service Information for proper repair procedures.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 9.

9. **CHECK IF THE REVERSE CARRIER SNAP RING IS DISLODGED AND THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. Looking through the windows in the bottom of the case, check whether the snap ring at the front of the Reverse (center) Carrier has dislodged.

NOTE: **It may be necessary to pry the Input Annulus Gear Shell rearward to check this snap ring.**

Is the Reverse Carrier Snap Ring dislodged?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

10. **CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 43: Checking L/R Pressure Switch Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission) if connected in a previous step or disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T50) L/R Pressure Switch Sense circuit between the Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T50) L/R Pressure Switch Sense circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 11.

11. **CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 44: Checking L/R Pressure Switch Sense Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T50) L/R Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T50) L/R Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION

VERIFICATION TEST.

No

- Go To 12.

12. **CHECK THE PCM POWERS AND GROUNDS**
    1. Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

       Were there any problems found?

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 13.

13. **ROAD TEST THE VEHICLE**
    1. With the scan tool, clear the DTC and road test the vehicle.
    2. Try to duplicate the conditions in which the DTC originally set using the Event Data recorded earlier.

       Did the DTC P0841 reset?

       Yes

       - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 17.

14. **CHECK FOR LOW LINE PRESSURE**
    1. In the Event Data recorded earlier, compare the Line Pressure and the Desired Line Pressure.

       Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

       Yes

- Repair as necessary to correct low line pressure. Check for low fluid level. Check the Primary Oil Filter seal for a split, crack, or improperly installed. Refer to the Service Information for the proper installation procedure. If the fluid level and Primary Oil Filter are OK, check the Main Regulator Valve in the Oil Pump in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 15.

15. **CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 45: Checking L/R Pressure Switch Sense Circuit For Short To Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Disconnect all PCM harness connectors.
4. Measure the resistance between the (T50) L/R Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T50) L/R Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T50) L/R Pressure Switch Sense circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 16.

16. **ROAD TEST THE VEHICLE**
    1. With the scan tool, clear the DTC and road test the vehicle.
    2. Try to duplicate the conditions in which the DTC originally set using the Event Data recorded earlier.

       Did the DTC P0841 reset?

       Yes

       - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 17.

17. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

       Were there any problems found?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P0845-2C HYDRAULIC PRESSURE TEST

Fig. 46: Pressure Switch Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

WHEN MONITORED:

In any forward gear with engine speed above 1000 rpm shortly after a shift and every minute thereafter.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 rpm, the Powertrain Control Module (PCM) momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO ANOTHER CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
EXTRA CHECK BALL IN PASSAGE DOWNSTREAM FROM #7 BALL POCKET
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINING IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are there any Loss of Prime, TCM Power Input, Line Pressure Sensor and/or TIPM TCM Power Control circuit DTCs present?

       Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. If the DTC P0944-LOSS OF PRIME is present, perform its respective test first.

No

- Go To 2.

2. **CHECK IF THE DTC P0755 IS PRESENT**
   1. With the scan tool, read DTCs.

      Is the DTC P0755 also present?

      Yes

      - Refer to **P0755-2C SOLENOID CIRCUIT** and perform diagnostics.

      No

      - Go To 3.

3. **CHECK IF THE DTCS P0732, P0733 AND/OR P0846 ARE PRESENT**
   1. With the scan tool, read DTCs.

      Are the DTCs P0732, P0733, and/or P0846 present also?

      Yes

      - Go To 12.

      No

      - Go To 4.

4. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 5.

      No

      - Go To 15.

5. **CHECK IF THE LINE PRESSURE STAYS THE SAME**
   1. Start the engine.
   2. Warm the transmission to 82° C or 180° F.

3. Firmly apply the brakes.
4. With the scan tool, monitor the Line Pressure during the following step.
5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

   Did the line pressure remain at a steady value between 585 and 655 kPa (85 and 95 psi) in each position?

   Yes

   - Go To 6.

   No

   - Go To 10.

6. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
   1. Ignition on, **engine not running.**
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

      Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 of a volt when the connector was pushed inward?

      Yes

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 7.

7. **CHECK THE LINE PRESSURE SENSOR OPERATION**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of three line pressure positions on the Transmission Simulator.

NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) of the reading specified on the Transmission Simulator.

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 47: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect Transmission Simulator.
3. Disconnect the PCM C1 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor

harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

Is the resistance above 5.0 Ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 48: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

10. **COMPARE SCAN TOOL TO PRESSURE GAUGE**
    1. Turn the ignition off to the lock position.
    2. Connect the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to the Service Information for proper installation procedure.

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the rpm to 1500, and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the rpm to 1500, and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive, raise the rpm to 1500, and compare the line pressure readings.

       Did the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

       Yes

       - Go To 11.

       No

       - Replace the Line Pressure Sensor in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK THE WIRING AND CONNECTORS**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Remove the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
4. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
5. On the Transmission Simulator, turn the Pressure Switch selector switch to 2C.
6. Ignition on, engine not running.
7. With the scan tool, monitor the 2C Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the 2C Pressure Switch.

   Did the 2C Pressure Switch state change to closed and remain closed while wiggling the wires?

   Yes

   - Go To 12.

   No

   - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition off to the lock position.
    2. Remove the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

       Does the Transmission Oil Pan contain excessive debris or contamination?

       Yes

       - Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 13.

13. **CHECK THE 2C HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the 2C clutch hydraulic circuit, in the 2C/4C clutch retainer,

for leakage in accordance with the Service Information.

NOTE: **The 2C hydraulic clutch circuit contains a small bleed orifice, a small amount of air leakage is normal.**

Was there excessive air leakage noticed during the air check?

Yes

- Repair as necessary. Check the 2C clutch piston, piston seals and bleed orifice assembly.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Disassemble and inspect the Valve Body and repair as necessary. Inspect the 2C Accumulator piston and seals. Check for an extra check ball downstream from the #7 check ball pocket and repair as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

14. **CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 49: Checking 2C Pressure Switch Sense Circuit For Short To Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: **Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

3. Measure the resistance between the (T147) 2C Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 Ohms between the (T147) 2C Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T147) 2C Pressure Switch Sense circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
    5. If the Event Data shows the DTC P0845 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or improperly installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

       Where there any problems found?

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Test Complete.

P0846-2C PRESSURE SWITCH RATIONALITY

Fig. 50: Pressure Switch Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

WHEN MONITORED:

Continuously with the ignition on, engine running, with the transmission in gear.

SET CONDITION:

The DTC is set if the 2C Pressure Switch reads open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT OPEN
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO OTHER CIRCUITS
EXCESSIVE FLUID LEAKAGE IN 2C CLUTCH CIRCUIT
NO. 5 AND/OR NO. 7 CHECK BALL CUT OR DAMAGED
EXTRA CHECK BALL DOWNSTREAM OF THE NO. 7 CHECK BALL POCKET
LOW LINE PRESSURE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)
WIRING AND CONNECTORS (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are there any TCM Power Input or TIPM TCM Power Control Circuit DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC DATA SHOWS THE CURRENT DTC**
    1. With the scan tool, read and record the Transmission Event Data.

       NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

       Does the Event Data show data for DTC P0846?

       Yes

       - Go To 3.

       No

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure shown in the Event Data.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.
3. **CHECK IF MULTIPLE DTCS ARE PRESENT**
    1. With the scan tool, check for other transmission DTCs.

       Are there two or more related pressure switch rationality DTCs present in addition to P0846?

       Yes

       - Go To 4.

       No

       - Go To 7.
4. **CHECK IF ALL THE PRESSURE SWITCHES READ CLOSED**

   In the Event Data recorded earlier, do all the pressure switches read CLOSED in the Event Data for

P0846?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure for P0882.

No

- Go To 5.

5. **CHECK IF ALL THE PRESSURE SWITCHES READ OPEN**

   In the Event Data recorded earlier, do all the pressure switches read OPEN?

   Yes

   - Go To 6.

   No

   - Go To 7.

6. **CHECK FOR LOW LINE PRESSURE**

   In the Event Data recorded earlier, is the Line Pressure less than 276 kPa (40 psi), and significantly below the Desired Line Pressure?

   Yes

   - Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK IF THE DTC SET IN PARK, NEUTRAL, OR REVERSE**

   In the Event Data recorded earlier, does the Event Data show the DTC P0846 set in Park, Neutral, or Reverse?

   Yes

- Go To 12.

No

- Go To 8.

8. **CHECK IF THE 2C PRESSURE SWITCH READS CLOSED**

   In the Event Data recorded earlier, does the Event Data show the 2C Pressure Switch reading CLOSED?

   Yes

   - Go To 10.

   No

   - Go To 9.

9. **CHECK THE LINE PRESSURE**

   In the Event Data recorded earlier, is the Line Pressure less than 276 kPa (40 psi), and significantly below the Desired Line Pressure?

   Yes

   - Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 15.

10. **CHECK THE PCM AND WIRING**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

       CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

       WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).

4. Ignition on, engine not running.
5. With the Transmission Simulator, turn the Pressure Switch selector switch to the 2C position.
6. With the scan tool, monitor the 2C Pressure Switch while pressing the Pressure Switch test button on the Transmission Simulator.

   Did the state of the 2C Pressure Switch change while pressing the Pressure Switch Test button?

   Yes

   - Go To 11.

   No

   - Go To 12.

11. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
    1. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    2. Wiggle the wires while checking for shorted and open circuits.

       Where there any problems found?

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

12. **CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 51: Checking 2C Pressure Switch Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C4 harness connector.
4. Connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A,

Kit, NGC, 38 Position) to perform diagnosis.

5. Measure the resistance of the (T147) 2C Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connect and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T147) 2C Pressure Switch Sense circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 13.

13. **CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 52: Checking 2C Pressure Switch Sense Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T147) 2C Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T147) 2C Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

- Go To 14.

14. **CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 53: Checking 2C Pressure Switch Sense Circuit For Short To Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (T147) 2C Pressure Switch Sense circuit and all the other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Repair the (T147) 2C Pressure Switch Sense circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK IF THE #5 AND/OR #7 CHECK BALL IS CUT OR DAMAGED**
    1. Turn the Ignition off to the lock position.
    2. Remove the Valve Body Assembly in accordance with the Service Information.
    3. Inspect the No. 5 and No. 7 check balls for any cuts or damage.
    4. Check for an extra check ball in the passage downstream from the #7 check ball pocket.
    5. Inspect the 2C accumulator piston and seals and also the 2C tower seal on top of the valve body. Refer to the Service Information.

    Where there any problems found?

    Yes

    - Repair as necessary. Check for excessive clutch debris in the transmission oil pan. If excessive clutch debris is present, repair 2C clutch as necessary. Refer to the Service Information for proper repair procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 16.
16. **CHECK FOR EXCESSIVE FLUID LEAKAGE WITHIN THE 2C CLUTCH CIRCUIT**
    1. Air check the 2C Clutch hydraulic circuit. Refer to the Service Information.

    NOTE: This hydraulic clutch circuit contains a small bleed orifice. Small leakage is considered normal.

    Was there excessive air leakage in the 2C Clutch hydraulic circuit?

    Yes

- Repair as necessary. Refer to the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0868-LINE PRESSURE LOW

Fig. 54: Line Pressure Sensor Circuit
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control

System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The actual line pressure is continuously being compared to the desired (target) line pressure. If the actual line pressure is consistently lower than the target while driving, the line pressure low DTC P0868 will set.

WHEN MONITORED:

Continuously while driving in a forward gear.

SET CONDITION:

The powertrain Control Module (PCM) continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure is more than 15 psi below Desired Line Pressure for 3.5 seconds continuously, this DTC will set.

POSSIBLE CAUSES

Possible Causes
CHECK FOR RELATED DTCS
LOW FLUID LEVEL
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
POOR LINE PRESSURE SENSOR CONNECTION
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT SHORTED TO ANOTHER CIRCUIT
INTERNAL TRANSMISSION
LINE PRESSURE SENSOR
CRACKED, PLUGGED, OR MIS-INSTALLED PRIMARY OIL FILTER
LOOSE COOLER RETURN SPIN ON FILTER (IF EQUIPPED)
STUCK OR STICKING MAIN REGULATOR VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

Is the DTC P0933 present also?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure for DTC P0933.

No

- Go To 2.

2. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 3.

      No

      - Go To 11.

3. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
   1. Ignition on, **engine not running.**
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

      Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 of a volt when the connector was pushed inward?

      Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 of a volt)

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No (value is higher than 207 kPa (30 psi) or 0.7 of a volt and did not change or the value was already 207 kPa (30 psi) or 0.7 of a volt and did not change)

      - Go To 4.

4. **CHECK THE PCM AND WIRING**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure during the following steps.
7. Using the Transmission Simulator, set the rotary knob to each of the three line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa (2.0 psi) or 0.1 of a volt of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa (2.0 psi) or 0.1 of a volt in all three positions?

Yes

- Go To 5.

No

- Go To 7.

5. **CHECK THE LINE PRESSURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission) and reconnect all previously disconnected connectors.
   3. Install the Line Pressure Adaptor (special tool #8259, Adapter, Pressure Test), and the Pressure Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.), 0 to 2, 000 kPa (0 to 300 psi).
   4. Start the engine in park.
   5. Monitor the line pressure readings of both the scan tool and the pressure gauge and compare the two readings.

   Is the line pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?

   Yes

   - Go To 6.

   No

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK FOR A PLUGGED TRANSMISSION OIL FILTER**
   1. Turn the ignition off to the lock position.
   2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
   3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

   NOTE: Make sure the Primary Transmission Oil Filter and/or O-ring is not cracked or split.

   Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked or plugged?

   Yes

   - Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or O-ring. If the Primary Transmission Oil Filter is plugged refer to the Service Information for the proper Hydraulic repair procedure.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Repair internal transmission and inspect the Transmission Oil Pump in accordance with the Service Information and replace if necessary. If no problem is found, replace the Solenoid/TRS Assembly.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 55: Checking 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
2. Reconnect all previously disconnected connectors except the Line Pressure Sensor harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (F856) 5-volt Supply circuit in the Line Pressure Sensor harness connector.

   Is the voltage above 5.5 volts?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 56: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C1 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in

poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

3. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 57: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

- Go To 10.

10. **CHECK THE (T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 58: Checking Line Pressure Variable Force Solenoid Control Circuit For Short To Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Disconnect all PCM harness connectors.
4. Measure the resistance between the (T118) Line Pressure Variable Force Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 Ohms between the (T118) Line Pressure Variable Force Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T118) Line Pressure Variable Force Solenoid Control circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

DIAGNOSIS AND TESTING

P0869-LINE PRESSURE HIGH

Fig. 1: Transmission Control System Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The actual line pressure is continuously being compared to the desired (target) line pressure. If the actual line pressure is consistently higher than the highest desired line pressure ever used in the current gear, the line pressure high DTC P0869 will set.

WHEN MONITORED:

Continuously while driving in a forward gear.

SET CONDITION:

The Powertrain Control Module (PCM) continuously monitors Actual Line Pressure. If the Actual Line Pressure reading is greater than the maximum desired line pressure ever used in the current gear, while the Pressure Control Solenoid duty cycle is at or near its maximum value (which should result in minimum line pressure) for 3.5 seconds continuously, the DTC will set.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR CONNECTION
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT
LINE PRESSURE SENSOR
STUCK OR STICKING MAIN REGULATOR VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Is the DTC P0882 or P0933 present also?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure for DTC P0882 or P0933.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 3.

       No

       - Go To 10.
3. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
    1. Ignition on, **engine not running.**
    2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

       Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 of a volt when the connector was pushed inward?

       Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 of a volt)

       - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No (value is higher than 207 kPa (30 psi) or 0.7 of a volt and did not change or the value was already 207 kPa (30 psi) or 0.7 of a volt and did not change)

       - Go To 4.
4. **CHECK THE PCM AND WIRING**

1. Turn the ignition off to the lock position.
2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure during the following step.
7. Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) or 0.1 of a volt of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ±14 kPa (2.0 psi) or 0.1 of a volt in all three positions?

Yes

- Go To 5.

No

- Go To 6.

5. **CHECK THE LINE PRESSURE SENSOR CALIBRATION**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission) and reconnect all previously disconnected connectors.
   3. Install the Line Pressure Adaptor (special tool #8259, Adapter, Pressure Test), and Pressure Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.), 0 to 2, 000 kPa (0 to 300 psi).
   4. Start the engine in park.
   5. Monitor the Line Pressure readings on the scan tool and the pressure gauge.
   6. Compare the Line Pressure readings between the scan tool and the pressure gauge.

   Is the pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?

   Yes

- Repair the internal transmission and inspect the Transmission Oil Pump in accordance with the Service Information and replace if necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly, possible cause is a stuck Pressure Control Solenoid.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Line Pressure Sensor per the Service information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK THE (T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT FOR AN OPEN**

Fig. 2: Checking Line Pressure Variable Force Solenoid Control Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the Powertrain Control Module C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM

harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T118) Line Pressure Variable Force Solenoid Control circuit between the Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T118) Line Pressure Variable Force Solenoid Control circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 7.

7. **CHECK THE (T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 3: Checking Line Pressure Variable Force Solenoid Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T118) Line Pressure Variable Force Solenoid Control circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T118) Line Pressure Variable Force Solenoid Control circuit for a short to ground.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 4: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

Is the resistance above 5.0 Ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 5: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the PCM C1 harness connector.
2. Disconnect the Line Pressure Sensor harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

3. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

10. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

       Where there any problems found?

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Test Complete.

P0870-OD HYDRAULIC PRESSURE TEST

Fig. 6: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly

Shutdown routine.

WHEN MONITORED:

In any forward gear with engine speed above 1000 rpm shortly after a shift and every minute thereafter.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 rpm, the Powertrain Control Module (PCM) momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close two times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
TRANSMISSION CONTROL RELAY DTCS PRESENT
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORTED TO OTHER CIRCUITS
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, check DTCs.

       Is there any Loss of Prime, TCM Power Input, Line Pressure Sensor and/or TIPM TCM Power Control Circuit DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. If the DTC P0944-LOSS OF PRIME is present, perform its respective test first. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To 2.

2. **CHECK IF THE DTC P0760 IS PRESENT**
   1. With the scan tool, check DTCs.

      Is the DTC P2706 also present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the diagnostics for P2706-MS SOLENOID CIRCUIT.

      No

      - Go To 3.

3. **CHECK IF OTHER DTCS ARE PRESENT**
   1. With the scan tool, check DTCs.

      Are any of the DTCs P0733, P0734, P0735, and/or P0871 present also?

      Yes

      - Go To 12.

      No

      - Go To 4.

4. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 5.

      No

      - Go To 15.

5. **CHECK IF THE LINE PRESSURE STAYS THE SAME**
   1. Start the engine.
   2. Warm the transmission to 82° C (180° F).
   3. Firmly apply the brakes.

4. With the scan tool, monitor the Line Pressure during the following step.
5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least five seconds in each range.

   Did the line pressure remain at a steady value between 585 and 655 kPa (85 and 95 psi) in each position?

   Yes

   - Go To 6.

   No

   - Go To 10.

6. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
   1. Ignition on, **engine not running.**
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

      Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 of a volt when the connector was pushed inward?

      Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 of a volt)

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No (value is higher than 207 kPa (30 psi) or 0.7 of a volt and did not change or the value was already 207 kPa (30 psi) or 0.7 of a volt and did not change)

      - Go To 7.

7. **CHECK THE LINE PRESSURE SENSOR OPERATION**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).

4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the three line pressure positions on the Transmission Simulator.

NOTE: **All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) or 0.1 of a volt of the reading specified on the Transmission Simulator.**

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 7: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect Transmission Simulator.
3. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor

harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

Is the resistance above 5.0 Ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 8: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

10. **COMPARE THE SCAN TOOL TO THE PRESSURE GAUGE**
    1. Turn the ignition off to the lock position.
    2. Connect the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to **DIAGNOSIS AND TESTING** .

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the rpm to 1500, and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the rpm to 1500, and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive, raise the rpm to 1500, and compare the line pressure readings.

       Did the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

       Yes

       - Go To 11.

       No

       - Replace the Line Pressure Sensor in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK THE WIRING AND CONNECTORS**
    1. Turn the ignition off to the lock position.
    2. Remove the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).

3. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

4. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
5. On the Transmission Simulator, turn the Pressure Switch selector switch to OD.
6. Ignition on, engine not running.
7. With the scan tool, monitor the OD Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the OD Pressure Switch.

   Did the OD Pressure Switch state change to closed and remain closed while wiggling the wires?

   Yes

   - Go To 12.

   No

   - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition off to the lock position.
    2. Remove the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

       Does the Transmission Oil Pan contain excessive debris or contamination?

       Yes

       - Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 13.

13. **CHECK THE OD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the OD hydraulic clutch circuit (in the case) for leakage in

accordance with the Service Information.

NOTE: **The OD hydraulic clutch circuit contains a small bleed orifice which connects to the Reverse hydraulic clutch circuit. A small amount of air leakage is normal.**

Was there excessive air leakage noticed during the air check?

Yes

- Repair as necessary. Check the OD/Rev clutch piston seals, bleed orifice assembly, reaction shaft support seal rings, and machining of the main mating faces on the pump housing, pump valve body, and reaction shaft support.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Disassemble and inspect the Valve Body and repair as necessary. Inspect the OD Accumulator piston and seals. Check for an extra check ball downstream from the #6 check ball pocket and repair as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

14. **CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 9: Checking OD Pressure Switch Sense Circuit For Short To Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: **Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

NOTE: **Check connectors - Clean/repair as necessary.**

3. Measure the resistance between the (T9) OD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T9) OD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T9) OD Pressure Switch Sense circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
    5. If the Event Data shows the DTC P0870 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or improperly installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

       Where there any problems found?

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Test Complete.

P0871-OD PRESSURE SWITCH RATIONALITY

Fig. 10: Pressure Switch Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The appropriate DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
RELATED TCM POWER INPUT DTCS PRESENT
LINE PRESSURE DTCS PRESENT
NO. 4 OR 6 CHECK BALL CUT OR DAMAGED
(T9) OD PRESSURE SWITCH SENSE CIRCUIT OPEN
(T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
(T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORTED TO OTHER CIRCUITS

**May be open when rolling in Neutral or at low oil temperatures.					

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF LINE PRESSURE DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are there any Line Pressure DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 3.
3. **CHECK FOR OTHER PRESSURE SWITCH DTCS**
    1. With the scan tool, read DTCs.

       Are there two or more other pressure switch rationality DTCs present in addition to P0871?

       Yes

       - Go To 5.

       No

       - Go To 4.
4. **CHECK IF DTC IS CURRENT**

1. With the scan tool, read and record the Event Data.

NOTE: **Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.**

Does the Event Data show data for P0871?

Yes

- Go To 8.

No

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

5. **CHECK IF RELATED DTC IS PRESENT**
   1. With the scan tool, read and record the Event Data.

NOTE: **Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.**

Do all the pressure switches read CLOSED in the Event Data?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure for DTC P0882. Follow instructions as if the DTC is current.

No

- Go To 6.

6. **CHECK IF PRESSURE SWITCHES READ OPEN**

In the Event Data recorded earlier, do all the pressure switches read open?

Yes

- Go To 7.

No

- Go To 8.

7. **CHECK FOR LOW LINE PRESSURE**

In the Event Data recorded earlier, is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter weal for a spit, crack, or improperly installed. If the filer and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

8. **CHECK IF IN PARK, NEUTRAL, OR REVERSE**

   In the Event Data recorded earlier, does the Event Data show the OD Pressure Switch DTC set while in Park, Neutral, or Reverse?

   Yes

   - Go To 18.

   No

   - Go To 9.

9. **CHECK IF THE OD PRESSURE SWITCH WAS OPEN**

   In the Event Data recorded earlier, did the OD Pressure Switch read OPEN?

   Yes

   - Go To 10.

   No

   - Go To 15.

10. **CHECK FOR LOW LINE PRESSURE**

    In the Event Data recorded earlier, is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

    Yes

    - Repair as necessary to correct low line pressure. Check the fluid level. Check the Primary Oil Filter seal for a split, crack, or improperly installed. Refer to the Service Information for the proper

installation procedure. If the fluid level and filter are OK, check the Main Regulator Valve in the Oil Pump.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 11.

11. **CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 11: Checking OD Pressure Switch Sense Circuit For Short To Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect all PCM harness connectors.

3. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Measure the resistance between the (T9) OD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T9) OD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T9) OD Pressure Switch Sense circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 12.

12. **CHECK IF THE DTC RESETS**
    1. Reconnect all previously disconnected connectors.
    2. With the scan tool, erase transmission DTCs.
    3. Test drive the vehicle, use the Event Data recorded earlier to help duplicate the conditions when the DTC originality set.

       Does the DTC P0871 reset?

       Yes

       - Go To 13.

       No

       - Go To 22.

13. **CHECK THE POWERTRAIN CONTROL MODULE**
    1. Remove the Transmission Control Relay.
    2. Operate the vehicle in Drive.

       Is the transmission slipping while in Drive?

       Yes

       - Go To 14.

       No

       - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground

circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

14. **AIR CHECK TRANSMISSION CLUTCH OPERATION**
    1. Perform an Air Check Transmission Clutch Operation procedure in accordance with the Service Information.

NOTE: The OD/Rev piston contains a small bleed orifice, a small amount of leakage between the OD and Reverse hydraulic clutch circuits is considered normal.

Is there excessive air leakage in any clutch circuit?

Yes

- Check the OD/Rev piston seals and bleed orifice, reaction shaft support seal rings, dribbler orifice assemblies in the reaction shaft support and for poor machine on the pump valve body faces. Refer to the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Repair the Valve Body. Check the OD Accumulator piston and seals, OD bleed orifice, and No. 6 check ball for cuts or damage. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly. Refer to the Service Information for proper repair procedures.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK THE PCM AND WIRING**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    3. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
    4. Ignition on, engine not running.
    5. With the Transmission Simulator, turn the Pressure Switch selector switch to OD.

6. With the scan tool, monitor the OD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

   Did the state of the OD Pressure Switch change from OPEN to CLOSED while pressing the Test button?

   Yes

   - Go To 16.

   No

   - Go To 18.

16. **CHECK IF THE NO. 4 AND/OR NO. 6 CHECK BALL IS CUT OR DAMAGED**
    1. With the scan tool, erase previously stored DTCs and test drive the vehicle, use the Event Data to help duplicate the conditions when the DTC originality set. Note any DTCs that may set.
    2. Remove the Transmission Valve Body in accordance with the Service Information.
    3. Check the No. 4 and No. 6 Check Balls for cuts or damage.

       Is the No. 4 and/or No. 6 Check Ball cut or damaged?

       Yes

       - Replace the No. 4 and/or No. 6 Check Ball and check for clutch debris in the transmission oil pan. If there is excessive debris, perform internal repairs to the OD Clutch Assembly. Refer to the Service Information for proper repair procedures.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 17.

17. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**

    Did the DTC P0871 reset during the test drive in the previous step?

    Yes

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 22.

18. **CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 12: Checking OD Pressure Switch Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).
3. Disconnect the Transmission Solenoid /TRS Assembly harness connector

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T9) OD Pressure Switch Sense circuit from the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position) to the Solenoid/TRS Assembly harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T9) OD Pressure Switch Sense circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 19.

19. **CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 13: Checking OD Pressure Switch Sense Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T9) OD Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T9) OD Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

- Go To 20.

20. **CHECK WIRING AND CONNECTORS**
    1. Using the schematics as a guide, inspect the wiring and connectors. Pay particular attention to all power and ground circuits.

       Were there any problems found

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 21.

21. **CHECK THE POWERTRAIN CONTROL MODULE**
    1. Reconnect all previously disconnected connectors.
    2. Make sure all Event Data is recorded.
    3. With the scan tool, erase previously stored DTCs and test drive the vehicle, use the Event Data to help duplicate the conditions when the DTC originality set.

       Does the DTC P0871 reset?

       Yes

       - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 22.

22. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

       Where there any problems found?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P0875-UD HYDRAULIC PRESSURE TEST

Fig. 14: Pressure Switch Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

WHEN MONITORED:

In any forward gear with engine speed above 1000 rpm shortly after a shift and every minute thereafter.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 rpm, the Powertrain Control Module (PCM) momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close two times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
(T29) UD PRESSURE SWITCH SENSE CIRCUIT OPEN
TRANSMISSION CONTROL RELAY DTCS PRESENT
(T29) UD PRESSURE SWITCH SENSE CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(T29) UD PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T29) UD PRESSURE SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Is there any Loss of Prime, TCM Power Input, TIPM TCM Power Control Circuit and/or Line Pressure Sensor DTCs present?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. If the DTC, P0944-LOSS OF PRIME is present, perform its respective test first.

No

- Go To 2.

2. **CHECK IF THE DTC P0765 IS PRESENT**
   1. With the scan tool, read DTCs.

      Is the DTC P0765 also present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure for DTC P0765-UD SOLENOID CIRCUIT.

      No

      - Go To 3.

3. **CHECK IF OTHER DTCS ARE PRESENT**
   1. With the scan tool, read DTCs.

      Are any of the DTCs, P0729, P0731, P0732, P0733, and/or P0876 present also?

      Yes

      - Go To 12.

      No

      - Go To 4.

4. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 5.

      No

      - Go To 17.

5. **CHECK IF THE LINE PRESSURE STAYS THE SAME**
    1. Start the engine.
    2. Warm the transmission to 82° C or 180° F.
    3. Firmly apply the brakes.
    4. With the scan tool, monitor the Line Pressure during the following step.
    5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

       Did the line pressure remain at a steady value between 585 and 655 kPa or 85 and 95 psi in each position?

       Yes

       - Go To 6.

       No

       - Go To 10.
6. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
    1. Ignition on, **engine not running.**
    2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

       Did the Line Pressure reading on the scan tool change to about 207 kPa or 30 psi when the connector was pushed inward?

       Yes

       - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 7.
7. **CHECK THE LINE PRESSURE SENSOR OPERATION**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 15: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect Transmission Simulator.
3. Disconnect the PCM C1 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (F856) 5-volt Supply circuit from the Line Pressure Sensor harness

connector to the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

Is the resistance above 5.0 Ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 16: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

10. **COMPARE THE SCAN TOOL READING TO PRESSURE GAUGE READING**
    1. Turn the ignition off to the lock position.
    2. Connect the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to the Service Information for proper installation procedure.

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the rpm to 1500, and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the rpm to 1500, and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive, raise the rpm to 1500, and compare the line pressure readings.

       Did the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

       Yes

       - Go To 11.

       No

       - Replace the Line Pressure Sensor in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK THE WIRING AND CONNECTORS**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Remove the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
4. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
5. On the Transmission Simulator, turn the Pressure Switch selector switch to UD.
6. Ignition on, engine not running.
7. With the scan tool, monitor the UD Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the UD Pressure Switch.

   Did the UD Pressure Switch state change to closed and remain closed while wiggling the wires?

   Yes

   - Go To 12.

   No

   - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition off to the lock position.
    2. Remove the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

       Does the Transmission Oil Pan contain excessive debris or contamination?

       Yes

       - Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 13.

13. **CHECK THE UD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) for leakage in

accordance with the Service Information.

NOTE: **The UD hydraulic clutch circuit contains a small bleed orifice. A small amount of air leakage is normal.**

Was there excessive air leakage noticed during the air check?

Yes

- Repair as necessary. Check the UD clutch piston, piston seals and bleed orifice, reaction shaft support seal rings, and machining of the main mating faces of the pump housing, pump valve body, and reaction shaft support.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Disassemble and inspect the Valve Body and repair as necessary. Inspect the UD Accumulator piston and seals. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

14. **CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 17: Checking UD Pressure Switch Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Remove the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).
4. Measure the resistance of the (T29) UD Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

Is the resistance above 5.0 Ohms?

Yes

- Repair the (T29) UD Pressure Switch Sense circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 15.

15. **CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 18: Checking UD Pressure Switch Sense Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T29) UD Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T29) UD Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION

VERIFICATION TEST.

No

- Go To 16.

16. **CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 19: Checking Ud Pressure Switch Sense Circuit For Short To Circuit

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.

3. Measure the resistance between the (T29) UD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T29) UD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T29) UD Pressure Switch Sense circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

17. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
    5. If the Event Data shows the DTC P0875 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or improperly installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

       Where there any problems found?

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION

VERIFICATION TEST.

No

- Test Complete.

P0876-UD PRESSURE SWITCH RATIONALITY

Fig. 20: Pressure Switch Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC is set if the UD pressure switch is in the wrong state for the current gear. For example, this code would be set if the UD pressure switch remained off while the transmission was in second gear.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
LOW FLUID LEVEL
NO. 2 CHECK BALL CUT OR DAMAGED
LOW LINE PRESSURE
CRACKED OR MIS-INSTALLED SUMP FILTER OR SEAL
LOOSE COOLER RETURN SPIN ON FILTER (IF EQUIPPED)
STICKING MAIN REGULATOR VALVE IN PUMP VALVE BODY
(T29) UD PRESSURE SWITCH SENSE CIRCUIT OPEN
(T29) UD PRESSURE SWITCH CIRCUIT SHORTED TO GROUND
(T29) UD PRESSURE SWITCH SENSE CIRCUIT SHORTED TO ANOTHER CIRCUITS
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

**May be open when rolling in Neutral or at low oil temperatures.					

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
   1. With the scan tool, read DTCs.

      Are there any Loss of Prime, TCM Power Input, Line Pressure, and/or TIPM TCM Power Control DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. If a Loss of Prime DTC is present, perform its respective test first.

      No

      - Go To 2.
2. **CHECK FOR PRESSURE SWITCH DTCS**

   Are there two or more other pressure switch rationality DTCs present in addition to P0876?

   Yes

   - Go To 3.

   No

   - Go To 4.
3. **CHECK IF ALL PRESSURE SWITCHES READ CLOSED**
   1. With the scan tool, read and record all Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data show all pressure switches reading CLOSED?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure for DTC P0882. Diagnose as if the DTC is current.

      No

      - Go To 4.
4. **CHECK FOR OTHER DTCS**
   1. With the scan tool, check DTCs.

Is the DTC P2704 present also?

Yes

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE EVENT DATA**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for the DTC P0876?

      Yes

      - Go To 6.

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure for the DTC listed in the Event Data.

6. **CHECK IF EVENT DATA WAS SET IN PARK, NEUTRAL OR REVERSE**

   In the Event Data recorded earlier, did the DTC P0876 set in Park, Neutral, or Reverse?

   Yes

   - Go To 10.

   No

   - Go To 7.

7. **CHECK THE UD PRESSURE SWITCH STATUS**

   In the Event Data recorded earlier, did the DTC P0876 set with the UD Pressure Switch closed?

   Yes

   - Go To 10.

No

- Go To 8.

8. **CHECK THE LINE PRESSURE**

   In the Event Data recorded earlier, is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

   Yes

   - Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 9.

9. **CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 21: Checking Ud Pressure Switch Sense Circuit For Short To Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect all PCM harness connectors.
3. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Measure the resistance between the (T29) UD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 Ohms between the (T29) UD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T29) UD Pressure Switch Sense circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

10. **CHECK THE PCM AND WIRING**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    4. Ignition on, engine not running.
    5. With the Transmission Simulator, turn the Pressure Switch selector switch to the UD position.
    6. With the scan tool, monitor the UD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

    Did the state of the UD Pressure Switch change while pressing the Pressure Switch Test button?

    Yes

    - Go To 14.

    No

    - Go To 11.

11. **CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 22: Checking UD Pressure Switch Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in

poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T29) UD Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T29) UD Pressure Switch Sense circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 12.

12. **CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 23: Checking UD Pressure Switch Sense Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T29) UD Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T29) UD Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION

VERIFICATION TEST.

No

- Go To 13.

13. **CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 24: Checking Ud Pressure Switch Sense Circuit For Short To Circuit

1. Disconnect all PCM harness connectors.

   NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.

2. Measure the resistance between the (T29) UD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T29) UD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T29) UD Pressure Switch Sense circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

14. **PERFORM A WIGGLE TEST USING THE TRANSMISSION SIMULATOR**

    1. Perform the steps in the previous test while wiggling the wiring harness and connectors pertaining to the UD Pressure Switch.

       Did the state of the UD Pressure Switch change while pressing the Pressure Switch Test button?

       Yes

       - Repair the wiring harness and/or connectors as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 15.

15. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY FOR A SHORT TO GROUND**

Fig. 25: Checking UD Pressure Switch Sense Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Transmission Simulator and reconnect the Transmission Solenoid/TRS Assembly harness connector.
2. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).
3. Measure the resistance between ground and the (T29) UD Pressure Switch Sense circuit in the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service

Information.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 16.

16. **CHECK IF THE DTC RESETS**
    1. Reconnect all previously disconnected connectors.
    2. With the scan tool, erase all transmission DTCs.
    3. Test drive the vehicle. Using the Event Data recorded earlier, try to duplicate the conditions in which the DTC originally set.

    Does the DTC P0876 reset?

    Yes

    - Go To 17.

    No

    - Go To 18.

17. **CHECK FOR A CUT NO. 2 CHECK BALL**
    1. Remove the Valve Body in accordance with the Service Information.
    2. Check the No. 2 check ball for cuts or damage.

    Is the No. 2 check ball cut or damaged?

    Yes

    - Replace the No. 2 check ball. Check for excessive clutch debris in the oil pan. If excessive debris is present, check the UD Clutch and repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Check for excessive clutch debris in the oil pan. If excessive debris is present, check the UD Clutch and repair as necessary. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

18. **CHECK FOR CHECK THE WIRING AND CONNECTORS**

1. The conditions necessary to set this DTC are not present at this time.
2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
3. Wiggle the wires while checking for shorted and open circuits.
4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0882-TCM POWER INPUT LOW

Fig. 26: TCM Power Control Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Output circuit is used to supply power to the Transmission Solenoid/TRS Assembly and to the Powertrain Control Module (PCM) when in normal operating mode. The purpose of the Transmission Output circuit is to allow the Transmission Control System to turn off the power to the Transmission Solenoid/TRS Assembly in event that the transmission should need to be placed into "limp-in" mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position, or after cranking the engine) the Transmission Control System verifies that the Transmission Output circuit is open by checking for voltage on the Transmission Output circuits before the Transmission Control System request for the circuit to be powered up. The request is sent by a direct circuit control from the PCM to the TIPM. If the Transmission Control System detects less that 3.0 volts when the output is commanded on, the DTC will set. **Note: Inadequate Transmission Control Output voltage can also cause DTCs P0846, P0869, P0871, P0876 or P0988 to set. Repairing the P0882 fault should also eliminate the related DTCs.**

WHEN MONITORED:

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

SET CONDITION:

This DTC is set when there is less than 3.0 volts present at the transmission control output circuits located in the Powertrain Control Module (PCM) when the Transmission Control System request the power up of those circuits. **Note: Due to the integration of the Transmission Control Module and the Powertrain Control Module, both systems have their own power and ground circuits.** .

POSSIBLE CAUSES

Possible Causes
RELATED TIPM DTCS
(T15) TRANSMISSION CONTROL CIRCUIT SHORTED TO GROUND
(T15) TRANSMISSION CONTROL CIRCUIT OPEN
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go To 2.

No

- Go To 5.

2. **CHECK FOR TIPM RELATED DTCS**
   1. With the scan tool, read TIPM DTCs.

      Are there any TCM TIPM DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 27: Checking Transmission Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

3. Disconnect the TIPM C1 harness connector.
4. Measure the resistance between ground and the (T15) Transmission Control circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T15) Transmission Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR AN OPEN**

Fig. 28: Checking Transmission Control Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T15) Transmission Control circuit between the TIPM C1 harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T15) Transmission Control circuit for an open.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0883-TCM POWER INPUT HIGH

Fig. 29: TCM Power Control Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Output circuit is used to supply power to the Transmission Solenoid/TRS Assembly and to the Powertrain Control Module (PCM) when in normal operating mode. The purpose of the Transmission Output circuit is to allow the Transmission Control System to turn off the power to the Transmission Solenoid/TRS Assembly in event that the transmission should need to be placed into "limp-in" mode due to a DTC.

After a Powertrain Control Module (PCM) reset, (ignition switch turned to the run position, or after cranking the engine) the Transmission Control System verifies that the Transmission Output circuit is open by checking for voltage on the Transmission Output circuits before the Transmission Control System request for the circuit to be powered up. The request is sent by a direct circuit control from the PCM to the Totally Integrated Power Module (TIPM). If voltage is detected on the Transmission Output circuits before the request is sent, the DTC will set.

WHEN MONITORED:

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

SET CONDITION:

This DTC is set if the Powertrain Control Module (PCM) senses greater than 3.0 volts on the Transmission Control Relay Output circuits prior to a request from the PCM to Totally Integrated Power Module (TIPM) to energize the Transmission Output circuits.

POSSIBLE CAUSES

Possible Causes
TIPM DTCS PRESENT
(T15) TRANSMISSION CONTROL CIRCUIT SHORTED TO VOLTAGE
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORTED VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR TCM TIPM DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM TCM Power Control Circuit DTCS present?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 2.

2. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 0 for this DTC?

      Yes

      - Go To 3.

      No

      - Go To 6.

3. **(T16) TRANSMISSION OUTPUT CIRCUIT SHORTED TO VOLTAGE**

Fig. 30: Checking Transmission Output Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C4 harness connector.
3. Connect PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.
4. Disconnect the TIPM C2 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

5. Ignition on, engine not running.
6. Measure the voltage of the (T16) Transmission Control Output circuits in the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the voltage above 0.5 of a volt on any (T16) Transmission Control Output circuit?

   Yes

   - Go To 4.

   No

   - Go To 5.

4. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**

Fig. 31: Checking Transmission Output Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (T16) Transmission Control Output circuits in the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T16) Transmission Control Output circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 32: Checking Transmission Control Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (T15) Transmission Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T15) Transmission Control circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P0884-POWER UP AT SPEED

Fig. 33: TCM Power Control Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

If a vehicle loses power to the Transmission Control System, the solenoids (LR, 2C, OD, UD, 4C) will go to their respective power off state. Some solenoids are normally vented and some are normally applied in their power off state. The transmission is designed to be in 3rd gear with all of the solenoids in this state. However, if power is restored, the Transmission Control System will power-up and normal operation will be restored.

This code identifies that power to the Transmission Control System was restored when the gear selector was in a "Drive" position while the vehicle was moving at speeds above 32 km/h (20 mph). **This DTC does not indicate a problem with the transmission or Transmission Control System,** instead, it suggests intermittent problems in the fused ignition switch output, fused B(+), or ground circuits to the TCM. Alternately, if a person performs a rolling restart maneuver, the DTC can be set. Therefore it is critical that this DTC be investigated if the vehicle is experiencing intermittent 3rd gear operation and a subsequent return to normal operation.

WHEN MONITORED:

When the Powertrain Control Module (PCM) initially powers up. Due to the integration of the Powertrain and Transmission Control Modules, the transmission part of the PCM has its own specific power and ground circuits.

SET CONDITION:

This DTC will set if the Powertrain Control Module (PCM) powers up and senses the vehicle in a valid forward gear, with no PRNDL DTCs, and an output speed above 800 rpm, approximately 32 km/h or 20 mph.

POSSIBLE CAUSES

Possible Causes
POWER UP AT SPEED

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK THE POWER AND GROUND CIRCUITS**
    1. This DTC is set when the Transmission portion of the Powertrain Control Module is initialized while the vehicle is moving down the road in a valid forward gear.
    2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

        NOTE: Due to the integration of the Powertrain and Transmission Control Modules, the transmission part of the PCM has its own specific power and ground circuits.

    3. Check all of the Fused B(+), Fused Ignition Switch Output, and ground circuits to the PCM for an

intermittent open or short to ground.

4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Repair

- Check all power and ground circuits to the PCM and repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0890-SWITCHED BATTERY

Fig. 34: Pressure Switch Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Control Module (TIPM) replaces the Transmission control relay. The Transmission Control Output circuit It is used to supply power to the solenoids and pressure switches (Transmission Solenoid/TRS Assembly) when the transmission is in normal operating mode. When the Transmission Control Output circuit is off, no power is supplied and the transmission.

Immediately after a controller reset (ignition key turned to the "run" position or after cranking engine), the TCM verifies that the Transmission Control Output circuits are open by checking for no voltage at the transmission control output terminals at the Powertrain Control Module (PCM). After this is verified, the voltage at the pressure switches are checked. There should be no voltage on the pressure switches at this time. The PCM will then activate the relay.

WHEN MONITORED:

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

SET CONDITION:

This DTC is set if the Powertrain Control Module (PCM) senses voltage on any of the pressure switch inputs prior to the Transmission Control Output circuit being energized.

POSSIBLE CAUSES

Possible Causes
PRESSURE SWITCH SENSE CIRCUITS SHORTED TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR TIPM TCM DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TCM Power Control DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**

1. With the scan tool, read DTCs.

   Is the status Active or is the Starts Since Set counter 0 for this DTC?

   Yes

   - Go To 3.

   No

   - Go To 5.

3. **CHECK THE PRESSURE SWITCH SENSE CIRCUITS FOR A SHORT TO VOLTAGE**

Fig. 35: Checking Pressure Switch Sense Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).
3. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Ignition on, engine not running.
5. With the scan tool under TIPM, actuate the Transmission.
6. Measure the voltage of the (T147) 2C, (T48) 4C, (T50) LR, (T9) OD, and (T29) UD Pressure Switch Sense circuits in the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the voltage above 0.5 of a volt on any of the measured circuits?

   Yes

   - Repair the (T147) 2C, (T48) 4C, (T50) LR, (T9) OD, and/or (T29) UD Pressure Switch Sense circuit(s) for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**

Fig. 36: Checking Pressure Switch Sense Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool under TIPM, stop the Transmission actuation.
2. Turn the ignition off.
3. Reconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Ignition on, engine not running.
5. Measure the voltage of the (T147) 2C, (T48) 4C, (T50) LR, (T9) OD, and (T29) UD Pressure Switch Sense circuits in the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the voltage above 0.5 of a volt on any of the sense circuits?

   Yes

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0933-HYDRAULIC PRESSURE SENSOR RANGE/PERFORMANCE

Fig. 37: Transmission Control System Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle =

solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality.

WHEN MONITORED:

Continuously with the ignition on, engine running, with the transmission in gear.

SET CONDITION:

The Powertrain Control Module (PCM) continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure reading is more than 172.4 kPa (25 psi) higher than the Desired Line Pressure, but is less than the highest Line Pressure ever used in the current gear, the DTC sets.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
LINE PRESSURE CONNECTOR AND WIRING
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINING IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, check for other transmission DTCs.

       Are there any other line pressure related DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the test for P0934 or P0935 first if present.

       No

       - Go To 2.
2. **COMPARE ACTUAL LINE PRESSURE TO DESIRED LINE PRESSURE**

   CAUTION: Apply Parking Brake

1. Start the engine.

CAUTION: Firmly apply the brakes.

2. With the scan tool, monitor the Line Pressure, Desired Line Pressure and the TPS degrees.
3. While firmly applying the brakes, place the shifter in reverse, then slowly press the accelerator pedal to a TPS degree of 15°.
4. Compare the Line Pressure reading to the Desired Line Pressure reading on the scan tool.

   Does the Line Pressure stay within ± 34 kPa or 5 psi of the Desired Line Pressure?

   No

   - Go To 3.

   Yes

   - Go To 6.

3. **CHECK LINE PRESSURE CONNECTOR AND WIRING**
   1. Ignition on, engine not running.
   2. With the scan tool, monitor the Line Pressure Sensor voltage while wiggling the wiring harness and connectors pertaining to the Line Pressure Sensor and the Transmission Solenoid/TRS Assembly.

      Did the voltage remain steady while wiggling the wiring harness and connectors?

      Yes

      - Go To 4.

      No

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

4. **CHECK PCM AND WIRING**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure during the following step.
7. With the Transmission Simulator, turn the selector switch to each of the three Line Pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Does the Line Pressure on the scan tool fluctuate up and down more than 69 kPa or 10 psi at any of the 3 line pressure positions on the Transmission Simulator?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE LINE PRESSURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission) and reconnect all previously disconnected connectors.
   3. Install the Line Pressure Adaptor (special tool #8259, Adapter, Pressure Test), and the Pressure Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.), 0 to 2000 kPa (0 to 300 psi).
   4. Start the engine in park.
   5. Monitor the line pressure readings of both the scan tool and the pressure gauge and compare the two readings.

   Is the line pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?

   Yes

- Repair internal transmission and inspect the oil pump per the Service information and replace if necessary. If no problems are found, replace the Transmission Solenoid/TRS Assembly - possible cause is the Pressure Control Solenoid is stuck.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0934-LINE PRESSURE SENSOR CIRCUIT LOW

Fig. 38: Transmission Control System Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle =

solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate an Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC will set when the monitored Line Pressure Sensor voltage is less than or equal to 0.35 of a volt for 0.18 of a second.

POSSIBLE CAUSES

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 2.

       No

- Go To 7.

2. **CHECK THE PCM AND WIRING**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the Totally Integrated Power Module (TIPM).

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the scan tool, under Transmission Sensors, monitor the Line Pressure.
   6. Using the Transmission Simulator, set the rotary switch to each of the three line pressure positions.

      NOTE: The readings should be within ±14 kPa (2.0 psi) on the scan tool to the pressure readings specified on Transmission Simulator.

      Does the Line Pressure on the scan tool match the line pressures on the Transmission Simulator?

      Yes

      - Replace the Line Pressure Sensor in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 3.

3. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 39: Checking Line Pressure Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).
3. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in

poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance between ground and the (T38) Line Pressure Sensor Signal circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T38) Line Pressure Sensor Signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 40: Checking Line Pressure Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.
2. Measure the resistance of the (T38) Line Pressure Sensor Signal circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 41: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position) to the PCM C1 harness connector.
2. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure sensor harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 6.

6. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 42: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the PCM C1 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).
2. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0935-LINE PRESSURE SENSOR CIRCUIT HIGH

Fig. 43: Transmission Control System Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle =

solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate an Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

WHEN MONITORED:

Continuously with ignition on and engine running.

SET CONDITION:

This DTC will set if the monitored Line Pressure Sensor voltage is greater than or equal to 4.75 volts for the period of 0.18 of a second.

POSSIBLE CAUSES

Possible Causes
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(K900) SENSOR GROUND CIRCUIT OPEN
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 2.

       No

       - Go To 6.

2. **CHECK THE PCM AND WIRING**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the scan tool, monitor the Line Pressure.
   6. Using the Transmission Simulator, set the rotary switch to each of the three line pressure positions.

NOTE: The readings should be within ±14 kPa (2.0 psi) on the scan tool of the pressure reading specified on Transmission Simulator.

Does the 3 line pressures on the scan tool match the Line pressure readings on the Transmission Simulator?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 3.

3. **CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 44: Checking Sensor Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (K900) Sensor Ground circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (K900) Sensor Ground circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 45: Checking Line Pressure Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).
2. Measure the resistance of the (T38) Line Pressure Sensor Signal circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 46: Checking Line Pressure Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. With the scan tool under TIPM, actuate the Transmission.
3. Measure the voltage of the (T38) Line Pressure Sensor Signal circuit.

   Is the voltage above 5.5 volts?

   Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0944-LOSS OF HYDRAULIC PUMP PRIME

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Loss of prime test is used to prevent transmission defaults and erroneous fault codes during temporary loss of pump prime that may occur with low transmission fluid under severe braking conditions, start-up, etc. and to point towards more subtle problems such as a plugged or cracked oil filter.

The Loss of Prime DTC is set by a loss of hydraulic pressure in the transmission system. This condition, if sustained, will result in the vehicle being unable to move.

WHEN MONITORED:

If the transmission is slipping in any forward gear and all the pressure switches are not indicating pressure, a loss of prime test is run.

SET CONDITION:

If the transmission begins to slip in a forward gear and all the pressure switch(s) that should be closed are open a loss of prime test begins. Available elements are turned on by the Powertrain Control Module (PCM) to see if pump prime exists. The DTC sets if no pressure switch(s) respond.

POSSIBLE CAUSES

Possible Causes
SHIFT LEVER OUT OF ADJUSTMENT
IMPROPER FLUID LEVEL
CRACKED OR IMPROPERLY INSTALLED PRIMARY OIL FILTER OR SEAL
LOOSE COOLER RETURN FILTER
STUCK OR STICKING MAIN REGULATOR VALVE
TRANSMISSION OIL PUMP

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **SHIFT LEVER POSITION TEST**
    1. Using the scan tool, perform a Shift Lever Position test. Follow the instructions on the scan tool.

       Did the Shift Lever Position Test pass?

       Yes

       - Go To 2.

       No

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.
2. **CHECK TO SEE IF DTC P0944 IS CURRENT**
    1. Place the gear selector in Park.
    2. Start the engine.
    3. The transmission must be at operating temperature prior to checking pressure. A cold transmission will give higher readings.
    4. Run the engine at 1500 rpm.

5. With the scan tool, monitor the Transmission Line Pressure.

   Does the Line Pressure match the Desired Line Pressure within ± 5 psi?

   No

   - Go To 6.

   Yes

   - Go To 3.

3. **CHECK LINE PRESSURE IN DRIVE AND REVERSE**
   1. Firmly apply the brake and repeat the previous test in both Drive and the Reverse gear positions.
   2. With the scan tool, monitor the Transmission Line Pressure.

      Does the Line Pressure match the Desired Line Pressure within ± 5 psi in all gear ranges?

      Yes

      - Go To 4.

      No

      - Go To 5.

4. **REVIEW CUSTOMER COMMENTS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Verify with the customer if a delayed engagement and/or an intermittent "No Drive" condition has occurred.
   3. If the customers answer is "No" erase the DTC and return the vehicle to the customer.
   4. Make sure to check for any TSBs or controller flash updates that my apply.
   5. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

      Has the customer experienced any delayed engagement and/or "No Drive" conditions?

      Yes

      - Go To 6.

      No

      - Test Complete.

5. **DTC VERIFICATION**
   1. Read and record the DTC and the Event Data information.
   2. Test drive the vehicle and attempt to operate the vehicle within the parameters in which the DTC

set.

3. With the scan tool, read DTCs.

   Did any following DTCs set, P0868, P0944, P0841, P0846, P0871, P0876, or P0988?

   Yes

   - Go To 6.

   No

   - Test Complete.

6. **CHECK TRANSMISSION OIL FILTER**
   1. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.
   2. Remove and inspect the Primary Oil Filter in accordance with the Service Information.
   3. Inspect the oil filter seal for damage and proper installation.

      Does the Oil Pan contain excessive debris, or is the oil filter plugged, loose, or damaged?

      Yes

      - Repair the cause of the plugged transmission oil filter or excessive debris. Check the Transmission Oil Filter seal for improper installation onto filter neck instead of into the pump bore, not fully seated against pump housing, filter neck not engaged into pump. Check that the spin-on cooler return filter (if equipped) is not loose, and that its gasket is in good condition and properly seated. Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Repair the Transmission Oil Pump as necessary. Check for a stuck main regulator valve and clean if necessary. Refer to the Service Information for the proper repair procedure.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0987-4C HYDRAULIC PRESSURE TEST

Fig. 47: Pressure Switch Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

WHEN MONITORED:

In any forward gear with engine speed above 1000 rpm shortly after a shift and every minute thereafter.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 rpm, the Powertrain Control Module (PCM) momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close two times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
RELATED TCM POWER INPUT DTCS PRESENT
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO ANOTHER CIRCUIT
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Is there any Loss of Prime, TCM Power Input, and/or Line Pressure Sensor DTCs present?

       Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. If the DTC P0944 is present, perform its respective test first.

No

- Go To 2.

2. **CHECK FOR DTCS**
   1. With the scan tool, read DTCs.

      Is the DTC P0770 also present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure for DTC P0770.

      No

      - Go To 3.

3. **OTHER DTCS PRESENT**
   1. With the scan tool, read DTCs.

      Are the DTCs P0988 and/or P1736 present also?

      Yes

      - Go To 12.

      No

      - Go To 4.

4. **CHECK TO SEE IF DTC IS CURRENT**
   1. With the scan tool, check if the DTC P0987-4C HYDRAULIC PRESSURE TEST FAILURE is active or stored.

      Is the DTC P0987-4C HYDRAULIC PRESSURE TEST FAILURE active?

      Yes

      - Go To 5.

      No

      - Go To 17.

5. **CHECK IF THE LINE PRESSURE STAYS THE SAME**

1. Start the engine.
2. Warm the transmission to 82° C or 180° F.
3. Firmly apply the brakes.
4. With the scan tool, monitor the Line Pressure during the following step.
5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

   Did the line pressure remain at a steady value between 585 and 655 kPa or 85 and 95 psi in each position?

   Yes

   - Go To 6.

   No

   - Go To 10.

6. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
   1. Ignition on, **engine not running.**
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

      Did the Line Pressure reading on the scan tool change to about 207 kPa or 30 psi when the connector was pushed inward?

      Yes

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 7.

7. **CHECK THE LINE PRESSURE SENSOR OPERATION**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM.

Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

NOTE: **All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.**

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 48: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect Transmission Simulator.
3. Disconnect the PCM C1 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor

harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

Is the resistance above 5.0 Ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 49: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

10. **COMPARE SCAN TOOL TO PRESSURE GAUGE**
    1. Turn the ignition off to the lock position.
    2. Connect the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to the Service Information for proper installation procedure.

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the RPM to 1500, and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500, and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500, and compare the line pressure readings.

       Did the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

       Yes

       - Go To 11.

       No

       - Replace the Line Pressure Sensor in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK PCM AND WIRING**
    1. Turn the ignition off to the lock position.
    2. Remove the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).

3. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

4. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
5. On the Transmission Simulator, turn the Pressure Switch selector switch to 4C.
6. Ignition on, engine not running.
7. With the scan tool, monitor the 4C Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the 4C Pressure Switch.

   Did the 4C Pressure Switch state change to closed and remain closed while wiggling the wires?

   Yes

   - Go To 12.

   No

   - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition off to the lock position.
    2. Remove the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

       Does the Transmission Oil Pan contain excessive debris or contamination?

       Yes

       - Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 13.

13. **CHECK 4C HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the 4C hydraulic clutch circuit (in the case) for leakage in

accordance with the Service Information.

NOTE: **The 4C hydraulic clutch circuit contains a small bleed orifice. A small amount of air leakage is normal.**

Was there excessive air leakage noticed during the air check?

Yes

- Repair as necessary. Check the 4C clutch piston, piston seals and bleed orifice assembly.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Disassemble and inspect the Valve Body and repair as necessary. Inspect the 4C Accumulator piston and seals. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

14. **CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 50: Checking 4C Pressure Switch Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Remove the Transmission Simulator (special tool #8333A, Simulator, Transmission) and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).
3. Disconnect the PCM C4 harness connector.
4. Measure the resistance of the (T48) 4C Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T48) 4C Pressure Switch Sense circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 15.

15. **CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 51: Checking 4C Pressure Switch Sense Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T48) 4C Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T48) 4C Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 16.

16. **CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 52: Checking 4C Pressure Switch Sense Circuit For Short To Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: **Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

NOTE: **Check connectors - Clean/repair as necessary.**

3. Measure the resistance between the (T48) 4C Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T48) 4C Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T48) 4C Pressure Switch Sense circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

17. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
    5. If the Event Data shows the DTC Pie set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or improperly installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

       Were there any problems found?

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Test Complete.

P0988-4C PRESSURE SWITCH RATIONALITY

Fig. 53: Pressure Switch Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the LR, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

WHEN MONITORED:

Continuously with the ignition on, engine running, with the transmission in gear.

SET CONDITION:

The DTC is set if the 4C Pressure Switch reads open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
RELATED TCM POWER INPUT DTCS PRESENT
DTC P0871 ALSO PRESENT
LOSS OF 12-VOLT FEED
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT OPEN
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
EXCESSIVE FLUID LEAKAGE WITH 4C CLUTCH CIRCUIT
NO. 5 AND/OR NO. 7 CHECK BALL CUT OR DAMAGED
LOW LINE PRESSURE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)
WIRING AND CONNECTORS

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN
1ST	CLOSED*	OPEN	OPEN	CLOSED	OPEN
2ND	OPEN	CLOSED	OPEN	CLOSED	OPEN
2ND PRIME	OPEN	OPEN	CLOSED	CLOSED	OPEN
3RD	OPEN	OPEN	OPEN	CLOSED	CLOSED
4TH	OPEN	OPEN	CLOSED	OPEN	CLOSED
5TH	OPEN	CLOSED	OPEN	OPEN	CLOSED
*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is closed in Manual 1.					
**May be open when rolling in Neutral or at low oil temperatures.					

DIAGNOSTIC TEST

1. **CHECK FOR TCM POWER INPUT SIGNAL DTCS**
    1. With the scan tool, read DTCs.

       Are there any TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **DTC DATA SHOW CURRENT DTC**
    1. With the scan tool, read and record the Event Data.

       NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

       Does the Event Data show data for DTC P0988?

       Yes

       - Go To 3.

       No

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate symptom identified in the Event Data.
3. **CHECK IF MULTIPLE DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are there two or more related Pressure Switch Sense DTCs present in addition to P0988?

       Yes

       - Go To 4.

       No

       - Go To 7.
4. **RELATED DTC PRESENT**

   In the Event Data recorded earlier, do all the pressure switches read CLOSED in the Event Data for P0988?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure for DTC P0882. Diagnose the DTC as if it is current.

No

- Go To 5.

5. **CHECK IF THE PRESSURE SWITCHES READ OPEN**

   In the Event Data recorded earlier, do all the pressure switches read OPEN?

   Yes

   - Go To 6.

   No

   - Go To 7.

6. **CHECK FOR LOW LINE PRESSURE**

   In the Event Data recorded earlier, is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

   Yes

   - Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK IF THE DTC P0871 ALSO SET**
   1. With the scan tool, read DTCs.

      Is the DTC P0871 also present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 8.

8. **CHECK IF THE DTC SET IN PARK, REVERSE OR NEUTRAL**

   In the Event Data recorded earlier, does the Event Data show the DTC set in Park, Neutral, or Reverse for P0988?

   Yes

   - Go To 13.

   No

   - Go To 9.

9. **CHECK IF THE Event Data READS CLOSED**

   In the Event Data recorded earlier, does the Event Data show the 4C Pressure Switch reading CLOSED?

   Yes

   - Go To 11.

   No

   - Go To 10.

10. **CHECK THE PRIMARY OIL FILTER SEAL**

    In the Event Data recorded earlier, is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

    Yes

    - Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 15.

11. **CHECK THE PCM AND WIRING**
    1. Turn the ignition off to the lock position.

2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. Ignition on, engine not running.
5. With the Transmission Simulator, turn the Pressure Switch selector switch to the 4C position.
6. With the scan tool, monitor the 4C Pressure Switch while pressing the Pressure Switch test button on the Transmission Simulator.

   Did the state of the 4C Pressure Switch change while pressing the Pressure Switch Test button?

   Yes

   - Go To 12.

   No

   - Go To 13.

12. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
    1. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    2. Wiggle the wires while checking for shorted and open circuits.

       Where there any problems found?

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

       No

       - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

13. **CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 54: Checking 4C Pressure Switch Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C4 harness connector.
4. Connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

5. Measure the resistance of the (T48) 4C Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T48) 4C Pressure Switch Sense circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 14.

14. **CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 55: Checking 4C Pressure Switch Sense Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T48) 4C Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T48) 4C Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Powertrain Control Module in accordance with the Service Information. With the scan tool, perform the Quick Learn procedure.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK IF THE NO. 5 AND/OR NO. 7 CHECK BALL IS CUT OR DAMAGED**
    1. Turn the Ignition off to the lock position.
    2. Remove the Valve Body Assembly in accordance with the Service Information.
    3. Inspect the No. 5 and No. 7 check balls for any cuts or damage.
    4. Inspect the 4C accumulator piston and seals and also the 4C tower seal on top of the valve body. Refer to the Service Information.

    Were there any problems found?

    Yes

    - Repair as necessary. Check for excessive clutch debris in the transmission oil pan. If excessive clutch debris is present, repair 4C clutch as necessary. Refer to the Service Information for proper repair procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 16.

16. **CHECK FOR EXCESSIVE LEAKAGE WITHIN THE 4C CLUTCH CIRCUIT**
    1. Air check the 4C Clutch hydraulic circuit. Refer to the Service Information.

    NOTE: This hydraulic clutch circuit contains a small bleed orifice. Small leakage is considered normal.

    Was there excessive air leakage in the 4C Clutch hydraulic circuit?

    Yes

    - Repair as necessary. Refer to the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P1684-BATTERY WAS DISCONNECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The PCM uses a battery backed RAM (Random Access Memory) is used to maintain some learned values. When the battery B(+) is disconnected, the memory is lost. When the B(+) is restored, this memory loss is detected by the Transmission Control System. The DTC is set and the learned values are initialized to known constants or previously learned values from EEPROM (Electronic Erasable Programmable Read Only Memory). This results in the re-initialization of some parameters.

WHEN MONITORED:

Whenever the ignition is in the Run/Start position.

SET CONDITION:

This DTC will set whenever Powertrain Control Module (PCM) is disconnected from Fused B(+) or ground. It will also be set using the scan tool to perform a Battery Disconnect and/or Quick Learn procedure.

POSSIBLE CAUSES

Possible Causes
BATTERY WAS DISCONNECTED
SCAN TOOL BATTERY DISCONNECT PERFORMED
PCM WAS REPLACED OR DISCONNECTED
QUICK LEARN WAS PERFORMED

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **POSSIBLE CAUSES**
    1. This DTC is an informational DTC only.
    2. This DTC is set due to a momentary loss of power and/or the ground circuits to the PCM.
    3. Below are a list of possible causes associated with this DTC.
    4. Battery was disconnected.
    5. The Battery Disconnect feature (if equipped) on the scan tool was performed.
    6. The Quick Learn feature on the scan tool was performed.
    7. PCM was replaced or disconnected.

Were any of the above possible causes performed?

Yes

- This is the cause of the DTC. Erase the DTC and return vehicle to customer.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 2.

2. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

      NOTE: Check all power and ground circuits to the PCM for a intermittent or high resistance condition.

   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

      Where there any problems found?

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Test Complete.

P1715-RESTRICTED MANUAL VALVE IN T3 RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the PRNDL code indicates Temp 3.

SET CONDITION:

This DTC sets when conditions for the DTC P1776 are satisfied or three unsuccessful attempts to engage 1st gear while the shifter is in the temp 3 zone. This indicates a restricted port at the manual valve because the shifter is not fully engaged in the drive position.

POSSIBLE CAUSES

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
CUSTOMER DRIVING HABITS
MISADJUSTED SHIFTER

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINING IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, check DTCs.

       Are any of the following DTCs P0731, P0732, P0733, P0734, P0736, or P0716 present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK SHIFTER ADJUSTMENT**
    1. Check Shifter adjustment in accordance with the Service Information.

       Is the shifter properly adjusted?

       Yes

       - Go To 3.

       No

       - Adjust the Shifter Assembly in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.
3. **CHECK CUSTOMER DRIVING HABIT**
    1. This DTC can be set if the customer rests their hand on the shift lever while they are driving. The transmission can be put in the T3 position if just enough upward pressure towards neutral is exerted on the shift lever.
    2. When this occurs, the feed port to the clutch is restricted, the transmission will declare neutral, and this DTC will be set. The customer should be informed not to rest their hand on the shifter while driving.

3. This DTC can also be set by simply bumping the shift lever toward neutral while accelerating.
4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Repair

- This DTC can be set by putting too much forward pressure on the shift lever while it is in the OD position. Make sure the customer is informed.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P1736-GEAR RATIO ERROR IN 2ND PRIME

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).

2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
INPUT SPEED SENSOR OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR 4C CLUTCH
CUT 4C OR UD PISTON SEAL
BROKEN 4C PISTON CASTING
BROKEN OR MISSING 4C BLEED ORIFICE
BROKEN OR MISSING UD BLEED ORIFICE
CUT 4C OR UD ACCUMULATOR PISTON SEAL
CRACKED 4C OR UD ACCUMULATOR PISTON
TRANSMISSION SOLENOID/TRS ASSEMBLY
BROKEN WELD - REACTION CARRIER TO REVERSE SUN GEAR
MISSING TEETH ON INPUT CLUTCH HUB TONE WHEEL

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
   1. With the scan tool, read DTCs.

      Are any Transmission solenoid, line pressure, speed sensor, or loss of prime DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. Perform the test for P0944-LOSS OF PRIME first if it is present.

      No

      - Go To 2.
2. **CHECK THE EVENT DATA**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for the DTC P1736?

Yes

- Go To 3.

No

- Go To 6.

3. **CHECK INPUT RPM IN THE EVENT DATA**

   In the Event Data recorded earlier, does the Input rpm read zero?

   Yes

   - Check the input speed sensor and wiring. Refer to **DIAGNOSIS AND TESTING** and perform test P0716 and diagnose as if the DTC is current.

   No

   - Go To 4.

4. **CHECK LINE PRESSURE READING**

   In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure?

   Yes

   - Go To 5.

   No

   - Go To 6.

5. **PLUGGED TRANSMISSION OIL FILTER**
   1. Turn the ignition off to the lock position.
   2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
   3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

      NOTE: Make sure the Primary Transmission Oil Filter and/or seal is not cracked or split.

      Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked or plugged?

      Yes

      - Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If the

Primary Transmission Oil Filter is plugged, refer to the Service Information for the proper hydraulic clutch repair procedure. Refer to **REMOVAL** .

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Remove the Transmission Oil Pump in accordance with the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK IF THE DTC P1736 IS CURRENT**
   1. With the scan tool, perform the 2nd Prime Gear Clutch Test. Follow the instructions on the scan tool.
   2. Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: If the 4C clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 2nd Prime Gear Clutch Test will not detect a faulty 4C clutch. However, it will detect a faulty UD clutch.

Did the clutch test pass, did the Input Speed remain at zero?

Yes

- Go To 7.

No

- Go To 9.

7. **CHECK FOR INTERMITTENT OPERATION**
   1. Check the Shifter adjustment in accordance with the Service Information.
   2. Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
   3. Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

Were there any problems found?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK FOR SLIPPAGE**
   1. With the scan tool, erase Transmission DTCs.
   2. Road test the vehicle.
   3. During the road test, operate in 4th gear, and perform kickdown shifts from 4th to 2nd (prime) gears.

   Is there an obvious slippage noticed in 4th or 2nd prime gears, or runaway on the 4-2 shift?

   Yes

   - Go To 11.

   No

   - Go To 14.

9. **UD CLUTCH HYDRAULIC CIRCUIT**
   1. Remove Transmission Oil Pan and check for excessive debris.
   2. Remove the Valve Body and air check the UD clutch hydraulic circuit (in the case) in accordance with the Service Information.

   NOTE: The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

   Were there any problems found, excessive debris and/or excessive air leakage in the UD clutch hydraulic circuit?

   Yes

   - Repair as necessary. Check the UD clutch piston seals and the dribbler assembly, reaction shaft support seal rings, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

     NOTE: If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs. Refer to ASSEMBLY, TRANSMISSION SOLENOID AND

TRS, REMOVAL .

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 10.

10. **UD ACCUMULATOR PISTON**
    1. Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

    Were there any problems found?

    Yes

    - Repair as necessary. Refer to **VALVE BODY, REMOVAL** for proper repair procedures.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

11. **EXCESSIVE DEBRIS**
    1. Remove the Transmission Oil Pan and check for excessive debris.
    2. Remove the valve body and air check the 4C clutch hydraulic circuit in accordance with the Service Information.

    NOTE: The 4C clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

    Were there any problems found, excessive debris, improperly assembled 4C clutch and/or excessive air leakage in the 4C clutch hydraulic circuit?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the 4C piston seals and bleed orifice.

    NOTE: If the 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal

repairs.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 12.

12. **4C ACCUMULATOR**
    1. Check the 4C Accumulator piston for cracks or a cut seal.
    2. Check for a cut or missing No. 5 check ball.
    3. Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

    Were there any problems found?

    Yes

    - Repair as necessary. Refer to **VALVE BODY, REMOVAL** for proper repair procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 13.

13. **CHECK FOR BROKEN REVERSE SUN GEAR WELD**
    1. Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:
       - Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
       - Rotate the Input Annulus gear and drive shell, (the drum that encloses the two rearmost carriers).
       - Check to see if the reaction carrier (the front most carrier, whose outer shell is splined to the 4C clutch) is rotating faster than the drive shell is being turned.

    Is the reaction carrier turning faster than the drive shell?

    Yes

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the reaction carrier in accordance with the Service Information. Refer to **REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

14. **CHECK IF THE DTC RESET**

Did the DTC P1736 reset during the road test?

Yes

- Go To 15.

No

- Go To 16.

15. **LIST OF POSSIBLE CAUSES**
    1. If any other DTCs set during the road test, refer to **DIAGNOSIS AND TESTING**.
    2. If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those:
       - Check for excessive debris in the Transmission Oil pan, plugged, cracked, or split Primary Transmission Oil Filter and/or seal.
       - Check for cuts or missing No. 5 check ball in the main valve body.
       - Check the 4C and UD accumulator pistons and seals, UD bleed orifice, and the Solenoid Switch Valve and Plugs in the main valve body.
       - Check the UD clutch piston seals, reaction shaft support seal rings, and the flatness of the pump valve body and pump housing faces.
       - Check the 4C clutch piston seals, and bleed orifice.
       - Check the UD clutch piston seals, reaction shaft support seal rings, and dribbler assemblies, and the flatness of the pump valve body and pump housing faces.

Repair

- Repair as necessary. Refer to **REMOVAL** for proper repair procedures.

NOTE: **If the UD or 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

16. **INTERMITTENT DTC**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Use the Event Data to help identify the conditions and/or possible causes that may have caused the DTC to set.
    3. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION

Fig. 56: Pressure Switch Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R Solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing the fluid to the L/R clutch circuit. In 2nd through 5th gears, it will be in the upshifted position and directing the fluid into the torque converter clutch (TCC).

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R Pressure Switch is monitored to confirm SSV movement. If movement is not confirmed (the L/R pressure switch does not close), EMCC is inhibited until SSV operation is confirmed.

WHEN MONITORED:

During an attempted shift into 1st gear.

SET CONDITION:

This DTC is set if three unsuccessful attempts are made to shift the Solenoid Switch Valve (SSV) into the downshifted position in one given ignition start. This DTC can take up to five minutes to mature before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
RELATED DTC P0841 PRESENT
SOLENOID SWITCH VALVE STICKING
L/R PRESSURE SWITCH SENSE CIRCUIT SHORTED TO OTHER CIRCUITS
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Is the DTC P0841 present also?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure for DTC P0841.

       No

       - Go To 2.

2. **CHECK IF THE DTC IS CURRENT**
    1. Perform a visual inspection of all connectors, wiring, and cooler connections before proceeding. Repair as necessary.
    2. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 3.

       No

       - Go To 6.
3. **CHECK THE PCM AND WIRING**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

       CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

       WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    4. Ignition on, engine not running.
    5. With the Transmission Simulator, turn the Pressure Switch selector switch to L/R.
    6. With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

       Did the state of the L/R Pressure Switch change while pressing the Pressure Switch Test button?

       Yes

       - Go To 4.

       No

       - Go To 5.
4. **CHECK IF THE SOLENOID SWITCH VALVE STICKING**
    1. Turn the ignition off to the lock position.
    2. Remove the Transmission Oil Pan in accordance with the Service Information.

3. Remove the Transmission Valve body in accordance with the Service Information.
4. Inspect the Solenoid Switch Valve and Plugs for sticking.

   Is the Solenoid Switch Valve or Plugs sticking?

   Yes

   - Clean and inspect in accordance with the Service Information. Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 57: Checking L/R Pressure Switch Sense Circuit For Short To Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Disconnect all PCM harness connectors.
4. Measure the resistance between the (T50) L/R Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T50) L/R Pressure Switch Sense circuit and all other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T50) L/R Pressure Switch Sense circuit for a short to another circuit(s).

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION

Fig. 58: Pressure Switch Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R Solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing the fluid to the L/R clutch circuit. In 2nd through 5th gears, it will be in the upshifted position and directing the fluid into the torque converter clutch (TCC).

When in 2nd, 2nd Prime, 3rd, 4th, or 5th gear, the Torque Converter Clutch (TCC) can be engaged when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the L/R solenoid until the torque converter slip difference (difference between engine and transmission input speed) is within 60 rpm. Then the L/R solenoid is fully energized (FEMCC - 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

WHEN MONITORED:

Continuously when performing partial or full EMCC - PEMCC or FEMCC.

SET CONDITION:

If the transmission senses the L/R pressure switch closing while performing PEMCC or FEMCC. This DTC will set after two unsuccessful attempts to perform PEMCC or FEMCC. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
RELATED DTC P0841 PRESENT
LR PRESSURE SWITCH SENSE CIRCUIT OPEN
LR PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
SOLENOID SWITCH VALVE
POWERTRAIN CONTROL MODULE (PCM)
CHECK THE WIRING AND CONNECTORS

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Is the DTC P0841 present also?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

- Go To 2.

2. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 3.

      No

      - Go To 7.

3. **CHECK THE PCM AND WIRING**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Pressure Switch selector switch to the LR position.
   6. With the scan tool, monitor the LR Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

      Did the state of the LR Pressure Switch change while pressing the Pressure Switch Test button?

      Yes

      - Go To 4.

      No

      - Go To 5.

4. **CHECK THE SOLENOID SWITCH VALVE**
   1. Remove the Valve Body in accordance with the Service Information.
   2. Inspect the Solenoid Switch Valve and plugs for sticking in the bore and/or wear.

      Were there any problems found?

Yes

- Clean and repair as necessary in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

5. **CHECK THE LR PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 59: Checking L/R Pressure Switch Sense Circuit For Open

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T50) LR Pressure Switch Sense circuit between the Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T50) LR Pressure Switch Sense circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 6.

6. **CHECK THE (T50) LR PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 60: Checking L/R Pressure Switch Sense Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T50) LR Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T50) LR Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION

VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. This DTC can also be set by the Solenoid Switch Valve intermittently sticking in it's bore under extreme temperature conditions, or by a worn Solenoid Switch Valve or plugs.
   5. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P1794-SPEED SENSOR GROUND ERROR

Fig. 61: Transmission Control System Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0729 and P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set when at a stop.

WHEN MONITORED:

The gear ratio is monitored continuously while the Transmission is in gear.

SET CONDITION:

After a controller reset in neutral and a ratio of input to output, of 1 to 2. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Engine Running, Shift lever in park.
    2. With the scan tool, read the Transmission Output and Input Speed Sensor states.

       Is the Output Speed Sensor reading twice the Input Speed Sensor reading?

       Yes

       - Go To 2.

       No

       - Go To 6.

2. **CHECK THE PCM AND WIRING**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

        CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

        WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    4. With the Transmission Simulator, set the Input/Output Speed selector switch to the "3000/1000" position. Turn the Input/Output Speed switch to "ON".
    5. Ignition on, engine not running.
    6. With the scan tool, monitor the Input and Output Speed Sensor state.

        Does the Input speed read 3000 rpm and the Output speed read 1000 rpm, within 50 rpm?

        Yes

        - Go To 6.

        No

        - Go To 3.
3. **(T13) SPEED SENSOR GROUND CIRCUIT OPEN**

Fig. 62: Checking Speed Sensor Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).
3. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T13) Speed Sensor Ground circuit between both Input and Output Speed Sensor harness connectors and the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms on any of the above measurements?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND**

Fig. 63: Checking Speed Sensor Ground Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 5.

5. **(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE**

Fig. 64: Checking Speed Sensor Ground Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. With the scan tool under TIPM, actuate the Transmission.
3. Measure the voltage of the (T13) Speed Sensor Ground circuit.

   Is the voltage above 0.5 of a volt?

Yes

- Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P2700-INADEQUATE ELEMENT VOLUME LR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

WHEN MONITORED:

Whenever the engine is running. The L/R clutch volume index (CVI) is updated during a 3-1 or 2-1 manual

downshift with throttle angle below 5 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the L/R clutch volume index (CVI) falls below 16.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN L/R CLUTCH PISTON RETURN SPRING OR SPRING RETAINERS
BROKEN L/R ACCUMULATOR SPRING(S)
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
    1. With the scan tool, read DTCs.

       Are there any Pressure Switch Sense circuit DTCs present also?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK L/R CLUTCH VOLUME INDEX**
    1. With the scan tool, erase DTCs.
    2. Start the engine and warm the transmission.

       NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

    3. Drive the vehicle and perform at least ten 3-1 manual downshifts at closed throttle from speeds of about 32 Km/h or 20 mph.
    4. With the scan tool, read the L/R CL VOL INDEX.

       Is the L/R CL VOL INDEX below 20?

Yes

- Go To 3.

No

- Go To 5.

3. **L/R CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
    1. Turn the ignition off to the lock position.
    2. Remove the transmission oil pan in accordance with the Service Information.
    3. Remove the valve body per the service information.
    4. Check condition of the L/R accumulator springs.
    5. Look for possible leak paths into the L/R clutch hydraulics circuit within the valve body.

    Were any problems found?

    Yes

    - Repair as necessary. Refer to **VALVE BODY, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 4.

4. **AIR CHECK L/R CLUTCH CIRCUITS**
    1. Perform an air check on the L/R Clutch circuit in accordance with the Service Information.
    2. Watch and listen for L/R Clutch piston movement.

    Does the L/R piston stroke and return properly?

    Yes

    - Replace the Transmission/TRS Solenoid Assembly per the service information. With the scan tool, perform Quick Learn. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Repair internal transmission as necessary. Pay attention to the components related to the L/R clutch. A broken or weak L/R clutch return spring, Accumulator Spring, and/or dislocated snap ring could cause this problem. Refer to **REMOVAL** .

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **VERIFY PCM OPERATION**

NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing the following steps.

1. Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Km/h or 50 mph, then brake lightly to a stop. Turn off engine.
2. With the scan tool, record the CL VOL INDEX (CVI) for all clutches
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P2701-INADEQUATE ELEMENT VOLUME 2C

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

WHEN MONITORED:

Whenever the engine is running. The 2C clutch volume index (CVI) is updated during a 3-2 kickdown with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the 2C CVI falls below 5.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN 2C CLUTCH PISTON RETURN SPRING / DISLODGED SNAP RING
BROKEN ACCUMULATOR SPRING(S)
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
   1. With the scan tool, read DTCs.

      Are there any Pressure Switch Sense circuit DTCs present also?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK 2C CLUTCH VOLUME INDEX**
   1. With the scan tool, erase Transmission DTCs.
   2. Drive the vehicle at about 80 Km/h (50 mph), then depress the OD off button. This will put the vehicle into third gear.

      NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing the following steps.

   3. Perform at least ten 3-2 kickdowns by depressing the throttle between 10 and 54 TPS Degrees at speeds of about 80 Km/h (50 mph).
   4. With the scan tool, read the 2C CL VOL INDEX.

      Is the 2C CL VOL INDEX below 10?

      Yes

- Go To 3.

No

- Go To 5.

3. **2C CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
    1. Turn the ignition off to the lock position.
    2. Remove the transmission oil pan in accordance with the Service Information.
    3. Remove the valve body per the service information.
    4. Check condition of the 2C accumulator springs.
    5. Look for possible leak paths into the 2C clutch hydraulics circuit within the valve body.

    Were any problems found?

    Yes

    - Repair as necessary. Refer to **VALVE BODY, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 4.

4. **AIR CHECK 2C CLUTCH CIRCUIT**
    1. Turn the ignition off to the lock position.
    2. Perform an air check on the 2C Clutch circuit in accordance with the Service Information.
    3. Watch and listen for 2C Clutch piston movement.

    Dose the piston stroke and return properly?

    Yes

    - Replace the Transmission/TRS Solenoid Assembly per the service information. With the scan tool, perform Quick Learn. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Repair internal transmission as necessary. Pay attention to the components related to the 2C clutch. A broken or dislodged 2C return spring, snap ring or broken 2C Accumulator Spring could cause this problem. Refer to **REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION

VERIFICATION TEST.

5. **VERIFY PCM OPERATION**

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

1. Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Km/h or 50 mph, then brake lightly to a stop. Turn off engine.
2. With the scan tool, record the CL VOL INDEX (CVI) for all clutches
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P2702-INADEQUATE ELEMENT VOLUME OD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

WHEN MONITORED:

Whenever the engine is running. The OD clutch volume index (CVI) is updated during a 2-3 upshift with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the OD CVI falls below 5.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN OD ACCUMULATOR SPRING
BROKEN OD/REV PISTON BELLEVILLE SPRING OR DISLODGED SNAP RING
INTERNAL LEAKAGE IN PUMP ASSEMBLY
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
   1. With the scan tool, check DTCs.

      Are there any Pressure Switch Sense circuit DTCs present also?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK THE OD CLUTCH VOLUME INDEX**
   1. With the scan tool, erase DTCs.

      NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing the following steps.

   2. Drive the vehicle and perform at least ten 2-3 upshifts with the TPS degree between 10 and 54.
   3. With the scan tool, read the OD CL VOL INDEX.

      Is the OD CL VOL INDEX below 10?

      Yes

      - Go To 3.

No

- Go To 5.

3. **OD CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
    1. Turn the ignition off to the lock position.
    2. Remove the transmission oil pan in accordance with the Service Information.
    3. Remove the valve body per the service information.
    4. Check condition of the OD accumulator spring.
    5. Look for possible leak paths into the OD clutch hydraulics circuit within the valve body.

    Were any problems found?

    Yes

    - Repair as necessary. Refer to **VALVE BODY, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 4.

4. **AIR CHECK OD CLUTCH CIRCUIT**
    1. Perform an air check on the OD Clutch circuit in accordance with the Service Information.
    2. Watch and listen for OD Clutch piston movement.
    3. Air check all other pump passages and watch for air leakage into the OD clutch passage.

    NOTE: There is a bleed orifice between the OD and Reverse Clutch passages, so a small amount of air leakage from Reverse to OD is normal.

    Were any problems found?

    Yes

    - Repair internal transmission. Pay attention to the OD Clutch. Broken or weak return spring or a dislocated snap ring could cause this problem. If no problems were found in the OD clutch, or if leakage into the OD passage was noted, replace Pump Assembly in accordance with the Service Information. Refer to **REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the Transmission/TRS Solenoid Assembly in accordance with the Service

Information. With the scan tool, perform Quick Learn. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **VERIFY PCM OPERATION**

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

1. Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Kmh or 50 MPH, then brake lightly to a stop. Turn off engine.
2. With the scan tool, record the CL VOL INDEX (CVI) for all clutches.
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P2703-INADEQUATE ELEMENT VOLUME UD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

WHEN MONITORED:

Whenever the engine is running. The UD clutch volume index (CVI) is updated during a 4-3 kickdown with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the UD CVI falls below 11.

POSSIBLE CAUSES

Possible Causes
BROKEN UD ACCUMULATOR SPRING(S)
BROKEN UD CLUTCH PISTON SPRING OR DISLODGED SNAP RING
INTERNAL LEAKAGE IN PUMP OR VALVE BODY ASSEMBLIES
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
   1. With the scan tool, check DTCs.

      Are there any Pressure Switch Sense circuit DTCs present also?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK UD CLUTCH VOLUME INDEX**
   1. With the scan tool, erase Transmission DTCs.

      NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

   2. Drive the vehicle and perform at least ten 4-3 kickdowns by depressing the throttle between 30 and 54 TPS degrees at speeds about 80 Km/h or 50 mph.
   3. With the scan tool, read the UD clutch volume index (CVI).

      Is the UD CVI below 10?

Yes

- Go To 3.

No

- Go To 5.

3. **UD CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
    1. Turn the ignition off to the lock position.
    2. Remove the transmission oil pan and valve body in accordance with the Service Information.
    3. Check the condition of the UD accumulator springs.
    4. Look for possible leak paths into the UD clutch hydraulics circuit within the valve body.

    Were there any problems found?

    Yes

    - Repair as necessary. Refer to **VALVE BODY, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 4.

4. **AIR CHECK UD CLUTCH CIRCUIT**
    1. Perform an air check on the UD Clutch circuit in accordance with the Service Information.
    2. Watch and listen for UD Clutch piston movement.
    3. Air check all other pump passages for air leakage into the UD Clutch circuit.

    Were any problems found?

    Yes

    - Repair internal transmission. Pay attention to components related to the UD clutch. Broken or weak return spring or a dislocated snap ring. If no trouble is found in UD clutch component or UD clutch leakage was noted in passage, replace the Pump Assembly. Refer to **REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the Transmission/TRS Solenoid Assembly per the service information. With the scan tool, perform Quick Learn. Refer to **ASSEMBLY, TRANSMISSION SOLENOID**

AND TRS, REMOVAL .

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **VERIFY PCM OPERATION**

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

1. Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Km/h or 50 mph, then brake lightly to a stop. Turn off engine.
2. With the scan tool, record the clutch volume index (CVI) for all clutches.
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P2704-INADEQUATE ELEMENT VOLUME 4C

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

WHEN MONITORED:

Whenever the engine is running. The 4C clutch volume index (CVI) is updated during a 3-4 upshift with throttle

angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the 4C CVI falls below 5.

POSSIBLE CAUSES

Possible Causes
BROKEN 4C RETURN SPRING OR DISLODGED SNAP RING
BROKEN 4C ACCUMULATOR SPRING(S)
HYDRAULIC LEAK IN THE VALVE BODY
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK THE 4C CLUTCH VOLUME**
    1. With the scan tool, record the 4C clutch volume index (CVI) and erase DTCs.
    2. Perform at least 10, 3-4 upshifts with the throttle between 10 and 54 degrees. The Transmission temperature must be at least 43° C or 110° F.
    3. With the scan tool, read the 4C CVI.

    Is the current 4C CVI below 10?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DTC P0876 PRESENT**
    1. With the scan tool, check DTCs.

    NOTE: The DTC P0876 must also be set with P2704 in order for this test to be valid.

    Is the DTC P0876 also present?

    Yes

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 3.

3. **4C CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan in accordance with the Service Information.
   3. Remove the valve body in accordance with the Service Information.
   4. Check condition of the 4C accumulator springs.
   5. Look for possible leak paths into the 4C clutch hydraulics circuit within the valve body.

   Were any problems found?

   Yes

   - Repair as necessary. Refer to **VALVE BODY, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **AIR CHECK 4C CLUTCH CIRCUIT**
   1. Perform an air check on the 4C Clutch circuit in accordance with the Service Information.
   2. Listen for proper 4C Clutch piston movement.

   Were any problems found?

   Yes

   - Repair Internal transmission as necessary. Pay attention to the mechanical components related to the 4th clutch. A broken or weak return spring or a dislocated snap ring could cause this problem. Refer to **REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the service

information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** . With the scan tool, perform Quick Learn.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **VERIFY PCM OPERATION**
    1. Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 50 MPH, then brake lightly to a stop. Turn off engine.
    2. With the scan tool, record Transmission CL VOL INDEX (CVI) for all clutches.
    3. With the scan tool, perform a BATTERY DISCONNECT.
    4. With the scan tool, read the CVIs and compare them to the reading recorded before the BATTERY DISCONNECT.

    Are any of the CVIs less than 5 or are they different than before the battery disconnect?

    Yes

    - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** . With the scan tool, perform Quick Learn.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P2706-MS SOLENOID CIRCUIT

Fig. 65: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System uses five electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three

consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

WHEN MONITORED:

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

SET CONDITION:

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: **This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement - do not replace the Valve Body.**

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T140) MS SOLENOID CONTROL CIRCUIT SHORTED TO OTHER CIRCUITS
(T140) MS SOLENOID CONTROL CIRCUIT OPEN
(T140) MS SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **RELATED TCM POWER INPUT DTCS PRESENT**
    1. With the scan tool, check DTCs.

       Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **TRANSMISSION SOLENOID/TRS ASSEMBLY**

1. Turn the ignition off to the lock position.
2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. Ignition on, engine not running.
5. With the scan tool, actuate the MS Solenoid.
6. Monitor the MS Solenoid LED on the Transmission Simulator.

   Did the MS Solenoid LED on the Transmission Simulator blink on and off?

   Yes

   - Go To 3.

   No

   - Go To 5.

3. **TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. With the scan tool, continue to actuate the MS Solenoid for the period of two minutes with the Transmission Simulator still connected.
   2. After two minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

      Did the DTC P2706 reset during the actuation test?

      Yes

      - Go To 5.

      No

      - Go To 4.

4. **WIGGLE TEST WITH TRANSMISSION SIMULATOR**
   1. With the Transmission simulator still connected, continue to actuate the MS Solenoid for another two minutes while wiggling the related wiring harness and connectors.
   2. With the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P2706 reset during the actuation test?

Yes

- Repair wiring harness or connectors as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. **Note: Do NOT replace the entire Valve Body.** . Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **(T140) MS SOLENOID CONTROL CIRCUIT SHORTED TO OTHER CIRCUITS**

Fig. 66: Checking MS Solenoid Control Circuit For Short To Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM harness connectors.
4. Measure the resistance between the (T140) MS Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T140) MS Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T140) MS Solenoid Control circuit for a short to other circuit(s).

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 6.

6. **(T140) MS SOLENOID CONTROL CIRCUIT OPEN**

Fig. 67: Checking MS Solenoid Control Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

2. Measure the resistance of the (T140) MS Solenoid Control circuit from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T140) MS Solenoid Control circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 7.

7. **(T140) MS SOLENOID CONTROL CIRCUIT SHORTED TO GROUND**

Fig. 68: Checking MS Solenoid Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T140) MS Solenoid Control circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T140) MS Solenoid Control circuit for a short to ground.

- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

U0002-CAN C BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view DTCs.

Is the DTC Active at this time?

Yes

- **Diagnose the U0002-CAN C BUS OFF PERFORMANCE as the U0001-CAN C BUS CIRCUIT test. Refer to DIAGNOSIS AND TESTING** and perform the U0001-CAN C Bus diagnostic procedure.

No

- **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0100-LOST COMMUNICATION WITH THE ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Powertrain Control Module (ECM/PCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
POWERTRAIN CONTROL MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
POWERTRAIN CONTROL MODULE (ECM/PCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view DTCs.

Is the DTC Active at this time?

Yes

- **Refer to DIAGNOSIS AND TESTING** and perform the U0100-Lost Communication with ECM/PCM diagnostic procedure.

No

- **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0121-LOST COMMUNICATION WITH ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
ABS MODULE
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view DTCs.

Is the DTC Active at this time?

Yes

- **Refer to DIAGNOSIS AND TESTING** and perform the U0121-Lost Communication with Anti-Lock Brake Module diagnostic procedure.

No

- **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

Fig. 69: CAN IHS Bus & TIPM CAN C Bus Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts. Engine run time greater than three seconds.

SET CONDITION:

The Transmission Control Module (TCM) loses communication over the CAN C Bus circuit. The circuit is continuously monitored. One Trip fault.

POSSIBLE CAUSES

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION TOTALLY INTEGRATED POWER MODULE (TIPM) TRANSMISSION CONTROL MODULE (TCM)

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view TCM DTCs.

    Is the DTC Active at this time?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

STANDARD PROCEDURE

545RFE TRANSMISSION VERIFICATION TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1.
    1. Perform the following after completion of a diagnostic repair:
        - **After completion of the Transmission Verification Test, the Powertrain Verification Test must be performed.**
        - With the scan tool check pinion factor (if equipped) for proper tire identification and program or reprogram if necessary.
        - Connect the scan tool to the Data Link Connector (DLC).
        - Reconnect any disconnected components.
        - If the PCM has been replaced or updated (flashed), or the transmission has been repaired or replaced, using the scan tool, perform a Quick Learn Procedure.
        - With the scan tool, erase all Transmission and Engine DTCs.
        - With the scan tool, perform a BATTERY DISCONNECT, this will clear the Event Data
        - With the scan tool, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT.
        - Check the Transmission fluid level and adjust if necessary. Refer to **STANDARD PROCEDURE** for the Fluid Fill procedure.
        - Road test the vehicle.
        - Perform the following shifts from a standing start with a constant throttle opening of 20 to 25 degrees to the speeds of 97 Km/h (60 mph); make fifteen to twenty 1 to 2, 2 to 3, 3 to 4, 4 to 5 upshifts.
        - Perform the following shifts with speeds below 40 Km/h (25 mph); make five to eight wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown.
        - Check for DTCs during and after the road test.
        - If after performing the road test, if any shift concerns are noted, perform the drive learn procedure for those affected shifts.
        - **Use the EATX OBDII task manager to run Good Trip time in each gear, this will confirm the repair and to make sure that the DTC does not re-mature.**

    Were there any Diagnostic Trouble Codes (DTCs) set during the road test?

Yes

- Refer to **DIAGNOSTIC CODE INDEX** or **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Repair is complete.

545RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1.
    1. Perform the following before attempting any diagnostic procedures:
        - With the scan tool check pinion factor (if equipped) for proper tire identification and program or reprogram if necessary.
        - Check the transmission fluid level. If the fluid level is low, locate and repair any leaks and fill the transmission to the proper level. Refer to **STANDARD PROCEDURE** for procedures. Many transmission symptoms can be caused by a low fluid level.
        - Check the battery. To avoid false diagnosis, testing should only be performed with the battery fully charged.
        - With the scan tool, read Engine (PCM) DTCs. If DTCs are present, refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform to the appropriate diagnostic procedure(s) before proceeding.
        - With the scan tool, read Transmission (TCM) DTCs. Record all Stored, Active, and Pending DTC information. Diagnose any Pending DTC as a matured DTC.
        - With the scan tool, read and record the Event Data. Use this data to identify the conditions in which the DTC was set.

NOTE: **DTC Event Data may exist even if no DTCs are stored. DTC Event Data is only erased by a Battery Disconnect, reflash, Quick Learn procedure or an actual disconnection of the battery. Clearing DTCs does NOT erase the DTC Event Data. Some DTCs require two "bad trips" before they are stored (and the MIL illuminates). The transmission may enter "limp-in" mode during the first "bad trip," but if the fault condition is not present after the vehicle is restarted, the pending DTC may be cleared without lighting the MIL. Nevertheless, the DTC Event Data for the pending DTC will remain stored and can still be retrieved with the scan tool. If the customer reports a "limp-in" event but no DTCs are present, check the DTC Event Data.**

-
- Performing a Battery Disconnect will clear all Event Data and reset all learned Transmission values to the default values, which may temporarily result in erratic shift schedules.
- With the scan tool, perform the Shift Lever Position Test. If the test does not pass, refer to **P0706-TRANSMISSION RANGE SENSOR RATIONALITY** .
- For Gear Ratio Error DTCs, use the scan tool to view CVI Monitor data. Read and record the Clutch Volume Index information.
- Use the wiring diagram as a guide. Inspect the wiring and connectors related to this circuit. Repair as necessary.
- Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, after driving under specific conditions and after diagnostic monitors have been run.
- Perform any applicable Technical Service Bulletins (TSBs) for controller software update information. Some conditions can be corrected by upgrading the Engine (PCM) or Transmission (TCM) controller software.
- Refer to any Service Information Tune Ups or Technical Service Bulletins that apply.

Were there any repairs made that fixed the vehicle?

Yes

- Testing complete.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Refer to **DIAGNOSTIC CODE INDEX** or **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
P0218	HIGH TEMPERATURE OPERATION ACTIVATED
P0562	BATTERY VOLTAGE LOW

U1449	IMPLAUSIBLE ERS MESSAGE RECEIVED

DIAGNOSIS AND TESTING

P0218-HIGH TEMPERATURE OPERATION ACTIVATED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The DTC is intended as an informational DTC to aid the technician in determining the root cause of a customer driveability issue. The DTC is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler is needed to support the customers driving behavior.

WHEN MONITORED:

Whenever the engine is running.

SET CONDITION:

Immediately after a Overheat shift schedule is activated when the Transmission temperature exceeds 116° C or 240° F.

POSSIBLE CAUSES

Possible Causes
HIGH TEMPERATURE OPERATION ACTIVATED
TORQUE CONVERTER CLUTCH SLIPPING / NOT ACTIVATING
OPERATING VEHICLE WITH TRANSMISSION IN LIMP-IN MODE FOR AN EXTENDED PERIOD OF TIME
EXCESSIVE TIME IDLING IN GEAR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **HIGH TEMPERATURE OPERATION**
    1. This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints.
    2. This DTC indicates that the transmission has been operating in the "Overheat" shift schedule which may generate a customer complaint.
    3. The customer driving patterns may indicate the need for an additional transmission oil cooler.
    4. Verify proper Engine cooling system operation which would affect proper transmission operation.
    5. Verify proper torque converter clutch operation.
    6. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Repair

    - Repair the cause of transmission overheating. Refer to the Service Information for the proper repair procedure. Make sure to check for any Service Bulletins pertaining to this problem. Refer to **COOLING SYSTEM - DIAGNOSIS AND TESTING** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0562-BATTERY VOLTAGE LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Friction element distress could result from an insufficient supply voltage to properly control the solenoids. To prevent this possibility, the battery voltage is monitored and the system is placed in logical limp-in if the battery

voltage drops below the limit.

WHEN MONITORED:

With the engine running and the PCM commanded the Transmission Control Relay closed.

SET CONDITION:

If battery voltage on the Transmission Control Relay Output Sense circuit(s) to the Powertrain Control Module (PCM) is less than 10.0 volts for 15 seconds. Note: P0562 generally indicates a gradually falling battery voltage or a resistive connection(s) to the PCM. The DTC will set if the battery voltage sensed at the PCM is less than 6.5 volts for 200ms or where Transmission Control Relay Output circuits are less than 7.2 volts for 200ms.

POSSIBLE CAUSES

Possible Causes
RELATED CHARGING SYSTEM DTCS
(Z908) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **RELATED CHARGING SYSTEM DTCS**
    1. With the scan tool, read PCM DTCs.

       Are any related Charging System DTCs present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate charging related DTC diagnostic procedure.
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Go To 2.
2. **CHECK FOR TIPM DTCS**

   NOTE: Generator, battery and charging system must be fully functional before performing this test.

1. With the scan tool, read TIPM DTCs.

   Are any TIPM TCM Power Control Circuit DTCs present?

   Yes

   - Refer to **TIPM - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Go To 3.

3. **P0562 ACTIVE**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter set at 0 for this DTC?

      Yes

      - Go To 4.

      No

      - Go To 7.

4. **CHECK THE GROUND CIRCUITS**

Fig. 1: Checking Ground Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

3. Using a 12-volt test light connected to 12-volts, check the PCM Ground circuits at the appropriate terminals of the (special tool #8815A, Kit, NGC, 38 Position).

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly for the PCM Ground circuits?

Yes

- Go To 5.

No

- Repair the Ground circuit(s) for an open or high resistance.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT**

Fig. 2: Checking Transmission Control Output Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.

NOTE: Check connectors - Clean/repair as necessary.

2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Ignition on, engine not running.
4. Using a scan tool under TIPM, actuate the transmission control circuit.

5. Using a 12-volt test light connected to ground, check all the (T16) Transmission Control Output circuits at the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminals of the (special tool #8815A, Kit, NGC, 38 Position).

NOTE: The (T16) Transmission Control Output circuit branches off to both the Transmission Solenoid/TRS Assembly and PCM.

Does the test light illuminate brightly during the actuation for all (T16) Transmission Control Output circuits?

Yes

- Go To 6.

No

- Repair the excessive resistance in the (T16) Transmission Control Output circuit.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

6. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN**

PCM PINOUT

BOX 8815

MODULE-
TOTALLY
INTEGRATED
POWER C2

ASSEMBLY-

Fig. 3: Checking Transmission Control Output Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TIPM C2 harness connector.
3. Measure the resistance of the (T16) Transmission Control Output circuits from the TIPM C2 harness connector to the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminals of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms on any circuit?

   Yes

   - Repair the excessive resistance in the (T16) Transmission Control Output circuit.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **3.7L, 4.7L & 5.7L - MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Where there any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Test Complete.

P0602-CONTROL MODULE PROGRAMMING ERROR/NOT PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The controller is programmed during manufacturing with generic software to facilitate testing. However, generic software does not have the proper calibrations to control a transmission in a vehicle. Generic software checked at power-up. If generic software is found the Malfunction Indicator Lamp (MIL) will light immediately and the MIL will stay on if the fault is cleared until the proper software is installed. Note: Transmission will be placed in limp-in mode.

WHEN MONITORED:

Generic software is checked at power-up

SET CONDITION:

If generic software is found the MIL will light immediately. This DTC is designed to inform the technician that the controller has generic software installed.

POSSIBLE CAUSES

Possible Causes
PCM - PROGRAMMING ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CONTROL MODULE PROGRAMMING ERROR**

   NOTE: Controller is programmed with generic software and will not allow the correct vehicle Powertrain management.

   1. With the scan tool.
   2. Record the vehicles controller part number.
   3. Select Use Controller Part Number under the Flash Tab.
   4. Flash the controller with the correct software.

   Verify the controller flashed successfully.

   Test Complete

   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0604-INTERNAL CONTROL MODULE RAM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the controller is reset (ignition turned to the RUN position), the microprocessor checks the integrity of each Random Access Memory (RAM) location by writing to it and reading back from it. The read value should be same as value written.

WHEN MONITORED:

One time after the controller is reset (ignition turned to the RUN position).

SET CONDITION:

When the Powertrain Control Module (PCM) detects an internal controller problem.

POSSIBLE CAUSES

Possible Causes
POWER OR GROUND CIRCUIT
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK WIRING AND CONNECTORS FOR INTERMITTENT OPERATION**
    1. Using the schematics as a guide, check the PCM terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits.
    2. Wiggle the wires while checking for shorted and open circuits.
    3. Check Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair the power and/or ground circuits to the PCM as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Replace the PCM in accordance with the Service Information. With the scan tool, perform

Quick Learn.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0605-INTERNAL CONTROL MODULE ROM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the controller is reset (ignition turned to the RUN position) the microprocessor checks the integrity of the program memory Read Only Memory (ROM). A checksum is calculated by adding all used bytes in the program memory. The sum should be the same as a known constant stored in the program memory.

WHEN MONITORED:

One time after the controller is reset (ignition turned to the RUN position).

SET CONDITION:

When the Powertrain Control Module (PCM) detects an internal controller problem.

POSSIBLE CAUSES

Possible Causes
POWER OR GROUND CIRCUIT POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK WIRING AND CONNECTORS FOR INTERMITTENT OPERATION**
    1. Using the schematics as a guide, check the PCM terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits.
    2. Wiggle the wires while checking for shorted and open circuits.
    3. Check Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair the power and/or ground circuits as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0613-INTERNAL TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The internal Watchdog (WD) is a separate hardware circuit that continuously monitors the microprocessor. To insure the proper operation of the Transmission controller the watchdog must receive a signal from the microprocessor within a specific time window (14 msec ± 1 msec) to prevent a system shutdown after a short delay (570 msec). The microprocessor periodically tests the watchdogs ability to provide this shutdown function using a three phase test;

1) Send the signal too late > 15 msec

2) Send the signal too early < 13 msec

3) Delay test < 590 msec

If the watchdog input signal arrives too early or too late, the Watchdog Fault line will go low and the watchdog delay will start to time out. The delay will be reset by the correct timing of watchdog signal sent during subsequent operations.

The Delay Test checks the delay time out. The Delay Monitor line is pulled low which forces the delay to start timing out. At the end of the delay time the Transmission Relay will be turned off. The delay test, upon detection of the relay turning off will immediately turn the relay back on before shutdown can occur.

WHEN MONITORED:

1) One time after the controller is reset (ignition turned to the RUN position) and every 60 seconds thereafter. The Delay Test is executed after a reset only.

2) Two seconds after an invalid test.

SET CONDITION:

If either of the following conditions occur three times:

1) The watchdog fault line remains high after the period has elapsed for the too early - too late watchdog test.

2) The Transmission Control Output remains on after the watchdog delay expired.

POSSIBLE CAUSES

Possible Causes
POWER OR GROUND CIRCUIT POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK THE WIRING AND CONNECTORS**
    1. Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits.
    2. Wiggle the wires while checking for shorted and open circuits.
    3. Check Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair the power and/or ground circuits as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0706-TRANSMISSION RANGE SENSOR RATIONALITY

Fig. 4: Transmission Range Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The T41 (C1), T42 (C2), T3 (C3), T1 (C4), T2 (C5) Sense circuits communicate the shift lever position to the Transmission Control System. Each circuit is terminated at the transmission by the Transmission Range Sensor (TRS) switch. Each switch can be open or closed depending on the shift lever position. The Powertrain Control Module (PCM) decodes this information and determines the shift lever position.

Each shift lever position has it own unique combination of closed and open switches, this is called PRNDL code. There are five switches, therefore: there are many possible combinations of open and closed switches (codes). There are 12 valid codes: two for neutral, one for each gear position (5), and five temporary (transition zone) codes. The remainder of the codes should never occur, these are called invalid codes.

WHEN MONITORED:

Continuously with the ignition on.

SET CONDITION:

The DTC will set if the controller detects an invalid PRNDL code which lasts for more than 0.042 of a second.

POSSIBLE CAUSES

Possible Causes
TRS SENSE CIRCUIT OPEN
TRS SENSE CIRCUIT SHORTED TO GROUND
TRS SENSE CIRCUIT SHORTED TO VOLTAGE
METAL DEBRIS IN OIL PAN
TRANSMISSION RANGE SENSOR (TRS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

SHIFT LEVER ERROR CODES

ERROR CODE	SWITCH STUCK	POSITION
1	T41 (C1)	OPEN
2	T41 (C1)	CLOSED
3	T42 (C2)	OPEN
4	T42 (C2)	CLOSED
5	T3 (C3)	OPEN
6	T3 (C3)	CLOSED
7	T1 (C4)	OPEN
8	T1 (C4)	CLOSED
9	T2 (C5)	OPEN

T2 (C5)	CL	CL	OP	OP	OP	OP	OP	OP	OP	CL	CL	CL

Note:
CL indicates that CLOSED should appear on the scan tool
OP indicates that OPEN should appear on the scan tool

DIAGNOSTIC TEST

1. **VERIFY DTC P0706 IS CURRENT**
   1. With the scan tool, perform the Shift Lever Position Test.

      Select the test outcome from the following:

      Test passes:

      - Go To 6.

      Test fails with Error Code:

      - Go To 2.

      Test fails without Error Code:

      - Perform the Gearshift Adjustment Procedure in accordance with the Service Information.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.
2. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install (special tool #8333A, Simulator, Transmission).
4. Ignition ON, Engine Not Running.
5. With the scan tool, perform the Shift Lever Position Test.
6. When the scan tool instructs to put the Gear Selector in a particular position, this must be done using the selector switch on the Transmission Simulator.
7. The LED for the gear position in question must illuminate on the Transmission Simulator prior to pressing "ENTER" on the scan tool.

NOTE: When the scan tool requests the O/D off button be depressed, this must be done using the O/D OFF button in the vehicle or this will fail the Shift Lever Position Test with an error code 11 or OD-TOW/HALL STUCK OPEN.

NOTE: If the Shift Lever Position Test fails, make sure to note the identification of the TRS Sense circuit for future reference.

Did the Shift Lever Position Test pass?

Yes

- Remove the Oil Pan and Main Valve Body Assembly in accordance with the Service Information. Check for metal debris on top of the Solenoid/TRS Assembly and the manual valve code plate. If debris is present, determine the cause of the debris and repair the transmission as necessary. If no problems are found, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 3.

3. **TRS SENSE CIRCUIT OPEN**
   1. Turn the ignition off to the lock position.
   2. Disconnect the (special tool #8333A, Simulator, Transmission).
   3. Disconnect the PCM harness connectors and install the (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

   4. Measure the resistance of the identified (T1, T2, T3, T41 or T42) TRS Sense circuit from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of the (special

tool #8815A, Kit, NGC, 38 Position).

Is the resistance above 5.0 ohms?

Yes

- Repair the identified (T41, T42, T3, T1 or T2 (C1-C5) TRS Sense circuit for an open.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 4.

4. **TRS SENSE CIRCUIT SHORT TO GROUND**
   1. Measure the resistance between ground and the identified (T41, T42, T3, T1 or T2 (C1-C5) TRS Sense circuit.

      Is the resistance below 5.0 ohms?

      Yes

      - Repair the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Sense circuit for a short to ground.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Go To 5.

5. **TRS SENSE CIRCUIT SHORT TO OTHER CIRCUITS**
   1. Measure the resistance between the identified (T1, T2, T3, T41, or T42) TRS Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

      Is the resistance below 100k ohms between the identified (T41, T42, T3, T1 or T2 (C1-C5) TRS Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

      Yes

      - Repair the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Sense circuit for a short to other circuit(s).
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wiring and connectors while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Test Complete.

P0711-TRANSMISSION TEMPERATURE SENSOR PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature or otherwise known as a thermistor. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up and/or when certain OBDII system self-diagnostic tests are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC will set when the desired transmission temperature does not reach a normal operating temperature within a given time. Time is variable due to ambient temperature. Approximate times are starting temperature to warm up: (-40°C [-40°F] - 35 min) (-28°C [-20°F] - 25 min) (-6.6°C [20°F] - 20 min) (15.5°C [60°F] - 10 min).

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
TRANSMISSION TEMPERATURE SENSOR (TRS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, check Transmission DTCs.

       Are any other related Transmission Temperature Sensor DTCs present?

       Yes

       - Refer to DTC Based Diagnostics and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 3.

       No

       - Go To 4.
3. **TRANSMISSION TEMPERATURE SENSOR**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

       CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

       WARNING: The Ignition Switch Feed fuse must be removed from the TIPM.

Failure to do so can result in possible serious or fatal injury.

3. Install the (special tool #8333A, Simulator, Transmission).
4. Ignition ON, Engine Not Running.
5. With the Transmission Simulator, turn the Input/Output switch to OFF.
6. With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
7. Compare the scan tool readings to the voltage readings listed on the Transmission Simulator.

   Do the readings on the scan tool match the Transmission Simulator readings ± 0.2 volts?

   Yes

   - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Test Complete.

P0712-TRANSMISSION TEMPERATURE SENSOR LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature or otherwise known as a thermistor. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up and/or when certain OBDII system self-diagnostic tests are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set when the monitored Temperature Sensor voltage drops below 0.078 volts for 0.45 of a second.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
TRANSMISSION TEMPERATURE SENSOR (TRS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are any line pressure sensor or throttle position sensor DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go To 3.

No

- Go To 5.

3. **TRANSMISSION TEMPERATURE SENSOR**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the (special tool #8333A, Simulator, Transmission).
   4. Ignition ON, Engine Not Running.
   5. With the Transmission Simulator, turn the Input/Output switch to OFF.
   6. With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
   7. Compare the scan tool readings with the numbers listed on the Transmission Simulator.

      Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 volts?

      Yes

      - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Go To 4.

4. **(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 5: Checking Transmission Temperature Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance between ground and the (T54) Transmission Temperature Sensor Signal circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Test Complete.

P0713-TRANSMISSION TEMPERATURE SENSOR HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature or otherwise known as a thermistor. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up and/or when certain OBDII system self-diagnostic tests are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set when the monitored Temperature Sensor voltage rises above 4.94 volts for 0.45 of a second.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO OTHER CIRCUITS
TRANSMISSION TEMPERATURE SENSOR (TRS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are any line pressure sensor or throttle position sensor DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go To 3.

No

- Go To 5.

3. **TRANSMISSION TEMPERATURE SENSOR**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the (special tool #8333A, Simulator, Transmission).
   4. Ignition ON, Engine Not Running.
   5. With the Transmission Simulator, turn the Input/Output switch to OFF.
   6. With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
   7. Compare the scan tool readings with the numbers listed on the Transmission Simulator.

      Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 volts?

      Yes

      - Replace Transmission Solenoid/TRS assembly in accordance with the Service Information.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Go To 4.

4. **(T54) TRANSMISSION SENSOR SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUIT**

Fig. 6: Checking Transmission Sensor Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM harness connectors.
4. Measure the resistance between the (T54) Transmission Temperature Sensor Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms between the (T54) Transmission Temperature Sensor Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the Transmission Temperature Sensor Signal circuit for a short to another circuit(s).
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Test Complete.

P0714-TRANSMISSION TEMPERATURE SENSOR INTERMITTENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature or otherwise known as a thermistor. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up and/or when certain OBDII system self-diagnostic tests are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set when the monitored Temperature Sensor voltage fluctuates or changes abruptly within a predetermined period of time.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
TRANSMISSION TEMPERATURE SENSOR (TRS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are any line pressure sensor or throttle position sensor DTCs present?

       Yes

       Perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 3.

       No

       - Go To 4.
3. **TRANSMISSION TEMPERATURE SENSOR**
    1. Turn the ignition OFF to the LOCK position.

2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the (special tool #8333A, Simulator, Transmission).
4. Ignition ON, Engine Not Running.
5. With the Transmission Simulator, turn the Input/Output switch to OFF.
6. With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
7. Compare the scan tool readings with the numbers listed on the Transmission Simulator.

   Do the readings on the Transmission Simulator match a non-fluctuating scan tool reading ± 0.2 volts?

   Yes

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

   Were any problems found?

   Yes

- Repair as necessary.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Test Complete.

P0716-INPUT SPEED SENSOR 1 CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio the corresponding in-gear DTCs P0731-36 and P1736 is set.

2) An excessive change in input or output speeds indicating an intermittent signal which results in DTCs P0716 and/or P0721 setting.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear the result is an apparent speed ratio of 1:2 and may cause DTC P1794 to set when at a stop.

WHEN MONITORED:

The transmission gear ratio is monitored continuously while the transmission is in gear.

SET CONDITION:

If there is an excessive change in input RPM in any gear. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
INPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK TO SEE IF DTC P0716 IS CURRENT**
   1. Start the engine in park.
   2. With the scan tool, monitor the Input Speed Sensor RPM.

      Is the Input Speed Sensor RPM below 400 RPM?

      Yes

      - Go To 2.

      No

      - Go To 9.
2. **INPUT SPEED SENSOR**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the (special tool #8333A, Simulator, Transmission).
   4. Ignition ON, Engine Not Running.
   5. With the Transmission Simulator, set the selector switch to 3000/1000 and the Input/Output switch to ON.
   6. With the scan tool, monitor the Input and Output Speed Sensor RPM.

      Does the Input speed read 3, 000 RPM and the Output speed read 1, 000 RPM ± 50 RPM?

      Yes

      - Replace the Input Speed Sensor in accordance with the Service Information.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 3.

3. **(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 7: Checking Input Speed Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

NOTE: **Make sure to leave the Speed Sensor, Transmission Solenoid/TRS Assembly, and Line Pressure Sensor harness connectors disconnected.**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

3. Ignition ON, Engine Not Running.
4. With the scan tool in TIPM, actuate the TCM output.
5. Measure the voltage of the (T52) Input Speed Sensor Signal circuit.

   Is the voltage above 0.5 volts?

   Yes

   - Repair the (T52) Input Speed Sensor Signal circuit for a short to voltage.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 4.

4. **(T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE**

Fig. 8: Checking Speed Sensor Ground Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool in TIPM, actuate the TCM output.
2. Measure the voltage of the (T13) Speed Sensor Ground circuit.

   Is the voltage above 0.5 volts?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

- Go To 5.

5. **(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN**

Fig. 9: Checking Input Speed Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool in TIPM, stop the actuation the TCM output.
2. Turn the ignition OFF to the LOCK position.
3. Measure the resistance of the (T52) Input Speed Sensor Signal circuit between the Input Speed Sensor harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

Yes

- Repair the (T52) Input Speed Sensor Signal circuit for an open.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 6.

6. **(T13) SPEED SENSOR GROUND CIRCUIT OPEN**

Fig. 10: Checking Speed Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T13) Speed Sensor Ground circuit between the Input Speed Sensor harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

- Repair the (T13) Speed Sensor Ground circuit for an open.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 7.

7. **(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND**

Fig. 11: Checking Input Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the Input Speed Sensor Signal circuit.

   Is the resistance below 5.0 ohms?

Yes

- Repair the (T52) Input Speed Sensor Signal circuit for a short to ground.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 8.

8. **(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND**

Fig. 12: Checking Speed Sensor Ground Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Test Complete.

P0721-OUTPUT SPEED SENSOR CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM.

These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1)When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear DTCs P0731-36, P1736 and P1776 is set.

2)An excessive change in input or output speeds indicating an intermittent signal results in DTCs P0716 and/or P0721 setting.

3)If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor has 60 teeth and the output speed sensor has 30 teeth, this results in a an apparent speed ratio of 1:2 and may cause DTC P1794 to set.

WHEN MONITORED:

The transmission gear ratio is monitored continuously while the transmission is in gear.

SET CONDITION:

If there is an excessive change in output RPM in any gear. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
OUTPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK TO SEE IF DTC P0721 IS CURRENT**
    1. Turn the ignition OFF to the LOCK position.

CAUTION: Properly support the vehicle and raise all drive wheels off the ground.

2. Release the parking brake.
3. Start the engine in park.
4. Place the transmission gear selector in drive and release foot from brake.

WARNING: Be sure to keep hands and feet clear of rotating wheels.

5. With the scan tool, monitor the Output Speed Sensor RPM.

   Is the Output Speed Sensor RPM below 100 RPM?

   Yes

   - Go To 2.

   No

   - Go To 9.

2. **OUTPUT SPEED SENSOR**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the (special tool #8333A, Simulator, Transmission).
   4. Ignition ON, Engine Not Running.
   5. With the Transmission Simulator, set the selector switch to 3000/1000 and the Input/Output switch to ON.
   6. With the scan tool, monitor the Input and Output Speed Sensor RPM

      Does the Input Speed read 3, 000 RPM and the Output Speed read 1, 000 RPM, ± 50 RPM?

      Yes

      - Replace the Output Speed Sensor in accordance with the Service Information.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 13: Checking Output Speed Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM harness connectors and connect the (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T14) Output Speed Sensor Signal circuit from the Output Speed Sensor harness connector to the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T14) Output Speed Sensor Signal circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 14: Checking Output Speed Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T13) Speed Sensor Ground circuit from the Output Speed Sensor harness connector to the appropriate terminal in the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

- Repair the (T13) Speed Sensor Ground circuit for an open.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 15: Checking Output Speed Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T14) Output Speed Sensor Signal circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (T14) Output Speed Sensor Signal circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 6.

6. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND**

Fig. 16: Checking Speed Sensor Ground Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 7.

7. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE**

Fig. 17: Checking Output Speed Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition ON, Engine Not Running.
2. With the scan tool in TIPM, actuate the TCM output.
3. Measure the voltage of the (T14) Output Speed Sensor Signal circuit.

   Is the voltage above 0.5 volts?

   Yes

- Repair the (T14) Output Speed Sensor Signal circuit for a short to voltage.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 8.

8. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 18: Checking Output Speed Sensor Ground Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool in TIPM, actuate the TCM output.

2. Measure the voltage of the (T13) Speed Sensor Ground circuit.

   Is the voltage above 0.5 volts?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Test Complete.

P0729-GEAR RATIO ERROR IN 6TH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore the integrity of this data is verified through the following checks:

NOTE: **Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.**

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear DTCs P0729 and P0731-36 is set.

2) An excessive change in input or output speeds indicating an intermittent signal which results in DTCs P0716 and/or P0721 setting.

3) If the common speed sensor ground circuit is lost, both sensor inputs reads the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input RPM to the Output RPM does not match the current gear ratio then DTC P0729 will set. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
LOW FLUID LEVEL
INPUT OR OUTPUT SPEED SENSOR(S) OR WIRING
VALVE BODY ACCUMULATOR COVER FAILED
CUT OD OR 2C ACCUMULATOR SEAL
CRACKED OD OR 2C ACCUMULATOR PISTON
BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY
CUT 2C TOWER SEAL
TRANSMISSION SOLENOID/TRS ASSEMBLY
CUT OR MISSING NO. 5, NO. 6, OR NO. 7 CHECK BALL
WORN SOLENOID SWITCH VALVE OR PLUGS
CUT OD OR 2C PISTON SEAL
STUCK MAIN REGULATOR VALVE
BURNED OD OR 2C CLUTCH
BROKEN OR MISSING 2C BLEED ORIFICE IN 2C/4C RETAINER
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE
LOOSE / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT

CRACKED / LOOSE / MISSING OD/REVERSE PISTON BLEED ORIFICE
FAILED OD SHAFT
FAILED REVERSE ANNULUS GEAR SPLINE
FAILED REVERSE CARRIER HUB SPLINE
FAILED REVERSE SUN GEAR SPLINE TO REACTION CARRIER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
   1. With the scan tool, check for other transmission DTCs
   2. If any related DTCs are present, perform their respective tests first.

      Are any Transmission solenoid, line pressure, speed sensor and/or loss of prime DTCs present?

      Yes

      - If any related DTCs are present they may cause a Speed Ratio Error. Perform test for **P0944-LOSS OF HYDRAULIC PUMP PRIME** first if it is present. Refer to **DIAGNOSIS AND TESTING**.

      No

      - Go To 2.
2. **CHECK THE EVENT DATA**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for DTC P0729?

      Yes

      - Go To 4.

      No

      - Go To 3.
3. **CHECK THE TARGET GEAR**

   In the Event Data recorded earlier, does the Event Data show the DTC P1790 with Target gear = 6th or with both the 2C and OD clutches applying?

Yes

- Go To 4.

No

- Go To 6.

4. **CHECK INPUT RPM**

   In the Event Data recorded earlier, does the Input RPM read zero?

   Yes

   - Perform the diagnostic procedure for P0716-Input Speed Sensor Circuit Performance. Diagnose the DTC as if it is set and current. Refer to **DIAGNOSIS AND TESTING**.

   No

   - Go To 5.

5. **CHECK LINE PRESSURE READING**

   In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure reading?

   Yes

   - Remove the Transmission Oil pan and check the Transmission Oil filter for improper installation or plugged. If the Primary oil filter is OK, check the main regulator valve in pump. If excessive debris is in the oil pan, check clutches and repair as necessary. Refer to the Service Information for proper repair procedures.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 6.

6. **CHECK TRANSMISSION FOR SLIPPAGE**
   1. Erase DTCs and road test the vehicle.
   2. Check the transmission operation in reverse and all forward gears.

      During the road test, was there any obvious slippage noted in any gear or did the transmission fail to make a 1-2 upshift?

      Yes

      - Go To 8.

No

- Go To 7.

7. **CHECK IF THE DTC RESETS**
   1. With the scan tool, check for Transmission DTCs after the road test.

      Did DTC P0729 reset?

      Yes

      - Go To 8.

      No

      - Test Complete.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

8. **CHECK INTERNAL TRANSMISSION**
   1. Remove the Transmission Oil Pan and Valve Body in accordance with the Service Information, and check for the following:
      - Excessive clutch and or metal debris in the oil pan.
      - If the accumulator cover is intact and the 2C tower seal is not cut or split.
      - OD and 2C accumulator pistons for cracks or cut seals.
      - Solenoid Switch Valve and its plugs for stickiness or wear.
      - Cut or missing No. 5, No. 6 or No. 7 check ball.
      - OD bleed orifice (on top of the main valve body) is intact.
      - Air check the OD and 2C hydraulic clutch circuits for excessive leakage. Refer to the Service information.

      NOTE: Both OD and 2C hydraulic clutch circuits contain a small bleed orifice. A small amount of air leakage is considered normal. The OD hydraulic clutch circuit bleed orifice connects to the Reverse input clutch hydraulic cavity. A small amount of air leakage into the Reverse hydraulic clutch circuit is considered normal.

      Were there any problems found?

      Yes

      - Repair as necessary. Refer to the Service Information for proper repair procedures.

        NOTE: If the OD or 2C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission

Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 9.

9. **CHECK ROAD TEST RESULTS**

During the road test, was Reverse, 1st, 2nd and 3rd gears OK but the transmission slipped in 4th, 5th and 6th gears?

Yes

- Go To 10.

No

- Go To 11.

10. **CHECK THE OD SHAFT AND REVERSE CARRIER SPLINE**
    1. Remove the Transmission in accordance with the Service Information and inspect the OD shaft and its spline to the reverse carrier hub.

    Were any problems found?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs and bleed orifice (in the OD/Reverse clutch piston) and repair as necessary in accordance with the Service Information.

    NOTE: **If the OD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, etc.), replace the Transmission Solenoid/TRS Assembly in addition to any other necessary repairs.**

    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

11. **CHECK FOR FAILED REVERSE GEARSET SPLINES**

Working through the windows in the bottom of the case, check for a failed Reverse Sun or Annulus gear spline as follows:

1. Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
2. Apply the 4C clutch using 30-40 psi shop air at the apply port in the center bulkhead.
3. Attempt to rotate the input annulus gear and drive shell (the drum that encloses the two rearmost gearsets).

NOTE: Due to the overrunning clutch the gear and drive shell normally rotates in one direction only.

Can the drive shell be rotated?

Yes

- Repair internal transmission as necessary in accordance with the Service Information. Check the reverse annulus gear spline to the input carrier and the reverse sun gear spline to the reaction carrier hub.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information. Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

NOTE: If continued slippage is noted in 2nd and/or 6th gear during the verification test, remove the transmission and inspect the 2C clutch and repair as necessary in accordance with the Service Information.

P0731-GEAR RATIO ERROR IN 1ST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first

achieving the correct ratio. Therefore a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio the corresponding in-gear DTCs P0729 and P0731-36 is set.

2) An excessive change in input or output speeds indicating an intermittent signal which results in DTCs P0716 and/or P0721 setting.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input RPM to the Output RPM does not match the current gear ratio then DTC P0731 will set. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
CUT UD PISTON SEAL
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
STUCK OR STICKING MAIN REGULATOR VALVE
FAILED OVERRUNNING CLUTCH
BURNED UD CLUTCH
CUT UD ACCUMULATOR SEAL RING
CRACKED UD ACCUMULATOR PISTON
BROKEN REACTION SHAFT SUPPORT SEAL RING
LOW LINE PRESSURE
BROKEN / MISSING MAIN VALVE BODY BLEED ORIFICE
BROKEN / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
POOR MACHINING ON PUMP VALVE BODY FACE
FAILED UD SHAFT
BROKEN OUTPUT SHAFT WELD
FAILED INPUT GEARSET
INPUT OR OUTPUT SPEED SENSOR(S) AND RELATED WIRING

TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.
    2. If any of these DTCs are present, perform their respective tests first.

    Are any Transmission solenoid, line pressure, speed sensor and/or loss of prime DTCs present?

    Yes

    - If any of these DTCs are present, they may cause a Speed Ratio Error. Perform test for P0944 first if it is present. Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To 2.
2. **CHECK THE L/R CLUTCH STATE**
    1. Start the vehicle, with the brakes firmly applied and the vehicle stationary, place the shift lever in Drive. Using the scan tool, check the L/R Clutch State.

    Did the L/R Clutch state read Applied?

    Yes

    - Go To 4.

    No

    - Go To 3.
3. **CHECK THE POWERTRAIN CONTROL MODULE**
    1. Turn the ignition off to the lock position for at least 30 seconds.
    2. Start the vehicle, with the brakes firmly applied and the vehicle stationary, place the shift lever in Drive. Using the scan tool, check the L/R Clutch State.

    Did the L/R Clutch state read Applied?

    Yes

- Go To 4.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

4. **CHECK FOR SLIPPAGE IN 1ST GEAR**
   1. With the scan tool, perform the 1st Gear Clutch Test. Follow the instructions on the scan tool.
   2. Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?

Yes

- Go To 6.

No

- Go To 5.

5. **CHECK THE OVERRUNNING CLUTCH**
   1. With the scan tool, monitor the L/R Clutch state while launching the vehicle from a stop in 1st gear.

   Does the transmission slip (neutral out) when the L/R Clutch state changes to Not Applied?

Yes

- Remove transmission and inspect for failed overrunning clutch (rotates in both directions). Refer to the Service Information for proper repair procedures.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 7.

6. **CHECK FOR INTERMITTENT OPERATION**
   1. The conditions to set this DTC are not currently present.
   2. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

- If the Event Data shows DTC P0731 was set in Park, Reverse or Neutral, replace the Powertrain Control Module.
- If the Event Data shows DTC P0731 set with input RPM = zero, check the input speed sensor and related wiring.
- If the Event Data shows DTC P0731 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e. oil level, mis-installed or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
- If the Event Data shows DTC P0731 set with the UD pressure switch open (but line pressure matches Desired Line Pressure), air check the UD hydraulic clutch circuit for leakage in accordance with the Service Information. If the UD hydraulic clutch circuit is OK, replace the solenoid/TRS assembly.

3. Check the gearshift linkage adjustment.
4. Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
5. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

6. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
7. Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.
8. Gear ratio DTCs can also be set under extreme temperature conditions.
9. Verify if the problem is only experienced under extreme hot or cold conditions.

Were any problems found.

Yes

- Repair as necessary.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Test complete.

7. **CHECK INTERNAL TRANSMISSION**
   1. Repair internal transmission as necessary. Refer to the Service Information.
   2. If there were any line pressure DTCs present along with this DTC, make sure to inspect the:

Primary oil filter and seal, Transmission Oil Pump and the Main regulator valve in accordance with the Service Information.

3. If DTCs P0876 and/or P0875 were present in addition to P0731, replace the Transmission Solenoid/TRS Assembly in addition to necessary internal repairs.
4. Pay particular attention to the following list of possible causes when repairing the transmission:
   - Cut UD piston seal
   - Failed overrunning clutch
   - Burned UD clutch
   - Cut UD accumulator seal ring
   - Broken UD accumulator piston
   - Low line pressure
   - Broken/missing main valve body bleed orifice
   - Broken/missing dribbler orifice assembly in reaction shaft support
   - Poor machining on pump valve body face
   - Transmission Solenoid/TRS Assembly

Repair

NOTE: **If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, low line pressure in Event Data or other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Repair internal transmission in accordance with the Service Information.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0732-GEAR RATIO ERROR IN 2ND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore the integrity of this data is verified through the following checks:

NOTE: **Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.**

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear DTCs P0729 and P0731-36 is set.

2) An excessive change in input or output speeds indicating an intermittent signal which results in DTCs P0716 and/or P0721 setting.

3) If the common speed sensor ground circuit is lost, both sensor inputs read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, with the transmission in gear.

SET CONDITION:

If the ratio of the Input RPM to the Output RPM does not match the current gear ratio then DTC P0732 will set. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
INPUT OR OUTPUT SPEED SENSOR(S) OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR 2C CLUTCH
CUT 2C OR UD PISTON SEAL
BROKEN 2C PISTON CASTING
BROKEN OR MISSING 2C BLEED ORIFICE
BROKEN OR MISSING UD BLEED ORIFICE
CUT 2C OR UD ACCUMULATOR PISTON SEAL
CRACKED 2C OR UD ACCUMULATOR PISTON
CUT OR MISSING NO. 5 OR NO. 7 CHECK BALL
TRANSMISSION SOLENOID/TRS ASSEMBLY
BROKEN INPUT ANNULUS TO DRIVE SHELL WELD
FAILED SPLINE - REVERSE ANNULUS GEAR TO INPUT CARRIER
FAILED SPLINE - REACTION CARRIER TO REVERSE SUN GEAR
MISSING TEETH ON INPUT CLUTCH HUB TONE WHEEL

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to <u>66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE</u>.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for other transmission DTCs.

       Are any Transmission solenoid, line pressure, speed sensor and/or loss of prime DTCs present?

       Yes

       - Perform the test for P0944-LOSS OF PRIME first if it is present. Refer to **P0944-LOSS OF HYDRAULIC PUMP PRIME**.

       No

       - Go To 2.
2. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read and record the Event Data.

       NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

       Does the Event Data display information for DTC P0732?

       Yes

       - Go To 4.

       No

       - Go To 3.
3. **CHECK THE EVENT DATA**
    1. In the Event Data, identify the DTC that was recorded earlier.

       In the Event Data recorded earlier, does the Event Data display information for DTC P1790 with target gear = 2nd or with both 2C and UD clutches applying?

       Yes

       - Go To 4.

       No

       - Go To 7.
4. **CHECK RPM IN EVENT DATA**

In the Event Data recorded earlier, does the Input RPM read zero?

Yes

- Check the input speed sensor and wiring. Perform the test for P0716 and diagnose as if the DTC is current. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To 5.

5. **CHECK LINE PRESSURE READING**

In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure?

Yes

- Go To 6.

No

- Go To 7.

6. **CHECK TRANSMISSION OIL FILTER**
   1. Turn the ignition off to the lock position.
   2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
   3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

NOTE: **Make sure the Primary Transmission Oil Filter and seal are properly installed and are not cracked or split.**

Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked, plugged or mis-installed?

Yes

- Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If excessive clutch debris is present, check the clutches for damage. Refer to the Service Information for the proper hydraulic clutch repair procedure.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Remove the Transmission Oil Pump in accordance with the Service Information. Check the

main Regulator Valve for sticking in its bore, scoring and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

7. **CHECK IF THE DTC P0732 IS CURRENT**
   1. With the scan tool, perform the 2nd Gear Clutch Test. Follow the scan tool instructions.
   2. Increase the throttle angle, TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: If the 2C clutch is faulty the overrunning clutch will hold and the slip test will pass. The 2nd gear clutch test will not detect a faulty 2C clutch. However, it will detect a faulty UD clutch.

Did the clutch test pass, did the Input Speed remain at zero?

Yes

- Go To 8.

No

- Go To 10.

8. **CHECK FOR INTERMITTENT OPERATION**
   1. Check the Shifter adjustment in accordance with the Service Information.
   2. Intermittent gear ratio DTCs can set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
   3. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   4. Check the Speed Sensor wiring and connectors for good connection then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

Were any problems found?

Yes

- Repair as necessary.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 9.

9. **CHECK FOR SLIPPAGE**
   1. With the scan tool, erase Transmission DTCs.
   2. Road test the vehicle.

   Does the Transmission fail to make a 1-2 upshift (stays in 1st gear and then shifts to direct gear) or is there obvious slippage noticed in 2nd gear?

   Yes

   - Go To 12.

   No

   - Go To 16.

10. **CHECK THE UD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove Transmission Oil Pan and check for excessive debris.
    2. Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) in accordance with the Service Information.

    NOTE: The UD clutch passage contains a small bleed orifice and a small amount of air leakage is normal.

    Were any problems found, excessive debris and/or excessive air leakage in the UD clutch hydraulic circuit?

    Yes

    - Repair as necessary. Check the UD clutch piston seals, reaction shaft support seal rings and the dribbler assembly and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

      NOTE: If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, low line pressure in Event Data or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE**

TRANSMISSION VERIFICATION TEST.

No

- Go To 11.

11. **CHECK THE UD ACCUMULATOR PISTON**
    1. Check the UD bleed orifice, accumulator piston and accumulator piston seal in the main valve body.

    Were any problems found?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Remove the Transmission Oil Pan and check for excessive debris.
    2. If grey sludge is present, check for a improperly assembled 2C clutch with the thick reaction plate not against the case.
    3. Remove the valve body and air check the 2C hydraulic clutch circuit (in the 2C/4C clutch retainer) in accordance with the Service Information.

    NOTE: The 2C clutch passage contains a small bleed orifice and a small amount of air leakage is normal.

    Were any problems found, excessive debris, improperly assembled 2C clutch and/or excessive air leakage in the 2C hydraulic clutch circuit?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the 2C piston seals and bleed orifice.

    NOTE: If the 2C clutch has failed but no obvious cause is found (such as a cut piston seal, cut tower seal, stuck regulator valve, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 13.

13. **CHECK THE 2C ACCUMULATOR**
    1. Check the 2C Accumulator piston for cracks or a cut seal.
    2. Check for a cut or missing No. 7 or No. 5 check ball.
    3. Check the Solenoid Switch Valve and Plugs for sticking in its bore or excessive wear.

    Were any problems found

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 14.

14. **CHECK FOR FAILED REVERSE GEARSET SPLINES**

    Working through the windows in the bottom of the case, check for a failed Reverse Sun or Annulus spline as follows:

    1. Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
    2. Apply the 4C clutch using 30-40 psi shop air at the apply port in the center bulkhead.
    3. Attempt to rotate the input annulus gear and drive shell (the drum that encloses the two rearmost gearsets).

    NOTE: Due to the overrunning clutch, the gear and drive shell normally rotates in one direction only.

    Can the drive shell be rotated?

    Yes

    - Repair internal transmission as necessary in accordance with the Service Information. Check the reverse annulus gear spline to the input carrier, and the reverse sun gear spline to the reaction carrier hub.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE**

TRANSMISSION VERIFICATION TEST.

No

- Go To 15.

15. **CHECK THE DRIVE SHELL WELD**
    1. Release the output shaft and the 4C clutch.
    2. Apply the L/R Clutch only using 30-40 psi of shop air.
    3. Attempt to rotate the drive shell as in the previous step.

    Can the drive shell be rotated?

    Yes

    - Repair Transmission as necessary in accordance with the Service Information. Check the drive shell weld to input annulus gear.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

16. **CHECK IF DTC RESETS**

    Did DTC P0732 reset during the road test?

    Yes

    - Go To 17.

    No

    - Go To 18.

17. **LIST OF POSSIBLE CAUSES**
    1. If any other DTCs set during the road test, refer to the appropriate symptom in the appropriate Transmission Electrical Diagnostic Information.
    2. If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those:
        - Check for excessive debris in the Transmission Oil pan, plugged, cracked, or misinstalled Primary Transmission Oil Filter and/or seal.
        - Check for cut and/or missing No. 7 and No. 5 check balls in the main valve body.

- Check the 2C and UD accumulator pistons and seals, UD bleed orifice and the Solenoid Switch Valve and Plugs in the main valve body.
- Check the UD clutch piston seals, reaction shaft support seal rings and dribbler assembly.
- Check the 2C clutch piston seals and bleed orifice.
- Check the main regulator valve for sticking in its bore and the flatness of the pump valve body and pump housing faces.
- Check for a improperly assembled 2C clutch with the thick reaction plate not against the case.

Repair

- Repair as necessary. Refer to the Service Information for proper repair procedures.

NOTE: If the UD or 2C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

18. **INTERMITTENT DTC**
    1. The conditions to set this DTC are not currently present.
    2. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
       - If the Event Data shows DTC P0732 was set in Park, Reverse or Neutral, replace the Powertrain Control Module.
       - If the Event Data shows DTC P0732 set with input RPM = zero, check the input speed sensor and related wiring.
       - If the Event Data shows DTC P0732 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
       - If the Event Data shows DTC P0732 set with the UD or 2C pressure switch open (but line pressure matches Desired Line Pressure), air check the UD and 2C hydraulic clutch circuits for leakage in accordance with the Service Information. If the UD and 2C hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.
    3. Check the gearshift linkage adjustment.
    4. Intermittent Gear Ratio DTCs can set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
    5. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

6. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
7. Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.
8. Gear ratio DTCs can also set under extreme temperature conditions.
9. Verify the problem is only experienced under extreme hot or cold conditions.

Were there any problems found.

Yes

- Repair as necessary.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Test Complete.

P0733-GEAR RATIO ERROR IN 3RD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) When in gear, if the gear ratio does not compare to a known gear ratio the corresponding in-gear DTCs P0729 and P0731-36 is set.

2) An excessive change in input or output speeds indicating an intermittent signal which results in DTCs P0716 and/or P0721 setting.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause DTC

P1794 to set when at a stop.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input RPM to the Output RPM does not match the current gear ratio then DTC P0733 will set. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
INPUT OR OUTPUT SPEED SENSOR(S) OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR 4C CLUTCH
CUT 4C OR UD PISTON SEAL
BROKEN 4C PISTON CASTING
BROKEN OR MISSING 4C BLEED ORIFICE
BROKEN OR MISSING UD BLEED ORIFICE
CUT 4C OR UD ACCUMULATOR PISTON SEAL
CRACKED 4C OR UD ACCUMULATOR PISTON
TRANSMISSION SOLENOID/TRS ASSEMBLY
BROKEN REACTION SUN GEAR WELD
BROKEN REACTION ANNULUS GEAR WELD
FAILED REVERSE SUN GEAR SPLINE
FAILED REVERSE ANNULUS GEAR SPLINE
MISSING TEETH ON INPUT CLUTCH HUB TONE WHEEL

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINING IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, check for other transmission DTCs.

       Are any Transmission solenoid, line pressure, speed sensor or loss of prime DTCs present?

Yes

- Perform the test for P0944-LOSS OF PRIME first if it is present. Refer to **P0944-LOSS OF HYDRAULIC PUMP PRIME**.

No

- Go To 2.

2. **CHECK EVENT DATA**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for DTC P0733?

      Yes

      - Go To 3.

      No

      - Go To 6.

3. **CHECK RPM IN THE EVENT DATA**

   In the Event Data recorded earlier, does the Input RPM read zero?

   Yes

   - Check the input speed sensor and wiring. Perform the test for P0716 and diagnose as if that DTC is current. Refer to **DIAGNOSIS AND TESTING**.

   No

   - Go To 4.

4. **CHECK LINE PRESSURE READING**

   In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure?

   Yes

   - Go To 5.

   No

- Go To 6.

5. **PLUGGED TRANSMISSION OIL FILTER**
    1. Turn the ignition off to the lock position.
    2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
    3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

    NOTE: Make sure the Primary Transmission Oil Filter and/or seal is not cracked or split.

    Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked or plugged?

    Yes

    - Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If the Primary Transmission Oil Filter is plugged, refer to the Service Information for the proper hydraulic clutch repair procedure.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Remove the Transmission Oil Pump in accordance with the Service Information. Check the main Regulator Valve for sticking in its bore, scoring and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

6. **CHECK TO SEE IF DTC P0733 IS CURRENT**
    1. With the scan tool, perform the 3rd Gear Clutch Test. Follow the scan tool instructions.
    2. Increase the throttle angle, TPS Degree to 30° for no more than a few seconds.

    CAUTION: Do not overheat the transmission.

    NOTE: If the 4C clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 3rd Gear Clutch Test will not detect a faulty 4C clutch. However, it will detect a faulty UD clutch.

    Did the clutch test pass, did the Input Speed remain at zero?

    Yes

    - Go To 7.

No

- Go To 9.

7. **CHECK FOR INTERMITTENT OPERATION**
   1. Check the Shifter adjustment in accordance with the Service Information.
   2. Intermittent gear ratio DTCs can set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
   3. Check the Speed Sensor wiring and connectors for good connection then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 8.

8. **CHECK FOR SLIPPAGE**
   1. With the scan tool, erase Transmission DTCs.
   2. Road test the vehicle.
   3. Check the Transmission is Reverse and all forward gears.

   Is there an obvious slippage noted in any gear?

   Yes

   - Go To 11.

   No

   - Go To 14.

9. **UD CLUTCH HYDRAULIC CIRCUIT**
   1. Remove Transmission Oil Pan and check for excessive debris.
   2. Remove the Valve Body and air check the UD clutch hydraulic circuit (in the case) in accordance with the Service Information.

   NOTE: The UD clutch passage contains a small bleed orifice and a small amount of air leakage is normal.

   Were there any problems found, excessive debris and/or excessive air leakage in the UD clutch

hydraulic circuit?

Yes

- Repair as necessary. Check the UD clutch piston seals and the dribbler assembly, reaction shaft support seal rings and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

NOTE: **If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 10.

10. **UD ACCUMULATOR PISTON**
    1. Check the UD bleed orifice, accumulator piston and accumulator piston seal in the main valve body.

    Were any problems found?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 11.

11. **EXCESSIVE DEBRIS**
    1. Remove the Transmission Oil Pan and check for excessive debris.
    2. Remove the valve body and air check the 4C clutch hydraulic circuit in accordance with the Service Information.

    NOTE: **The 4C clutch passage contains a small bleed orifice and a small amount of air leakage is normal.**

    Were any problems found, excessive debris, improperly assembled 4C clutch and/or excessive air leakage in the 4C clutch hydraulic circuit?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the 4C piston seals and bleed orifice.

NOTE: **If the 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, low line pressure in Event Data, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 12.

12. **4C ACCUMULATOR**
    1. Check the 4C Accumulator piston for cracks or a cut seal.
    2. Check for a cut or missing No. 5 check ball.
    3. Check the Solenoid Switch Valve and Plugs for sticking in its bore or excessive wear.

    Were any problems found?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 13.

13. **CHECK FOR BROKEN REVERSE SUN GEAR WELD**

    Working through the windows in the bottom of the case, check the failed Reverse or reaction gear set connections follows:

    1. Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
    2. Apply the 4C clutch using 30-40 psi shop air at the apply port in the center bulkhead.
    3. Attempt to rotate the input annulus gear and drive shell (the drum that encloses the to rearmost gearsets). Note that (due to the overrunning clutch) the gear and drive shell normally rotates in one direction only.

    Can the drive shell be rotated?

Yes

- Repair Transmission as necessary in accordance with the Service Information. Check the reverse annulus gear spline to the input carrier the reverse sun gear spline to the reaction carrier hub, and the reaction sun gear weld to the 4C clutch hub.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 17.

14. **CHECK IF DTC RESET**

Did DTC P0733 reset during the road test?

Yes

- Go To 15.

No

- Go To 16.

15. **LIST OF POSSIBLE CAUSES**
    1. If any other DTCs set during the road test, refer to the appropriate symptom in the appropriate Transmission Electrical Diagnostic Information.
    2. If no other DTCs set during the road test, below is a list of possible causes but not strictly limited to those:
    3. Check for excessive debris in the Transmission Oil pan, plugged, cracked or split Primary Transmission Oil Filter and/or seal.
    4. Check for cuts or missing No. 5 check ball in the main valve body.
    5. Check the 4C and UD accumulator pistons and seals, UD bleed orifice and the Solenoid Switch Valve and Plugs in the main valve body.
    6. Check the UD clutch piston seals, reaction shaft support seal rings and the flatness of the pump valve body and pump housing faces.
    7. Check the 4C clutch piston seals and bleed orifice.
    8. Check the UD clutch piston seals, reaction shaft support seal rings, dribbler assemblies and the flatness of the pump valve body and pump housing faces.

    Repair

    - Repair as necessary. Refer to the Service Information for proper repair procedures.

    NOTE: **If the UD or 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator**

valve or other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

16. **INTERMITTENT DTC**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Use the Event Data to help identify the conditions and/or possible causes that may have caused the DTC to set.
    3. Check Service Information Tune-ups or Technical Service Bulletins that may apply.

    Where any problems found?

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Test Complete.

17. **INTERMITTENT DTC**
    1. The conditions to set this DTC are not currently present.
    2. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.
       - If the Event Data shows DTC P0733 was set in Park, Reverse or Neutral, replace the Powertrain Control Module.
       - If the Event Data shows DTC P0733 set with input RPM = zero, check the input speed sensor and related wiring.
       - If the Event Data shows DTC P0733 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e. oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
       - If the Event Data shows DTC P0733 set with the UD or 4C pressure switch open (but line pressure matches Desired Line Pressure), air check the UD and 4C hydraulic clutch circuits for leakage in accordance with the Service Information. If the UD and 4C hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.
    3. Check the gearshift linkage adjustment.
    4. Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
    5. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will

prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

6. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
7. Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.
8. Gear ratio DTCs can also be set under extreme temperature conditions.
9. Verify if the problem is only experienced under extreme hot or cold conditions.

Were any problems found.

Yes

- Repair as necessary.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Test Complete.

P0734-GEAR RATIO ERROR IN 4TH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio the corresponding in-gear DTCs P0729 and P0731-36 is set.

2) An excessive change in input or output speeds indicating an intermittent signal which result in DTCs P0716 and/or P0721 setting.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input

speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input RPM to the Output RPM does not match the current gear ratio then DTC P0734 will set. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
INPUT OR OUTPUT SPEED SENSOR(S) OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
BENT OR BROKEN ACCUMULATOR COVER ON MAIN VALVE BODY
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR OD CLUTCH
CUT OD OR UD PISTON SEAL
BROKEN OR MISSING UD OR OD BLEED ORIFICE IN MAIN VALVE BODY
BROKEN OR MISSING BLEED ORIFICE IN UD OR OD CLUTCH PISTON
CUT OD OR UD ACCUMULATOR PISTON SEAL
CRACKED OD OR UD ACCUMULATOR PISTON
CUT OR MISSING #6 CHECK BALL
TRANSMISSION SOLENOID/TRS ASSEMBLY
FAILED OD SHAFT
FAILED SPLINE ON REVERSE CARRIER HUB
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, check for other transmission DTCs

Are any Transmission; solenoid, line pressure, speed sensor and/or loss of prime DTCs present?

Yes

- Perform the test for P0944-LOSS OF PRIME first if it is present. Refer to **P0944-LOSS OF HYDRAULIC PUMP PRIME**.

No

- Go To 2.

2. **CHECK Event Data**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for DTC P0734?

      Yes

      - Go To 4.

      No

      - Go To 3.

3. **CHECK THE TARGET GEAR IN Event Data**
   1. In the Event Data, identify the DTC that was recorded earlier.

      Does the Event Data display information for DTC P1790 with target gear = 4th or with both OD and UD clutches applying?

      Yes

      - Go To 4.

      No

      - Go To 7.

4. **CHECK INPUT RPM IN Event Data**
   1. Refer to the Event Data recorded earlier.

      Does the Input RPM read zero?

      Yes

- Check the input speed sensor and wiring. Refer to test P0716 and diagnose as if the DTC is current. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To 5.

5. **CHECK LINE PRESSURE READING**
   1. Refer to the Event Data recorded earlier.

      Is the line pressure reading more than 10 psi below the desired line pressure?

      Yes

      - Go To 6.

      No

      - Go To 7.

6. **CHECK TRANSMISSION OIL FILTER**
   1. Turn the ignition off to the lock position.
   2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
   3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

      NOTE: Make sure the Primary Transmission Oil Filter and seal are properly installed and are not cracked or split.

      Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked, plugged or mis-installed?

      Yes

      - Repair the plugged, cracked or split Primary Transmission Oil Filter and/or seal. If excessive clutch debris is present, check the clutches for damage. Refer to the Service Information for the proper hydraulic clutch repair procedure.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Remove the Transmission Oil Pump in accordance with the Service Information. Check the main Regulator Valve for sticking in its bore, scoring and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

7. **CHECK FOR CLUTCH SLIPPAGE**
   1. With the scan tool, perform the Direct Gear Clutch Test. Follow the scan tool instructions.
   2. Increase the throttle angle, TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: If the OD clutch is faulty, the overrunning clutch will hold and the slip test will pass. The Direct gear clutch test will not detect a faulty OD clutch. However, it will detect a faulty UD clutch.

Did the clutch test pass, did the Input Speed remain at zero?

Yes

- Go To 8.

No

- Go To 10.

8. **CHECK FOR INTERMITTENT OPERATION**
   1. Check the Shifter adjustment in accordance with the Service Information.
   2. Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
   3. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   4. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   5. Check the Speed Sensor wiring and connectors for good connection then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

Were any problems found?

Yes

- Repair as necessary.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE**

TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **ROAD TEST THE VEHICLE AND CHECK FOR SLIPPAGE**
    1. With the scan tool, erase Transmission DTCs.
    2. Road test the vehicle. Check operation in all forward gears and Reverse.
    3. If slippage is detected, check whether the line pressure is more than 10 psi below the desired line pressure reading on the scan tool.
    4. Check and record any transmission DTCs.
    5. Disconnect the Transmission Solenoid/TRS Assembly harness connector to induce Limp-in.
    6. Again test drive the vehicle and check the transmission operation in Drive and Reverse while in Limp-in.
    7. Note whether Drive Limp-in provides 1st gear or 4th (direct) gear.
    8. Reconnect all disconnected connectors and erase Transmission DTCs.

    Perform the appropriate procedure that best describes your road test results:

    No obvious slippage noted in any gear

    - Go To 15.

    Obvious slippage noted in one or more gears and line pressure (actual) is often more than 10 psi below the Desired Line Pressure reading on the scan tool

    - Go To 6.

    Slippage noted in 4th gear and Drive Limp-in provides 1st gear

    - Go To 12.

    Slippage noted in Reverse gear and Drive Limp-in provides 1st gear

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    Slippage noted in 4th gear while Drive Limp-in allows 4th gear WITHOUT slippage

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE**

TRANSMISSION VERIFICATION TEST.

All other possible conditions

- Go To 12.

10. **CHECK THE UD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove Transmission Oil Pan and check for excessive debris.
    2. Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) in accordance with the Service Information.

    NOTE: The UD clutch passage contains a small bleed orifice and a small amount of air leakage is normal.

    Were any problems found, excessive debris and/or excessive air leakage in the UD hydraulic clutch circuit?

    Yes

    - Repair as necessary. Check the UD clutch piston seals, reaction shaft support seal rings and dribbler assemblies, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

      NOTE: If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, low line pressure in DTC Event Data, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 11.

11. **CHECK UD ACCUMULATOR PISTON**
    1. Check the UD bleed orifice, accumulator piston and accumulator piston seal in the main valve body.

    Were any problems found?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures.

    No

- Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Remove the Transmission Oil Pan and check for excessive debris.
    2. Remove the valve body and check if the accumulator cover is intact.
    3. Air check the OD hydraulic clutch circuit (in the case) in accordance with the Service Information.

    NOTE: The OD clutch passage contains a small bleed orifice which connects to the Reverse clutch hydraulic circuit and a small amount of air leakage into the Reverse clutch passage is normal.

    Were any problems found, excessive debris and/or excessive air leakage in the OD hydraulic clutch circuit?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the bleed orifice in the OD/Reverse clutch piston.

      NOTE: If the OD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, low line pressure in DTC Event Data, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 13.

13. **CHECK THE OD ACCUMULATOR**
    1. Check the OD Accumulator piston for cracks or a cut seal.
    2. Check for a cut or missing #6 check ball.
    3. Check the Solenoid Switch Valve and Plugs for sticking in its bore or excessive wear.

    Were any problems found?

    Yes

    - Repair as necessary. Refer to the Service Information for proper repair procedures.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 14.

14. **CHECK FOR FAILED OD SHAFT/SPLINE**
    1. Remove the Transmission in accordance with the Service Information and inspect the OD shaft and its spline to the reverse carrier hub.

       Were any problems found?

       Yes

       - Repair as necessary.

       No

       - Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs and bleed orifice (in the OD/Reverse clutch piston). Check the OD hub and shaft, repair as necessary. Refer to the Service Information for proper repair procedures.

         NOTE: If the OD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, etc.), replace the Transmission Solenoid/TRS Assembly in addition to any other necessary repairs.

       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

15. **CHECK IF DTC RESETS**

    Did DTC P0734 reset during the road test?

    Yes

    - Go To 16.

    No

    - Go To 17.

16. **LIST OF POSSIBLE CAUSES**
    1. If other DTCs set during the road test, refer to the appropriate symptom in the appropriate Transmission Electrical Diagnostic Information.
    2. If no other DTCs set during the road test, below is a list of possible causes but not strictly limited to those.
    3. Check for:
       - Excessive debris in the Transmission Oil pan, plugged, cracked or mis-installed Primary Transmission Oil Filter and/or seal.

- Cut or missing #6 check ball in the main valve body.
- OD and UD accumulator pistons and seals and bleed orifices and the Solenoid Switch Valve and Plugs in the main valve body.
- OD and UD clutch piston seals, reaction shaft support seal rings, dribbler assemblies and the flatness of the pump valve body and pump housing faces.
- Main regulator valve for sticking in its bore.

Repair

- Repair as necessary. Refer to the Service Information for proper repair procedures.

NOTE: **If the OD or UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

17. **CHECK FOR INTERMITTENT OPERATION**
    1. The conditions to set this DTC are not currently present.
    2. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.
       - If the DTC Event Data shows DTC P0734 was set in the Park, Reverse or Neutral, replace the Powertrain Control Module.
       - If the DTC Event Data shows DTC P0734 set with input RPM = zero, check the input speed sensor and related wiring.
       - If the DTC Event Data shows DTC P0734 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e. oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
       - If the DTC Event Data shows DTC P0734 set with the OD or UD pressure switch open (but line pressure matches Desired Line Pressure), air check the OD and UD hydraulic clutch circuits for leakage in accordance with the Service Information. If the OD and UD hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.
    3. Check the gearshift linkage adjustment.
    4. Intermittent Gear Ratio DTCs can set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
    5. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: **Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.**

WARNING: **The Ignition Switch Feed fuse must be removed from the TIPM.**

Failure to do so can result in possible serious or fatal injury.

6. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
7. Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.
8. Gear ratio DTCs can also set under extreme temperature conditions.
9. Verify the problem is only experienced under extreme hot or cold conditions.

   Were there any problems found.

   Yes

   - Repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Test Complete.

P0735-GEAR RATIO ERROR IN 5TH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore the integrity of this data is verified through the following checks:

NOTE: **Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.**

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio the corresponding in-gear DTCs P0729 and P0731-36 is set.

2) An excessive change in input or output speeds indicating an intermittent signal which results in DTCs P0716 and/or P0721 setting.

3) If the common speed sensor ground circuit is lost, both sensor inputs read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input RPM to the Output RPM does not match the current gear ratio then DTC P0735 will set. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
LOW FLUID LEVEL
INPUT OR OUTPUT SPEED SENSOR(S) OR WIRING
VALVE BODY ACCUMULATOR COVER FAILED
CUT OD OR 4C ACCUMULATOR SEAL
CRACKED OD OR 4C ACCUMULATOR PISTON
BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY
CUT 4C TOWER SEAL
TRANSMISSION SOLENOID/TRS ASSEMBLY
CUT OR MISSING NO. 5 OR NO. 6 CHECK BALL
WORN SOLENOID SWITCH VALVE OR PLUGS
CUT OD OR 4C PISTON SEAL
STUCK MAIN REGULATOR VALVE
BURNED OD OR 4C CLUTCH
BROKEN OR MISSING 4C BLEED ORIFICE IN 2C/4C RETAINER
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE
LOOSE / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
CRACKED / LOOSE / MISSING OD/REVERSE PISTON BLEED ORIFICE
FAILED OD SHAFT
BROKEN REACTION ANNULUS GEAR WELD
FAILED REVERSE ANNULUS GEAR SPLINE
BROKEN REACTION SUN GEAR WELD
FAILED REVERSE CARRIER HUB SPLINE
FAILED REVERSE SUN GEAR SPLINE TO REACTION CARRIER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for other transmission DTCs

2. If any of these DTCs are present, perform their respective tests first.

   Are any Transmission solenoid, line pressure, speed sensor and/or loss of prime DTCs present?

   Yes

   - If these DTCs are present they may cause a Speed Ratio Error. Perform the test for P0944 first if it is present. Refer to **DIAGNOSIS AND TESTING**.

   No

   - Go To 2.

2. **CHECK THE EVENT DATA**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for DTC P0735?

      Yes

      - Go To 4.

      No

      - Go To 3.

3. **CHECK FOR ANOTHER DTC**

   In the Event Data recorded earlier, does the Event Data show DTC P1790 with Target Gear = 5th or with both the 4C and OD clutches applying?

   Yes

   - Go To 4.

   No

   - Go To 6.

4. **CHECK THE INPUT RPM**

   In the Event Data recorded earlier, does the Input RPM read zero?

   Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure for P0716-Input Speed Sensor Circuit Performance. Diagnose the DTC as if it is set and current.

No

- Go To 5.

5. **CHECK THE LINE PRESSURE READING**

   In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure reading?

   Yes

   - Remove the Transmission Oil pan and check the Transmission Oil filter for improper installation or plugged. If the Primary oil filter is OK, check the main regulator valve in pump. If excessive debris is in the oil pan, check clutches and repair as necessary. Refer to the Service Information for proper repair procedures.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 6.

6. **CHECK TRANSMISSION FOR SLIPPAGE**
   1. Erase DTCs and road test the vehicle.
   2. Check the transmission operation in forward and reverse gears.

      During the road test, was there obvious slippage noted in any gear?

      Yes

      - Go To 8.

      No

      - Go To 7.

7. **CHECK IF THE DTC RESETS**
   1. With the scan tool, check for transmission DTCs after the road test.

      Did DTC P0735 reset?

      Yes

      - Go To 8.

No

- Test Complete.

8. **CHECK INTERNAL TRANSMISSION**
   1. Remove the Transmission Oil Pan and Valve Body in accordance with the Service Information and check for the following:
      - Excessive debris in the oil pan.
      - Remove the Valve Body and check if the accumulator cover is intact and the 4C tower seal is not cut or split.
      - OD and 4C accumulator pistons for cracks and/or cut seals.
      - Solenoid Switch Valve and its plugs for stickiness or wear.
      - Cut or missing No. 5 and/or No. 6 check ball.
      - OD bleed orifice (on top of the main valve body) is intact.
      - Air check the OD and 4C hydraulic clutch circuits for excessive leakage. Refer to the Service information.

NOTE: **Both the OD and 4C hydraulic clutch circuits contain a small bleed orifice. A small amount of air leakage is considered normal. The OD hydraulic clutch circuit bleed orifice connects to the Reverse input clutch hydraulic cavity. A small amount of air leakage into the Reverse hydraulic clutch circuit is considered normal.**

Were any problems found?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures.

NOTE: **If the OD or 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 9.

9. **CHECK ROAD TEST RESULTS**

Perform the appropriate action for the condition(s) which best describe the road test results:

1st gear was OK. Slipped in 2nd (or failed to make the 1-2 upshift and went into Limp-in) and slipped in Reverse

- Go To 10.

1st and 2nd gears were OK. Slipped in 3rd gear AND in Reverse

- Remove the Transmission in accordance with the Service Information. Inspect the reaction annulus gear weld to the reverse carrier and the reaction sun gear weld to the 4C clutch hub and repair as necessary.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

1st and 2nd gears were OK. Slipped in 3rd gear but NOT in Reverse.

- Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information. Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**. If a continued Slippage is noted in 3rd gear during the Verification test, Remove the Transmission and inspect the 4C clutch and repair as necessary in accordance with the Service Information.

1st through 3rd gears were OK. Slipped in 4th, 5th or 6th gear. Reverse was OK

- Go To 11.

10. **CHECK FOR FAILED REVERSE GEARSET SPLINES**

Working through the windows in the bottom of the case, check for a failed Reverse Sun or Annulus gear spline as follows:

1. Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
2. Apply the 4C clutch using 30-40 psi shop air at the apply port in the center bulkhead. Refer to appropriate Transmission Service Information article.
3. Attempt to rotate the input annulus gear and drive shell (the drum that encloses the two rearmost gearsets).

NOTE: Due to the overrunning clutch, the gear and drive shell normally rotates in one direction only.

Can the drive shell be rotated?

Yes

- Repair internal transmission as necessary in accordance with the Service Information. Check the reverse annulus gear spline to the input carrier, and the reverse sun gear spline to the reaction carrier hub.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

11. **CHECK THE OD SHAFT AND REVERSE CARRIER SPLINE**
    1. Remove the Transmission in accordance with the Service Information and inspect the OD shaft and its spline to the reverse carrier hub.

       Were any problems found?

       Yes

       - Repair as necessary. Refer to the Service Information for proper repair procedures.
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs and bleed orifice (in the OD/Reverse clutch piston) and repair as necessary in accordance with the Service Information.

         NOTE: If the OD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any other necessary repairs.

       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0736-GEAR RATIO ERROR IN REVERSE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore a transmission with no drive (or reverse)

may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio the corresponding in-gear DTCs P0729 and P0731-36 is set.

2) An excessive change in input or output speeds indicating an intermittent signal which results in DTCs P0716 and/or P0721 setting.

3) If the common speed sensor ground circuit is lost, both sensor inputs read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input RPM to the Output RPM does not match the current gear ratio then DTC P0736 will set. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
LOW FLUID LEVEL
CUT L/R TOWER SEAL ON MAIN VALVE BODY
CUT L/R CLUTCH PISTON SEALS
BROKEN OR MISSING L/R CLUTCH BLEED ORIFICE (IN L/R CLUTCH RETAINER)
CUT L/R ACCUMULATOR PISTON SEAL IN MAIN VALVE BODY
CRACKED L/R ACCUMULATOR PISTON IN MAIN VALVE BODY
BURNED REVERSE OR L/R CLUTCH
CUT OD/REV PISTON SEALS
BROKEN OR MISSING OD/REV BLEED ORIFICE (IN OD/REV CLUTCH PISTON)
BROKEN REACTION ANNULUS GEAR WELD
BROKEN REACTION SUN GEAR WELD
BROKEN INPUT ANNULUS TO DRIVE SHELL WELD
FAILED REVERSE ANNULUS SPLINE TO INPUT CARRIER
FAILED REVERSE SUN GEAR SPLINE TO THE REACTION CARRIER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for other transmission DTCs.

       Are any Transmission solenoid, line pressure, speed sensor and/or loss of prime DTCs present?

       Yes

       - Perform the test for P0944-LOSS OF PRIME first if it is present. Refer to **P0944-LOSS OF HYDRAULIC PUMP PRIME**.

       No

       - Go To 2.
2. **CHECK IF DTC IS CURRENT**

   NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

   1. With the scan tool, perform the Reverse Gear Clutch test. Follow the scan tool instructions.
   2. Increase the throttle angle, TPS degree to 30° for no more than a few seconds.

      CAUTION: Do not overheat the transmission.

      Did the clutch test pass, input speed remain at zero?

      Yes

      - Go To 3.

      No

      - Go To 4.
3. **CHECK THE EVENT DATA**
   1. The conditions necessary to set this DTC are not currently present.
   2. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Does the Event Data show an input speed reading of zero?

      Yes

      - Go To 8.

      No

- Go To 4.

4. **POSSIBLE INTERNAL TRANSMISSION CAUSES**
    1. Remove the Transmission Oil Pan and Valve Body and check the following in accordance with the Service Information:
        - Clutch or metal debris in the pan
        - L/R clutch tower seal on the main valve body or cuts and the L/R accumulator piston and seals.
        - Air check the Reverse and L/R Hydraulic Clutch circuits (in the case) for excessive air leakage.

        NOTE: **Both Hydraulic Clutch circuits contain a small bleed orifice and a small amount of air leakage is normal. The Reverse hydraulic clutch circuit bleed orifice connects to the OD hydraulic clutch cavity. A small amount of air leakage into the OD hydraulic clutch circuit is considered normal.**

        Were any problems found?

        Yes

        - Repair as necessary. If clutch debris is present, remove the transmission and inspect the Reverse and L/R clutches and inspect the Transmission Oil Pump and Main Regulator Valve for damage or sticking in its bore.

            NOTE: **If the L/R clutch has failed but no obvious cause is found (such as a cut piston seal, cut tower seal, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

        - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

        No

        - Go To 5.

5. **CLUTCH TEST FAILURE**

    Did the clutch test fail in reverse?

    Yes

    - Go To 6.

    No

- Test complete.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

6. **CHECK FOR FAILED REVERSE GEARSET SPLINES**

Working through the windows in the bottom of the case, check for a failed Reverse Sun or Annulus spline as follows:

1. Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
2. Apply the 4C clutch using 30-40 psi shop air at the apply port in the center bulkhead.
3. Attempt to rotate the input annulus gear and drive shell (the drum that encloses the two rearmost gearsets).

NOTE: Due to the overrunning clutch, the gear and drive shell normally rotates in one direction only.

Can the drive shell be rotated?

Yes

- Repair internal transmission as necessary in accordance with the Service Information. Check the reaction annulus gear weld to the reverse carrier and the reaction sun gear weld to the 4C clutch hub.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 7.

7. **CHECK THE DRIVE SHELL WELD**
   1. Release the output shaft and the 4C clutch.
   2. Apply the L/R Clutch only using 30-40 psi of shop air.
   3. Attempt to rotate the drive shell as in the previous step.

   Can the drive shell be rotated?

   Yes

   - Repair Transmission as necessary in accordance with the Service Information. Check the drive shell weld to input annulus gear.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Disassemble and inspect the input clutch assembly. Check the Reverse clutch reaction plate snap ring. Check the OD and Reverse clutch seals, discs and bleed orifice (in the OD/Reverse clutch piston). Check the Reverse hub and shaft. If no problems are found, check the L/R clutch assembly and repair as necessary. If all clutches are OK, replace the Transmission Solenoid/TRS assembly in accordance with the Service Information.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

8. **CHECK FOR INTERMITTENT OPERATION**
   1. Intermittent gear ratio DTCs can set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Check the Speed Sensor wiring and connectors for good connection then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Test complete.

P0740-TCC OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When the transmission is in 2nd gear through 6th gear, the Torque Converter Clutch (TCC) can be engaged when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the

L/R-TCC Solenoid until the torque converter slip difference (difference between engine and transmission input speed) is within 60 RPM. Then the L/R-TCC solenoid is fully energized (FEMCC - 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

WHEN MONITORED:

During Electronically Modulated Converter Clutch (EMCC) Operation.

SET CONDITION:

Transmission must be in EMCC with input speed greater than 1750 RPM. The L/R-TCC Solenoid achieves the maximum duty cycle and can not pull engine speed within 60 RPM of input speed. Also when the transmission is in FEMCC and the engine slips TCC more than 100 RPM for 10 seconds then DTC P0740 will set. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
RELATED DTC PRESENT
L/R-TCC SOLENOID
TCC SWITCH VALVE STUCK
TCC REGULATOR VALVE STUCK
INPUT SHAFT SEAL RING CUT
TORQUE CONVERTER AND/OR INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTC P0750**
    1. With the scan tool, read DTCs.

       Is DTC P0750 present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**

1. With the scan tool, read and **RECORD ALL** Transmission DTCs. After recording DTCs, erase DTCs.
2. Drive the vehicle until the transmission temperature is at least 43° C or 110° F and the engine temperature at least 49° C or 120° F.
3. Perform the following steps 3 times.
4. Using the AutoStick® (ERS) to place the transmission in 3rd gear.
5. While monitoring the Torque convertor slip on the scan tool, accelerate smoothly at light to moderate throttle from 1200 to 2500 engine RPM and watch for TCC engagement.

NOTE: Normal torque converter clutch slippage is 0 (± 20 RPM) in full lock-up.

Pick the one that best describes your findings:

TCC State remained at "Unlock" (controller never commanded TCC engagement)

- Go To 3.

Torque Converter Slip dropped properly to 0 (± 20 RPM)

- Go To 4.

TCC State showed "Transitioning" or "Full EMCC", but there was little or no change in T/C Slip

- Go To 5.

TCC tried to engage but had significant positive slip (60-150 RPM)

- Replace the Torque Converter and remove inspect the Transmission Oil Pump Assembly in accordance with the Service Information.

NOTE: Check the input shaft end play before removing the pump. HOLD the input shaft during pump removal to prevent thrust bearings in the input clutches from falling out of position. Split the pump assembly and inspect for torque converter debris. Clean as necessary. Verify the Torque Converter Switch Valve and the Torque Converter Clutch Control Valve (located in the Transmission Oil Pump Valve Body) are not sticking in their bores. Reinstall Transmission Oil Pump Assembly and verify proper input shaft end play.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

3. **CHECK FOR TCC ENGAGEMENT COMMANDED**

1. Verify the transmission temperature is at least 43° C or 110° F and the engine temperature at least 49° C or 120° F.
2. Using the scan tool, monitor the "Target Gear TCC State" in the following steps.
3. Road test the vehicle. Using the AutoStick® (ERS) in ERS "3", ERS "4", ERS "5" and Drive with an engine speed up to 2500 RPM in each position.

   Pick the one that best describes your findings:

   TCC would engage properly when commanded

   - Go To 4.

   TCC would NOT engage properly when commanded

   - Go To 5.

   Target Gear TCC State remained in the "Unlock" state continuously

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

4. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorts and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Test Complete.

5. **CHECK THE L/R-TCC SOLENOID**

1. With the scan tool, check for other transmission DTCs.

   Are DTCs P1775 and P0841 present?

   Yes

   - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 6.

6. **CHECK THE TORQUE CONVERTER AND/OR INTERNAL TRANSMISSION**
   1. Repair internal transmission as necessary.
   2. Check for the following possible causes. Refer to the Service information for the proper repair procedures.
   3. Inspect the Transmission Oil Pump Assembly. **Note:** Check the input shaft end play before removing the pump. HOLD the input shaft during pump removal to prevent thrust bearings in the input clutches from falling out of position. Split the pump assembly and inspect for torque converter debris. Clean as necessary. Verify that the Torque Converter Switch Valve and the Torque Converter Clutch Control Valve (located in the Transmission Oil Pump Valve Body) are not sticking in their bores. Reinstall Transmission Oil Pump Assembly and verify proper input shaft end play.
   4. Check the Teflon seal rings on the input shaft. **Note:** If one of the seal rings is cut the loose piece will often lodge in the TCC switch valve causing it to stick in its bore.
   5. If no problems are found, replace the Transmission Solenoid/TRS Assembly.

      Repair

      - In all cases, replace the Torque Converter in accordance with the Service Information.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0750-LR SOLENOID CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System uses five electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which is sensed by the Transmission Control System. If an inductive spike is not sensed by the

Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

WHEN MONITORED:

Initially at power-up, then every 10 seconds after. The solenoid circuits will be tested immediately after a gear ratio or pressure switch error is detected.

SET CONDITION:

After three consecutive solenoid continuity test failures or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: **This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement - do not replace the Valve Body.**

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T20) L/R SOLENOID CONTROL CIRCUIT SHORTED TO OTHER CIRCUITS
(T20) L/R SOLENOID CONTROL CIRCUIT OPEN
(T20) L/R SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK DTCS**
    1. With the scan tool, read DTCs.

       Are any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **TIPM - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

- Go To 2.

2. **CHECK IF DTC P0750 IS PRESENT**
   1. Ignition ON, Engine Not Running.
   2. With the scan tool, erase all Transmission DTCs.
   3. Turn the ignition OFF to the LOCK position.
   4. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

   5. Install the (special tool #8333A, Simulator, Transmission).
   6. Ignition ON, Engine Not Running.
   7. With the scan tool, actuate the L/R Solenoid.
   8. Monitor the L/R Solenoid LED on the Transmission Simulator.

   Did the L/R Solenoid LED on the Transmission Simulator blink on and off?

   Yes

   - Go To 3.

   No

   - Go To 5.

3. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. With the Transmission Simulator connected, continue to actuate the L/R solenoid for two minutes.
   2. After two minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

   Did DTC P0750 reset during the actuation test?

   Yes

   - Go To 5.

   No

- Go To 4.

4. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
    1. With the Transmission Simulator connected, continue to actuate the L/R solenoid for another two minutes while wiggling the related wiring harness and connectors.
    2. Stop the actuation and check for transmission DTCs.

    Did DTC P0750 reset during the actuation test?

    Yes

    - Repair wiring harness or connectors as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. **Note: Do NOT replace the entire Valve Body.**
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 19: Checking L/R Solenoid Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM harness connectors.
4. Measure the resistance between the (T20) L/R Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms between the (T20) L/R Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

- Repair the (T20) L/R Solenoid Control circuit for a short to another circuit(s).
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 6.

6. **CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR AN OPEN**

Fig. 20: Checking L/R Solenoid Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

2. Measure the resistance of the (T20) L/R Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (T20) L/R Solenoid Control circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 7.

7. **CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 21: Checking L/R Solenoid Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T20) L/R Solenoid Control circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (T20) L/R Solenoid Control circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0755-2C SOLENOID CIRCUIT

Yes

- Go To 3.

No

- Go To 5.

3. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. With the Transmission Simulator connected, continue to actuate the 4C solenoid for two minutes.
   2. After two minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

   Did DTC P0770 reset during the actuation test?

   Yes

   - Go To 5.

   No

   - Go To 4.

4. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. With the Transmission Simulator connected, continue to actuate the 4C solenoid for another two minutes while wiggling the related wiring harness and connectors.
   2. With the scan tool, stop the actuation and check for transmission DTCs.

   Did DTC P0770 reset during the actuation test?

   Yes

   - Repair wiring harness or connectors as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. **Note: Do NOT replace the entire Valve Body.**
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **CHECK THE (T259) 4C CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 28: Checking 4C Solenoid Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM harness connectors.
4. Measure the resistance between the (T259) 4C Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms between the (T259) 4C Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T259) 4C Control circuit for a short to another circuit(s).

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 6.

6. **CHECK THE (T259) 4C CONTROL CIRCUIT FOR AN OPEN**

Fig. 29: Checking 4C Solenoid Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

2. Measure the resistance of the (T259) 4C Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (T259) 4C Control circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 7.

7. **CHECK THE (T259) 4C CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 30: Checking 4C Solenoid Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T259) 4C Control circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (T259) 4C Control circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0841-LR PRESSURE SWITCH RATIONALITY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown in chart.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set if the L/R Pressure Switch reads open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
LOSS OF PRIME AND/OR TCM POWER INPUT DTCS PRESENT
LOW FLUID LEVEL
LOW LINE PRESSURE
REVERSE CARRIER SNAP RING DISLODGED
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR FILTER SEAL
STICKING MAIN REGULATOR VALVE IN PUMP VALVE BODY
NO. 1 CHECK BALL CUT OR DAMAGED
WIRING AND CONNECTORS
(T50) L/R PRESSURE CONTROL CIRCUIT OPEN
(T50) L/R PRESSURE CONTROL CIRCUIT SHORTED TO GROUND
(T50) L/R PRESSURE CONTROL CIRCUIT SHORTED TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-

DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN
1ST	CLOSED*	OPEN	OPEN	CLOSED	OPEN
2ND	OPEN	CLOSED	OPEN	CLOSED	OPEN
2ND PRIME	OPEN	OPEN	CLOSED	CLOSED	OPEN
3RD	OPEN	OPEN	OPEN	CLOSED	CLOSED
4TH	OPEN	OPEN	CLOSED	OPEN	CLOSED
5TH	OPEN	CLOSED	OPEN	OPEN	CLOSED
*L/R is closed if output speed is below 100 RPM in Drive and Manual 2. L/R is closed in Manual 1.					
**May be open when rolling in Neutral or at low oil temperatures.					

DIAGNOSTIC TEST

1. **CHECK FOR OTHER DTCS**
    1. Ignition ON, Engine Not Running.
    2. With the scan tool, check for transmission DTCs.

    Are any Transmission Loss of Prime, TCM Power Input and/or TIPM TCM Power Control Circuit DTCs present?

    Yes

    - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure. If the DTC P0944 is present, perform its respective test first.

    No

    - Go To 2.
2. **CHECK IF DTC P0841 IS PRESENT**
    1. With the scan tool, check the Event Data for P0841.

    NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

    Does the Event Data show DTC P0841?

    Yes

    - Go To 3.

No

- Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform diagnostics for the DTC reported in the Event Data.

3. **CHECK IF DTC SET IN REVERSE**

   Does the Event Data show DTC P0841 set while in Reverse?

   Yes

   - Go To 10.

   No

   - Go To 4.

4. **CHECK IF THE L/R PRESSURE SWITCH WAS CLOSED**

   Does the Event Data show the L/R Pressure Switch reading CLOSED when DTC P0841 set?

   Yes

   - Go To 5.

   No

   - Go To 14.

5. **CHECK THE PCM AND WIRING**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

   3. Install (special tool #8333A, Simulator, Transmission).
   4. Ignition ON, Engine Not Running.
   5. Turn the Pressure Switch selector to L/R on the Transmission Simulator.

6. With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

   Did the L/R Pressure Switch state change from open to closed while pressing the Pressure Switch Test button on the Transmission Simulator?

   Yes

   - Go To 6.

   No

   - Go To 10.

6. **CHECK WIRING AND CONNECTORS**
   1. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   2. Wiggle the wires while checking for shorted and open circuits.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Go To 7.

7. **CHECK IF DTC SET IN FIRST GEAR**

   In the Event Data recorded earlier, does the Event Data show the Present Gear as first gear when DTC P0841 set ?

   Yes

   - Go To 8.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

8. **CHECK IF THE NO. 1 CHECK BALL IS CUT OR DAMAGED**
   1. Turn the ignition OFF to the LOCK position.

2. Remove the Transmission Valve Body in accordance with the Service Information.
3. Check the No. 1 Check Ball for any possible cuts or damage.

   Is the No. 1 Check Ball cut or damaged?

   Yes

   - Replace the No. 1 Check Ball and check for clutch debris in the transmission oil pan. If there is excessive debris, perform internal repairs to the L/R Clutch assembly. Refer to **REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 9.

9. **CHECK IF THE REVERSE CARRIER SNAP RING IS DISLODGED**
   1. Looking through the windows in the bottom of the case, check whether the snap ring at the front of the Reverse (center) Carrier has dislodged.

      NOTE: It may be necessary to pry the Input Annulus Gear Shell rearward to check this snap ring.

      Is the Reverse Carrier Snap Ring dislodged?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

10. **CHECK THE (T50) L/R PRESSURE CONTROL CIRCUIT FOR AN OPEN**

Fig. 31: Checking L/R Pressure Switch Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission) if connected in a previous step or disconnect the Transmission Solenoid/TRS Assembly harness connector.

3. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T50) L/R Pressure Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (T50) L/R Pressure Control circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 11.

11. **CHECK THE (T50) L/R PRESSURE CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 32: Checking L/R Pressure Switch Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T50) L/R Pressure Control circuit.

   Is the resistance below 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Control circuit for a short to ground.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 12.

12. **CHECK THE PCM POWERS AND GROUNDS**
    1. Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 13.

13. **CHECK IF THE DTC RESETS**
    1. With the scan tool, clear the DTC and road test the vehicle.
    2. Try to duplicate the conditions in which the DTC set using the Event Data recorded earlier.

    Did DTC P0841 reset?

    Yes

    - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 17.

14. **CHECK FOR LOW LINE PRESSURE**
    1. In the Event Data recorded earlier, compare the Line Pressure and the Desired Line Pressure.

    Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check for low fluid level. Check the Primary Oil Filter seal for a split, crack or improperly installed. Refer to the Service Information for the proper installation procedure. If the fluid level and Primary Oil Filter are OK, check the Main Regulator Valve in the Oil Pump in accordance with the Service Information. Refer to **PUMP, TRANSMISSION OIL, DISASSEMBLY** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 15.

15. **CHECK THE (T50) L/R PRESSURE CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 33: Checking L/R Pressure Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Disconnect all PCM harness connectors.
4. Measure the resistance between the (T50) L/R Pressure Control circuit and all other circuits in the

Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T50) L/R Pressure Control circuit and all other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T50) L/R Pressure Control circuit for a short to other circuit(s).
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 16.

16. **CHECK IF DTC RESETS**
    1. With the scan tool, clear the DTC and road test the vehicle.
    2. Try to duplicate the conditions in which the DTC set using the Event Data recorded earlier.

    Did DTC P0841 reset?

    Yes

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 17.

17. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Test Complete.

P0845-2C HYDRAULIC PRESSURE TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies the switches are operational (Close with pressure applied). The Transmission Control System verifies the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

WHEN MONITORED:

In any forward gear with engine speed above 1000 RPM, shortly after a shift and every minute after.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 RPM, the Powertrain Control Module (PCM) momentarily turns on element pressure to the clutch circuits that does not have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close two times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO ANOTHER CIRCUIT
EXTRA CHECK BALL IN PASSAGE DOWNSTREAM FROM NO. 7 BALL POCKET
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for transmission DTCs

       Are any Loss of Prime, TIPM TCM Power Control Circuit and/or TCM Power Input DTCs present also?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure. If DTC, P0944-LOSS OF PRIME is present, perform its respective test first.

       No

       - Go To 2.
2. **CHECK IF DTC P0755 IS PRESENT**
    1. With the scan tool, read DTCs.

       Is DTC P0755 present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

       No

       - Go To 3.
3. **CHECK IF DTCS P0732, P0735 AND/OR P0846 ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are DTCs P0732, P0735 and/or P0846 present?

       Yes

       - Go To 12.

       No

       - Go To 4.
4. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go To 5.

No

- Go To 15.

5. **CHECK IF THE LINE PRESSURE STAYS THE SAME**
   1. Start the engine.
   2. Warm the transmission to 82° C or 180° F.
   3. Firmly apply the brakes.
   4. With the scan tool, monitor the Line Pressure during the following step.
   5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least five seconds in each range.

      Did the line pressure remain at a steady value between 585 and 655 kPa or 85 and 95 psi in each position?

      Yes

      - Go To 6.

      No

      - Go To 10.

6. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
   1. Ignition ON, Engine Not Running.
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

      Did the Line Pressure reading on the scan tool change to about 207 kPa (30 psi) or 0.7 volts when the connector was pushed inward?

      Yes

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect the terminals and repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Go To 7.

7. **CHECK THE LINE PRESSURE SENSOR OPERATION**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

   3. Install the (special tool #8333A, Simulator, Transmission).
   4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
   5. Ignition ON, Engine Not Running.
   6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the three line pressure positions on the Transmission Simulator.

NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) or 1.0 volt of the reading specified on the Transmission Simulator.

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information. Refer to **SENSOR, VARIABLE LINE PRESSURE, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 34: Checking 5-Volt Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect Transmission Simulator.
3. Disconnect the PCM C1 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 35: Checking 5-Volt Supply Circuit For A Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

10. **COMPARE SCAN TOOL TO THE PRESSURE GAUGE**
    1. Turn the ignition OFF to the LOCK position.
    2. Connect the (special tool #8259, Adapter, Pressure Test) and 0-300 psi (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to the Service Information for proper installation procedure.

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the RPM to 1500 and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500 and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500 and compare the line pressure readings.

       Does the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

Yes

- Go To 11.

No

- Replace the Line Pressure Sensor in accordance with the Service Information. Refer to **SENSOR, VARIABLE LINE PRESSURE, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

11. **CHECK WIRING AND CONNECTORS**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

    3. Remove the (special tool #8259, Adapter, Pressure Test) and 0-300 psi (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
    4. Install the (special tool #8333A, Simulator, Transmission).
    5. On the Transmission Simulator, turn the Pressure Switch selector switch to 2C.
    6. Ignition ON, Engine Not Running.
    7. With the scan tool, monitor the 2C Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the 2C Pressure Switch.

    Did the 2C Pressure Switch state change to closed and remain closed while wiggling the wires?

    Yes

    - Go To 12.

    No

    - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition OFF to the LOCK position.

2. Remove the (special tool #8333A, Simulator, Transmission).
3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

   Does the Transmission Oil Pan contain excessive debris or contamination?

   Yes

   - Repair the cause of the excessive debris in the Transmission Oil Pan.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 13.

13. **CHECK THE 2C HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the 2C clutch hydraulic circuit in the 2C/4C clutch retainer for leakage in accordance with the Service Information.

       NOTE: The 2C hydraulic clutch circuit contains a small bleed orifice and a small amount of air leakage is normal.

       Was there excessive air leakage noticed during the air check?

       Yes

       - Repair as necessary. Check the 2C clutch piston, piston seals and bleed orifice assembly. Refer to **VALVE BODY, REMOVAL** .
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Disassemble and inspect the Valve Body and repair as necessary. Inspect the 2C Accumulator piston and seals. Check for an extra check ball downstream from the No. 7 check ball pocket and repair as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

14. **CHECK THE (T147) 2C PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 36: Checking 2C Pressure Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: Make sure the Transmission Solenoid/TRS Assembly harness

connector is disconnected.

3. Measure the resistance between the (T147) 2C Pressure Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms between the (T147) 2C Pressure Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T147) 2C Pressure Signal circuit for a short to another circuit(s).
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

15. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.
    5. If the Event Data shows DTC P0845 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

       Where any problems found?

       Yes

       - Repair as necessary.
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Test Complete.

P0846-2C PRESSURE SWITCH RATIONALITY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown in chart.

WHEN MONITORED:

Continuously with the ignition on, engine running and the transmission in gear.

SET CONDITION:

The DTC is set if the 2C Pressure Switch reads open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T147) 2C PRESSURE SIGNAL CIRCUIT OPEN
(T147) 2C PRESSURE SIGNAL CIRCUIT SHORTED TO GROUND
(T147) 2C PRESSURE SIGNAL CIRCUIT SHORTED TO OTHER CIRCUITS
EXCESSIVE FLUID LEAKAGE IN 2C CLUTCH CIRCUIT
NO. 5 AND/OR NO. 7 CHECK BALL CUT OR DAMAGED
EXTRA CHECK BALL DOWNSTREAM OF THE NO. 7 CHECK BALL POCKET
LOW LINE PRESSURE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)
WIRING AND CONNECTORS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

		**May be open when rolling in Neutral or at low oil temperatures.			

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED TCM POWER INPUT DTCS ARE PRESENT**
    1. Using the scan tool, check for transmission DTCs.

       Are TCM Power Input DTCs present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, check the Event Data.

       Does the Event Data show data for DTC P0846?

       Yes

       - Go To 3.

       No

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate symptom shown in the Event Data.
3. **CHECK FOR MULTIPLE DTCS**
    1. Using the scan tool, check for transmission DTCs.

       Are there two or more related pressure switch rationality DTCs present in addition to P0846?

       Yes

       - Go To 4.

       No

- Go To 7.

4. **CHECK IF ALL PRESSURE SWITCHES READ CLOSED**
   1. Using the scan tool, check the Event Data for P0846.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Do all the pressure switches read CLOSED in the Event Data for P0846?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the diagnostics for P0882.

      No

      - Go To 5.

5. **CHECK IF ALL PRESSURE SWITCHES READ OPEN**

   In the Event Data recorded earlier, do all the pressure switches read OPEN?

   Yes

   - Go To 6.

   No

   - Go To 7.

6. **CHECK FOR LOW LINE PRESSURE**

   In the Event Data recorded earlier, is the Line Pressure less than 40 psi and significantly below the Desired Line Pressure?

   Yes

   - Repair as necessary to correct low line pressure. Check the fluid level and adjust as necessary. If the fluid level is OK, check the Primary Oil Filter seal for a split, crack or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures. Refer to **PUMP, TRANSMISSION OIL, DISASSEMBLY** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.

Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

7. **CHECK IF THE DTC SET IN PARK REVERSE OR NEUTRAL**
   1. Using the scan tool, check the Event Data for P0846.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data show DTC P0846 set in Park, Reverse or Neutral?

      Yes

      - Go To 12.

      No

      - Go To 8.

8. **CHECK IF THE 2C PRESSURE SWITCH READS CLOSED**

   In the Event Data recorded earlier, does the Event Data show the 2C Pressure Switch reading CLOSED?

   Yes

   - Go To 10.

   No

   - Go To 9.

9. **COMPARE THE LINE PRESSURE TO THE DESIRED LINE PRESSURE**
   1. In the Event Data recorded earlier, compare the Line Pressure and the Desired Line Pressure.

      Is the Line Pressure less than 40 psi and significantly below the Desired Line Pressure?

      Yes

      - Repair as necessary to correct low line pressure. Check the fluid level and adjust as necessary. If the fluid level is OK, check the Primary Oil Filter seal for a split, crack or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to **PUMP, TRANSMISSION OIL, DISASSEMBLY** .
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

- Go To 15.

10. **CHECK THE PCM AND WIRING**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

    3. Install the (special tool #8333A, Simulator, Transmission).
    4. Ignition ON, Engine Not Running.
    5. With the Transmission Simulator, turn the Pressure Switch selector switch to the 2C position.
    6. Using the scan tool, monitor the 2C Pressure Switch while pressing the Pressure Switch test button on the Transmission Simulator.

    Did the state of the 2C Pressure Switch change while pressing the Pressure Switch Test button?

    Yes

    - Go To 11.

    No

    - Go To 12.

11. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
    1. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    2. Wiggle the wires while checking for shorted and open circuits.

    Where any problems found?

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

12. **CHECK THE (T147) 2C PRESSURE SIGNAL CIRCUIT FOR AN OPEN**

Fig. 37: Checking 2C Pressure Signal Circuit For An Open

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C4 harness connector.
4. Connect the (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

5. Measure the resistance of the (T147) 2C Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (T147) 2C Pressure Switch Sense circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 13.

13. **CHECK THE (T147) 2C PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 38: Checking 2C Pressure Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T147) 2C Pressure Switch Sense circuit.

   Is the resistance below 5.0 ohms?

Yes

- Repair the (T147) 2C Pressure Switch Sense circuit for a short to ground.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 14.

14. **CHECK THE (T147) 2C PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 39: Checking 2C Pressure Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (T147) 2C Pressure Switch Sense circuit and all the other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms?

Yes

- Repair the (T147) 2C Pressure Switch Sense circuit for a short to another circuit(s).
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Using the scan tool, perform a Quick Learn procedure. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

15. **CHECK IF THE NO. 5 AND/OR NO. 7 CHECK BALL IS CUT OR DAMAGED**
    1. Turn the Ignition OFF to the LOCK position.
    2. Remove the Valve Body Assembly in accordance with the Service Information.
    3. Inspect the No. 5 and No. 7 check balls for any cuts or damage.
    4. Check for an extra check ball in the passage downstream from the No. 7 check ball pocket.
    5. Inspect the 2C accumulator piston and seals and also the 2C tower seal on top of the valve body.

    Where any problems found?

    Yes

    - Repair as necessary. Check for excessive clutch debris in the transmission oil pan. If excessive clutch debris is present, repair 2C clutch as necessary. Refer to **A/T - REMOVAL** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 16.

16. **CHECK FOR EXCESSIVE FLUID LEAKAGE WITHIN 2C CLUTCH CIRCUIT**
    1. Air check the 2C Clutch hydraulic circuit. Refer to the Service Information.

    NOTE: **This hydraulic clutch circuit contains a small bleed orifice. Small leakage is considered normal.**

    Was there excessive air leakage in the 2C Clutch hydraulic circuit?

    Yes

    - Repair as necessary. Refer to **A/T - REMOVAL** .

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0868-LINE PRESSURE LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System, (5% duty cycle = solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on engine and transmission inputs.

The Transmission Control System calculates torque input to the transmission and uses this as the primary input for the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level of 827 or 931 kPa (120 or 135 psi) during shifts and in Park or Neutral to ensure consistent shift quality. The actual line pressure is continuously being compared to the desired target line pressure. If the actual line pressure is consistently lower than the target while driving, the line pressure low DTC P0868 will set.

WHEN MONITORED:

Continuously while driving in a forward gear.

SET CONDITION:

The Powertrain Control Module (PCM) continuously monitors Actual Line Pressure and compares this to Desired Line Pressure. If the Actual Line Pressure is more than 15 psi below Desired Line Pressure for 3.5 seconds continuously, this DTC will set.

POSSIBLE CAUSES

Possible Causes
CHECK FOR RELATED DTCS
LOW FLUID LEVEL
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
POOR LINE PRESSURE SENSOR CONNECTION

(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT SHORTED TO ANOTHER CIRCUIT
INTERNAL TRANSMISSION
LINE PRESSURE SENSOR
CRACKED, PLUGGED, OR MIS-INSTALLED PRIMARY OIL FILTER
LOOSE COOLER RETURN SPIN ON FILTER (IF EQUIPPED)
STUCK OR STICKING MAIN REGULATOR VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
   1. With the scan tool, read DTCs.

      Is DTC P0933 present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure for DTC P0933.

      No

      - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 3.

      No

      - Go To 11.
3. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
   1. Ignition ON, Engine Not Running.
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure

Sensor connector inwards towards the Transmission.

Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 volts when the connector was pushed inward?

Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 volts)

- Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No (value is higher than 207 kPa (30 psi) or 0.7 volts and did not change or the value was already 207 kPa (30 psi) or 0.7 volts and did not change)

- Go To 4.

4. **CHECK THE PCM AND WIRING**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the (special tool #8333A, Simulator, Transmission).
   4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
   5. Ignition ON, Engine Not Running.
   6. With the scan tool, monitor the Line Pressure during the following steps.
   7. Using the Transmission Simulator, set the rotary knob to each of the three line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa (2.0 psi) or 0.1 volts of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa (2.0 psi) or 0.1 volts in all three positions?

Yes

- Go To 5.

No

- Go To 7.

5. **CHECK THE LINE PRESSURE SENSOR**
    1. Turn the ignition OFF to the LOCK position.
    2. Disconnect the (special tool #8333A, Simulator, Transmission) and reconnect all previously disconnected connectors.
    3. Install the (special tool #8259, Adapter, Pressure Test), and the (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
    4. Start the engine in park.
    5. Monitor the line pressure readings of both the scan tool and the pressure gauge and compare the two readings.

    Is the line pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?

    Yes

    - Go To 6.

    No

    - Replace the Line Pressure Sensor in accordance with the Service Information.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

6. **CHECK FOR A PLUGGED TRANSMISSION OIL FILTER**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
    3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

    NOTE: Make sure the Primary Transmission Oil Filter and/or O-ring is not cracked or split.

    Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked or plugged?

    Yes

    - Repair the plugged, cracked or split Primary Transmission Oil Filter and/or O-ring. If the Primary Transmission Oil Filter is plugged, refer to the Service Information for the proper Hydraulic repair procedure.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Repair internal transmission and inspect the Transmission Oil Pump in accordance with the

Service Information and replace if necessary. If no problem is found, replace the Solenoid/TRS Assembly.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

7. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 40: Checking 5-Volt Supply Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the (special tool #8333A, Simulator, Transmission).
2. Reconnect all previously disconnected connectors except the Line Pressure Sensor harness connector.
3. Ignition ON, Engine Not Running.
4. Measure the voltage of the (F856) 5-volt Supply circuit in the Line Pressure Sensor harness connector.

   Is the voltage above 5.5 volts?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to voltage.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 41: Checking 5-Volt Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the PCM C1 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

3. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 42: Checking 5-Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

- Go To 10.

10. **CHECK THE (T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 43: Checking Line Pressure Variable Force Solenoid Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Disconnect all PCM harness connectors.
4. Measure the resistance between the (T118) Line Pressure Variable Force Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T118) Line Pressure Variable Force Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T118) Line Pressure Variable Force Solenoid Control circuit for a short to another circuit(s).
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

11. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Test Complete.

P0869-LINE PRESSURE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System, (5% duty cycle =

solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on engine and transmission inputs.

The Transmission Control System calculates torque input to the transmission and uses this as the primary input for the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level of 827 or 931 kPa (120 or 135 psi) during shifts and in Park or Neutral to ensure consistent shift quality. The actual line pressure is continuously being compared to the desired target line pressure. If the actual line pressure is consistently higher than the highest desired line pressure used in the current gear, the line pressure high DTC P0869 will set.

WHEN MONITORED:

Continuously while driving in a forward gear.

SET CONDITION:

The Powertrain Control Module (PCM) continuously monitors Actual Line Pressure. If the Actual Line Pressure reading is greater than the maximum desired line pressure used in the current gear, while the Pressure Control Solenoid duty cycle is at or near its maximum value (which should result in minimum line pressure) for 3.5 seconds continuously, the DTC will set.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR CONNECTION
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT
LINE PRESSURE SENSOR
STUCK OR STICKING MAIN REGULATOR VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Is DTC P0882 or P0933 present?

       Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure for DTC P0882 or P0933.

No

- Go To 2.

2. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 3.

      No

      - Go To 10.

3. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
   1. Ignition ON, Engine Not Running.
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the transmission.

      Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 volts when the connector was pushed inward?

      Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 volts)

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No (value is higher than 207 kPa (30 psi) or 0.7 volts and did not change or the value was already 207 kPa (30 psi) or 0.7 volts and did not change)

      - Go To 4.

4. **CHECK THE PCM AND WIRING**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition ON, Engine Not Running.
6. With the scan tool, monitor the Line Pressure during the following step.
7. Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) or 0.1 volts of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ±14 kPa (2.0 psi) or 0.1 volts in all three positions?

Yes

- Go To 5.

No

- Go To 6.

5. **CHECK THE LINE PRESSURE SENSOR CALIBRATION**
   1. Turn the ignition OFF to the LOCK position.
   2. Disconnect the (special tool #8333A, Simulator, Transmission) and reconnect all previously disconnected connectors.
   3. Install the (special tool #8259, Adapter, Pressure Test), and (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
   4. Start the engine in park.
   5. Monitor the Line Pressure readings on the scan tool and the pressure gauge.
   6. Compare the Line Pressure readings between the scan tool and the pressure gauge.

   Is the pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?

   Yes

   - Repair the internal transmission and inspect the Transmission Oil Pump in accordance with the Service Information and replace if necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly, possible cause is a stuck Pressure Control Solenoid.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

- Replace the Line Pressure Sensor per the Service information.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

6. **CHECK THE (T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT FOR AN OPEN**

Fig. 44: Checking Line Pressure Variable Force Solenoid Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).
3. Disconnect the Powertrain Control Module C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T118) Line Pressure Variable Force Solenoid Control circuit between the Solenoid/TRS Assembly harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (T118) Line Pressure Variable Force Solenoid Control circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 7.

7. **CHECK THE (T118) LINE PRESSURE VARIABLE FORCE SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 45: Checking Line Pressure Variable Force Solenoid Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T118) Line Pressure Variable Force Solenoid Control circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (T118) Line Pressure Variable Force Solenoid Control circuit for a short to ground.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 46: Checking 5-Volt Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

Is the resistance above 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 47: Checking 5-Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the PCM C1 harness connector.
2. Disconnect the Line Pressure Sensor harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

3. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

10. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

       Where any problems found?

       Yes

       - Repair as necessary.
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Test Complete.

P0870-OD HYDRAULIC PRESSURE TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies the switches are operational (Close with pressure applied). The Transmission Control System verifies the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

WHEN MONITORED:

In a forward gear with engine speed above 1000 RPM, shortly after a shift and every minute after.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 RPM, the PCM momentarily turns on element pressure to the clutch circuits that does not have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
(K856) 5-VOLT SUPPLY CIRCUIT OPEN
(K856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T9) OD PRESSURE SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUIT
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for transmission DTCs.

       Are any Loss of Prime, TCM Power Input and/or Line Pressure Sensor DTCs present?

Yes

- Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure. If DTC P0944-LOSS OF PRIME is present, perform its respective test first.

No

- Go To 2.

2. **CHECK FOR RELATED DTCS**
   1. With the scan tool, read DTCs.

      Is DTC P2706 present?

      Yes

      - Refer to **P2706-MS SOLENOID CIRCUIT** and perform diagnostics for P2706-MS SOLENOID CIRCUIT.

      No

      - Go To 3.

3. **CHECK FOR RELATED DTCS**
   1. With the scan tool, check for transmission DTCs.

      Are DTCs, P0733, P0734, P0735 and/or P0871 present?

      Yes

      - Go To 12.

      No

      - Go To 4.

4. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 5.

      No

- Go To 15.

5. **CHECK LINE PRESSURE**
    1. Start the engine.
    2. Warm the transmission to 82° C or 180° F.
    3. Firmly apply the brakes.
    4. With the scan tool, monitor the Line Pressure during the following step.
    5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least five seconds in each range.

    Did the line pressure remain at a steady value between 585 and 655 kPa (85 and 95 psi) in each position?

    Yes

    - Go To 6.

    No

    - Go To 10.

6. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
    1. Ignition ON, Engine Not Running.
    2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the transmission.

    Did the Line Pressure reading on the scan tool change to about 207 kPa (30 psi) or 0.7 volts when the connector was pushed inward?

    Yes

    - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 7.

7. **CHECK THE LINE PRESSURE SENSOR OPERATION**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

3. Install the (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition ON, Engine Not Running.
6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the three line pressure positions on the Transmission Simulator.

NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) or 0.1 volts of the reading specified on the Transmission Simulator.

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information. Refer to **SENSOR, VARIABLE LINE PRESSURE, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 8.

8. **CHECK THE (K856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 48: Checking 5-Volt Supply Circuit For An Open

1. Turn the ignition OFF to the LOCK position.
2. Disconnect Transmission Simulator.
3. Disconnect the PCM C1 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (K856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (K856) 5-volt Supply circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 9.

9. **CHECK THE (K856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 49: Checking 5-Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K856) 5-volt Supply circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (K856) 5-volt Supply circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

10. **COMPARE SCAN TOOL TO PRESSURE GAUGE**
    1. Turn the ignition OFF to the LOCK position.
    2. Connect the (special tool #8259, Adapter, Pressure Test) and (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to the Service Information for proper installation procedure.

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the RPM to 1500 and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500 and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500 and compare the line pressure readings.

       Does the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

       Yes

- Go To 11.

No

- Replace the Line Pressure Sensor in accordance with the Service Information. Refer to **SENSOR, VARIABLE LINE PRESSURE, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

11. **CHECK PCM AND WIRING**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the (special tool #8259, Adapter, Pressure Test) and (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
    3. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

    4. Install the (special tool #8333A, Simulator, Transmission).
    5. On the Transmission Simulator, turn the Pressure Switch selector switch to OD.
    6. Ignition ON, Engine Not Running.
    7. With the scan tool, monitor the OD Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the OD Pressure Switch.

       Did the OD Pressure Switch state change to closed and remain closed while wiggling the wires?

       Yes

       - Go To 12.

       No

       - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the (special tool #8333A, Simulator, Transmission).

3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

   Does the Transmission Oil Pan contain excessive debris or contamination?

   Yes

   - Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 13.

13. **CHECK THE OD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the OD hydraulic clutch circuit (in the case) for leakage in accordance with the Service Information.

       NOTE: The OD hydraulic clutch circuit contains a small bleed orifice which connects to the Reverse hydraulic clutch circuit. A small amount of air leakage is normal.

       Was excessive air leakage noticed during the air check?

       Yes

       - Repair as necessary. Check the OD/Rev clutch piston seals, bleed orifice assembly, reaction shaft support seal rings, and machining of the main mating faces on the pump housing, pump valve body and reaction shaft support. Refer to **REMOVAL** .
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Disassemble and inspect the Valve Body and repair as necessary. Inspect the OD Accumulator piston and seals. Check for an extra check ball downstream from the No. 6 check ball pocket and repair as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

14. **CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 50: Checking OD Pressure Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: **Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

3. Measure the resistance between the (T9) OD Pressure Signal circuit and all other circuits in the

Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T9) OD Pressure Signal circuit and any other circuit (s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T9) OD Pressure Signal circuit for a short to another circuit(s).
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

15. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.
    5. If the Event Data shows DTC P0870 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

    Where any problems found?

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Test Complete.

P0871-OD PRESSURE SWITCH RATIONALITY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown in chart.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The appropriate DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
NO. 4 OR NO. 6 CHECK BALL CUT OR DAMAGED
(T9) OD PRESSURE SIGNAL CIRCUIT OPEN
(T9) OD PRESSURE SIGNAL CIRCUIT SHORTED TO GROUND
(T9) OD PRESSURE SIGNAL CIRCUIT SHORTED TO OTHER CIRCUITS
LOW LINE PRESSURE
WIRING AND CONNECTORS
CUT OD/REV PISTON SEAL
BROKEN OR MISSING OD/REV PISTON BLEED ORIFICE
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE
BROKEN OR MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
TRANSMISSION SOLENOID/TRS ASSEMBLY
CUT OD ACCUMULATOR PISTON SEAL
CRACKED OD ACCUMULATOR PISTON
BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK DTCS**
    1. With the scan tool, read DTCs.

       Are TCM Power Input DTCs present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK FOR LINE PRESSURE DTCS**
    1. With the scan tool, read DTCs.

       Are Line Pressure DTCs present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

       No

       - Go To 3.
3. **CHECK FOR OTHER PRESSURE SWITCH DTCS**
    1. With the scan tool, check Transmission DTCs.

       Are there two or more pressure switch rationality DTCs present in addition to P0871?

       Yes

- Go To 5.

No

- Go To 4.

4. **CHECK IF DTC IS CURRENT**
   1. With the scan tool, check and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data show data for P0871?

      Yes

      - Go To 8.

      No

      - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

5. **CHECK IF PRESSURE SWITCHES READ CLOSED**
   1. With the scan tool, check and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Do all the pressure switches read CLOSED in the Event Data?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure for P0882. Follow instructions as if the DTC is current.

      No

      - Go To 6.

6. **CHECK IF PRESSURE SWITCHES READ OPEN**

   In the Event Data recorded earlier, do all the pressure switches read open?

   Yes

   - Go To 7.

No

- Go To 8.

7. **CHECK FOR LOW LINE PRESSURE**

In the Event Data recorded earlier, is the Line Pressure less than 40 psi and significantly below the Desired Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check the fluid level and adjust as necessary. If the fluid level is OK, check the Primary Oil Filter weal for a spit, crack or improperly installed. If the filer and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures. Refer to **PUMP, TRANSMISSION OIL, DISASSEMBLY** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

8. **CHECK IF IN DTC SET IN PARK, NEUTRAL, OR REVERSE**

In the Event Data recorded earlier, does the Event Data show the OD Pressure Switch DTC set while in Park, Neutral or Reverse?

Yes

- Go To 18.

No

- Go To 9.

9. **CHECK IF THE OD PRESSURE SWITCH IS OPEN**

In the Event Data recorded earlier, did the OD Pressure Switch read OPEN?

Yes

- Go To 10.

No

- Go To 15.

10. **CHECK FOR LOW LINE PRESSURE**

    In the Event Data recorded earlier, is the Line Pressure less than 40 psi and significantly below the Desired Line Pressure?

    Yes

    - Repair as necessary to correct low line pressure. Check the fluid level. Check the Primary Oil Filter seal for a split, crack or improperly installed. Refer to the Service Information for the proper installation procedure. If the fluid level and filter are OK, check the Main Regulator Valve in the Oil Pump. Refer to **PUMP, TRANSMISSION OIL, DISASSEMBLY** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 11.

11. **CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 51: Checking OD Pressure Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect all PCM harness connectors.
3. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Measure the resistance between the (T9) OD Pressure Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms between the (T9) OD Pressure Signal circuit and any other circuit

(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T9) OD Pressure Signal circuit for a short to another circuit(s).
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 12.

12. **CHECK IF THE DTC RESETS**
    1. Reconnect all previously disconnected connectors.
    2. With the scan too, erase transmission DTCs.
    3. Test drive the vehicle, use the Event Data recorded earlier to help duplicate the conditions when the DTC set.

    Does DTC P0871 reset?

    Yes

    - Go To 13.

    No

    - Go To 22.

13. **CHECK THE POWERTRAIN CONTROL MODULE (PCM)**
    1. Remove the Transmission Control Relay.
    2. Operate the vehicle in Drive.

    Is the transmission slipping while in Drive?

    Yes

    - Go To 14.

    No

    - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the and program PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

14. **CHECK INTERNAL TRANSMISSION**
    1. Perform an Air Check Transmission Clutch Operation procedure in accordance with the Service Information.

NOTE: **The OD/Rev piston contains a small bleed orifice and a small amount of leakage between the OD and Reverse hydraulic clutch circuits is considered normal.**

Is there excessive air leakage in any clutch circuit?

Yes

- Check the OD/Rev piston seals and bleed orifice, reaction shaft support seal rings, dribbler orifice assemblies in the reaction shaft support and for poor machine on the pump valve body faces. Refer to **REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Repair the Valve Body. Check the OD Accumulator piston and seals, OD bleed orifice and No. 6 check ball cuts or damage. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

15. **CHECK PCM AND WIRING**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the Starter Relay.

CAUTION: **Removal of the Starter Relay will prevent the vehicle from being started in gear.**

WARNING: **The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.**

NOTE: **Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

    3. Install (special tool #8333A, Simulator, Transmission).
    4. Ignition ON, Engine Not Running.
    5. With the Transmission Simulator, turn the Pressure Switch selector switch to OD.
    6. With the scan tool, monitor the OD Pressure Switch state while pressing the Pressure Switch Test

button on the Transmission Simulator.

Did the state of the OD Pressure Switch change from OPEN to CLOSED while pressing the Test button?

Yes

- Go To 16.

No

- Go To 18.

16. **CHECK IF THE NO. 4 AND/OR NO. 6 CHECK BALL IS CUT OR DAMAGED**
    1. With the scan tool, erase previously stored DTCs and test drive the vehicle, use the Event Data to help duplicate the conditions when the DTC set. Note any DTCs that may set.
    2. Remove the Transmission Valve Body in accordance with the Service Information.
    3. Check the No. 4 and No. 6 Check Balls for cuts or damage.

    Is the No. 4 and/or No. 6 Check Ball cut or damaged?

    Yes

    - Replace the No. 4 and/or No. 6 Check Ball and check for clutch debris in the transmission oil pan. If there is excessive debris, perform internal repairs to the OD Clutch Assembly. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 17.

17. **TRANSMISSION SOLENOID/TRS ASSEMBLY**

    Did DTC P0871 reset during the test drive in the previous step?

    Yes

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 22.

18. **CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR AN OPEN**

Fig. 52: Checking OD Pressure Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38

Position).

3. Disconnect the Transmission Solenoid/TRS Assembly harness connector

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T9) OD Pressure Signal circuit between the Solenoid/TRS Assembly harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (T9) OD Pressure Signal circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 19.

19. **CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 53: Checking OD Pressure Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T9) OD Pressure Signal circuit.

   Is the resistance below 5.0 ohms?

Yes

- Repair the (T9) OD Pressure Signal circuit for a short to ground.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 20.

20. **CHECK WIRING AND CONNECTORS**
    1. Using the schematics as a guide, inspect the wiring and connectors. Pay particular attention to all power and ground circuits.

    Were any problems found

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 21.

21. **CHECK IF DTC RESETS**
    1. Reconnect all previously disconnected connectors.
    2. Make sure all Event Data is recorded.
    3. With the scan tool, erase previously stored DTCs and test drive the vehicle, use the Event Data to help duplicate the conditions when the DTC set.

    Does DTC P0871 reset?

    Yes

    - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 22.

22. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

    Where any problems found?

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Test Complete.

P0875-UD HYDRAULIC PRESSURE TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (Close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

WHEN MONITORED:

In a forward gear with engine speed above 1000 RPM, shortly after a shift and every minute after.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 RPM, the Powertrain Control Module (PCM) momentarily turns on element pressure to the clutch circuits that does not have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close two times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION

RELATED DTCS PRESENT
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
TRANSMISSION CONTROL RELAY DTCS PRESENT
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T29) UD PRESSURE SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUIT
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are any Loss of Prime, TCM Power Input, and/or Line Pressure Sensor DTCs present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure. If DTC, P0944-LOSS OF PRIME is present, perform its respective test first.

       No

       - Go To 2.
2. **CHECK FOR DTC P0765**
    1. With the scan tool, read DTCs.

       Is DTC P0765 present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

       No

       - Go To 3.

3. **CHECK FOR OTHER DTCS**
    1. With the scan tool, read DTCs.

       Are DTCs, P0731, P0732, P0733, P0876 and/or P1736 present?

       Yes

       - Go To 12.

       No

       - Go To 4.
4. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 5.

       No

       - Go To 15.
5. **CHECK LINE PRESSURE**
    1. Start the engine.
    2. Warm the transmission to 82° C (180° F).
    3. Firmly apply the brakes.
    4. With the scan tool, monitor the Line Pressure during the following step.
    5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least five seconds in each range.

       Did the line pressure remain at a steady value between 585 and 655 kPa (85 and 95 psi) in each position?

       Yes

       - Go To 6.

       No

       - Go To 10.
6. **CHECK LINE PRESSURE SENSOR CONNECTION**
    1. Ignition ON, Engine Not Running.

2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the transmission.

   Did the Line Pressure reading on the scan tool change to about 207 kPa (30 psi) or 0.7 volts when the connector was pushed inward?

   Yes

   - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 7.

7. **CHECK LINE PRESSURE SENSOR OPERATION**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Starter Relay.

      CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

      WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

      NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

   3. Install the (special tool #8333A, Simulator, Transmission).
   4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
   5. Ignition ON, Engine Not Running.
   6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the three line pressure positions on the Transmission Simulator.

      NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) 0.1 volts of the reading specified on the Transmission Simulator.

      Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

      Yes

- Replace the Line Pressure Sensor in accordance with the Service Information. Refer to **SENSOR, VARIABLE LINE PRESSURE, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 54: Checking 5-Volt Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect Transmission Simulator.
3. Disconnect the PCM C1 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 55: Checking 5-Volt Supply Circuit For A Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

10. **COMPARE SCAN TOOL TO PRESSURE GAUGE**
    1. Turn the ignition OFF to the LOCK position.
    2. Connect the (special tool #8259, Adapter, Pressure Test) and (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to the Service Information for proper installation procedure.

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the RPM to 1500 and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500 and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive and raise the RPM to 1500 and compare the line pressure readings.

       Does the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

Yes

- Go To 11.

No

- Replace the Line Pressure Sensor in accordance with the Service Information. Refer to **SENSOR, VARIABLE LINE PRESSURE, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

11. **CHECK WIRING AND CONNECTORS**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the (special tool #8259, Adapter, Pressure Test) and (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
    3. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

    4. Install the (special tool #8333A, Simulator, Transmission).
    5. On the Transmission Simulator, turn the Pressure Switch selector switch to UD.
    6. Ignition ON, Engine Not Running.
    7. With the scan tool, monitor the UD Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the UD Pressure Switch.

    Did the UD Pressure Switch state change to closed and remain closed while wiggling the wires?

    Yes

    - Go To 12.

    No

    - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition OFF to the LOCK position.

2. Remove the (special tool #8333A, Simulator, Transmission).
3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

   Does the Transmission Oil Pan contain excessive debris or contamination?

   Yes

   - Repair the cause of the excessive debris in the Transmission Oil Pan.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 13.

13. **CHECK THE UD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) for leakage in accordance with the Service Information.

       NOTE: The UD hydraulic clutch circuit contains a small bleed orifice. A small amount of air leakage is normal.

       Was there excessive air leakage noticed during the air check?

       Yes

       - Repair as necessary. Check the UD clutch piston, piston seals and bleed orifice, reaction shaft support seal rings and machining of the main mating faces of the pump housing, pump valve body and reaction shaft support. Refer to **REMOVAL** .
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Disassemble and inspect the Valve Body and repair as necessary. Inspect the UD Accumulator piston and seals. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

14. **CHECK THE (T29) UD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 56: Checking UD Pressure Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: **Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

3. Measure the resistance between the (T29) UD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms between the (T29) UD Pressure Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T29) UD Pressure Signal circuit for a short to another circuit(s).
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

15. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.
    5. If the Event Data shows DTC P0875 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

       Where any problems found?

       Yes

       - Repair as necessary.
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

- Test Complete.

P0876-UD PRESSURE SWITCH RATIONALITY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown in chart.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC sets when the UD pressure switch is in the wrong state for the current gear. For example, this code would set if the UD pressure switch remained off while the transmission was in second gear.

POSSIBLE CAUSES

Possible Causes
RELATED RELAY DTCS PRESENT
LOW FLUID LEVEL
NO. 2 CHECK BALL CUT OR DAMAGED
LOW LINE PRESSURE
CRACKED OR MIS-INSTALLED SUMP FILTER OR SEAL
LOOSE COOLER RETURN SPIN ON FILTER (IF EQUIPPED)
STICKING MAIN REGULATOR VALVE IN PUMP VALVE BODY
(T29) UD PRESSURE SIGNAL CIRCUIT OPEN
(T29) UD PRESSURE SIGNAL CIRCUIT SHORTED TO GROUND
(T29) UD PRESSURE SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUITS
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN

4TH	OPEN	OPEN	CLOSED	OPEN	CLOSED
5TH	OPEN	CLOSED	OPEN	OPEN	CLOSED
*L/R is closed if output speed is below 100 RPM in Drive and Manual 2. L/R is closed in Manual 1.					
**May be open when rolling in Neutral or at low oil temperatures.					

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
   1. With the scan tool, read DTCs.

      Are any TCM Power Input, Line Pressure, and/or Loss of Prime DTCs present?

      Yes

      - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure. If a Loss of Prime DTC is present, perform its respective test first.
      -

      No

      - Go To 2.
2. **CHECK FOR PRESSURE SWITCH DTCS**

   Are two or more pressure switch rationality DTCs present in addition to P0876?

   Yes

   - Go To 3.

   No

   - Go To 4.
3. **CHECK IF ALL PRESSURE SWITCHES READ CLOSED**
   1. With the scan tool, read and record all Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data show all pressure switches reading CLOSED?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform diagnostics for P0882. Diagnose the symptom as if the DTC is current.

No

- Go To 4.

4. **CHECK FOR OTHER DTCS**
   1. With the scan tool, read DTCs.

      Is DTC P2704 present?

      Yes

      - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Go To 5.

5. **CHECK THE EVENT DATA**

   In the Event Data recorded earlier, does the Event Data display information for DTC P0876?

   Yes

   - Go To 6.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform diagnostics for the DTC listed in the Event Data.

6. **CHECK IF EVENT DATA WAS SET IN PARK, NEUTRAL OR REVERSE**

   In the Event Data recorded earlier, did DTC P0876 set in Park, Neutral or Reverse?

   Yes

   - Go To 10.

   No

- Go To 7.

7. **CHECK FOR UD PRESSURE SWITCH STATUS**

   In the Event Data recorded earlier, did DTC P0876 set with the UD Pressure Switch closed?

   Yes

   - Go To 10.

   No

   - Go To 8.

8. **CHECK LINE PRESSURE**

   In the Event Data recorded earlier, is the Line Pressure less than 40 psi and significantly below the Desired Line Pressure?

   Yes

   - Repair as necessary to correct low line pressure. Check the fluid level and adjust as necessary. If the fluid level is OK, check the Primary Oil Filter seal for a split, crack or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures. Refer to **PUMP, TRANSMISSION OIL, DISASSEMBLY** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 9.

9. **CHECK THE (T29) UD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 57: Checking UD Pressure Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect all PCM harness connectors.

3. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Measure the resistance between the (T29) UD Pressure Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms between the (T29) UD Pressure Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T29) UD Pressure Signal circuit for a short to another circuit(s).
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

10. **CHECK THE PCM AND WIRING**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the Starter Relay.

       CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

       WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

       NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

    3. Install the (special tool #8333A, Simulator, Transmission).
    4. Ignition ON, Engine Not Running.
    5. With the Transmission Simulator, turn the Pressure Switch selector switch to the UD position.
    6. With the scan tool, monitor the UD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

       Did the state of the UD Pressure Switch change while pressing the Pressure Switch Test button?

       Yes

- Go To 14.

No

- Go To 11.

11. **CHECK THE (T29) UD PRESSURE SIGNAL CIRCUIT FOR AN OPEN**

Fig. 58: Checking UD Pressure Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38

Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T29) UD Pressure Signal circuit from the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (T29) UD Pressure Signal circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 12.

12. **CHECK THE (T29) UD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 59: Checking UD Pressure Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T29) UD Pressure Signal circuit.

   Is the resistance below 5.0 ohms?

   Yes

- Repair the (T29) UD Pressure Signal circuit for a short to ground.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 13.

13. **CHECK THE (T29) UD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 60: Checking UD Pressure Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.

NOTE: **Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

2. Measure the resistance between the (T29) UD Pressure Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms between the (T29) UD Pressure Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T29) UD Pressure Signal circuit for a short to another circuit(s).
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

14. **WIGGLE TEST USING THE TRANSMISSION SIMULATOR**
    1. Perform the steps in the previous test while wiggling the wiring harness and connectors pertaining to the UD Pressure Switch.

       Did the state of the UD Pressure Switch change while pressing the Pressure Switch Test button?

       Yes

       - Repair the wiring harness and/or connectors as necessary.
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Go To 15.

15. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**

Fig. 61: Checking The Transmission Solenoid/TRS Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Transmission Simulator and reconnect the Transmission Solenoid/TRS Assembly harness connector.
2. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).
3. Measure the resistance between ground and the (T29) UD Pressure Signal circuit in the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance below 5.0 ohms?

   Yes

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service

Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 16.

16. **CHECK IF THE DTC RESETS**
    1. Reconnect all previously disconnected connectors.
    2. With the scan tool, erase all transmission DTCs.
    3. Test drive the vehicle. Using the Event Data recorded earlier, try to duplicate the conditions in which the DTC set.

    Does DTC P0876 reset?

    Yes

    - Go To 17.

    No

    - Go To 18.

17. **CHECK FOR A CUT NO. 2 CHECK BALL**
    1. Remove the Valve Body in accordance with the Service Information.
    2. Check the No. 2 check ball for cuts or damage.

    Is the No. 2 check ball cut or damaged?

    Yes

    - Replace the No. 2 check ball. Check for excessive clutch debris in the oil pan. If excessive debris is present, check the UD Clutch and repair as necessary. Refer to **VALVE BODY, REMOVAL** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** . Check for excessive clutch debris in the oil pan. If excessive debris is present, check the UD Clutch and repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

18. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Test Complete.

P0882-TCM POWER INPUT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Relay is used to supply power to the solenoids and pressure switches when the transmission is in normal operating mode. The relay output is fed back to the TCM through pins 16, 17 and 36. It is referred to as "Transmission Control Relay Output". This circuit does not supply power to the TCM, it is only a sense circuit. When the relay is off, no power is supplied to the solenoids or pressure switches and the transmission is in "limp-in" or "default" mode. **Note: Inadequate Transmission Control Relay Output voltage can cause DTCs P0846, P0869, P0871, P0876 or P0988 to set. This does not indicate an internal transmission or solenoid/TRS problem. Repairing the P0882 fault should eliminate the related DTCs.**

WHEN MONITORED:

When the ignition is turned from OFF position to RUN position and/or the ignition is turned from START position to RUN position.

SET CONDITION:

This DTC is set when less than 3.0 volts are present at the transmission control relay output circuits at the Powertrain Control Module when the PCM is energizing the relay.

POSSIBLE CAUSES

Possible Causes
TIPM INTERNAL FUSED B(+) CIRCUIT OPEN

(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
(T15) TRANSMISSION CONTROL CIRCUIT OPEN
(T15) TRANSMISSION CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION CONTROL RELAY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 0 for this DTC?

       Yes

       - Go To 2.

       No

       - Go To 8.
2. **CHECK THE INTERNAL FUSED B(+) CIRCUIT FOR AN OPEN**

Fig. 62: Checking Internal Fused B(+) Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Remove the Transmission Control Relay.

NOTE: Check connectors - Clean/repair as necessary.

3. Ignition ON, Engine Not Running.
4. Using a 12-volt test light connected to ground, check the internal Fused B(+) circuit in the Transmission Control Relay connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 3.

No

- Repair the internal Fused B(+) circuit for an open. If the fuse is open make sure to check for a short to ground.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

3. **CHECK THE TRANSMISSION CONTROL RELAY**
   1. Turn the ignition OFF to the LOCK position.
   2. Install a substitute relay in place of the Transmission Control Relay.
   3. Start the vehicle.
   4. With the scan tool, read DTCs.

   Did DTC P0882 reset?

   Yes

   - Go To 4.

   No

   - Replace the Transmission Control Relay.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.
4. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN**

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (T15) Transmission Control circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

8. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Where any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Test Complete.

P0883-TCM POWER INPUT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Relay is used to supply power (Transmission Control Output) to the Transmission Solenoid/TRS Assembly when in normal operating mode and to pins C4-19, C4-28 and C4-38 of the PCM. The purpose of the Transmission Control Relay is to allow the Powertrain Control Module (PCM) to turn off power to the Transmission Solenoid/TRS Assembly in event the transmission should need to be placed into "limp-in" mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position or after cranking engine) the PCM verifies the Transmission Control Relay contacts are open by checking for voltage on the Transmission Control Relay Output circuit before the Transmission Control Relay is energized. If voltage is detected, the DTC will set.

WHEN MONITORED:

When the ignition is turned from OFF position to RUN position and/or the ignition is turned from START position to RUN position.

SET CONDITION:

This DTC is set if the Powertrain Control Module (PCM) senses greater than 3.0 volts on the Transmission Control Relay Output circuits prior to a request from the PCM to energize the Transmission Control Relay.

POSSIBLE CAUSES

Possible Causes
(T15) TRANSMISSION CONTROL CIRCUIT SHORTED TO VOLTAGE
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORTED VOLTAGE
TRANSMISSION CONTROL RELAY
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 0 for this DTC?

       Yes

       - Go To 2.

       No

       - Go To 5.

2. **CHECK THE TRANSMISSION CONTROL RELAY**
    1. Turn the ignition OFF to the LOCK position.
    2. Disconnect the Transmission Control Relay.
    3. Install a substitute relay.
    4. Ignition ON, Engine Not Running.
    5. With the scan tool, read DTCs.

    Is the status Active or is the Starts Since Set counter 0 for this DTC?

    Yes

    - Go To 3.

    No

    - Replace the Transmission Control Relay.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.
3. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 67: Checking Transmission Control Output Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Remove the Transmission Control Relay.
2. Ignition ON, Engine Not Running.
3. Measure the voltage at the (T16) Transmission Control Output circuit in the Transmission Control Relay connector.

   Is the voltage above 0.5 volts?

   Yes

   - Repair the (T16) Transmission Control Output circuit for a short to voltage.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

PCM PINOUT

BOX 8815

MODULE-
TOTALLY
INTEGRATED

Fig. 68: Checking Transmission Control Circuit For A Short To Voltage

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

3. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Disconnect the TIPM C1 harness connector.
5. Ignition ON, Engine Not Running.
6. Measure the voltage of the (T15) Transmission Control circuit.

   Is the voltage above 0.5 volts?

   Yes

   - Repair the (T15) Transmission Control circuit for a short to voltage.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

   Where any problems found?

   Yes

   - Repair as necessary.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Test Complete.

P0884-POWER UP AT SPEED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

If a vehicle loses power to the Transmission Control System, the solenoids (L/R, 2C, OD, UD, 4C) will go to their respective power off state. Some solenoids are normally vented and some are normally applied in their power off state. The transmission is designed to be in 4th gear with all of the solenoids in this state. However, if power is restored the Transmission Control System will power-up and normal operation is restored.

This code identifies that power to the Transmission Control System was restored when the gear selector is in a "Drive" position while the vehicle is moving at speeds above 32 Km/h (20 mph). **This DTC does not indicate a problem with the transmission or Transmission Control System,** instead, it suggests intermittent problems in the fused ignition switch output, fused B(+) or ground circuits to the PCM. Alternately, if a rolling restart maneuver is performed, the DTC can set. Therefore it is critical that this DTC be investigated if the vehicle is experiencing intermittent 4th gear operation and a subsequent return to normal operation.

WHEN MONITORED:

When Powertrain Control Module (PCM) initially powers up.

SET CONDITION:

This DTC will set if the PCM powers up and senses the vehicle in a valid forward gear with no PRNDL DTCs and an output speed above 800 RPM, approximately 32 Km/h or 20 mph.

POSSIBLE CAUSES

Possible Causes
POWER UP AT SPEED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK THE POWER AND GROUND CIRCUITS**
    1. This DTC is set when the transmission portion of the PCM is initialized while the vehicle is moving down the road in a valid forward gear.

2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
3. Check all of the Fused B(+), Fused Ignition Switch Output and ground circuits to the PCM for an intermittent open or short to ground.
4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

Repair

- Check all power and ground circuits to the PCM and repair as necessary.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0890-SWITCHED BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Relay is used to supply power to the solenoids and pressure switches (Transmission Solenoid/TRS Assembly) when the transmission is in normal operating mode. When the relay is off, no power is supplied and the transmission is in "limp-in" mode. The relay output is fed back to the PCM through pins C4-19, C4-28 and C4-38 and are referred to as "Transmission Control Relay Output".

Immediately after a controller reset (ignition key turned to the RUN position or after cranking engine), the TCM verifies the relay contacts are open by checking for no voltage at the transmission control relay output terminals. After this is verified, the voltage at the pressure switches are checked. There should be no voltage on the pressure switches at this time. The Powertrain Control Module (PCM) will activate the relay.

WHEN MONITORED:

When the ignition is turned from OFF position to RUN position and/or the ignition is turned from START position to RUN position.

SET CONDITION:

This DTC is set if the Powertrain Control Module (PCM) senses voltage on any of the pressure switch inputs prior to the Transmission Control Relay being energized.

POSSIBLE CAUSES

Possible Causes
PRESSURE SIGNAL CIRCUITS SHORTED TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 0 for this DTC?

       Yes

       - Go To 2.

       No

       - Go To 4.
2. **PRESSURE SIGNAL CIRCUITS SHORTED TO VOLTAGE**

Fig. 69: Checking Pressure Signal Circuits For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).
3. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Remove the Transmission Control Relay.

NOTE: Note: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

5. Connect a jumper wire between the internal Fused B(+) circuit and the Transmission Control Output circuit in the Transmission Control Relay connector.
6. Ignition ON, Engine Not Running.
7. Measure the voltage of the (T147) 2C, (T48) 4C, (T50) L/R, (T9) OD and (T29) UD Pressure Signal circuits in the (special tool #8815A, Kit, NGC, 38 Position).

   Is the voltage above 0.5 volts on any of the measured circuits?

   Yes

   - Repair the (T147) 2C, (T48) 4C, (T50) L/R, (T9) OD and/or (T29) UD Pressure Signal circuit(s) for a short to voltage.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 3.

3. **TRANSMISSION SOLENOID/TRS ASSEMBLY**

Fig. 70: Checking Pressure Signal Circuits For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Remove the jumper wire.

NOTE: Do not reinstall the Transmission Relay.

3. Reconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Ignition ON, Engine Not Running.
5. Measure the voltage of the (T147) 2C, (T48) 4C, (T50) L/R, (T9) OD and (T29) UD Pressure Signal circuits in the (special tool #8815A, Kit, NGC, 38 Position).

   Is the voltage above 0.5 volts on any of the sense circuits?

   Yes

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

   Where any problems found?

   Yes

   - Repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

- Test Complete.

P0933-HYDRAULIC PRESSURE SENSOR RANGE/PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS), (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level of 1034 to 1103 kPa (150 to 160 psi) during shifts to ensure consistent shift quality.

WHEN MONITORED:

Continuously with the ignition on, engine running and the transmission in gear.

SET CONDITION:

The Powertrain Control Module (PCM) continuously monitors actual Line Pressure and compares it to Desired Target Line Pressure. If the Line Pressure reading is more than 172.4 kPa (25 psi) higher than the Desired Line Pressure, but is less than the highest Line Pressure used in the current gear, the DTC sets.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
LINE PRESSURE CONNECTOR AND WIRING
LINE PRESSURE SENSOR
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are any other line pressure DTCs present?

Yes

- Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure. Perform the test for P0934 and/or P0935 first if they are present.

No

- Go To 2.

2. **COMPARE ACTUAL LINE PRESSURE TO DESIRED LINE PRESSURE**

CAUTION: Apply Parking Brake

1. Start the engine.

CAUTION: Firmly apply the brakes.

2. With the scan tool, monitor the Line Pressure, Desired Line Pressure and the TPS degrees.
3. While firmly applying the brakes, place the shifter in reverse, then slowly press the accelerator pedal to a TPS degree of 15°.
4. Compare the Line Pressure reading to the Desired Line Pressure reading on the scan tool.

Does the Line Pressure stay within ± 34 kPa (5 psi) of the Desired Line Pressure?

No

- Go To 3.

Yes

- Go To 6.

3. **CHECK LINE PRESSURE CONNECTOR AND WIRING**

1. Ignition on, engine not running.
2. With the scan tool, monitor the Line Pressure Sensor voltage while wiggling the wiring harness and connectors pertaining to the Line Pressure Sensor and the Transmission Solenoid/TRS Assembly.

Did the voltage remain steady while wiggling the wiring harness and connectors?

Yes

- Go To 4.

No

- Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

4. **CHECK PCM AND WIRING USING THE TRANSMISSION SIMULATOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
   5. Ignition on, engine not running.
   6. With the scan tool, monitor the Line Pressure during the following step.
   7. With the Transmission Simulator, turn the selector switch to each of the three Line Pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) or 0.1 volts of the reading specified on the Transmission Simulator.

Does the Line Pressure on the scan tool fluctuate up and down more than 69 kPa (10 psi) or 0.25 volts at any of the 3 line pressure positions on the Transmission Simulator?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK THE LINE PRESSURE SENSOR**

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission) and reconnect all previously disconnected connectors.
3. Install the Line Pressure Adaptor (special tool #8259, Adapter, Pressure Test), and the Pressure Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.), 0 to 2000 kPa (0 to 300 psi).
4. Start the engine in park.
5. Monitor the line pressure readings of the scan tool and the pressure gauge and compare the two readings.

   Is the line pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?

   Yes

   - Repair internal transmission and inspect the oil pump in accordance with the Service information and replace if necessary. If no problems are found, replace the Transmission Solenoid/TRS Assembly - possible cause is the Pressure Control Solenoid is stuck.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Replace the Line Pressure Sensor in accordance with the Service Information.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Where any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Test Complete.

P0934-LINE PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS), (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on transmission and engine inputs. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 psi) during shifts and in Park or Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate a Line Pressure Sensor or wiring problem and will cause DTC P0934 or P0935 to set.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC will set when the monitored Line Pressure Sensor voltage is less than or equal to 0.35 volts for 0.18 of a second.

POSSIBLE CAUSES

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go To 2.

No

- Go To 7.

2. **CHECK THE PCM AND WIRING**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Ignition Switch Feed fuse from the Totally Integrated Power Module (TIPM).

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the (special tool #8333A, Simulator, Transmission).
   4. Ignition ON, Engine Not Running.
   5. With the scan tool, under Transmission Sensors, monitor the Line Pressure.
   6. Using the Transmission Simulator, set the rotary switch to each of the three line pressure positions.

      NOTE: The readings should be within ±14 kPa (2.0 psi) on the scan tool to the pressure readings specified on Transmission Simulator.

      Does the Line Pressure on the scan tool match the line pressures on the Transmission Simulator?

      Yes

      - Replace the Line Pressure Sensor in accordance with the Service Information.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 71: Checking Line Pressure Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).
3. Disconnect the (special tool #8333A, Simulator, Transmission).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in

poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance between ground and the (T38) Line Pressure Sensor Signal circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (T38) Line Pressure Sensor Signal circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 72: Checking Line Pressure Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.
2. Measure the resistance of the (T38) Line Pressure Sensor Signal circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms?

   Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for an open.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 73: Checking 5-Volt Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the (special tool #8815A, Kit, NGC, 38 Position) to the PCM C1 harness connector.
2. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure sensor harness

connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 6.

6. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 74: Checking 5-Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the PCM C1 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).
2. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Where any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Test Complete.

P0935-LINE PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS), (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on transmission and engine inputs. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 psi) during shifts and in Park or Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate a Line Pressure Sensor or wiring problem and will cause DTC P0934 or P0935 to set.

WHEN MONITORED:

Continuously with ignition on and engine running.

SET CONDITION:

This DTC will set if the monitored Line Pressure Sensor voltage is greater than or equal to 4.75 volts for 0.18 of a second.

POSSIBLE CAUSES

Possible Causes
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(K900) SENSOR GROUND CIRCUIT OPEN
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 2.

No

- Go To 6.

2. **CHECK THE PCM AND WIRING**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the (special tool #8333A, Simulator, Transmission).
   4. Ignition ON, Engine Not Running.
   5. With the scan tool, monitor the Line Pressure.
   6. Using the Transmission Simulator, set the rotary switch to each of the three line pressure positions.

NOTE: The readings should be within ±14 kPa (2.0 psi) on the scan tool of the pressure reading specified on Transmission Simulator.

Does the 3 line pressures on the scan tool match the Line pressure readings on the Transmission Simulator?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 75: Checking Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (K900) Sensor Ground circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (K900) Sensor Ground circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 76: Checking Line Pressure Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).
2. Measure the resistance of the (T38) Line Pressure Sensor Signal circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for an open.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 77: Checking Line Pressure Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition ON, Engine Not Running.
2. With the scan tool under TIPM, actuate the Transmission.
3. Measure the voltage of the (T38) Line Pressure Sensor Signal circuit.

   Is the voltage above 5.5 volts?

   Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for a short to voltage.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

   Where any problems found?

   Yes

   - Repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Test Complete.

P0944-LOSS OF HYDRAULIC PUMP PRIME

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Loss of Prime Test is used to prevent transmission defaults and erroneous fault codes during temporary loss of pump prime that may occur with low transmission fluid under severe braking conditions, start-up, etc. and to point towards more subtle problems such as a plugged or cracked oil filter.

The Loss of Hydraulic Pump Prime DTC is set by a loss of hydraulic pressure in the transmission system. This condition, if sustained, will result in the vehicle being unable to move.

WHEN MONITORED:

If the transmission is slipping in any forward gear and all the pressure switches are not indicating pressure, a loss of prime test is run.

SET CONDITION:

If the transmission begins to slip in a forward gear and all the pressure switches are open a loss of prime test begins. Available elements are turned on by the PCM to see if pump prime exists. The DTC sets if no pressure switches respond.

POSSIBLE CAUSES

Possible Causes
SHIFT LEVER OUT OF ADJUSTMENT
IMPROPER FLUID LEVEL
CRACKED OR IMPROPERLY INSTALLED PRIMARY OIL FILTER OR SEAL
LOOSE COOLER RETURN FILTER
STUCK OR STICKING MAIN REGULATOR VALVE
TRANSMISSION OIL PUMP

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **SHIFT LEVER POSITION TEST**
    1. Using the scan tool, perform a Shift Lever Position Test. Follow the scan tool instructions.

       Did the Shift Lever Position Test pass?

       Yes

       - Go To 2.

       No

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.
2. **CHECK TO SEE IF DTC P0944 IS CURRENT**
    1. Place the gear selector in Park.
    2. Start the engine.
    3. The transmission must be at operating temperature prior to checking pressure. A cold transmission will give higher readings.

4. Run the engine at 1500 RPM.
5. With the scan tool, monitor the Transmission Line Pressure.

   Does the Actual Line Pressure match the Desired Line Pressure within ± 34 kPa (5 psi)?

   No

   - Go To 6.

   Yes

   - Go To 3.

3. **CHECK LINE PRESSURE IN DRIVE AND REVERSE**
   1. Firmly apply the brake and repeat the previous test in both Drive and the Reverse gear positions.
   2. With the scan tool, monitor the Transmission Line Pressure.

      Does the Line Pressure match the Desired Line Pressure within ± 5 psi in all gear ranges?

      Yes

      - Go To 4.

      No

      - Go To 5.

4. **REVIEW CUSTOMER COMMENTS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Verify with the customer if a delayed engagement and/or an intermittent "No Drive" condition has occurred.
   3. If the customers answer is "No" erase the DTC and return the vehicle to the customer.
   4. Make sure to check for TSBs or controller flash updates that my apply.
   5. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Has the customer experienced any delayed engagement and/or "No Drive" conditions?

      Yes

      - Go To 6.

      No

      - Test Complete.

5. **DTC VERIFICATION**
   1. Read and record the DTC and the Event Data information.

2. Test drive the vehicle and attempt to operate the vehicle within the parameters in which the DTC set.
3. With the scan tool, read DTCs.

   Did any following DTCs set, P0868, P0944, P0841, P0846, P0871, P0876 or P0988?

   Yes

   - Go To 6.

   No

   - Test Complete.

6. **CHECK TRANSMISSION OIL FILTER**
   1. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.
   2. Remove and inspect the Primary Oil Filter in accordance with the Service Information.
   3. Inspect the oil filter seal for damage and proper installation.

      Does the Oil Pan contain excessive debris, or is the oil filter plugged, loose or damaged?

      Yes

      - Repair the cause of the plugged transmission oil filter or excessive debris. Check the Transmission Oil Filter seal for improper installation onto filter neck instead of into the pump bore, not fully seated against pump housing, filter neck not engaged into pump. Check that the spin-on cooler return filter (if equipped) is not loose, and that its gasket is in good condition and properly seated. Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Repair the Transmission Oil Pump as necessary. Check for a stuck main regulator valve and clean if necessary. Refer to the Service Information for the proper repair procedure.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P0987-4C HYDRAULIC PRESSURE TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies the switches are operational (Close with pressure applied). The Transmission Control System verifies the switch closes when

the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

WHEN MONITORED:

In a forward gear with engine speed above 1000 RPM, shortly after a shift and every minute after.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 RPM, the PCM momentarily turns on element pressure to the clutch circuits that does not have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close two times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
POOR LINE PRESSURE SENSOR CONNECTION
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
EXCESSIVE DEBRIS IN OIL PAN
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T48) 4C PRESSURE SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUIT
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINING IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are any Loss of Prime, TCM Control Input and/or Line Pressure Sensor DTCs present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure. If DTC P0944 is present, perform its respective test first.

       No

- Go To 2.

2. **DTC P0770 PRESENT**
    1. With the scan tool, read DTCs.

       Is DTC P0770 also present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

       No

       - Go To 3.

3. **OTHER DTCS PRESENT**
    1. With the scan tool, read DTCs.

       Are DTCs P0988 and/or P1736 present?

       Yes

       - Go To 12.

       No

       - Go To 4.

4. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 0 for this DTC?

       Yes

       - Go To 5.

       No

       - Go To 15.

5. **LINE PRESSURE STAYS THE SAME**
    1. Start the engine.
    2. Warm the transmission to 82° C (180° F).
    3. Firmly apply the brakes.
    4. With the scan tool, monitor the Line Pressure during the following step.

5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least five seconds in each range.

   Did the line pressure remain at a steady value between 585 and 655 kPa (85 and 95 psi) in each position?

   Yes

   - Go To 6.

   No

   - Go To 10.

6. **CHECK LINE PRESSURE SENSOR CONNECTION**
   1. Ignition ON, Engine Not Running.
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the transmission.

      Did the Line Pressure reading on the scan tool change to about 207 kPa (30 psi) when the connector was pushed inward?

      Yes

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Go To 7.

7. **LINE PRESSURE SENSOR OPERATION**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

3. Install the (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition ON, Engine Not Running.
6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the three line pressure positions on the Transmission Simulator.

NOTE: **All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) or 0.1 volts of the reading specified on the Transmission Simulator.**

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information. Refer to **SHIFTER, TRANSMISSION, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 8.

8. **(F856) 5-VOLT SUPPLY CIRCUIT OPEN**

Fig. 78: Checking 5-Volt Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect Transmission Simulator.
3. Disconnect the PCM C1 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 9.

9. **(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND**

Fig. 79: Checking 5-Volt Supply Circuit For A Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

10. **COMPARE SCAN TOOL TO PRESSURE GAUGE**
    1. Turn the ignition OFF to the LOCK position.
    2. Connect the (special tool #8259, Adapter, Pressure Test) and (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to the Service Information for proper installation procedure.

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the RPM to 1500 and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500 and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500 and compare the line pressure readings.

       Does the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

Yes

- Go To 11.

No

- Replace the Line Pressure Sensor in accordance with the Service Information. Refer to **SENSOR, VARIABLE LINE PRESSURE, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

11. **WIRING AND CONNECTORS**
    1. Turn the ignition off to the lock position.
    2. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

    3. Remove the (special tool #8259, Adapter, Pressure Test) and (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
    4. Install the (special tool #8333A, Simulator, Transmission).
    5. On the Transmission Simulator, turn the Pressure Switch selector switch to 4C.
    6. Ignition ON, Engine Not Running.
    7. With the scan tool, monitor the 4C Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the 4C Pressure Switch.

    Did the 4C Pressure Switch state change to closed and remain closed while wiggling the wires?

    Yes

    - Go To 12.

    No

    - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition OFF to the LOCK position.

2. Remove the (special tool #8333A, Simulator, Transmission).
3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

   Does the Transmission Oil Pan contain excessive debris or contamination?

   Yes

   - Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 13.

13. **CHECK 4C HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the 4C hydraulic clutch circuit (in the case) for leakage in accordance with the Service Information.

       NOTE: The 4C hydraulic clutch circuit contains a small bleed orifice. A small amount of air leakage is normal.

       Was there excessive air leakage noticed during the air check?

       Yes

       - Repair as necessary. Check the 4C clutch piston, piston seals and bleed orifice assembly. Refer to **REMOVAL** .
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Disassemble and inspect the Valve Body and repair as necessary. Inspect the 4C Accumulator piston and seals. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

14. **(T48) 4C PRESSURE SIGNAL CIRCUIT SHORT TO ANOTHER CIRCUIT**

Fig. 80: Checking 4C Pressure Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: Make sure the Transmission Solenoid/TRS Assembly harness

connector is disconnected.

3. Measure the resistance between the (T48) 4C Pressure Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms between the (T48) 4C Pressure Signal circuit and any other circuit (s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T48) 4C Pressure Signal circuit for a short to another circuit(s).
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

15. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.
    5. If the Event Data shows DTC P0987 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

       Where any problems found?

       Yes

       - Repair as necessary.
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Test Complete.

P0988-4C PRESSURE SWITCH RATIONALITY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission System uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown in chart.

WHEN MONITORED:

Continuously with the ignition on, engine running and the transmission in gear.

SET CONDITION:

The DTC is set if the 4C Pressure Switch reads open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
LOSS OF 12 VOLT FEED
(T48) 4C PRESSURE SIGNAL CIRCUIT OPEN
(T48) 4C PRESSURE SIGNAL CIRCUIT SHORTED TO GROUND
EXCESSIVE FLUID LEAKAGE IN THE 4C CLUTCH CIRCUIT
NO. 5 CHECK BALL CUT OR DAMAGED
LOW LINE PRESSURE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)
WIRING AND CONNECTORS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to <u>66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE</u>.

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN
1ST	CLOSED*	OPEN	OPEN	CLOSED	OPEN
2ND	OPEN	CLOSED	OPEN	CLOSED	OPEN
2ND PRIME	OPEN	OPEN	CLOSED	CLOSED	OPEN
3RD	OPEN	OPEN	OPEN	CLOSED	CLOSED
4TH	OPEN	OPEN	CLOSED	OPEN	CLOSED
5TH	OPEN	CLOSED	OPEN	OPEN	CLOSED

*L/R is closed if output speed is below 100 RPM in Drive and Manual 2. L/R is closed in Manual 1.
**May be open when rolling in Neutral or at low oil temperatures.

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED TCM POWER INPUT DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK THE EVENT DATA**
    1. With the scan tool, check the Event Data.

       Does the Event Data show data for DTC P0988?

       Yes

       - Go To 3.

       No

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
3. **MULTIPLE DTCS PRESENT**
    1. With the scan tool, read DTCs.

       Are there two or more related Pressure Switch DTCs present in addition to P0988?

       Yes

       - Go To 4.

       No

       - Go To 7.
4. **RELATED DTC PRESENT**
    1. With the scan tool, check the Event Data for P0988.

       NOTE: Make sure to record all Event Data stored in the scan tool for future

reference in this test procedure.

Do all the pressure switches read CLOSED in the Event Data for P0988?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform diagnostics for DTC P0882.

No

- Go To 5.

5. **EVENT DATA READ OPEN**

In the Event Data recorded earlier, do all the pressure switches read OPEN?

Yes

- Go To 6.

No

- Go To 7.

6. **LOW LINE PRESSURE**

In the Event Data recorded earlier, is the Line Pressure less than 40 psi and significantly below the Desired Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check the fluid level and adjust as necessary. If the fluid level is OK, check the Primary Oil Filter seal for a split, crack or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to **PUMP, TRANSMISSION OIL, DISASSEMBLY** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

7. **DTC P0871 ALSO PRESENT**
   1. With the scan tool, read DTCs.

Is DTC P0871 present?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 8.

8. **EVENT DATA READ PARK REVERSE OR NEUTRAL**

   In the Event Data recorded earlier, does the Event Data show the DTC set in Park, Neutral or Reverse for P0988?

   Yes

   - Go To 13.

   No

   - Go To 9.

9. **EVENT DATA READ CLOSED**

   In the Event Data recorded earlier, does the Event Data show the 4C Pressure Switch reading CLOSED?

   Yes

   - Go To 11.

   No

   - Go To 10.

10. **PRIMARY OIL FILTER SEAL**

    In the Event Data recorded earlier, is the Line Pressure less than 40 psi and significantly below the Desired Line Pressure?

    Yes

    - Repair as necessary to correct low line pressure. Check the fluid level and adjust as necessary. If the fluid level is OK, check the Primary Oil Filter seal for a split, crack or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to **PUMP, TRANSMISSION OIL, DISASSEMBLY** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 15.

11. **CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

    3. Install the (special tool #8333A, Simulator, Transmission).
    4. Ignition ON, Engine Not Running.
    5. With the Transmission Simulator, turn the Pressure Switch selector switch to the 4C position.
    6. With the scan tool, monitor the 4C Pressure Switch while pressing the Pressure Switch test button on the Transmission Simulator.

    Did the state of the 4C Pressure Switch change while pressing the Pressure Switch Test button?

    Yes

    - Go To 12.

    No

    - Go To 13.

12. **TRANSMISSION SOLENOID/TRS ASSEMBLY**
    1. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    2. Wiggle the wires while checking for shorted and open circuits.

    Where any problems found?

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

13. **CHECK THE (T48) 4C PRESSURE SIGNAL CIRCUIT FOR AN OPEN**

ASSEMBLY-
TRANSMISSION
SOLENOID/TRS

PCM PINOUT

BOX 8815

Fig. 81: Checking 4C Pressure Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C4 harness connector.
4. Connect the (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

5. Measure the resistance of the (T48) 4C Pressure Signal circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (T48) 4C Pressure Signal circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 14.

14. **CHECK THE (T48) 4C PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND**

ASSEMBLY-
TRANSMISSION
SOLENOID/TRS

PCM PINOUT

BOX 8815

Fig. 82: Checking 4C Pressure Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T48) 4C Pressure Signal circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (T48) 4C Pressure Signal circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

15. **NO. 5 CHECK BALL CUT OR DAMAGED**
    1. Turn the Ignition off to the lock position.
    2. Remove the Valve Body Assembly in accordance with the Service Information.
    3. Inspect the No. 5 check ball for any cuts or damage.
    4. Inspect the 4C accumulator piston and seals and also the 4C tower seal on top of the valve body.

       Where any problems found?

       Yes

       - Repair as necessary. Check for excessive clutch debris in the transmission oil pan. If excessive clutch debris is present, repair 4C clutch as necessary. Refer to the Service Information for proper repair procedures. Refer to **VALVE BODY, DISASSEMBLY** .
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Go To 16.

16. **EXCESSIVE FLUID LEAKAGE WITH 4C CLUTCH CIRCUIT**
    1. Air check the 4C Clutch hydraulic circuit. Refer to the Service Information.

NOTE: **This hydraulic clutch circuit contains a small bleed orifice. Small leakage is considered normal.**

Was there excessive air leakage in the 4C Clutch hydraulic circuit?

Yes

- Repair as necessary. Refer to the Service Information.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Refer to **ASSEMBLY, TRANSMISSION SOLENOID AND TRS, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P1684-BATTERY WAS DISCONNECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The PCM uses a battery backed Random Access Memory (RAM) to maintain some learned values. When the battery is disconnected the memory is lost. When the battery is restored this memory loss is detected by the Transmission Control System. The DTC is set and the learned values are initialized to known constants or previously learned values from Electronic Erasable Programmable Read Only Memory (EEPROM). This results in the reinitialization of some parameters.

WHEN MONITORED:

When the ignition is in the Run/Start position.

SET CONDITION:

This DTC will set when the Powertrain Control Module (PCM) is disconnected from Fused B(+) or ground. It also sets while using the scan tool to perform a Battery Disconnect and/or Quick Learn procedure.

POSSIBLE CAUSES

Possible Causes
BATTERY WAS DISCONNECTED
SCAN TOOL BATTERY DISCONNECT PERFORMED
PCM WAS REPLACED OR DISCONNECTED

QUICK LEARN WAS PERFORMED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

POSSIBLE CAUSES

1. **POSSIBLE CAUSES**
    1. This DTC is an informational DTC only.
    2. This DTC is set due to a momentary loss of power and/or the ground circuits to the PCM.
    3. Below are a list of possible causes associated with this DTC.
    4. Battery was disconnected.
    5. The battery disconnect feature (if equipped) on the scan tool was performed.
    6. A Quick Learn using the scan tool was performed.
    7. PCM was replaced or disconnected.

    Were any of the above possible causes performed?

    Yes

    - This is the cause of the DTC. Erase the DTC and return vehicle to customer.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 2.
2. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

    NOTE: Check all power and ground circuits to the PCM for a intermittent or high resistance condition.

    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

    Where any problems found?

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE**

TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P1715-RESTRICTED MANUAL VALVE IN T3 RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

When the PRNDL code indicates Temp 3.

SET CONDITION:

This DTC sets when conditions for DTC P1776 are satisfied or 3 unsuccessful attempts to engage 1st gear while the shifter is in the temp 3 zone. This indicates a restricted port at the manual valve because the shifter is not fully engaged in the drive position.

POSSIBLE CAUSES

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
CUSTOMER DRIVING HABITS
MISADJUSTED SHIFTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are DTCs P0729, P0731, P0732, P0733, P0734, P0735 or P0716 present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure for the reported DTC(s).

       No

       - Go To 2.

2. **CHECK SHIFTER ADJUSTMENT**
    1. Check Shift Lever adjustment in accordance with the Service Information.

       Is the shifter properly adjusted?

       Yes

       - Go To 3.

       No

       - Adjust the Shifter Assembly in accordance with the Service Information.
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.
3. **CHECK CUSTOMER DRIVING HABIT**
    1. This DTC can set if the customer rests their hand on the shift lever while they are driving. The transmission can be put in the T3 position if just enough upward pressure towards neutral is exerted on the shift lever.
    2. When this occurs, the feed port to the clutch is restricted, the transmission will declare neutral and this DTC will set. The customer should be informed not to rest their hand on the shifter while driving.
    3. This DTC can set by simply bumping the shift lever toward neutral while accelerating.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

       If there are no possible causes remaining, view repair.

       Repair

       - This DTC can set by putting too much forward pressure on the shift lever while it is in the OD position. Make sure the customer is informed.
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R Solenoid is energized. The SSV will be in the downshifted position in 1st gear, directing the fluid to the L/R clutch circuit. In 2nd through 6th gears, it will be in the upshifted position and directing the fluid to the Torque Converter Clutch (TCC) control circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the

downshifted position. The L/R Pressure Switch is monitored to confirm SSV movement. If movement is not confirmed (the L/R pressure switch does not close), EMCC is inhibited until SSV operation is confirmed.

WHEN MONITORED:

During an attempted shift into 1st gear.

SET CONDITION:

This DTC is set if three unsuccessful attempts are made to shift the Solenoid Switch Valve (SSV) into the downshifted position in one given ignition start. This DTC can take up to five minutes before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
RELATED DTC PRESENT
SOLENOID SWITCH VALVE STICKING
L/R PRESSURE SWITCH SENSE CIRCUIT SHORTED TO OTHER CIRCUITS
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for other transmission DTCs.

       Is DTC P0841 also present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go To 3.

No

- Go To 6.

3. **CHECK THE PCM AND WIRING**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Pressure Switch selector switch to L/R.
   6. With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

      Did the state of the L/R Pressure Switch change while pressing the Pressure Switch Test button?

      Yes

      - Go To 4.

      No

      - Go To 5.

4. **CHECK IF THE SOLENOID SWITCH VALVE STICKING**
   1. Turn the ignition off to the lock position.
   2. Remove the Transmission Oil Pan in accordance with the Service Information.
   3. Remove the Transmission Valve body in accordance with the Service Information.
   4. Inspect the Solenoid Switch Valve and Plugs for sticking.

      Is the Solenoid Switch Valve or Plugs sticking?

      Yes

      - Clean and inspect in accordance with the Service Information. Repair as necessary.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **CHECK THE L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 83: Checking L/R Pressure Switch Sense Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

3. Disconnect all PCM harness connectors.
4. Measure the resistance between the (T50) L/R Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms between the (T50) L/R Pressure Switch Sense circuit and all other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T50) L/R Pressure Switch Sense circuit for a short to another circuit(s).
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

      Where any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Test Complete.

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R Solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing fluid to the L/R clutch circuit. In 2nd gear through 5th gear, it will be in the upshifted position and directing fluid into the Torque Converter Clutch (TCC).

When in 2nd, 2nd Prime, 3rd, 4th or 5th gear, the Torque Converter Clutch (TCC) will engage when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the L/R solenoid until the torque converter slip difference (difference between engine and transmission input speed) is within 60 RPM. Then the L/R solenoid is fully energized (FEMCC / 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

WHEN MONITORED:

Continuously when performing partial or full EMCC - PEMCC or FEMCC.

SET CONDITION:

If the transmission senses the L/R pressure switch closing while performing PEMCC or FEMCC. This DTC will set after two unsuccessful attempts to perform PEMCC or FEMCC. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
RELATED DTC P0841 PRESENT
L/R PRESSURE SWITCH SENSE CIRCUIT OPEN
L/R PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
SOLENOID SWITCH VALVE
POWERTRAIN CONTROL MODULE (PCM)
CHECK THE WIRING AND CONNECTORS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINING IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, check for transmission DTCs

       Is DTC P0841 present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

No

- Go To 2.

2. **CHECK TO SEE IF DTC P1776 IS CURRENT**
   1. With the scan tool, Check the Starts Since Set counter.

      NOTE: NOTE: This counter only applies to the last DTC set.

      Is the Starts Since Set counter 2 or less?

      Yes

      - Go To 3.

      No

      - Go To 7.

3. **PCM AND WIRING**
   1. Turn the ignition OFF to the LOCK position.
   2. Remove the Starter Relay.

      CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

      WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

      NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.

   3. Install the (special tool #8333A, Simulator, Transmission).
   4. Ignition ON, Engine Not Running.
   5. With the Transmission Simulator, turn the Pressure Switch selector switch to the L/R position.
   6. With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

      Did the state of the L/R Pressure Switch change while pressing the Pressure Switch Test button?

      Yes

      - Go To 4.

      No

- Go To 5.

4. **SOLENOID SWITCH VALVE**
    1. Remove the Valve Body in accordance with the Service Information.
    2. Inspect the Solenoid Switch Valve and Plugs for sticking in the bore and/or wear.

    Were any problems found?

    Yes

    - Clean and repair as necessary in accordance with the Service Information. Refer to **VALVE BODY, REMOVAL** .
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 7.

5. **L/R PRESSURE SWITCH SENSE CIRCUIT OPEN**

Fig. 84: Checking L/R Pressure Switch Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).

3. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).

NOTE: Note: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T50) L/R Pressure Switch Sense circuit between the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position) to the Solenoid/TRS Assembly harness connector.

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (T50) L/R Pressure Switch Sense circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 6.

6. **(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND**

Fig. 85: Checking L/R Pressure Switch Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T50) L/R Pressure Switch Sense circuit.

   Is the resistance below 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for a short to ground.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. This DTC can also be set by the Solenoid Switch Valve intermittently sticking in it's bore under extreme temperature conditions or by a worn Solenoid Switch Valve or Plugs.
   5. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

   Where any problems found?

   Yes

   - Repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Test Complete.

P1794-SPEED SENSOR GROUND ERROR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear DTCs P0729 and P0731-36 is set.

2) An excessive change in input or output speeds indicating an intermittent signal which results in DTCs P0716 and/or P0721 set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause DTC P1794 to set when at a stop.

WHEN MONITORED:

The gear ratio is monitored continuously while the transmission is in gear.

SET CONDITION:

After a controller reset in neutral and a ratio of input to output, of 1:2. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Engine Running, Shift lever in park.
    2. With the scan tool, read the Transmission Output and Input Speed Sensor states.

       Is the Output Speed Sensor reading twice the Input Speed Sensor reading?

       Yes

       - Go To 2.

       No

       - Go To 6.

2. **CHECK THE PCM AND WIRING**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

        CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

        WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    3. Install the (special tool #8333A, Simulator, Transmission).
    4. With the Transmission Simulator, set the Input/Output Speed selector switch to the "3000/1000" position. Turn the Input/Output Speed switch to "ON".
    5. Ignition ON, Engine Not Running.
    6. With the scan tool, monitor the Input and Output Speed Sensor state.

        Does the Input speed read 3000 RPM and the Output speed read 1000 RPM, within 50 RPM?

        Yes

        - Go To 6.

        No

        - Go To 3.
3. **(T13) SPEED SENSOR GROUND CIRCUIT OPEN**

Fig. 86: Checking Speed Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the PCM C4 harness connector and connect the (special tool #8815A, Kit, NGC, 38 Position).
3. Disconnect the (special tool #8333A, Simulator, Transmission).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

4. Measure the resistance of the (T13) Speed Sensor Ground circuit between both Input and Output Speed Sensor harness connectors and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms on any of the above measurements?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 4.

4. **(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND**

Fig. 87: Checking Speed Sensor Ground Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to ground.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 5.

5. **(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE**

Fig. 88: Checking Speed Sensor Ground Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition ON, Engine Not Running.
2. With the scan tool under TIPM, actuate the Transmission.
3. Measure the voltage of the (T13) Speed Sensor Ground circuit.

   Is the voltage above 0.5 volts?

Yes

- Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC set.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Test Complete.

P2700-INADEQUATE ELEMENT VOLUME LR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volume of transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volume resulting in setting a DTC. The DTC will usually set with other DTCs which indicates an internal transmission problem.

WHEN MONITORED:

When the engine is running. The L/R Clutch Volume Index (CVI) is updated during a 3-1 or 2-1 manual

AutoStick® (ERS) downshift with throttle angle below 5 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the L/R clutch volume index CVI falls below 16.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN L/R CLUTCH PISTON RETURN SPRING OR SPRING RETAINERS
BROKEN L/R ACCUMULATOR SPRING(S)
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
   1. With the scan tool, check for transmission DTCs.

      Are any Pressure Switch Sense circuit DTCs present?

      Yes

      - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK L/R CLUTCH VOLUME INDEX**
   1. With the scan tool, erase DTCs.
   2. Start the engine and warm the transmission.

      NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

   3. Drive the vehicle and perform at least ten 3-1 manual (ERS) downshifts at closed throttle from speeds of about 16 to 24 Km/h (10 to 15 mph).
   4. With the scan tool, read the L/R CL VOL INDEX.

Is the L/R CL VOL INDEX below 20?

Yes

- Go To 3.

No

- Go To 5.

3. **L/R CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
    1. Turn the ignition off to the lock position.
    2. Remove the transmission oil pan in accordance with the Service Information.
    3. Remove the valve body in accordance with the service information.
    4. Check condition of the L/R accumulator springs.
    5. Look for possible leak paths into the L/R clutch hydraulics circuit within the valve body.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Go To 4.

4. **AIR CHECK L/R CLUTCH CIRCUITS**
    1. Perform an air check on the L/R Clutch circuit in accordance with the Service Information.
    2. Watch and listen for L/R Clutch piston movement.

    Does the L/R piston stroke and return properly?

    Yes

    - Replace the Transmission/TRS Solenoid Assembly in accordance with the service information. With the scan tool, perform a Quick Learn.
    - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

    No

    - Repair internal transmission as necessary. Pay attention to the components related to the L/R clutch. A broken or weak L/R clutch return spring, Accumulator Spring and/or dislocated

snap ring could cause this problem.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **VERIFY PCM OPERATION**

NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing the following steps.

1. Perform eight learnable starts. A learnable start is defined as follows: Start the engine and accelerate lightly to 80 Km/h or 50 mph then brake lightly to a stop. Turn engine off.
2. With the scan tool, record the CL VOL INDEX (CVI) for all clutches
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Test Complete.

P2701-INADEQUATE ELEMENT VOLUME 2C

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volume of transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volume resulting in setting a DTC. The DTC will usually set with other DTCs which indicates an internal transmission problem.

WHEN MONITORED:

When the engine is running. The 2C Clutch Volume Index (CVI) is updated during a 3-2 or 4-2 kickdown with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the 2C CVI falls below 5.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN 2C CLUTCH PISTON RETURN SPRING / DISLODGED SNAP RING
BROKEN ACCUMULATOR SPRING(S)
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
   1. With the scan tool, check for transmission DTCs.

      Are any Pressure Switch Sense circuit DTCs present?

      Yes

      - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK 2C CLUTCH VOLUME INDEX**
   1. With the scan tool, erase transmission DTCs.
   2. Drive the vehicle at about 1000 RPM on the Output Speed sensor then use the AutoStick® (ERS) and select 3rd gear. This will put the vehicle into third gear.

      NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing the following steps.

   3. Perform at least ten 3-2 kickdowns by allowing the vehicle to coast down to 650 to 550 RPM on the Output Speed sensor then apply the throttle between 40 and 50 Degrees.

      NOTE: Do not exceed 54 Degrees of Throttle Angle.

4. With the scan tool, read the 2C CL VOL INDEX.

   Is the 2C CL VOL INDEX below 10?

   Yes

   - Go To 3.

   No

   - Go To 5.

3. **2C CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan in accordance with the Service Information.
   3. Remove the valve body in accordance with the service information.
   4. Check condition of the 2C accumulator springs.
   5. Look for possible leak paths into the 2C clutch hydraulics circuit within the valve body.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Go To 4.

4. **AIR CHECK 2C CLUTCH CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Perform an air check on the 2C Clutch circuit in accordance with the Service Information.
   3. Watch and listen for 2C Clutch piston movement.

      Dose the piston stroke and return properly?

      Yes

      - Replace the Transmission/TRS Solenoid Assembly in accordance with the service information. With the scan tool, perform a Quick Learn.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

- Repair internal transmission as necessary. Pay attention to the components related to the 2C clutch. A broken or dislodged 2C return spring, snap ring or broken 2C Accumulator Spring could cause this problem.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **VERIFY PCM OPERATION**

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

1. Perform eight learnable starts. A learnable start is defined as follows: Start the engine. Accelerate lightly to 80 Km/h or 50 mph then brake lightly to a stop. Turn off the engine.
2. With the scan tool, record the CL VOL INDEX (CVI) for all clutches
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Test Complete.

P2702-INADEQUATE ELEMENT VOLUME OD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volume of transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volume resulting in setting a DTC. The DTC will usually set with other DTCs which indicates an internal transmission problem.

WHEN MONITORED:

When the engine is running. The OD Clutch Volume Index (CVI) is updated during a 3-4 upshift with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the OD CVI falls below 5.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN OD ACCUMULATOR SPRING
BROKEN OD/REV PISTON BELLEVILLE SPRING OR DISLODGED SNAP RING
INTERNAL LEAKAGE IN PUMP ASSEMBLY
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
   1. With the scan tool, check for transmission DTCs.

      Are any Pressure Switch Sense circuit DTCs present?

      Yes

      - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK THE OD CLUTCH VOLUME INDEX**
   1. With the scan tool, erase DTCs.

      NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing the following steps.

   2. Drive the vehicle and perform ten 3-4 upshifts with the TPS degree between 10 and 54.
   3. With the scan tool, read the OD CL VOL INDEX.

Is the OD CL VOL INDEX below 10?

Yes

- Go To 3.

No

- Go To 5.

3. **OD CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan in accordance with the Service Information.
   3. Remove the valve body in accordance with the Service Information.
   4. Check condition of the OD accumulator spring.
   5. Look for possible leak paths into the OD clutch hydraulics circuit within the valve body.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 4.

4. **AIR CHECK OD CLUTCH CIRCUIT**
   1. Perform an air check on the OD Clutch circuit in accordance with the Service Information.
   2. Watch and listen for OD Clutch piston movement.
   3. Air check all pump passages and watch for air leakage into the OD clutch passage.

   NOTE: **There is a bleed orifice between the OD and Reverse Clutch passages, so a small amount of air leakage from Reverse to OD is normal.**

   Were any problems found?

   Yes

   - Repair internal transmission. Pay attention to the OD Clutch. Broken or weak return spring or a dislocated snap ring could cause this problem. If no problems were found in the OD clutch or if leakage into the OD passage was noted, replace Pump Assembly in accordance with the Service Information.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace the Transmission/TRS Solenoid Assembly in accordance with the service information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **VERIFY PCM OPERATION**

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

1. Perform eight learnable starts. A learnable start is defined as follows: Start the engine and accelerate lightly to 80 Kmh or 50 MPH then brake lightly to a stop. Turn the engine off.
2. With the scan tool, record the CL VOL INDEX (CVI) for all clutches.
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Test Complete.

P2703- INADEQUATE ELEMENT VOLUME UD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volume of transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volume resulting in setting a

DTC. The DTC will usually set with other DTCs which indicates an internal transmission problem.

WHEN MONITORED:

When the engine is running. The UD Clutch Volume Index (CVI) is updated during a 5-4 kickdown with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the UD CVI falls below 11.

POSSIBLE CAUSES

Possible Causes
BROKEN UD ACCUMULATOR SPRING(S)
BROKEN UD CLUTCH PISTON SPRING OR DISLODGED SNAP RING
INTERNAL LEAKAGE IN PUMP OR VALVE BODY ASSEMBLIES
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
   1. With the scan tool, check for transmission DTCs.

      Are any Pressure Switch Sense circuit DTCs present?

      Yes

      - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK UD CLUTCH VOLUME INDEX**
   1. With the scan tool, erase transmission DTCs.

      NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

   2. Drive the vehicle and perform ten 5-4 kickdowns by applying the throttle between 40 and 50 TPS

degrees at speeds about 1500 to 1700 RPM on the Output Speed sensor.

3. With the scan tool, read the UD CVI.

   Is the UD CVI below 10?

   Yes

   - Go To 3.

   No

   - Go To 5.

3. **UD CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan and valve body in accordance with the Service Information.
   3. Check the condition of the UD accumulator springs.
   4. Look for possible leak paths into the UD clutch hydraulics circuit within the valve body.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Go To 4.

4. **AIR CHECK UD CLUTCH CIRCUIT**
   1. Perform an air check on the UD Clutch circuit in accordance with the Service Information.
   2. Watch and listen for UD Clutch piston movement.
   3. Air check all other pump passages for air leakage into the UD Clutch circuit.

      Were any problems found?

      Yes

      - Repair internal transmission. Pay attention to components related to the UD clutch. Broken or weak return spring or a dislocated snap ring. If no trouble is found in UD clutch component or UD clutch leakage was noted in passage, replace the Pump Assembly.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Replace the Transmission/TRS Solenoid Assembly in accordance with the service information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **VERIFY PCM OPERATION**

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

1. Perform eight learnable starts. A learnable start is defined as follows: Start the engine and accelerate lightly to 80 Km/h or 50 mph then brake lightly to a stop. Turn the engine off.
2. With the scan tool, record the clutch volume index CVI for all clutches.
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Test Complete.

P2704-INADEQUATE ELEMENT VOLUME 4C

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volume of transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volume resulting in setting a DTC. The DTC will usually set with other DTCs which indicates an internal transmission problem.

WHEN MONITORED:

When the engine is running. The 4C Clutch Volume Index (CVI) is updated during a 4-5 upshift with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the 4C CVI falls below 5.

POSSIBLE CAUSES

Possible Causes
BROKEN 4C RETURN SPRING OR DISLODGED SNAP RING
BROKEN 4C ACCUMULATOR SPRING(S)
HYDRAULIC LEAK IN THE VALVE BODY
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK THE 4C CLUTCH VOLUME**
    1. With the scan tool, record the 4C Clutch Volume Index (CVI) and erase DTCs.
    2. Perform ten, 4-5 upshifts with the throttle between 10 and 54 degrees. The Transmission temperature must be at least 43° C or 110° F.
    3. With the scan tool, read the 4C CVI.

    Is the current 4C CVI below 10?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DTC P0876 PRESENT**
    1. With the scan tool, read DTCs.

    NOTE: DTC P0876 must be set with P2704 in order for this test to be valid.

    Is DTC P0876 present?

    Yes

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 3.

3. **4C CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan in accordance with the Service Information.
   3. Remove the valve body in accordance with the Service Information.
   4. Check condition of the 4C accumulator springs.
   5. Look for possible leak paths into the 4C clutch hydraulics circuit within the valve body.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 4.

4. **AIR CHECK 4C CLUTCH CIRCUIT**
   1. Perform an air check on the 4C Clutch circuit in accordance with the Service Information.
   2. Listen for proper 4C Clutch piston movement.

   Were any problems found?

   Yes

   - Repair Internal transmission as necessary. Pay attention to the mechanical components related to the 4th clutch. A broken or weak return spring or a dislocated snap ring could cause this problem.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the service information. With the scan tool, perform a Quick Learn.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

5. **VERIFY PCM OPERATION**
    1. Perform eight learnable starts. A learnable start is defined as follows: Start the engine and accelerate lightly to 50 MPH then brake lightly to a stop. Turn the engine off.
    2. With the scan tool, record Transmission CL VOL INDEX (CVI) for all clutches.
    3. With the scan tool, perform a BATTERY DISCONNECT.
    4. With the scan tool, read the CVIs and compare them to the reading recorded before the BATTERY DISCONNECT.

       Are any of the CVIs less than 5 or are they different than before the battery disconnect?

       Yes

       - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
       - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

       No

       - Test Complete.

P2706-MS SOLENOID CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System uses five electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which is sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC. **Note: This DTC is strictly an electrical fault and does not apply to any internal transmission failures.**

WHEN MONITORED:

Initially at power-up, then every 10 seconds after. The solenoid circuits will be tested immediately after a gear ratio or pressure switch error is detected.

SET CONDITION:

After three consecutive solenoid continuity test failures or one failure if test is run in response to a gear ratio or pressure switch error. **Note: This DTC is strictly an electrical fault and does not apply to any internal transmission failures.**

POSSIBLE CAUSES

Possible Causes
RELATED TCM POWER INPUT DTCS PRESENT
(T118) MS SOLENOID CONTROL CIRCUIT SHORTED TO ANOTHER CIRCUITS
(T118) MS SOLENOID CONTROL CIRCUIT OPEN
(T118) MS SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED TCM POWER INPUT DTCS ARE PRESENT**
    1. With the scan tool, read Transmission DTCs

       Are any TCM Power Input DTCs present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **TRANSMISSION SOLENOID/TRS ASSEMBLY**
    1. Turn the ignition OFF to the LOCK position.
    2. Remove the Starter Relay.

CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.

WARNING: The Starter Relay must be removed from the PDC. Failure to do so may result in possible serious or fatal injury.

NOTE: **Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

3. Install (special tool #8333A, Simulator, Transmission).
4. Ignition ON, Engine Not Running.
5. With the scan tool, actuate the MS Solenoid.
6. Monitor the MS Solenoid LED on the Transmission Simulator.

   Did the MS Solenoid LED on the Transmission Simulator blink on and off?

   Yes

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 3.

3. **TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. With the scan tool, continue to actuate the MS Solenoid for the period of two minutes using the Transmission Simulator.
   2. After two minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

      Did DTC P2706 reset during the actuation test?

      Yes

      - Go To 4.

      No

      - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

4. **(T118) MS SOLENOID CONTROL CIRCUIT SHORTED TO ANOTHER CIRCUIT**

Fig. 89: Checking MS Solenoid Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition OFF to the LOCK position.
2. Disconnect the (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM harness connectors.
4. Measure the resistance between the (T118) MS Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 ohms between the (T118) MS Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T118) MS Solenoid Control circuit for a short to another circuit(s).

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Go To 5.

5. **(T118) MS SOLENOID CONTROL CIRCUIT OPEN**

Fig. 90: Checking MS Solenoid Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the (special tool #8815A, Kit, NGC, 38 Position) to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

2. Measure the resistance of the (T118) MS Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 ohms?

   Yes

   - Repair the (T118) MS Solenoid Control circuit for an open.
   - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

   No

   - Go To 6.

6. **(T118) MS SOLENOID CONTROL CIRCUIT SHORTED TO GROUND**

Fig. 91: Checking MS Solenoid Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T118) MS Solenoid Control circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (T118) MS Solenoid Control circuit for a short to ground.

- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform a Quick Learn.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

U0002-CAN C BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view DTCs.

    Is the DTC Active at this time?

Yes

- **Diagnose the U0002-CAN C BUS OFF PERFORMANCE as the U0001-CAN C BUS CIRCUIT test. Refer to TIPM - DIAGNOSIS AND TESTING** and perform the U0001-CAN C Bus diagnostic procedure.

No

- **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0100-LOST COMMUNICATION WITH THE ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Powertrain Control Module (PCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
POWERTRAIN CONTROL MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
POWERTRAIN CONTROL MODULE (PCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view DTCs.

    Is the DTC Active at this time?

    Yes

- **Refer to TIPM - DIAGNOSIS AND TESTING** and perform the U0100-Lost Communication with ECM/PCM diagnostic procedure.

No

- **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0121-LOST COMMUNICATION WITH ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
ABS MODULE
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view DTCs.

    Is the DTC Active at this time?

    Yes

- **Refer to TIPM - DIAGNOSIS AND TESTING** and perform the U0121-Lost Communication with Anti-Lock Brake Module diagnostic procedure.

No

- **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

Is this DTC active?

Yes

- **Refer to TIPM - DIAGNOSIS AND TESTING** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

No

- **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U1449-IMPLAUSIBLE ERS MESSAGE RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This message is used by the Powertrain Control Module (PCM) for Electronic Range Select (ERS) operation. The ERS switch is hard wired to the Cabin Compartment Node (CCN). The CCN then sends a CAN bus message to the PCM.

WHEN MONITORED:

Continuously with the ignition on.

SET CONDITION:

This DTC is set when the ERS message is not received or invalid.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
CABIN COMPARTMENT NODE (CCN)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to 66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there TIPM CAN BUS DTCs?

Yes

- Refer to **TIPM - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 2.

2. **CHECK IF CCN DTCS ARE PRESENT**
   1. With the scan tool, read CCN DTCs.

      Are there CCN DTCs?

      Yes

      - Refer to **CCN - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

      No

      - Using the schematics as a guide, check the Powertrain Control Module (PCM) pins, terminals and connectors for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information.
      - Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST** **66RFE TRANSMISSION VERIFICATION TEST**.

STANDARD PROCEDURE

66RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **This vehicle uses a Cummins Control Module which controls the Transmission operation and the Diesel engine operation. In these procedures, the Cummins Control Module is referred to as the Powertrain Control Module (PCM).**

DIAGNOSTIC TEST

1.
   1. Perform the following before attempting any diagnostic procedures:
      1. With the scan tool check pinion factor (if equipped) for proper tire identification and program

or reprogram if necessary.

2. Check the transmission fluid level. If the fluid level is low, locate and repair any leaks and fill the transmission to the proper level. Refer to the appropriate Service Information for procedures. Many transmission symptoms are caused by low fluid level.
3. Check the battery. To avoid false diagnosis, testing should only be performed with the battery fully charged.
4. With the scan tool, read Engine (PCM) DTCs. If DTCs are present, refer to the **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform to the appropriate diagnostic procedure(s) before proceeding.
5. With the scan tool, read Transmission (PCM) DTCs. Record all Stored, Active and Pending DTC information. Diagnose any Pending DTC as a matured DTC.
6. With the scan tool, read and record the Event Data. Use this data to identify the conditions in which the DTC set.

NOTE: **DTC Event Data may exist even if no DTCs are stored. DTC Event Data is only erased by a Battery Disconnect, reflash or a Quick Learn procedure. Clearing DTCs does NOT erase the DTC Event Data. Some DTCs require two "bad trips" before they are stored (and the MIL illuminates). The transmission may enter "limp-in" mode during the first "bad trip," but if the fault condition is not present after the vehicle is restarted, the pending DTC may be cleared without lighting the MIL. Nevertheless, the DTC Event Data for the pending DTC will remain stored and can still be retrieved with the scan tool. If the customer reports a "limp-in" event but no DTCs are present, check the DTC Event Data.**

7.
8. Performing a Battery Disconnect will clear all Event Data and reset all learned Transmission values to the default values which may temporarily result in erratic shift schedules.
9. With the scan tool, perform the Shift Lever Position Test. If the test fails with an error code, refer to the diagnostic procedure for P0706 Transmission Range Sensor Rationality. If the test fails without an error code, adjust the shift linkage in accordance with the Service Information.
10. For Gear Ratio Error DTCs or shift quality complaints, use the scan tool to view Clutch Volume Index (CVI) Monitor data. Read and record the CVI information.
11. Use the wiring diagram as a guide. Inspect the wiring and connectors related to this circuit. Repair as necessary.
12. Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, engine start up, after driving under specific conditions and after diagnostic monitors have been run.
13. Review Technical Service Bulletins (TSBs) for controller software update information. Some conditions can be corrected by upgrading the PCM controller software.

Were any repairs made that fixed the vehicle?

Yes

- Testing complete.
- Perform the 66RFE TRANSMISSION VERIFICATION TEST. Refer to **66RFE TRANSMISSION VERIFICATION TEST**.

No

- Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and perform the appropriate diagnostic procedure.

66RFE TRANSMISSION VERIFICATION TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. Perform the following after completion of a diagnostic repair:
    1. With the scan tool check pinion factor (if equipped) for proper tire identification and program or reprogram if necessary.
    2. Connect the scan tool to the Data Link Connector (DLC).
    3. Reconnect any disconnected components.
    4. If the PCM has been replaced or updated (flashed) or the transmission has been repaired or replaced, using the scan tool perform a Quick Learn Procedure.
    5. With the scan tool, erase all Transmission and Engine DTCs.
    6. With the scan tool, perform a BATTERY DISCONNECT, this will clear the Event Data
    7. With the scan tool, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT.
    8. Check the transmission fluid level and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure.
    9. Road test the vehicle.
    10. Perform the following shifts from a standing start with a constant throttle opening of 20 to 25 degrees to the speeds of 97 km/h (60 mph); make fifteen to twenty 1 to 2, 2 to 3, 3 to 4, 4 to 5, 5 to 6 upshifts.
    11. Perform the following shifts with speeds below 40 km/h (25 mph); make five to eight wide open throttle kickdowns to 2nd gear. Allow at least 5 seconds each in 3rd and 4th gear between each kickdown.
    12. Check for DTCs during and after the road test.
    13. After performing the road test, if any shift concerns are noted, perform the drive learn procedure for those affected shifts.
    14. **Use the OBDII task manager to run Good Trip time in each gear, this will confirm the repair**

and to ensure that the DTC does not re-mature.

Were any DTCs set during the road test?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Repair is complete.

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
P0218	HIGH TEMPERATURE OPERATION ACTIVATED
P0562	BATTERY VOLTAGE LOW
P0602	CONTROL MODULE PROGRAMMING ERROR/NOT PROGRAMMED
P0604	INTERNAL CONTROL MODULE RAM
P0605	INTERNAL CONTROL MODULE ROM
P0613	INTERNAL TCM
P0706	TRANSMISSION RANGE SENSOR RATIONALITY
P0711	TRANSMISSION TEMPERATURE SENSOR PERFORMANCE
P0712	TRANSMISSION TEMPERATURE SENSOR LOW
P0713	TRANSMISSION TEMPERATURE SENSOR HIGH
P0714	TRANSMISSION TEMPERATURE SENSOR INTERMITTENT
P0716	INPUT SPEED SENSOR 1 CIRCUIT PERFORMANCE
P0721	OUTPUT SPEED SENSOR CIRCUIT PERFORMANCE
P0729	GEAR RATIO ERROR IN 6TH
P0731	GEAR RATIO ERROR IN 1ST
P0732	GEAR RATIO ERROR IN 2ND
P0733	GEAR RATIO ERROR IN 3RD
P0734	GEAR RATIO ERROR IN 4TH
P0735	GEAR RATIO ERROR IN 5TH
P0736	GEAR RATIO ERROR IN REVERSE

DIAGNOSIS AND TESTING

P0218-HIGH TEMPERATURE OPERATION ACTIVATED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The DTC is intended as an informational DTC to aid the technician in determining the root cause of a customer driveability issue. The DTC is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler is needed to support the customers driving behavior.

WHEN MONITORED:

Whenever the engine is running.

SET CONDITION:

Immediately after a Overheat shift schedule is activated when the Transmission temperature exceeds 116° C or 240° F.

POSSIBLE CAUSES

Possible Causes
HIGH TEMPERATURE OPERATION ACTIVATED
TORQUE CONVERTER CLUTCH SLIPPING / NOT ACTIVATING
OPERATING VEHICLE WITH TRANSMISSION IN LIMP-IN MODE FOR AN EXTENDED PERIOD OF TIME
EXCESSIVE TIME IDLING IN GEAR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **HIGH TEMPERATURE OPERATION**
    1. This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints.
    2. This DTC indicates that the transmission has been operating in the "Overheat" shift schedule which may generate a customer complaint.
    3. The customer driving patterns may indicate the need for an additional transmission oil cooler.
    4. Verify proper Engine cooling system operation which would affect proper transmission operation.
    5. Verify proper torque converter clutch operation.
    6. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Repair

    - Repair the cause of transmission overheating. Refer to **STANDARD PROCEDURE** for the proper repair procedure. Make sure to check for any Service Bulletins pertaining to this problem. Refer to **DIAGNOSIS AND TESTING** .
    - Refer to **STANDARD PROCEDURE** and perform the appropriate TRANSMISSION VERIFICATION TEST.

P0562-BATTERY VOLTAGE LOW

Fig. 1: PCM Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Friction element distress could result from an insufficient supply voltage to properly control the solenoids. To prevent this possibility, the battery voltage is monitored and the system is placed in logical limp-in if the battery voltage drops below the limit.

WHEN MONITORED:

With the engine running and the (Powertrain Control Module (PCM) has requested the Totally Integrated Power Module (TIPM) to activate the Transmission Control Output circuit.

SET CONDITION:

If the battery voltage of the Transmission Output circuit to the PCM is less than 10.0 volts for the period of 15 seconds. Note: P0562 generally indicates a gradually falling battery voltage or a resistive connection(s) to the PCM. The DTC will also set if the battery voltage sensed at the PCM is less than 6.5 volts for 200ms or where the Transmission Output circuits are less than 7.2 volts for 200ms.

POSSIBLE CAUSES

Possible Causes
RELATED CHARGING SYSTEM DTCS
(Z915) GROUND CIRCUITS OPEN OR HIGH RESISTANCE
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
PCM/TCM RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **RELATED CHARGING SYSTEM DTCS**
    1. With the scan tool, read the Powertrain Control Module (PCM) DTCs.

       Are there any related Charging System DTCs also present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate charging related DTC diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No

- Go To 2.

2. **CHECK FOR TIPM DTCS**

NOTE: Generator, battery, and charging system must be fully functional before performing this test.

1. With the scan tool, read TIPM DTCs.

   Are there any TIPM TCM Power Control circuit DTCs present.

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Go To 3.

3. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 0 for this DTC?

      Yes

      - Go To 4.

      No

      - Go To 7.

4. **CHECKING (Z915) GROUND CIRCUITS**

Fig. 2: Checking PCM Ground Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C2 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Using a 12-volt test light connected to 12-volts, check the (Z915) Ground circuits at the appropriate terminals of the PCM C2 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for all of the Ground circuits?

Yes

- Go To 5.

No

- Repair the (Z915) Ground circuit(s) for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN TO PCM**

Fig. 3: Checking Transmission Control Output Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TIPM C2 harness connector.

3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (T16) Transmission Control Output circuit between the TIPM C2 harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6.

   No

   - Repair the (T16) Transmission Control Output circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN TO THE TRANSMISSION SOLENOID ASSEMBLY**

Fig. 4: Checking Transmission Control Output Circuit For Open To Transmission Solenoid Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

2. Measure the resistance of the (T16) Transmission Control Output circuit between the TIPM C2 harness connector and the Transmission Solenoid/TRS harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Repair the (T16) Transmission Control Output circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

      Where there any problems found?

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Test Complete.

P0602-CONTROL MODULE PROGRAMMING ERROR/NOT PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The controller is programmed during manufacturing with generic software to facilitate testing. However, generic software does not have the proper calibrations to control a transmission in a vehicle. The check for

generic software is made at power-up. If generic software is found, the MIL will light immediately and the MIL will stay on even if the fault is cleared, until the proper software is installed. Note: Transmission will be placed in limp-in mode.

WHEN MONITORED:

Check for generic software is made at power-up

SET CONDITION:

If generic software is found, the MIL will light immediately. This DTC is designed to inform the technician that the controller still has generic software installed.

POSSIBLE CAUSES

Possible Causes
PCM - PROGRAMMING ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CONTROL MODULE PROGRAMMING ERROR**

   NOTE: Controller is programmed with generic software and will not allow the correct vehicle Powertrain management.

   1. With the scan tool.
   2. Record the vehicles controller part number.
   3. Select Use Controller Part Number under the Flash Tab.
   4. Flash the controller with the correct software.

      Verify the controller flashed successfully.

      Test Complete

      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0604-INTERNAL CONTROL MODULE RAM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the controller is reset (ignition turned to the RUN position), the microprocessor checks the integrity of each RAM location by writing to it and reading back from it. The read value should be same as value written.

WHEN MONITORED:

One time after the controller is reset (ignition turned to the RUN position).

SET CONDITION:

Whenever the Powertrain Control Module (PCM) detects an internal controller problem.

POSSIBLE CAUSES

Possible Causes
POWER OR GROUND CIRCUIT POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK WIRING AND CONNECTORS FOR INTERMITTENT OPERATION**
    1. Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.
    2. Wiggle the wires while checking for shorted and open circuits.
    3. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair the power and/or ground circuits to the PCM as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0605-INTERNAL CONTROL MODULE ROM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the controller is reset (ignition turned to the RUN position) the microprocessor checks the integrity of the program memory (ROM). A checksum is calculated by adding all used bytes in the program memory. The sum should be the same as a known constant stored in the program memory.

WHEN MONITORED:

One time after the controller is reset (ignition turned to the RUN position).

SET CONDITION:

Whenever the Powertrain Control Module (PCM) detects an internal controller problem.

POSSIBLE CAUSES

Possible Causes
POWER OR GROUND CIRCUIT POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK WIRING AND CONNECTORS FOR INTERMITTENT OPERATION**
    1. Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.
    2. Wiggle the wires while checking for shorted and open circuits.
    3. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair the power and/or ground circuits as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0613-INTERNAL TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The internal Watchdog (WD) is a separate hardware circuit that continuously monitors the microprocessor. To insure the proper operation of the Transmission controller the watchdog must receive a signal from the microprocessor within a specific time window (14 msec ± 1 msec) to prevent a system shutdown after a short delay (570 msec). The microprocessor periodically tests the WD's ability to provide this shutdown function using a three phase test;

1) Send the signal too late > 15 msec

2) Send the signal too early < 13 msec

3) Delay test < 590 msec

If the watchdog input signal arrives too early or too late, the Watchdog Fault line will go low and the watchdog delay will start to time out. The delay will be reset by the correct timing of watchdog signal sent during subsequent operations.

The Delay Test checks the delay time out. The Delay Monitor line is pulled low, which forces the delay to start timing out. At the end of the delay time the Transmission Relay will be turned off. The delay test, upon detection of the relay turning off, will immediately turn the relay back on before shutdown can occur.

WHEN MONITORED:

1) One time after the controller is reset (ignition turned to the RUN position) and every 60 seconds thereafter. The Delay Test is executed after a reset only.

2) Two seconds after an invalid test.

SET CONDITION:

If either of the following conditions occur three times:

1) The watchdog fault line remains high after the period has elapsed for the too early - too late watchdog test.

2) The Transmission Control Output remains on after the watchdog delay expired.

POSSIBLE CAUSES

Possible Causes
POWER OR GROUND CIRCUIT
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK THE WIRING AND CONNECTORS**
    1. Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.
    2. Wiggle the wires while checking for shorted and open circuits.
    3. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair the power and/or ground circuits as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0706-TRANSMISSION RANGE SENSOR RATIONALITY

Fig. 5: Transmission Range Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The T41 (C1), T42 (C2), T3 (C3), T1 (C4), T2 (C5) Signal circuits communicate the shift lever position to the Transmission Control System. Each circuit is terminated at the transmission by a switch (TRS). Each switch can

be either open or closed, depending on the shift lever position. The PCM can decode this information and determine the shift lever position.

Each shift lever position has it own unique combination of closed and open switches. This is called a PRNDL code. There are five switches, therefore: there are many possible combinations of open and closed switches (codes). There are eight valid codes: two for neutral, one for each other gear position (3), and three temporary (transition zone) codes. The remainder of the codes should never occur, these are called invalid codes.

WHEN MONITORED:

Continuously with the ignition on.

SET CONDITION:

The DTC will set if the controller detects an invalid PRNDL code which lasts for more than 0.042 of a second.

POSSIBLE CAUSES

Possible Causes
TRS SIGNAL CIRCUIT OPEN
TRS SIGNAL CIRCUIT SHORTED TO GROUND
TRS SIGNAL CIRCUIT SHORTED TO VOLTAGE
METAL DEBRIS IN OIL PAN
TRANSMISSION RANGE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

SHIFT LEVER ERROR CODES

ERROR CODE	SWITCH STUCK	POSITION
1	T41 (C1)	OPEN
2	T41 (C1)	CLOSED
3	T42 (C2)	OPEN
4	T42 (C2)	CLOSED
5	T3 (C3)	OPEN
6	T3 (C3)	CLOSED
7	T1 (C4)	OPEN
8	T1 (C4)	CLOSED
9	T2 (C5)	OPEN
10	T2 (C5)	CLOSED
11	TOW/HAUL	OPEN
12	TOW/HAUL	CLOSED

TRS SWITCH STATES

	PARK	TMP 1	REV	TMP 2	N1	N2	TMP 3	D
T41 (C1)	CLOSED	OPEN	OPEN	OPEN	CLOSED	CLOSED	OPEN	OPEN
T42 (C2)	CLOSED	CLOSED	CLOSED	CLOSED	CLOSED	CLOSED	CLOSED	OPEN
T3 (C3)	OPEN	OPEN	OPEN	CLOSED	CLOSED	CLOSED	CLOSED	CLOSED
T1 (C4)	OPEN	OPEN	OPEN	OPEN	OPEN	CLOSED	CLOSED	CLOSED
T2 (C5)	CLOSED	CLOSED	OPEN	OPEN	OPEN	OPEN	OPEN	OPEN

DIAGNOSTIC TEST

1. **CHECK TO SEE IF P0706 DTC IS CURRENT**
   1. With the scan tool, perform the Shift Lever Position Test.

      Select the test outcome from the following:

      Test passes:

      - Go To 6.

      Test fails with Error Code:

      - Go To 2.

      Test fails without Error Code:

      - Refer to **STANDARD PROCEDURE** and perform the Gearshift Adjustment Procedure
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.
2. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the scan tool, perform the Shift Lever Position Test.
   6. When the scan tool instructs you to put the Gear Selector in a particular position, you must do so using the selector switch on the Transmission Simulator.

7. The LED for the gear position in question must be illuminated on the Transmission Simulator prior to pressing "ENTER" on the scan tool.

NOTE: **When the scan tool requests the O/D off button be depressed, you must use the TOW/HAUL button in the vehicle or you will fail the Shift Lever Position Test with an error code 11 or OD-TOW/HALL STUCK OPEN.**

NOTE: **If the Shift Lever Position test fails, make sure to note the identification of the TRS Signal circuit for future reference.**

Did the Shift Lever Position test pass?

Yes

- Remove the Oil Pan and Main Valve Body Assembly in accordance with the Service Information. Check for metal debris on top of the Solenoid/TRS Assembly and the manual valve code plate. If debris is present, determine the cause of the debris and repair the transmission as necessary. If no problems are found, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 3.

3. **TRS SIGNAL CIRCUIT OPEN**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Simulator, Miller tool # (special tool #8333A, Simulator, Transmission).
   3. Disconnect the PCM C2 harness connector.
   4. Measure the resistance of the identified (T1, T2, T3, T41, or T42) TRS Signal circuit, from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Signal circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

- Go To 4.

4. **TRS SIGNAL CIRCUIT SHORTED TO GROUND**
    1. Measure the resistance between ground and the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Signal circuit.

       Is the resistance below 5.0 Ohms?

       Yes

       - Repair the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Signal circuit for a short to ground.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 5.

5. **TRS SIGNAL CIRCUIT SHORTED TO OTHER CIRCUITS**
    1. Measure the resistance between the identified (T1, T2, T3, T41, or T42) TRS Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

       Is the resistance below 100k Ohms between the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

       Yes

       - Repair the identified (T41, T42, T3, T1, or T2 (C1-C5) TRS Signal circuit for a short to other circuit(s).
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No

       - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wiring and connectors while checking for shorted and open circuits.

4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0711-TRANSMISSION TEMPERATURE SENSOR PERFORMANCE

Fig. 6: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermistor. The temperature of the transmission fluid can affect a variety of electronically controlled

transmission operations such as shift quality, torque converter clutch engagement, and when and/or if certain OBDII or system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC will set when the desired transmission temperature does not reach a normal operating temperature within a given time frame. Time is variable due to ambient temperature. Approximate times are starting temperature to warm up time: (-40° F / -40° C - 35 min) (-20° F / -28° C - 25 min) (20° F / -6.6° C - 20 min) (60° F / 15.5 ° C - 10 min)

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are there any other Transmission Temperature Sensor DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

- Go To 3.

No

- Go To 4.

3. **TRANSMISSION TEMPERATURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Input/Output switch to OFF.
   6. With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
   7. Compare the scan tool readings to the voltage readings listed on the Transmission Simulator.

      Do the readings on the scan tool match the Transmission Simulator readings ± 0.2 of a volt?

      Yes

      - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.

4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0712-TRANSMISSION TEMPERATURE SENSOR LOW

Fig. 7: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermister. The temperature of the transmission fluid can affect a variety of electronically controlled

transmission operations such as shift quality, torque converter clutch engagement, and when and/or if certain OBDII or system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set when the monitored Temperature Sensor voltage drops below 0.078 of a volt for the period of 0.45 of a second.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are there any line pressure sensor or throttle position sensor DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate charging related DTC diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

- Go To 3.

No

- Go To 5.

3. **TRANSMISSION TEMPERATURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Input/Output switch to OFF.
   6. With the scan tool, monitor the Transmission Temperature voltage while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
   7. Compare the scan tool readings with the numbers listed on the Transmission Simulator.

   Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 of a volt?

   Yes

   - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 8: Checking Transmission Temperature Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance between ground and the (T54) Transmission Temperature Sensor Signal circuit.

Is the resistance below 5.0 Ohms?

Yes

- Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0713-TRANSMISSION TEMPERATURE SENSOR HIGH

Fig. 9: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermister. The temperature of the transmission fluid can affect a variety of electronically controlled

transmission operations such as shift quality, torque converter clutch engagement, and when and/or if certain OBDII or system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set when the monitored Temperature Sensor voltage rises above 4.94 volts for the period of 0.45 of a second.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO OTHER CIRCUITS
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are there any line pressure sensor DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate charging related DTC diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

- Go To 3.

No

- Go To 5.

3. **TRANSMISSION TEMPERATURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Input/Output switch to OFF.
   6. With the scan tool, monitor the Transmission Temperature voltage while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
   7. Compare the scan tool readings with the numbers listed on the Transmission Simulator.

      Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 of a volt?

      Yes

      - Replace Transmission Solenoid/TRS assembly in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 4.

4. **CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 10: Measuring Resistance Between Transmission Temperature Sensor Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator, Miller tool # (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance between the (T54) Transmission Temperature Sensor Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T54) Transmission Temperature Sensor Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the Transmission Temperature Sensor Signal circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0714-TRANSMISSION TEMPERATURE SENSOR INTERMITTENT

Fig. 11: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermister. The temperature of the transmission fluid can affect a variety of electronically controlled

transmission operations such as shift quality, torque converter clutch engagement, and when and/or if certain OBDII or system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set when the monitored Temperature Sensor voltage fluctuates or changes abruptly within a predetermined period of time.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are there any line pressure sensor or throttle position sensor DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate charging related DTC diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 3.

No

- Go To 4.

3. **TRANSMISSION TEMPERATURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Input/Output switch to OFF.
   6. With the scan tool, monitor the Transmission Temperature voltage while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
   7. Compare the scan tool readings with the numbers listed on the Transmission Simulator.

      Do the readings on the Transmission Simulator match a non-fluctuating scan tool reading ± 0.2 of a volt?

      Yes

      - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.

4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0716-INPUT SPEED SENSOR 1 CIRCUIT PERFORMANCE

Fig. 12: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified

through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0729 and P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set when at a stop.

WHEN MONITORED:

The transmission gear ratio is monitored continuously while the transmission is in gear.

SET CONDITION:

If there is an excessive change in input rpm in any gear. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
INPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Start the engine in park.
    2. With the scan tool, monitor the Input Speed Sensor rpm.

       Is the Input Speed Sensor rpm below 400 rpm?

       Yes

- Go To 2.

No

- Go To 9.

2. **INPUT SPEED SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, set the selector switch to 3000/1000 and the Input/Output switch to ON.
   6. With the scan tool, monitor the Input and Output Speed Sensor rpm.

      Does the Input speed read 3000 rpm and the Output speed read 1000 rpm ± 50 rpm?

      Yes

      - Replace the Input Speed Sensor in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 3.

3. **CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 13: Checking Input Speed Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C2 harness connector.

NOTE: **Make sure to leave the Speed Sensor, Transmission Solenoid/TRS Assembly, and Line Pressure Sensor harness connectors disconnected.**

3. Ignition on, engine not running.
4. With the scan tool in TIPM, actuate the Transmission.

5. Measure the voltage of the (T52) Input Speed Sensor Signal circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T52) Input Speed Sensor Signal circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 14: Checking Input Speed Sensor Ground Circuit For Open Or Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool under TIPM, actuate the TCM output.
2. Measure the voltage of the (T13) Speed Sensor Ground circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION

VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 15: Checking Input Speed Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool in TIPM, stop the actuation the TCM output.
2. Turn the ignition off to the lock position.

3. Measure the resistance of the (T52) Input Speed Sensor Signal circuit between the Input Speed Sensor harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T52) Input Speed Sensor Signal circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 6.

6. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 16: Checking Input Speed Sensor Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T13) Speed Sensor Ground circuit between the Input Speed Sensor harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION

VERIFICATION TEST.

No

- Go To 7.

7. **CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 17: Checking Input Speed Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the Input Speed Sensor Signal circuit.

Is the resistance below 5.0 Ohms?

Yes

- Repair the (T52) Input Speed Sensor Signal circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND**

Fig. 18: Checking Speed Sensor Ground Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0721-OUTPUT SPEED SENSOR CIRCUIT PERFORMANCE

Fig. 19: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified

through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0729 and P0731- P0736).

2) An excessive change in input or output speeds indicating signal intermittent will result in codes P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor has 60 teeth and the output speed sensor has 30 teeth, this results in a an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

The transmission gear ratio is monitored continuously while the transmission is in gear.

SET CONDITION:

If there is an excessive change in output rpm in any gear. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
OUTPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK TO SEE IF DTC P0721 IS CURRENT**
    1. Turn the ignition off to the lock position.

        CAUTION: Properly support the vehicle and raise all drive wheels off the ground.

    2. Release the parking brake.

3. Start the engine in park.
4. Place the transmission gear selector in drive, release foot from brake.

WARNING: Be sure to keep hands and feet clear of rotating wheels.

5. With the scan tool, monitor the Output Speed Sensor rpm.

   Is the Output Speed Sensor rpm below 100 rpm?

   Yes

   - Go To 2.

   No

   - Go To 9.

2. **OUTPUT SPEED SENSOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, set the selector switch to 3000/1000 and the Input/Output switch to ON.
   6. With the scan tool, monitor the Input and Output Speed Sensor rpm

      Does the Input Speed read 3000 rpm and the Output Speed read 1000 rpm, ± 50 rpm?

      Yes

      - Replace the Output Speed Sensor in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

- Go To 3.

3. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 20: Checking Output Speed Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (T14) Output Speed Sensor Signal circuit from the Output Speed Sensor harness connector to the appropriate terminal of the PCM C2 harness connector.

Is the resistance above 5.0 Ohms?

Yes

- Repair the (T14) Output Speed Sensor Signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 21: Checking Output Speed Sensor Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T13) Speed Sensor Ground circuit from the Output Speed Sensor harness connector to the appropriate terminal in the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION

VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 22: Checking Output Speed Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T14) Output Speed Sensor Signal circuit.

Is the resistance below 5.0 Ohms?

Yes

- Repair the (T14) Output Speed Sensor Signal circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND**

Fig. 23: Checking Speed Sensor Ground Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

7. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE**

Fig. 24: Checking Output Speed Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. With the scan tool in TIPM, actuate the TCM output.
3. Measure the voltage of the (T14) Output Speed Sensor Signal circuit.

Is the voltage above 0.5 of a volt?

Yes

- Repair the (T14) Output Speed Sensor Signal circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 25: Checking Output Speed Sensor Ground Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool in TIPM, actuate the TCM output.
2. Measure the voltage of the (T13) Speed Sensor Ground circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to voltage.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P0729-GEAR RATIO ERROR IN 6TH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: **Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.**

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble

code is set (DTCs P0729 and P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
LOW FLUID LEVEL
INPUT OR OUTPUT SPEED SENSOR(S) OR WIRING
VALVE BODY ACCUMULATOR COVER FAILED
CUT OD OR 2C ACCUMULATOR SEAL
CRACKED OD OR 2C ACCUMULATOR PISTON
BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY
CUT 2C TOWER SEAL
TRANSMISSION SOLENOID/TRS ASSEMBLY
CUT OR MISSING NO. 5, NO. 6, OR NO. 7 CHECK BALL
WORN SOLENOID SWITCH VALVE OR PLUGS
CUT OD OR 2C PISTON SEAL
STUCK MAIN REGULATOR VALVE
BURNED OD OR 2C CLUTCH
BROKEN OR MISSING 2C BLEED ORIFICE IN 2C/4C RETAINER
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE
LOOSE / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
CRACKED / LOOSE / MISSING OD/REVERSE PISTON BLEED ORIFICE
FAILED OD SHAFT
FAILED REVERSE ANNULUS GEAR SPLINE
FAILED REVERSE CARRIER HUB SPLINE
FAILED REVERSE SUN GEAR SPLINE TO REACTION CARRIER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
   1. With the scan tool, check for other transmission DTCs
   2. If any of these DTCs are present, perform their respective tests first.

      Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

      Yes

      - If any of these DTCs are present, they may cause a Speed Ratio Error. Refer to **DIAGNOSTIC CODE INDEX** and perform the test for P0944 first if it is present.

      No

      - Go To 2.
2. **CHECK THE EVENT DATA**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for the DTC P0729?

      Yes

      - Go To 4.

      No

      - Go To 3.
3. **CHECK THE TARGET GEAR**

   In the Event Data recorded earlier, does the Event Data show the DTC P1790, with Target gear = 6th, or with both the 2C and OD clutches applying?

   Yes

   - Go To 4.

   No

- Go To 6.

4. **CHECK INPUT RPM**

   In the Event Data recorded earlier, does the Input rpm read zero?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the diagnostic procedure for P0716-Input Speed Sensor Circuit Performance. Diagnose the DTC as if it is set and current.

   No

   - Go To 5.

5. **CHECK LINE PRESSURE READING**

   In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure reading?

   Yes

   - Remove the Transmission Oil pan and check the Transmission Oil filter for improper installation or plugged, if Primary oil filter is OK, check the main regulator valve in pump. If excessive debris is in the oil pan, check clutches and repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 6.

6. **CHECK TRANSMISSION FOR SLIPPAGE**
   1. Erase DTCs and road test the vehicle.
   2. Check the transmission operation in reverse and all forward gears.

      During the road test, was there any obvious slippage noted in any gear, or did the transmission fail to make a 1-2 upshift?

      Yes

      - Go To 8.

      No

      - Go To 7.

7. **CHECK IF THE DTC RESETS**

1. With the scan tool, check for Transmission DTCs after the road test.

   Did the DTC P0729 reset?

   Yes

   - Go To 8.

   No

   - Test Complete.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

8. **CHECK INTERNAL TRANSMISSION**
   1. Remove the Transmission Oil Pan and Valve Body, in accordance with the Service Information, and check for the following:
      - Excessive clutch and or metal debris in the oil pan.
      - If the accumulator cover is intact and the 2C tower seal is not cut or split.
      - OD and 2C accumulator pistons for cracks or cut seals.
      - Solenoid Switch Valve and its plugs for stickiness or wear.
      - Cut or missing No. 5, No. 6, or No. 7 check ball.
      - OD bleed orifice (on top of the main valve body) is intact.
      - Air check the OD and 2C hydraulic clutch circuits for excessive leakage. Refer to **STANDARD PROCEDURE** .

      NOTE: Both the OD and 2C hydraulic clutch circuits contain a small bleed orifice. A small amount of air leakage is considered normal. The OD hydraulic clutch circuit bleed orifice connects to the Reverse input clutch hydraulic cavity. A small amount of air leakage into the Reverse hydraulic clutch circuit is considered normal.

      Were there any problems found?

      Yes

      - Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.

        NOTE: If the OD or 2C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION

VERIFICATION TEST.

No

- Go To 9.

9. **CHECK ROAD TEST RESULTS**

During the road test, were Reverse, 1st, 2nd, and 3rd gears OK, but the transmission slipped in 4th, 5th, and 6th gears?

Yes

- Go To 10.

No

- Go To 11.

10. **CHECK THE OD SHAFT AND REVERSE CARRIER SPLINE**
    1. Remove the Transmission in accordance with the Service Information and inspect the OD shaft and its spline to the reverse carrier hub.

       Were there any problems found?

       Yes

       - Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No

       - Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston) and repair as necessary in accordance with the Service Information.

         NOTE: If the OD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, etc.), replace the Transmission Solenoid/TRS Assembly in addition to any other necessary repairs.

       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK FOR FAILED REVERSE GEARSET SPLINES**

Working through the windows in the bottom of the case, check for a failed Reverse Sun or Annulus gear spline as follows:

1. Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
2. Apply the 4C clutch using 30-40 psi shop air at the apply port in the center bulkhead.
3. Attempt to rotate the input annulus gear and drive shell (the drum that encloses the two rearmost gearsets).

NOTE: Due to the overrunning clutch, the gear and drive shell normally rotates in one direction only.

Can the drive shell be rotated?

Yes

- Repair internal transmission as necessary in accordance with the Service Information. Check the reverse annulus gear spline to the input carrier, and the reverse sun gear spline to the reaction carrier hub.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information and Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

NOTE: If continued slippage is noted in 2nd and/or 6th gear during the verification test, remove the transmission and inspect the 2C clutch and repair as necessary in accordance with the Service Information.

P0731-GEAR RATIO ERROR IN 1ST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble

code is set (DTCs P0729 and P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
CUT UD PISTON SEAL
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
STUCK OR STICKING MAIN REGULATOR VALVE
FAILED OVERRUNNING CLUTCH
BURNED UD CLUTCH
CUT UD ACCUMULATOR SEAL RING
CRACKED UD ACCUMULATOR PISTON
BROKEN REACTION SHAFT SUPPORT SEAL RING
LOW LINE PRESSURE
BROKEN / MISSING MAIN VALVE BODY BLEED ORIFICE
BROKEN / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
POOR MACHINING ON PUMP VALVE BODY FACE
FAILED UD SHAFT
BROKEN OUTPUT SHAFT WELD
FAILED INPUT GEARSET
INPUT OR OUTPUT SPEED SENSOR(S) AND RELATED WIRING
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.
    2. If any of these DTCs are present, perform their respective tests first.

    Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

    Yes

    - If any of these DTCs are present, they may cause a Speed Ratio Error. Refer to **DIAGNOSTIC CODE INDEX** and perform the test for P0944 first if it is present.

    No

    - Go To 2.
2. **CHECK THE L/R CLUTCH STATE**
    1. Start the vehicle, with the brakes firmly applied and the vehicle stationary, place the shift lever in Drive. Using the scan tool, check the L/R Clutch State.

    Did the L/R Clutch state read Applied?

    Yes

    - Go To 4.

    No

    - Go To 3.
3. **CHECK THE POWERTRAIN CONTROL MODULE**
    1. Turn the ignition off to the lock position for at least 30 seconds.
    2. Again, start the vehicle, with the brakes firmly applied and the vehicle stationary, place the shift lever in Drive. Using the scan tool, check the L/R Clutch State.

    Did the L/R Clutch state read Applied?

    Yes

    - Go To 4.

    No

    - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the

Service Information. With the scan tool, perform Quick Learn.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

4. **CHECK FOR SLIPPAGE IN 1ST GEAR**
   1. With the scan tool, perform the 1st Gear Clutch Test. Follow the instructions on the scan tool.
   2. Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

      CAUTION: Do not overheat the transmission.

      Did the Clutch Test pass, Input Speed remain at zero?

      Yes

      - Go To 6.

      No

      - Go To 5.

5. **CHECK THE OVERRUNNING CLUTCH**
   1. With the scan tool, monitor the L/R Clutch state while launching the vehicle from a stop in 1st gear.

      Does the transmission slip (neutral out) when the L/R Clutch state changes to Not Applied?

      Yes

      - Remove transmission and inspect for failed overrunning clutch (rotates in both directions). Refer to **STANDARD PROCEDURE** for proper repair procedures.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 7.

6. **CHECK FOR INTERMITTENT OPERATION**
   1. The conditions to set this DTC are not currently present.
   2. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
      - If the Event Data shows fault P0731 was set in Park, Reverse, or Neutral, replace the Powertrain Control Module.
      - If the Event Data shows fault P0731 set with input rpm = zero, check the input speed sensor and related wiring.
      - If the Event Data shows fault P0731 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, mis-installed or damaged

primary filter or filter seal, sticking main regulator valve in pump, etc.).

- If the Event Data shows fault P0731 set with the UD pressure switch open (but line pressure matches Desired Line Pressure), air check the UD hydraulic clutch circuit for leakage in accordance with the Service Information. If the UD hydraulic clutch circuit is OK, replace the solenoid/TRS assembly.

3. Check the gearshift linkage adjustment.
4. Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
5. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

6. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
7. Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.
8. Gear ratio DTCs can also be set under extreme temperature conditions.
9. Verify if the problem is only experienced under extreme hot or cold conditions.

Were there any problems found.

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Test complete.

7. **CHECK INTERNAL TRANSMISSION**
   1. Repair internal transmission as necessary. Refer to **STANDARD PROCEDURE** .
   2. If there were any line pressure DTCs present along with this DTC, make sure to inspect the: Primary oil filter and seal, Transmission Oil Pump, and the Main regulator valve in accordance with the Service Information.
   3. If DTCs P0876 and/or P0875 were present in addition to the P0731, replace the Transmission Solenoid/TRS Assembly in addition to necessary internal repairs.
   4. Pay particular attention to the following list of possible causes when repairing the transmission:
      - Cut UD piston seal

- Failed overrunning clutch
- Burned UD clutch
- Cut UD accumulator seal ring
- Broken UD accumulator piston
- Low line pressure
- Broken/missing main valve body bleed orifice
- Broken/missing dribbler orifice assembly in reaction shaft support
- Poor machining on pump valve body face
- Transmission Solenoid/TRS Assembly

Repair

NOTE: **If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, low line pressure in Event Data, or other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Repair internal transmission in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0732-GEAR RATIO ERROR IN 2ND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: **Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.**

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0729 and P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input

speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, with the transmission in gear.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
INPUT OR OUTPUT SPEED SENSOR(S) OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR 2C CLUTCH
CUT 2C OR UD PISTON SEAL
BROKEN 2C PISTON CASTING
BROKEN OR MISSING 2C BLEED ORIFICE
BROKEN OR MISSING UD BLEED ORIFICE
CUT 2C OR UD ACCUMULATOR PISTON SEAL
CRACKED 2C OR UD ACCUMULATOR PISTON
CUT OR MISSING NO. 5 OR NO. 7 CHECK BALL
TRANSMISSION SOLENOID/TRS ASSEMBLY
BROKEN INPUT ANNULUS TO DRIVE SHELL WELD
FAILED SPLINE - REVERSE ANNULUS GEAR TO INPUT CARRIER
FAILED SPLINE - REACTION CARRIER TO REVERSE SUN GEAR
MISSING TEETH ON INPUT CLUTCH HUB TONE WHEEL

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for other transmission DTCs.

Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

Yes

- Refer to **DIAGNOSTIC CODE INDEX** and perform the test for P0944-LOSS OF PRIME first if it is present.

No

- Go To 2.

2. **CHECK IF DTC IS CURRENT**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for the DTC P0732?

      Yes

      - Go To 4.

      No

      - Go To 3.

3. **CHECK THE EVENT DATA**
   1. In the Event Data, identify the DTC that was recorded earlier.

      In the Event Data recorded earlier, does the Event Data display information for the DTC P1790, with target gear = 2nd, or with both 2C and UD clutches applying?

      Yes

      - Go To 4.

      No

      - Go To 7.

4. **CHECK RPM IN EVENT DATA**

   In the Event Data recorded earlier, does the Input rpm read zero?

   Yes

   - Check the input speed sensor and wiring. Refer to **DIAGNOSTIC CODE INDEX** and test P0716

and diagnose as if the DTC is current.

No

- Go To 5.

5. **CHECK LINE PRESSURE READING**

In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure?

Yes

- Go To 6.

No

- Go To 7.

6. **CHECK TRANSMISSION OIL FILTER**
   1. Turn the ignition off to the lock position.
   2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
   3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

NOTE: **Make sure the Primary Transmission Oil Filter and seal are properly installed and are not cracked or split.**

Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked, plugged or mis-installed?

Yes

- Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If excessive clutch debris is present, check the clutches for damage. Refer to **STANDARD PROCEDURE** for the proper hydraulic clutch repair procedure.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Remove the Transmission Oil Pump in accordance with the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK IF THE DTC P0732 IS CURRENT**

1. With the scan tool, perform the 2nd Gear Clutch Test. Follow the instructions on the scan tool.
2. Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: If the 2C clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 2nd gear clutch test will not detect a faulty 2C clutch. However, it will detect a faulty UD clutch.

Did the clutch test pass, did the Input Speed remain at zero?

Yes

- Go To 8.

No

- Go To 10.

8. **CHECK FOR INTERMITTENT OPERATION**
   1. Check the Shifter adjustment in accordance with the Service Information.
   2. Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
   3. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   4. Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

- Go To 9.

9. **CHECK FOR SLIPPAGE**
    1. With the scan tool, erase Transmission DTCs.
    2. Road test the vehicle.

    Does the Transmission fail to make a 1-2 upshift (stays in 1st gear and then shifts to direct gear), or is there obvious slippage noticed in 2nd gear?

    Yes

    - Go To 12.

    No

    - Go To 16.

10. **CHECK THE UD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove Transmission Oil Pan and check for excessive debris.
    2. Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) in accordance with the Service Information.

    NOTE: The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

    Were there any problems found, excessive debris and/or excessive air leakage in the UD clutch hydraulic circuit?

    Yes

    - Repair as necessary. Check the UD clutch piston seals, reaction shaft support seal rings and the dribbler assembly, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

      NOTE: If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, low line pressure in Event Data, or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 11.

11. **CHECK THE UD ACCUMULATOR PISTON**

1. Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

   Were there any problems found?

   Yes

   - Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Remove the Transmission Oil Pan and check for excessive debris.
    2. If grey sludge is present, check for a improperly assembled 2C clutch with the thick reaction plate not against the case.
    3. Remove the valve body and air check the 2C hydraulic clutch circuit (in the 2C/4C clutch retainer) in accordance with the Service Information.

       NOTE: The 2C clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

       Were there any problems found, excessive debris, improperly assembled 2C clutch and/or excessive air leakage in the 2C hydraulic clutch circuit?

       Yes

       - Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures. Note: Check the 2C piston seals and bleed orifice.

         NOTE: If the 2C clutch has failed but no obvious cause is found (such as a cut piston seal, cut tower seal, stuck regulator valve, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 13.

13. **CHECK THE 2C ACCUMULATOR**
    1. Check the 2C Accumulator piston for cracks or a cut seal.
    2. Check for a cut or missing No. 7 or No. 5 check ball.
    3. Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

    Were there any problems found

    Yes

    - Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 14.
14. **CHECK FOR FAILED REVERSE GEARSET SPLINES**

    Working through the windows in the bottom of the case, check for a failed Reverse Sun or Annulus spline as follows:

    1. Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
    2. Apply the 4C clutch using 30-40 psi shop air at the apply port in the center bulkhead.
    3. Attempt to rotate the input annulus gear and drive shell (the drum that encloses the two rearmost gearsets).

    NOTE: Due to the overrunning clutch, the gear and drive shell normally rotates in one direction only.

    Can the drive shell be rotated?

    Yes

    - Repair internal transmission as necessary in accordance with the Service Information. Check the reverse annulus gear spline to the input carrier, and the reverse sun gear spline to the reaction carrier hub.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 15.
15. **CHECK THE DRIVE SHELL WELD**

1. Release the output shaft and the 4C clutch.
2. Apply the L/R Clutch only using 30-40 psi of shop air.
3. Attempt to rotate the drive shell as in the previous step.

   Can the drive shell be rotated?

   Yes

   - Repair Transmission as necessary in accordance with the Service Information. Check the drive shell weld to input annulus gear.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

16. **CHECK IF DTC RESETS**

    Did the DTC P0732 reset during the road test?

    Yes

    - Go To 17.

    No

    - Go To 18.

17. **LIST OF POSSIBLE CAUSES**
    1. If any other DTCs set during the road test, refer to **DIAGNOSTIC CODE INDEX**.
    2. If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those:
       - Check for excessive debris in the Transmission Oil pan, plugged, cracked, or misinstalled Primary Transmission Oil Filter and/or seal.
       - Check for cut and/or missing No. 7 and No. 5 check balls in the main valve body.
       - Check the 2C and UD accumulator pistons and seals, UD bleed orifice, and the Solenoid Switch Valve and Plugs in the main valve body.
       - Check the UD clutch piston seals, reaction shaft support seal rings and dribbler assembly.
       - Check the 2C clutch piston seals, and bleed orifice.
       - Check the main regulator valve for sticking in its bore and the flatness of the pump valve body and pump housing faces.

- Check for a improperly assembled 2C clutch with the thick reaction plate not against the case.

Repair

- Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.

NOTE: If the UD or 2C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

18. **INTERMITTENT DTC**
    1. The conditions to set this DTC are not currently present.
    2. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
       - If the Event Data shows fault P0732 was set in Park, Reverse, or Neutral, replace the Powertrain Control Module.
       - If the Event Data shows fault P0732 set with input rpm = zero, check the input speed sensor and related wiring.
       - If the Event Data shows fault P0732 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
       - If the Event Data shows fault P0732 set with the UD or 2C pressure switch open (but line pressure matches Desired Line Pressure), air check the UD and 2C hydraulic clutch circuits for leakage in accordance with the Service Information. If the UD and 2C hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.
    3. Check the gearshift linkage adjustment.
    4. Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
    5. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    6. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
    7. Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.

8. Gear ratio DTCs can also be set under extreme temperature conditions.
9. Verify if the problem is only experienced under extreme hot or cold conditions.

   Were there any problems found.

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0733-GEAR RATIO ERROR IN 3RD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0729 and P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set when at a stop.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
INPUT OR OUTPUT SPEED SENSOR(S) OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR 4C CLUTCH
CUT 4C OR UD PISTON SEAL
BROKEN 4C PISTON CASTING
BROKEN OR MISSING 4C BLEED ORIFICE
BROKEN OR MISSING UD BLEED ORIFICE
CUT 4C OR UD ACCUMULATOR PISTON SEAL
CRACKED 4C OR UD ACCUMULATOR PISTON
TRANSMISSION SOLENOID/TRS ASSEMBLY
BROKEN REACTION SUN GEAR WELD
BROKEN REACTION ANNULUS GEAR WELD
FAILED REVERSE SUN GEAR SPLINE
FAILED REVERSE ANNULUS GEAR SPLINE
MISSING TEETH ON INPUT CLUTCH HUB TONE WHEEL

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINING IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, check for other transmission DTCs.

       Are any Transmission solenoid, line pressure, speed sensor, or loss of prime DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the test for P0944-LOSS OF PRIME first if it is present.

       No

       - Go To 2.

2. **CHECK EVENT DATA**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for the DTC P0733?

      Yes

      - Go To 3.

      No

      - Go To 6.
3. **CHECK RPM IN THE EVENT DATA**

   In the Event Data recorded earlier, does the Input rpm read zero?

   Yes

   - Check the input speed sensor and wiring. Refer to **DIAGNOSTIC CODE INDEX** and test P0716 and diagnose as if that DTC is current.

   No

   - Go To 4.
4. **CHECK LINE PRESSURE READING**

   In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure?

   Yes

   - Go To 5.

   No

   - Go To 6.
5. **PLUGGED TRANSMISSION OIL FILTER**
   1. Turn the ignition off to the lock position.
   2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
   3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

NOTE: **Make sure the Primary Transmission Oil Filter and/or seal is not cracked or split.**

Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked or plugged?

Yes

- Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If the Primary Transmission Oil Filter is plugged, Refer to **STANDARD PROCEDURE** for the proper hydraulic clutch repair procedure.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Remove the Transmission Oil Pump in accordance with the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK TO SEE IF DTC P0733 IS CURRENT**
   1. With the scan tool, perform the 3rd Gear Clutch Test. Follow the instructions on the scan tool.
   2. Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: **If the 4C clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 3rd Gear Clutch Test will not detect a faulty 4C clutch. However, it will detect a faulty UD clutch.**

Did the clutch test pass, did the Input Speed remain at zero?

Yes

- Go To 7.

No

- Go To 9.

7. **CHECK FOR INTERMITTENT OPERATION**
   1. Check the Shifter adjustment in accordance with the Service Information.
   2. Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

3. Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 8.

8. **CHECK FOR SLIPPAGE**
   1. With the scan tool, erase Transmission DTCs.
   2. Road test the vehicle.
   3. Check the Transmission is Reverse and all forward gears.

      Is there an obvious slippage noted in any gear?

      Yes

      - Go To 11.

      No

      - Go To 14.

9. **UD CLUTCH HYDRAULIC CIRCUIT**
   1. Remove Transmission Oil Pan and check for excessive debris.
   2. Remove the Valve Body and air check the UD clutch hydraulic circuit (in the case) in accordance with the Service Information.

      NOTE: The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

      Were there any problems found, excessive debris and/or excessive air leakage in the UD clutch hydraulic circuit?

      Yes

      - Repair as necessary. Check the UD clutch piston seals and the dribbler assembly, reaction shaft support seal rings, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

NOTE: **If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 10.

10. **UD ACCUMULATOR PISTON**
    1. Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

    Were there any problems found?

    Yes

    - Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 11.

11. **EXCESSIVE DEBRIS**
    1. Remove the Transmission Oil Pan and check for excessive debris.
    2. Remove the valve body and air check the 4C clutch hydraulic circuit in accordance with the Service Information.

    NOTE: **The 4C clutch passage contains a small bleed orifice, a small amount of air leakage is normal.**

    Were there any problems found, excessive debris, improperly assembled 4C clutch and/or excessive air leakage in the 4C clutch hydraulic circuit?

    Yes

    - Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures. Note: Check the 4C piston seals and bleed orifice.

    NOTE: **If the 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, low line pressure in Event Data, etc.) replace the Transmission Solenoid/TRS Assembly in**

addition to any necessary internal repairs.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 12.

12. **4C ACCUMULATOR**
    1. Check the 4C Accumulator piston for cracks or a cut seal.
    2. Check for a cut or missing No. 5 check ball.
    3. Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

    Were there any problems found?

    Yes

    - Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 13.

13. **CHECK FOR BROKEN REVERSE SUN GEAR WELD**

    Working through the windows in the bottom of the case, check the failed Reverse or reaction gear set connections follows:

    1. Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
    2. Apply the 4C clutch using 30-40 psi shop air at the apply port in the center bulkhead.
    3. Attempt to rotate the input annulus gear and drive shell (the drum that encloses the to rearmost gearsets). Note that (due to the overrunning clutch) the gear and drive shell normally rotates in one direction only.

    Can the drive shell be rotated?

    Yes

    - Repair Transmission as necessary in accordance with the Service Information. Check the reverse annulus gear spline to the input carrier, the reverse sun gear spline to the reaction carrier hub, and the reaction sun gear weld to the 4C clutch hub.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 17.

14. **CHECK IF DTC RESET**

Did the DTC P0733 reset during the road test?

Yes

- Go To 15.

No

- Go To 16.

15. **LIST OF POSSIBLE CAUSES**
    1. If any other DTCs set during the road test, refer to **DIAGNOSTIC CODE INDEX**.
    2. If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those:
    3. Check for excessive debris in the Transmission Oil pan, plugged, cracked, or split Primary Transmission Oil Filter and/or seal.
    4. Check for cuts or missing No. 5 check ball in the main valve body.
    5. Check the 4C and UD accumulator pistons and seals, UD bleed orifice, and the Solenoid Switch Valve and Plugs in the main valve body.
    6. Check the UD clutch piston seals, reaction shaft support seal rings, and the flatness of the pump valve body and pump housing faces.
    7. Check the 4C clutch piston seals, and bleed orifice.
    8. Check the UD clutch piston seals, reaction shaft support seal rings, and dribbler assemblies, and the flatness of the pump valve body and pump housing faces.

    Repair

    - Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.

    NOTE: **If the UD or 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, or other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

16. **INTERMITTENT DTC**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Use the Event Data to help identify the conditions and/or possible causes that may have caused the

DTC to set.

3. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

17. **INTERMITTENT DTC**
    1. The conditions to set this DTC are not currently present.
    2. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
       - If the Event Data shows fault P0733 was set in Park, Reverse, or Neutral, replace the Powertrain Control Module.
       - If the Event Data shows fault P0733 set with input rpm = zero, check the input speed sensor and related wiring.
       - If the Event Data shows fault P0733 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
       - If the Event Data shows fault P0733 set with the UD or 4C pressure switch open (but line pressure matches Desired Line Pressure), air check the UD and 4C hydraulic clutch circuits for leakage in accordance with the Service Information. If the UD and 4C hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.
    3. Check the gearshift linkage adjustment.
    4. Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
    5. Remove the Ignition Switch Feed fuse from the TIPM.

       CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

       WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    6. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
    7. Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.

8. Gear ratio DTCs can also be set under extreme temperature conditions.
9. Verify if the problem is only experienced under extreme hot or cold conditions.

   Were there any problems found.

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0734-GEAR RATIO ERROR IN 4TH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0729 and P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
INPUT OR OUTPUT SPEED SENSOR(S) OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
BENT OR BROKEN ACCUMULATOR COVER ON MAIN VALVE BODY
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR OD CLUTCH
CUT OD OR UD PISTON SEAL
BROKEN OR MISSING UD OR OD BLEED ORIFICE IN MAIN VALVE BODY
BROKEN OR MISSING BLEED ORIFICE IN UD OR OD CLUTCH PISTON
CUT OD OR UD ACCUMULATOR PISTON SEAL
CRACKED OD OR UD ACCUMULATOR PISTON
CUT OR MISSING #6 CHECK BALL
TRANSMISSION SOLENOID/TRS ASSEMBLY
FAILED OD SHAFT
FAILED SPLINE ON REVERSE CARRIER HUB
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, check for other transmission DTCs

       Are there any Transmission; solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the test for P0944-LOSS OF PRIME first if it is present.

       No

- Go To 2.

2. **CHECK Event Data**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for the DTC P0734?

      Yes

      - Go To 4.

      No

      - Go To 3.

3. **CHECK THE TARGET GEAR IN Event Data**
   1. In the Event Data, identify the DTC that was recorded earlier.

      Does the Event Data display information for the DTC P1790, with target gear = 4th, or with both OD and UD clutches applying?

      Yes

      - Go To 4.

      No

      - Go To 7.

4. **CHECK INPUT RPM IN Event Data**
   1. Refer to the Event Data recorded earlier.

      Does the Input rpm read zero?

      Yes

      - Check the input speed sensor and wiring. Refer to **DIAGNOSTIC CODE INDEX** and test P0716 and diagnose as if the DTC is current.

      No

      - Go To 5.

5. **CHECK LINE PRESSURE READING**
   1. Refer to the Event Data recorded earlier.

Is the line pressure reading more than 10 psi below the desired line pressure?

Yes

- Go To 6.

No

- Go To 7.

6. **CHECK TRANSMISSION OIL FILTER**
   1. Turn the ignition off to the lock position.
   2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
   3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

NOTE: Make sure the Primary Transmission Oil Filter and seal are properly installed and are not cracked or split.

Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked, plugged or mis-installed?

Yes

- Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If excessive clutch debris is present, check the clutches for damage. Refer to **STANDARD PROCEDURE** for the proper hydraulic clutch repair procedure.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Remove the Transmission Oil Pump in accordance with the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK FOR CLUTCH SLIPPAGE**
   1. With the scan tool, perform the Direct Gear Clutch Test. Follow the instructions on the scan tool.
   2. Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: If the OD clutch is faulty, the overrunning clutch will hold and the slip

test will pass. The Direct gear clutch test will not detect a faulty OD clutch. However, it will detect a faulty UD clutch.

Did the clutch test pass, did the Input Speed remain at zero?

Yes

- Go To 8.

No

- Go To 10.

8. **CHECK FOR INTERMITTENT OPERATION**
   1. Check the Shifter adjustment in accordance with the Service Information.
   2. Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
   3. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   4. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   5. Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 9.

9. **ROAD TEST THE VEHICLE AND CHECK FOR SLIPPAGE**
   1. With the scan tool, erase Transmission DTCs.
   2. Road test the vehicle. Check operation in all forward gears and Reverse.
   3. If slippage is detected, check whether the line pressure is more than 10 psi below the desired line

pressure reading on the scan tool.

4. Check and record any transmission DTCs.
5. Disconnect the Transmission Solenoid/TRS Assembly harness connector to induce Limp-in.
6. Again test drive the vehicle and check the transmission operation in Drive and Reverse while in Limp-in.
7. Note whether Drive Limp-in provides 1st gear or 4th (direct) gear.
8. Reconnect all disconnected connectors and erase any Transmission DTCs.

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate procedure that best describes your road test results:

No obvious slippage noted in any gear

- Go To 15.

Obvious slippage noted in one or more gears, and line pressure (actual) is often more than 10 psi below the Desired Line Pressure reading on the scan tool

- Go To 6.

Slippage noted in 4th gear and Drive Limp-in provides 1st gear

- Go To 12.

Slippage noted in Reverse gear and Drive Limp-in provides 1st gear

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

Slippage noted in 4th gear while Drive Limp-in allows 4th gear WITHOUT slippage

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

All other possible conditions

- Go To 12.

10. **CHECK THE UD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove Transmission Oil Pan and check for excessive debris.
    2. Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) in accordance with the Service Information.

NOTE: **The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.**

Were there any problems found, excessive debris and/or excessive air leakage in the UD hydraulic clutch circuit?

Yes

- Repair as necessary. Check the UD clutch piston seals, reaction shaft support seal rings and dribbler assemblies, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

  NOTE: **If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, low line pressure in DTC Event Data, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 11.

11. **CHECK UD ACCUMULATOR PISTON**
    1. Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

    Were there any problems found?

    Yes

    - Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.

    No

    - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Remove the Transmission Oil Pan and check for excessive debris.
    2. Remove the valve body and check if the accumulator cover is intact.
    3. Air check the OD hydraulic clutch circuit (in the case) in accordance with the Service Information.

    NOTE: **The OD clutch passage contains a small bleed orifice which connects to the Reverse clutch hydraulic circuit, a small amount of air leakage**

into the Reverse clutch passage is normal.

Were there any problems found, excessive debris, and/or excessive air leakage in the OD hydraulic clutch circuit?

Yes

- Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures. Note: Check the bleed orifice in the OD/Reverse clutch piston.

NOTE: **If the OD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, low line pressure in DTC Event Data, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 13.

13. **CHECK THE OD ACCUMULATOR**
    1. Check the OD Accumulator piston for cracks or a cut seal.
    2. Check for a cut or missing #6 check ball.
    3. Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

    Were there any problems found?

    Yes

    - Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 14.

14. **CHECK FOR FAILED OD SHAFT/SPLINE**
    1. Remove the Transmission in accordance with the Service Information and inspect the OD shaft and its spline to the reverse carrier hub.

    Were there any problems found?

    Yes

- Repair as necessary.

No

- Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston). Check the OD hub and shaft. Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.

NOTE: **If the OD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, etc.), replace the Transmission Solenoid/TRS Assembly in addition to any other necessary repairs.**

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK IF DTC RESETS**

Did the DTC P0734 reset during the road test?

Yes

- Go To 16.

No

- Go To 17.

16. **LIST OF POSSIBLE CAUSES**
    1. If any other DTCs set during the road test, refer to **DIAGNOSTIC CODE INDEX**.
    2. If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those.
    3. Check for:
        - Excessive debris in the Transmission Oil pan, plugged, cracked, or mis-installed Primary Transmission Oil Filter and/or seal.
        - Cut or missing #6 check ball in the main valve body.
        - OD and UD accumulator pistons and seals and bleed orifices, and the Solenoid Switch Valve and Plugs in the main valve body.
        - OD and UD clutch piston seals, reaction shaft support seal rings and dribbler assemblies, and the flatness of the pump valve body and pump housing faces.
        - Main regulator valve for sticking in its bore.

Repair

- Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.

NOTE: **If the OD or UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, or other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

17. **CHECK FOR INTERMITTENT OPERATION**
    1. The conditions to set this DTC are not currently present.
    2. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
       - If the DTC Event Data shows fault P0734 was set in the Park, Reverse, or Neutral, replace the Powertrain Control Module.
       - If the DTC Event Data shows fault P0734 set with input rpm = zero, check the input speed sensor and related wiring.
       - If the DTC Event Data shows fault P0734 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
       - If the DTC Event Data shows fault P0734 set with the OD or UD pressure switch open (but line pressure matches Desired Line Pressure), air check the OD and UD hydraulic clutch circuits for leakage in accordance with the Service Information. If the OD and UD hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.
    3. Check the gearshift linkage adjustment.
    4. Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
    5. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: **Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.**

WARNING: **The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.**

    6. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    7. Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.
    8. Gear ratio DTCs can also be set under extreme temperature conditions.
    9. Verify if the problem is only experienced under extreme hot or cold conditions.

    Were there any problems found.

    Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P0735-GEAR RATIO ERROR IN 5TH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0729 and P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes

LOW FLUID LEVEL
INPUT OR OUTPUT SPEED SENSOR(S) OR WIRING
VALVE BODY ACCUMULATOR COVER FAILED
CUT OD OR 4C ACCUMULATOR SEAL
CRACKED OD OR 4C ACCUMULATOR PISTON
BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY
CUT 4C TOWER SEAL
TRANSMISSION SOLENOID/TRS ASSEMBLY
CUT OR MISSING NO. 5 OR NO. 6 CHECK BALL
WORN SOLENOID SWITCH VALVE OR PLUGS
CUT OD OR 4C PISTON SEAL
STUCK MAIN REGULATOR VALVE
BURNED OD OR 4C CLUTCH
BROKEN OR MISSING 4C BLEED ORIFICE IN 2C/4C RETAINER
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE
LOOSE / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
CRACKED / LOOSE / MISSING OD/REVERSE PISTON BLEED ORIFICE
FAILED OD SHAFT
BROKEN REACTION ANNULUS GEAR WELD
FAILED REVERSE ANNULUS GEAR SPLINE
BROKEN REACTION SUN GEAR WELD
FAILED REVERSE CARRIER HUB SPLINE
FAILED REVERSE SUN GEAR SPLINE TO REACTION CARRIER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for other transmission DTCs
    2. If any of these DTCs are present, perform their respective tests first.

    Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

    Yes

    - If any of these DTCs are present, they may cause a Speed Ratio Error. Refer to **DIAGNOSTIC CODE INDEX** and perform the test for P0944 first if it is present.

    No

- Go To 2.

2. **CHECK THE EVENT DATA**
   1. With the scan tool, read and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data display information for the DTC P0735?

      Yes

      - Go To 4.

      No

      - Go To 3.

3. **CHECK FOR ANOTHER DTC**

   In the Event Data recorded earlier, does the Event Data show the DTC P1790, with Target Gear = 5th, or with both the 4C and OD clutches applying?

   Yes

   - Go To 4.

   No

   - Go To 6.

4. **CHECK THE INPUT RPM**

   In the Event Data recorded earlier, does the Input rpm read zero?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the diagnostic procedure for P0716-Input Speed Sensor Circuit Performance. Diagnose the DTC as if it is set and current.

   No

   - Go To 5.

5. **CHECK THE LINE PRESSURE READING**

   In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure reading?

Yes

- Remove the Transmission Oil pan and check the Transmission Oil filter for improper installation or plugged, if Primary oil filter is OK, check the main regulator valve in pump. If excessive debris is in the oil pan, check clutches and repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 6.

6. **CHECK TRANSMISSION FOR SLIPPAGE**
   1. Erase DTCs and road test the vehicle.
   2. Check the transmission operation in reverse and all forward gears.

      During the road test, was there any obvious slippage noted in any gear?

      Yes

      - Go To 8.

      No

      - Go To 7.

7. **CHECK IF THE DTC RESETS**
   1. With the scan tool, check for Transmission DTCs after the road test.

      Did the DTC P0735 reset?

      Yes

      - Go To 8.

      No

      - Test Complete.

8. **CHECK INTERNAL TRANSMISSION**
   1. Remove the Transmission Oil Pan and Valve Body in accordance with the Service Information and check for the following:
      - Excessive debris in the oil pan.
      - Remove the Valve Body and check if the accumulator cover is intact and the 4C tower seal is not cut or split.
      - OD and 4C accumulator pistons for cracks and/or cut seals.

- Solenoid Switch Valve and its plugs for stickiness or wear.
- Cut or missing No. 5 and/or No. 6 check ball.
- OD bleed orifice (on top of the main valve body) is intact.
- Air check the OD and 4C hydraulic clutch circuits for excessive leakage. Refer to **STANDARD PROCEDURE** .

NOTE: **Both the OD and 4C hydraulic clutch circuits contain a small bleed orifice. A small amount of air leakage is considered normal. The OD hydraulic clutch circuit bleed orifice connects to the Reverse input clutch hydraulic cavity. A small amount of air leakage into the Reverse hydraulic clutch circuit is considered normal.**

Were there any problems found?

Yes

- Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.

NOTE: **If the OD or 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK ROAD TEST RESULTS**

Perform the appropriate action for the condition(s) which best describe the road test results:

1st gear was OK. Slipped in 2nd (or failed to make the 1-2 upshift and went into Limp-in) and slipped in Reverse

- Go To 10.

1st and 2nd gears were OK. Slipped in 3rd gear AND in Reverse

- Remove the Transmission in accordance with the Service Information. Inspect the reaction annulus gear weld to the reverse carrier, and the reaction sun gear weld to the 4C clutch hub and repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION

VERIFICATION TEST.

1st and 2nd gears were OK. Slipped in 3rd gear but NOT in Reverse.

- Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information and Perform 68RFE TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE**. If a continued Slippage is noted in 3rd gear during the Verification test, Remove the Transmission and inspect the 4C clutch and repair as necessary in accordance with the Service Information.

1st through 3rd gears were OK. Slipped in 4th, 5th, or 6th gear. Reverse was OK

- Go To 11.

10. **CHECK FOR FAILED REVERSE GEARSET SPLINES**

Working through the windows in the bottom of the case, check for a failed Reverse Sun or Annulus gear spline as follows:

1. Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
2. Apply the 4C clutch using 30-40 psi shop air at the apply port in the center bulkhead. Refer to **STANDARD PROCEDURE** .
3. Attempt to rotate the input annulus gear and drive shell (the drum that encloses the two rearmost gearsets).

NOTE: Due to the overrunning clutch, the gear and drive shell normally rotates in one direction only.

Can the drive shell be rotated?

Yes

- Repair internal transmission as necessary in accordance with the Service Information. Check the reverse annulus gear spline to the input carrier, and the reverse sun gear spline to the reaction carrier hub.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK THE OD SHAFT AND REVERSE CARRIER SPLINE**

1. Remove the Transmission in accordance with the Service Information and inspect the OD shaft and

its spline to the reverse carrier hub.

Were there any problems found?

Yes

- Repair as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston) and repair as necessary in accordance with the Service Information.

  NOTE: If the OD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, etc.), replace the Transmission Solenoid/TRS Assembly in addition to any other necessary repairs.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0736-GEAR RATIO ERROR IN REVERSE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0729 and P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and

the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

WHEN MONITORED:

Continuously with the ignition on, engine running, and after the transmission achieves the correct gear ratio.

SET CONDITION:

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

POSSIBLE CAUSES

Possible Causes
LOW FLUID LEVEL
CUT L/R TOWER SEAL ON MAIN VALVE BODY
CUT L/R CLUTCH PISTON SEALS
BROKEN OR MISSING L/R CLUTCH BLEED ORIFICE (IN L/R CLUTCH RETAINER)
CUT L/R ACCUMULATOR PISTON SEAL IN MAIN VALVE BODY
CRACKED L/R ACCUMULATOR PISTON IN MAIN VALVE BODY
BURNED REVERSE OR L/R CLUTCH
CUT OD/REV PISTON SEALS
BROKEN OR MISSING OD/REV BLEED ORIFICE (IN OD/REV CLUTCH PISTON)
BROKEN REACTION ANNULUS GEAR WELD
BROKEN REACTION SUN GEAR WELD
BROKEN INPUT ANNULUS TO DRIVE SHELL WELD
FAILED REVERSE ANNULUS SPLINE TO INPUT CARRIER
FAILED REVERSE SUN GEAR SPLINE TO THE REACTION CARRIER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for other transmission DTCs.

       Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the test for P0944-LOSS OF PRIME first if it is present.

No

- Go To 2.

2. **CHECK IF DTC IS CURRENT**

NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

1. With the scan tool, perform the Reverse Gear Clutch test. Follow the instructions on the scan tool.
2. Increase the throttle angle, TPS degree, to 30°, for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the clutch test pass, input speed remain at zero?

Yes

- Go To 3.

No

- Go To 4.

3. **CHECK THE EVENT DATA**
   1. The conditions necessary to set this DTC are not currently present.
   2. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Does the Event Data show an input speed reading of zero?

   Yes

   - Go To 8.

   No

   - Go To 4.

4. **POSSIBLE INTERNAL TRANSMISSION CAUSES**
   1. Remove the Transmission Oil Pan and Valve Body and check the following in accordance with the Service Information:
      - Clutch or metal debris in the pan
      - L/R clutch tower seal on the main valve body or cuts and the L/R accumulator piston and seals.
      - Air check the Reverse and L/R Hydraulic Clutch circuits (in the case) for excessive air leakage.

NOTE: **Both Hydraulic Clutch circuits contain a small bleed orifice, a small amount of air leakage is normal. The Reverse hydraulic clutch circuit bleed orifice connects to the OD hydraulic clutch cavity. A small amount of air leakage into the OD hydraulic clutch circuit is considered normal.**

Were there any problems found?

Yes

- Repair as necessary. If clutch debris is present, remove the transmission and inspect the Reverse and L/R clutches, and inspect the Transmission Oil Pump and Main Regulator Valve for damage or sticking in its bore.

  NOTE: **If the L/R clutch has failed but no obvious cause is found (such as a cut piston seal, cut tower seal, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 5.

5. **CLUTCH TEST FAILURE**

Did the clutch test fail in reverse?

Yes

- Go To 6.

No

- Test complete.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK FOR FAILED REVERSE GEARSET SPLINES**

Working through the windows in the bottom of the case, check for a failed Reverse Sun or Annulus spline as follows:

1. Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.

2. Apply the 4C clutch using 30-40 psi shop air at the apply port in the center bulkhead.
3. Attempt to rotate the input annulus gear and drive shell (the drum that encloses the two rearmost gearsets).

NOTE: Due to the overrunning clutch, the gear and drive shell normally rotates in one direction only.

Can the drive shell be rotated?

Yes

- Repair internal transmission as necessary in accordance with the Service Information. Check the reaction annulus gear weld to the revers carrier, and the reaction sun gear weld to the 4C clutch hub.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

7. **CHECK THE DRIVE SHELL WELD**
   1. Release the output shaft and the 4C clutch.
   2. Apply the L/R Clutch only using 30-40 psi of shop air.
   3. Attempt to rotate the drive shell as in the previous step.

      Can the drive shell be rotated?

      Yes

      - Repair Transmission as necessary in accordance with the Service Information. Check the drive shell weld to input annulus gear.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Disassemble and inspect the input clutch assembly. Check the Reverse clutch reaction plate snap ring. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston). Check the Reverse hub and shaft. If no problems are found, check the L/R clutch assembly and repair as necessary. If all clutches are OK, replace the Transmission Solenoid/TRS assembly in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

8. **CHECK FOR INTERMITTENT OPERATION**

1. Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.
2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator (special tool #8333A, Simulator, Transmission).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test complete.

P0740-TCC OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When in 2nd through 6th gear, the torque converter clutch (TCC) can be engaged when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the L/R-TCC Solenoid until the torque converter slip difference (difference between engine and transmission input speed) is within 60 rpm. Then the L/R-TCC solenoid is fully energized (FEMCC - 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

WHEN MONITORED:

During Electronically Modulated Converter Clutch (EMCC) Operation.

SET CONDITION:

Transmission must be in EMCC, with input speed greater than 1750 rpm. L/R-TCC Solenoid achieves the

maximum duty cycle and can not pull engine speed within 60 rpm of input speed. Also when the transmission is in FEMCC and the engine slips TCC more than 100 rpm for 10 seconds. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
RELATED DTC PRESENT
L/R-TCC SOLENOID
TCC SWITCH VALVE STUCK
TCC REGULATOR VALVE STUCK
INPUT SHAFT SEAL RING CUT
TORQUE CONVERTER AND/OR INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTC P0750**
    1. With the scan tool, read DTCs.

       Is the DTC P0750 present also?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read and **RECORD ALL** Transmission DTCs. After recording DTCs, erase DTCs.
    2. Drive the vehicle until the transmission temperature is at least 43° C or 110° F and the engine temperature at least 49° C or 120° F.
    3. Perform the following steps 3 times.
    4. Using the AutoStick® (ERS) to place the transmission in 3rd gear.
    5. While monitoring the Torque convertor slip on the scan tool, accelerate smoothly at light to moderate throttle from 1200 to 2500 engine rpm and watch for TCC engagement.

       NOTE: Normal torque converter clutch slippage is 0 (± 20 rpm) in full lock-up.

Pick the one that best describes your findings:

TCC State remained at "Unlock" (controller never commanded TCC engagement)

- Go To 3.

Torque Converter Slip dropped properly to 0 (± 20 rpm)

- Go To 4.

TCC State showed "Transitioning" or "Full EMCC", but there was little or no change in T/C Slip

- Go To 5.

TCC tried to engage but had significant positive slip (60-150 rpm)

- Replace the Torque Converter and remove inspect the Transmission Oil Pump Assembly in accordance with the Service Information.

  NOTE: **Check the input shaft end play before removing the pump. HOLD the input shaft during pump removal to prevent thrust bearings in the input clutches from falling out of position. Split the pump assembly and inspect for torque converter debris. Clean as necessary. Verify that the Torque Converter Switch Valve and the Torque Converter Clutch Control Valve (located in the Transmission Oil Pump Valve Body) are not sticking in their bores. Reinstall Transmission Oil Pump Assembly and verify proper input shaft end play.**

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

3. **CHECK FOR TCC ENGAGEMENT COMMANDED**
   1. Verify that the transmission temperature is at least 43° C or 110° F and the engine temperature at least 49° C or 120° F.
   2. Using the scan tool, monitor the "Target Gear TCC State" in the following steps.
   3. Road test the vehicle. Using the AutoStick® (ERS) in ERS "3", ERS "4", ERS "5", and Drive with an engine speed up to 2500 rpm in each position.

   Pick the one that best describes your findings:

   TCC would engage properly when commanded

   - Go To 4.

   TCC would NOT engage properly when commanded

- Go To 5.

Target Gear TCC State remained in the "Unlock" state continuously

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

4. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorts and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

5. **CHECK THE L/R-TCC SOLENOID**
   1. With the scan tool, check for other transmission DTCs.

   Are the DTCs P1775 and P0841 present also?

   Yes

   - Replace Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 6.

6. **CHECK THE TORQUE CONVERTER AND/OR INTERNAL TRANSMISSION**

1. Repair internal transmission as necessary.
2. Check for the following possible causes. Refer to **STANDARD PROCEDURE** for the proper repair procedures.
3. Inspect the Transmission Oil Pump Assembly. **Note:** Check the input shaft end play before removing the pump. HOLD the input shaft during pump removal to prevent thrust bearings in the input clutches from falling out of position. Split the pump assembly and inspect for torque converter debris. Clean as necessary. Verify that the Torque Converter Switch Valve and the Torque Converter Clutch Control Valve (located in the Transmission Oil Pump Valve Body) are not sticking in their bores. Reinstall Transmission Oil Pump Assembly and verify proper input shaft end play.
4. Check the Teflon seal rings on the input shaft. **Note:** If one of the seal rings is cut, the loose piece will often lodge in the TCC switch valve, causing it to stick in its bore.
5. If no problems are found, replace the Transmission Solenoid/TRS Assembly.

Repair

- In all cases, replace the Torque Converter in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0750-LR SOLENOID CIRCUIT

Fig. 26: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System uses five electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each

solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

WHEN MONITORED:

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

SET CONDITION:

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: **This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement - do not replace the Valve Body.**

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T20) L/R SOLENOID CONTROL CIRCUIT SHORTED TO OTHER CIRCUITS
(T20) L/R SOLENOID CONTROL CIRCUIT OPEN
(T20) L/R SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK DTCS**
    1. With the scan tool, read DTCs.

       Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 2.

2. **CHECK TO SEE IF P0750 IS PRESENT**
   1. Ignition on, engine not running.
   2. With the scan tool, erase all Transmission DTCs.
   3. Turn the ignition off to the lock position.
   4. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   5. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   6. Ignition on, engine not running.
   7. With the scan tool, actuate the L/R Solenoid.
   8. Monitor the L/R Solenoid LED on the Transmission Simulator.

      Did the L/R Solenoid LED on the Transmission Simulator blink on and off?

      Yes

      - Go To 3.

      No

      - Go To 5.

3. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. With the Transmission simulator still connected, continue to actuate the L/R solenoid for two minutes.
   2. After two minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

      Did the DTC P0750 reset during the actuation test?

      Yes

      - Go To 5.

      No

- Go To 4.

4. **WIGGLE TEST WITH TRANSMISSION SIMULATOR**
    1. With the Transmission simulator still connected, continue to actuate the L/R solenoid for another two minutes while wiggling the related wiring harness and connectors.
    2. With the scan tool, stop the actuation and check for transmission DTCs.

    Did the DTC P0750 reset during the actuation test?

    Yes

    - Repair wiring harness or connectors as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. **Note: Do NOT replace the entire Valve Body.**
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 27: Checking L/R Solenoid Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance between the (T20) L/R Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T20) L/R Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T20) L/R Solenoid Control circuit for a short to another circuit(s).

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR AN OPEN**

Fig. 28: Checking L/R Solenoid Control Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T20) L/R Solenoid Control circuit between the Transmission

Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

Is the resistance above 5.0 Ohms?

Yes

- Repair the (T20) L/R Solenoid Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

7. **CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 29: Checking L/R Solenoid Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T20) L/R Solenoid Control circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T20) L/R Solenoid Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0755-2C SOLENOID CIRCUIT

Fig. 30: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Transmission Control System uses five electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an

inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

WHEN MONITORED:

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

SET CONDITION:

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: **This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement - do not replace the Valve Body.**

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T219) 2C SOLENOID CONTROL CIRCUIT SHORTED TO OTHER CIRCUITS
(T219) 2C SOLENOID CONTROL CIRCUIT OPEN
(T219) 2C SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK DTCS**
    1. With the scan tool, read DTCs.

       Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

- Go To 2.

2. **CHECK THE 2C SOLENOID USING THE TRANSMISSION SIMULATOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the scan tool, actuate the 2C Solenoid.

      Did the 2C Solenoid LED blink on and off on the Transmission Simulator?

      Yes

      - Go To 3.

      No

      - Go To 5.

3. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. With the Transmission simulator still connected, continue to actuate the 2C solenoid for two minutes.
   2. After two minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

      Did the DTC P0755 reset during the actuation test?

      Yes

      - Go To 5.

      No

      - Go To 4.

4. **WIGGLE TEST WITH TRANSMISSION SIMULATOR**
   1. With the Transmission simulator still connected, continue to actuate the 2C solenoid for another two minutes while wiggling the related wiring harness and connectors.
   2. With the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0755 reset during the actuation test?

Yes

- Repair wiring harness or connectors as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. **Note: Do NOT replace the entire Valve Body.**
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE (T219) 2C SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 31: Checking 2C Solenoid Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance between the (T219) 2C Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T219) 2C Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T219) 2C Solenoid Control circuit for a short to another circuit(s).

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE (T219) 2C SOLENOID CONTROL CIRCUIT FOR AN OPEN**

Fig. 32: Checking 2C Solenoid Control Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T219) 2C Solenoid Control circuit between the Transmission

Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

Is the resistance above 5.0 Ohms?

Yes

- Repair the (T219) 2C Solenoid Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

7. **CHECK THE (T219) 2C SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 33: Checking 2C Solenoid Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T219) 2C Solenoid Control circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T219) 2C Solenoid Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0765-UD SOLENOID CIRCUIT

Fig. 34: Solenoid Control Wiring Diagram

THEORY OF OPERATION

The Transmission Control System uses five electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each

solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

WHEN MONITORED:

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

SET CONDITION:

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: **This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement - do not replace the Valve Body.**

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T59) UD SOLENOID CONTROL CIRCUIT SHORTED TO OTHER CIRCUITS
(T59) UD SOLENOID CONTROL CIRCUIT OPEN
(T59) UD SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 2.

2. **CHECK THE UD SOLENOID USING THE TRANSMISSION SIMULATOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the scan tool, clear Transmission DTCs.
   6. With the scan tool, actuate the UD Solenoid.
   7. Monitor the UD Solenoid LED on the Transmission Simulator.

      Did the UD Solenoid LED on the Transmission Simulator blink on and off?

      Yes

      - Go To 3.

      No

      - Go To 5.

3. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. With the Transmission simulator still connected, continue to actuate the UD solenoid for two minutes.
   2. After two minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

      Did the DTC P0765 reset during the actuation test?

      Yes

      - Go To 5.

      No

      - Go To 4.

4. **WIGGLE TEST WITH TRANSMISSION SIMULATOR**
    1. With the Transmission simulator still connected, continue to actuate the UD solenoid for another two minutes while wiggling the related wiring harness and connectors.
    2. With the scan tool, stop the actuation and check for transmission DTCs.

    Did the DTC P0765 reset during the actuation test?

    Yes

    - Repair wiring harness or connectors as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. **Note: Do NOT replace the entire Valve Body.**
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.
5. **CHECK THE (T59) UD SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 35: Checking UD Solenoid Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance between the (T59) UD Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T59) UD Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T59) UD Solenoid Control circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

- Go To 6.

6. **CHECK THE (T59) UD SOLENOID CONTROL CIRCUIT FOR AN OPEN**

Fig. 36: Checking UD Solenoid Control Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T59) UD Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T59) UD Solenoid Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T59) UD Solenoid Control circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T59) UD Solenoid Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0770-4C SOLENOID CIRCUIT

Fig. 38: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System uses five electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each

solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

WHEN MONITORED:

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

SET CONDITION:

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: **This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement - do not replace the Valve Body.**

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T259) 4C SOLENOID CONTROL CIRCUIT SHORTED TO OTHER CIRCUITS
(T259) 4C SOLENOID CONTROL CIRCUIT OPEN
(T259) 4C SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 2.

2. **CHECK THE 4C SOLENOID USING THE TRANSMISSION SIMULATOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the scan tool, clear Transmission DTCs.
   6. With the scan tool, actuate the 4C Solenoid.
   7. Monitor the 4C Solenoid LED on the Transmission Simulator.

      Did the 4C Solenoid LED on the Transmission Simulator blink on and off?

      Yes

      - Go To 3.

      No

      - Go To 5.

3. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. With the Transmission simulator still connected, continue to actuate the 4C solenoid for two minutes.
   2. After two minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

      Did the DTC P0770 reset during the actuation test?

      Yes

      - Go To 5.

      No

      - Go To 4.

4. **WIGGLE TEST WITH TRANSMISSION SIMULATOR**
    1. With the Transmission simulator still connected, continue to actuate the 4C solenoid for another two minutes while wiggling the related wiring harness and connectors.
    2. With the scan tool, stop the actuation and check for transmission DTCs.

    Did the DTC P0770 reset during the actuation test?

    Yes

    - Repair wiring harness or connectors as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. **Note: Do NOT replace the entire Valve Body.**
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.
5. **CHECK THE (T259) 4C SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 39: Checking 4C Solenoid Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM harness connectors.
4. Measure the resistance between the (T259) 4C Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T259) 4C Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T259) 4C Solenoid Control circuit for a short to another circuit(s).

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE (T259) 4C SOLENOID CONTROL CIRCUIT FOR AN OPEN**

Fig. 40: Checking 4C Solenoid Control Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T259) 4C Solenoid Control circuit between the Transmission

Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

Is the resistance above 5.0 Ohms?

Yes

- Repair the (T259) 4C Solenoid Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

7. **CHECK THE (T259) 4C SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 41: Checking 4C Solenoid Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T259) 4C Solenoid Control circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T259) 4C Solenoid Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0841-LR PRESSURE SWITCH RATIONALITY

Fig. 42: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The DTC will set if the L/R Pressure Switch reads open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
LOSS OF PRIME AND/OR TIPM DTC PRESENT
LOW FLUID LEVEL
LOW LINE PRESSURE
CRACKED OR MISINSTALLED PRIMARY OIL FILTER OR FILTER SEAL
STICKING MAIN REGULATOR VALVE IN PUMP VALVE BODY
NO. 1 CHECK BALL CUT OR DAMAGED
WIRING AND CONNECTORS
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)
REAR ANNULUS GEAR DRIVE SHELL SNAP RING DISLODGED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN
1ST	CLOSED*	OPEN	OPEN	CLOSED	OPEN
2ND	OPEN	CLOSED	OPEN	CLOSED	OPEN
3RD	OPEN	OPEN	CLOSED	CLOSED	OPEN
4TH	OPEN	OPEN	OPEN	CLOSED	CLOSED
5TH	OPEN	OPEN	CLOSED	OPEN	CLOSED
6TH	OPEN	CLOSED	OPEN	OPEN	CLOSED
*L/R is closed if output speed is below 100 rpm in Drive. L/R is closed in Manual (ERS) 1st.					
**May be open when rolling in Neutral or at low oil temperatures.					

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, check for other transmission DTCs.

    Are there any Loss of Prime, TCM Power Input, and/or TIPM TCM Power Control circuit DTCs present?

    Yes

    - If the DTC P0944 is present, perform its respective test first. For the TIPM related DTCs, Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To 2.
2. **CHECK IF THE CONDITION FOR P0841 IS PRESENT**
    1. With the scan tool, check the Event Data for P0841.

    NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

    Does the Event Data show the DTC P0841?

    Yes

    - Go To 3.

    No

    - Refer to **DIAGNOSTIC CODE INDEX** and perform diagnostics for the DTC reported in the Event Data.
3. **CHECK IF THE DTC SET IN REVERSE**

    Does the Event Data show the DTC P0841 set while in Reverse?

    Yes

    - Go To 10.

    No

    - Go To 4.
4. **CHECK IF THE L/R PRESSURE SWITCH IS CLOSED**

Does the Event Data show the L/R Pressure Switch reading CLOSED when the DTC P0841 was set?

Yes

- Go To 5.

No

- Go To 14.

5. **CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. Turn the Pressure Switch selector to L/R on the Transmission Simulator.
   6. With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

      Did the L/R Pressure Switch state change from open to closed while pressing the Pressure Switch Test button on the Transmission Simulator?

      Yes

      - Go To 6.

      No

      - Go To 10.

6. **CHECK FOR POOR WIRING AND CONNECTIONS**
   1. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   2. Wiggle the wires while checking for shorted and open circuits.

      Were there any problems found?

      Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

7. **CHECK IF THE DTC SET IN FIRST GEAR**

   In the Event Data recorded earlier, does the Event Data show the Present Gear as first gear when the DTC P0841 set ?

   Yes

   - Go To 8.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

8. **CHECK IF THE NO. 1 CHECK BALL IS CUT OR DAMAGED**
   1. Turn the ignition off to the lock position.
   2. Remove the Transmission Valve Body in accordance with the Service Information.
   3. Check the No. 1 Check Ball for any possible cuts or damage.

      Is the No. 1 Check Ball cut or damaged?

      Yes

      - Replace the No. 1 Check Ball and check for clutch debris in the transmission oil pan. If there is excessive debris, perform internal repairs to the L/R Clutch assembly. Refer to **STANDARD PROCEDURE** for proper repair procedures.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 9.

9. **CHECK IF THE DRIVE SHELL SNAP RING IS DISLODGED AND THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. Looking through the windows in the bottom of the case, check whether the snap ring at the front of the input annulus gear drive shell and Reverse (center) Carrier has dislodged.

NOTE: **It may be necessary to pry the Input Annulus Gear Drive Shell rearward to check this snap ring.**

Is the Drive Shell Snap Ring dislodged?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

10. **CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 43: Checking L/R Pressure Switch Sense & Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission) if connected in a previous step or disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Disconnect the PCM C2 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T50) L/R Pressure Switch Sense circuit between the Transmission

Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

Is the resistance above 5.0 Ohms?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 11.

11. **CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 44: Checking L/R Pressure Switch Sense & Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T50) L/R Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T50) L/R Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 12.

12. **CHECK THE PCM POWERS AND GROUNDS**
    1. Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 13.

13. **ROAD TEST THE VEHICLE**
    1. With the scan tool, clear the DTC and road test the vehicle.
    2. Using the Event Data recorded earlier, try to duplicate the conditions in which the DTC originally set.

    Did the DTC P0841 reset?

    Yes

    - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 17.

14. **CHECK FOR LOW LINE PRESSURE**

    In the Event Data recorded earlier, is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

    Yes

    - Repair as necessary to correct low line pressure. Check for low fluid level. Check the Primary Oil

Filter seal for a split, crack, or improperly installed. Refer to **STANDARD PROCEDURE** for the proper installation procedure. If the fluid level and Primary Oil Filter are OK, check the Main Regulator Valve in the Oil Pump in accordance with the Service Information.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 15.

15. **CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 45: Checking L/R Pressure Switch Sense Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

3. Disconnect all PCM harness connectors.
4. Measure the resistance between the (T50) L/R Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T50) L/R Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T50) L/R Pressure Switch Sense circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 16.

16. **ROAD TEST THE VEHICLE**
    1. With the scan tool, clear the DTC and road test the vehicle.
    2. Using the Event Data recorded earlier, try to duplicate the conditions in which the DTC originally set.

       Did the DTC P0841 reset?

       Yes

       - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 17.

17. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

       Were there any problems found?

       Yes

       - Repair as necessary.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P0845-2C HYDRAULIC PRESSURE TEST

Fig. 46: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

WHEN MONITORED:

In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 RPM, the Powertrain Control Module (PCM) momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close two times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
(T147) 2C PRESSURE SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Is there any Loss of Prime, TCM Power Input, Line Pressure Sensor and/or TIPM TCM Power Control Circuit DTCs present?

       Yes

       - If the DTC P0944-LOSS OF PRIME is present, perform its respective test first. For the TIPM related DTCs, Refer to **DIAGNOSIS AND TESTING** and perform the appropriate

diagnostic procedure.

No

- Go To 2.

2. **CHECK IT THE DTC P0755 IS PRESENT**
   1. With the scan tool, read DTCs.

      Is the DTC P0755 also present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform diagnostics for P0755-2C SOLENOID CIRCUIT.

      No

      - Go To 3.

3. **CHECK IF THE DTCS P0729, P0732, AND/OR P0846 ARE PRESENT**
   1. With the scan tool, read DTCs.

      Are the DTCs P0729, P0732, and/or P0846 present also?

      Yes

      - Go To 12.

      No

      - Go To 4.

4. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 5.

      No

      - Go To 15.

5. **CHECK IF THE LINE PRESSURE STAYS THE SAME**
   1. Start the engine.
   2. Warm the transmission to 82° C (180° F).

3. Firmly apply the brakes.
4. With the scan tool, monitor the Line Pressure during the following step.
5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least five seconds in each range.

   Did the line pressure remain at a steady value between 585 and 655 kPa (85 and 95 psi) in each position?

   Yes

   - Go To 6.

   No

   - Go To 10.

6. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
   1. Ignition on, **engine not running.**
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inward towards the Transmission.

      Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi or 0.7 of a volt) when the connector was pushed inward?

      Yes (value was higher and changed to 30 psi or 0.7 of a volt)

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No (value is higher than 30 psi or 0.7 of a volt and did not change, or the value was already 30 psi or 0.7 of a volt and did not change)

      - Go To 7.

7. **CHECK THE LINE PRESSURE SENSOR OPERATION**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

NOTE: **All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) or 0.2 of a volt of the reading specified on the Transmission Simulator.**

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 47: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect Transmission Simulator.
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 48: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

10. **COMPARE SCAN TOOL TO PRESSURE GAUGE**
    1. Turn the ignition off to the lock position.
    2. Connect the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to **STANDARD PROCEDURE** for proper installation procedure.

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the RPM to 1500, and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500, and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500, and compare the line pressure readings.

       Did the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

       Yes

- Go To 11.

No

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK THE WIRING AND CONNECTORS**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    3. Remove the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
    4. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    5. On the Transmission Simulator, turn the Pressure Switch selector switch to 2C.
    6. Ignition on, engine not running.
    7. With the scan tool, monitor the 2C Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the 2C Pressure Switch.

    Did the 2C Pressure Switch state change to closed and remain closed while wiggling the wires?

    Yes

    - Go To 12.

    No

    - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition off to the lock position.
    2. Remove the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

    Does the Transmission Oil Pan contain excessive debris or contamination?

Yes

- Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to **STANDARD PROCEDURE** for the proper procedures.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 13.

13. **CHECK THE 2C HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the 2C clutch hydraulic circuit, in the 2C/4C clutch retainer, for leakage in accordance with the Service Information.

    NOTE: The 2C hydraulic clutch circuit contains a small bleed orifice, a small amount of air leakage is normal.

    Was there excessive air leakage noticed during the air check?

    Yes

    - Repair as necessary. Check the 2C clutch piston, piston seals and bleed orifice assembly.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Disassemble and inspect the Valve Body and repair as necessary. Inspect the 2C Accumulator piston and seals. Check for an extra check ball downstream from the No. 7 check ball pocket and repair as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

14. **CHECK THE (T147) 2C PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 49: Checking 2C Pressure Switch Sense Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: **Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

3. Measure the resistance between the (T147) 2C Pressure Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T147) 2C Pressure Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T147) 2C Pressure Signal circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION

VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
    5. If the Event Data shows the DTC P0845 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P0846-2C PRESSURE SWITCH RATIONALITY

Fig. 50: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

WHEN MONITORED:

Continuously with the ignition on, engine running, with the transmission in gear.

SET CONDITION:

The DTC is set if the 2C Pressure Switch reads open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
RELATED TIPM TCM DTCS PRESENT
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT OPEN
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO OTHER CIRCUIT
EXCESSIVE FLUID LEAKAGE IN 2C CLUTCH CIRCUIT
NO. 5 AND/OR NO. 7 CHECK BALL CUT OR DAMAGED
EXTRA CHECK BALL DOWNSTREAM OF THE NO. 7 CHECK BALL SOCKET
LOW LINE PRESSURE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)
WIRING AND CONNECTORS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN

*L/R is closed if output speed is below 100 rpm in Drive. L/R is closed in Manual (ERS) 1st.					
**May be open when rolling in Neutral or at low oil temperatures.					

DIAGNOSTIC TEST

1. **CHECK FOR TIPM DTCS**
    1. With the scan tool, read DTCs.

       Are there any TIPM TCM Power Control circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 2.
2. **CHECK IF THE DTC DATA SHOWS THE CURRENT DTC**
    1. With the scan tool, read and record the Event Data.

       NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

       Does the Event Data show data for DTC P0846?

       Yes

       - Go To 3.

       No

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure shown in the Event Data.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.
3. **CHECK IF MULTIPLE DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are there two or more related pressure switch rationality DTCs present in addition to P0846?

       Yes

       - Go To 4.

       No

       - Go To 7.
4. **CHECK IF ALL THE PRESSURE SWITCHES READ CLOSED**

1. With the scan tool, check the Event Data for P0846.

   NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

   Do all the pressure switches read CLOSED in the Event Data for P0846?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform diagnostics for P0882.

   No

   - Go To 5.

5. **CHECK IF ALL THE PRESSURE SWITCHES READ OPEN**

   In the Event Data recorded earlier, do all the pressure switches read OPEN?

   Yes

   - Go To 6.

   No

   - Go To 7.

6. **CHECK FOR LOW LINE PRESSURE**

   In the Event Data recorded earlier, is the (actual) Line Pressure less than 276 kPa (40 psi), and significantly below the Desired (target) Line Pressure?

   Yes

   - Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to **STANDARD PROCEDURE** for the above procedures.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK IF THE DTC SET IN PARK, NEUTRAL, OR REVERSE**

1. With the scan tool, read and record the Event Data for P0846.

   NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

   Does the Event Data show the DTC P0846 set in Park, Neutral, or Reverse?

   Yes

   - Go To 12.

   No

   - Go To 8.

8. **CHECK IF THE 2C PRESSURE SWITCH READS CLOSED**

   In the Event Data recorded earlier, does the Event Data show the 2C Pressure Switch reading CLOSED?

   Yes

   - Go To 10.

   No

   - Go To 9.

9. **CHECK THE LINE PRESSURE**

   In the Event Data recorded earlier, is the (actual) Line Pressure less than 276 kPa (40 psi), and significantly below the Desired (target) Line Pressure?

   Yes

   - Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to **STANDARD PROCEDURE** for the above procedures.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 15.

10. **CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. Ignition on, engine not running.
5. With the Transmission Simulator, turn the Pressure Switch selector switch to the 2C position.
6. With the scan tool, monitor the 2C Pressure Switch while pressing the Pressure Switch test button on the Transmission Simulator.

   Did the state of the 2C Pressure Switch change while pressing the Pressure Switch Test button?

   Yes

   - Go To 11.

   No

   - Go To 12.

11. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
    1. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    2. Wiggle the wires while checking for shorted and open circuits.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

12. **CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 51: Checking 2C Pressure Switch Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (T147) 2C Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connect and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T147) 2C Pressure Switch Sense circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 13.

13. **CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 52: Checking 2C Pressure Switch Sense Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T147) 2C Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T147) 2C Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 14.

14. **CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 53: Checking 2C Pressure Switch Sense Circuit For A Short To Another Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (T147) 2C Pressure Switch Sense circuit and all the other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T147) 2C Pressure Switch Sense circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK IF THE NO. 5 AND/OR NO. 7 CHECK BALL IS CUT OR DAMAGED**
    1. Turn the Ignition off to the lock position.
    2. Remove the Valve Body Assembly in accordance with the Service Information.
    3. Inspect the No. 5 and No. 7 check balls for any cuts or damage.
    4. Check for an extra check ball in the passage downstream from the No. 7 check ball pocket.
    5. Inspect the 2C accumulator piston and seals and also the 2C tower seal on top of the valve body. Refer to **STANDARD PROCEDURE** .

       Where there any problems found?

       Yes

       - Repair as necessary. Check for excessive clutch debris in the transmission oil pan. If excessive clutch debris is present, repair 2C clutch as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 16.

16. **CHECK FOR EXCESSIVE FLUID LEAKAGE WITHIN THE 2C CLUTCH CIRCUIT**
    1. Air check the 2C Clutch hydraulic circuit. Refer to **STANDARD PROCEDURE** .

NOTE: **This hydraulic clutch circuit contains a small bleed orifice. Small leakage is considered normal.**

Was there excessive air leakage in the 2C Clutch hydraulic circuit?

Yes

- Repair as necessary. Refer to **STANDARD PROCEDURE** .
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0868-LINE PRESSURE LOW

Fig. 54: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle =

solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 1034 or 1103 kPa (150 or 160 psi) during shifts to ensure consistent shift quality. The actual line pressure is continuously being compared to the desired (target) line pressure. If the actual line pressure is consistently lower than the target while driving, the line pressure low DTC P0868 will set.

WHEN MONITORED:

Continuously while driving in a forward gear.

SET CONDITION:

The PCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure is more than 15 psi below Desired Line Pressure for 3.5 seconds continuously, this DTC will set.

POSSIBLE CAUSES

Possible Causes
CHECK FOR RELATED DTCS
LOW FLUID LEVEL
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
POOR LINE PRESSURE SENSOR CONNECTION
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT SHORTED TO ANOTHER CIRCUIT
INTERNAL TRANSMISSION
LINE PRESSURE SENSOR
CRACKED, PLUGGED, OR MIS-INSTALLED PRIMARY OIL FILTER
LOOSE COOLER RETURN SPIN ON FILTER (IF EQUIPPED)
STUCK OR STICKING MAIN REGULATOR VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read and record all DTCs.

       Is the DTC P0933 present also?

Yes

- Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

- Go To 2.

2. **CHECK THE Event Data**
   1. With the scan tool, read the DTC Event Data for the DTC P0868.

      Does the Line Pressure reading in the DTC Event Data show zero (0) psi?

      Yes

      - Go To 3.

      No

      - Go To 4.

3. **VERIFY PROPER LINE PRESSURE**
   1. With the scan tool, erase all DTCs.
   2. Start the vehicle in Park and raise engine speed to 1500 rpm.
   3. With the scan tool, compare the Line Pressure and Desired Line Pressure.

      Does the Line Pressure reading match the Desired Line Pressure reading (± 34.5 kPa or 5 psi)?

      Yes

      - Disregard this DTC P0868. Refer to **DIAGNOSTIC CODE INDEX** and follow the diagnostic procedure for any other DTCs which are present.

      No

      - Go To 4.

4. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 5.

      No

- Go To 15.

5. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
   1. Ignition on, **engine not running.**
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

      Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 of a volt when the connector was pushed inward?

      Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 of a volt)

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No (value is higher than 207 kPa (30 psi) or 0.7 of a volt and did not change or the value was already 207 kPa (30 psi) or 0.7 of a volt and did not change)

      - Go To 6.

6. **CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
   5. Ignition on, engine not running.
   6. With the scan tool, monitor the Line Pressure during the following steps.
   7. Using the Transmission Simulator, set the rotary knob to each of the three line pressure positions.

      NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa (2.0 psi) or 0.1 of a volt of the reading specified on the Transmission Simulator.

      Did the Line Pressure read within ± 14 kPa (2.0 psi) or 0.1 of a volt in all three positions?

Yes

- Go To 7.

No

- Go To 11.

7. **CHECK THE LINE PRESSURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission) and reconnect all previously disconnected connectors.
   3. Install the Line Pressure Adaptor (special tool #8259, Adapter, Pressure Test), and the Pressure Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.), 0 to 2000 kPa (0 to 300 psi).
   4. Start the engine in park.
   5. Monitor the line pressure readings of both the scan tool and the pressure gauge and compare the two readings.

      Is the line pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?

      Yes

      - Go To 8.

      No

      - Replace the Line Pressure Sensor in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

8. **CHECK FOR PROPER LINE PRESSURE**
   1. With the vehicle still in Park, raise the engine speed to 1500 rpm.
   2. Compare line pressure readings of both the scan tool and the pressure gauge to the Desired Line Pressure reading on the scan tool.

      Is the Line Pressure gauge and scan tool reading within 34 kPa (5 psi) of the Desired Line Pressure scan tool reading?

      Yes

      - Go To 15.

      No

      - Go To 9.

9. **CHECK THE DEFAULT LINE PRESSURE**

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: Disconnection of the Transmission Solenoid/TRS Assembly harness connector may set several DTCs in the following steps. Disregard and erase any DTCs that set due to the disconnection.

3. Start the engine.
4. With the vehicle still in Park, raise the engine speed to 1500 rpm while monitoring the line pressure on the pressure gauge and record your findings.

   Was the gauge reading greater than 130 psi?

   Yes

   - Go To 14.

   No

   - Go To 10.

10. **CHECK FOR A PLUGGED TRANSMISSION OIL FILTER**
    1. Turn the ignition off to the lock position.
    2. Remove and inspect the Transmission Oil Pan for excessive debris in accordance with the Service Information.
    3. Remove and inspect the Primary Oil Filter in accordance with the Service Information.

    NOTE: Make sure the Primary Transmission Oil Filter and/or O-ring is not cracked or split.

    Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked or plugged?

    Yes

    - Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or O-ring. If the Primary Transmission Oil Filter is plugged Refer to **STANDARD PROCEDURE** for the proper Hydraulic repair procedure.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Repair internal transmission and inspect the Transmission Oil Pump in accordance with the Service Information and replace if necessary. If no problem is found, replace the Solenoid/TRS Assembly.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 55: Measuring Voltage Of 5-Volt Supply Circuit For Short
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
2. Reconnect all previously disconnected connectors except the Line Pressure Sensor harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (F856) 5-volt Supply circuit in the Line Pressure Sensor harness connector.

   Is the voltage above 5.5 volts?

   Yes

- Repair the (F856) 5-volt Supply circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 12.

12. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 56: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 13.

13. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 57: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 14.

14. **CHECK THE (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 58: Checking Pressure Control Solenoid Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Disconnect all PCM harness connectors.
4. Measure the resistance between the (T118) Pressure Control Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T118) Pressure Control Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T118) Pressure Control Solenoid Control circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P0869-LINE PRESSURE HIGH

Fig. 59: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle =

solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 1034 or 1103 kPa (150 or 160 psi) during shifts to ensure consistent shift quality. The actual line pressure is continuously being compared to the desired (target) line pressure. If the actual line pressure is consistently higher than the highest desired line pressure ever used in the current gear, the line pressure high DTC P0869 will set.

WHEN MONITORED:

Continuously while driving in a forward gear.

SET CONDITION:

The Powertrain Control Module (PCM) continuously monitors Actual Line Pressure. If the Actual Line Pressure reading is greater than the maximum desired line pressure ever used in the current gear, while the Pressure Control Solenoid duty cycle is at or near its maximum value (which should result in minimum line pressure) for 3.5 seconds continuously, the DTC will set.

POSSIBLE CAUSES

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
LINE PRESSURE SENSOR CONNECTION
(T118) LP VFS CONTROL CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T118) LP VFS CONTROL CIRCUIT SHORTED TO GROUND
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT
LINE PRESSURE SENSOR
STUCK OR STICKING MAIN REGULATOR VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Is the DTC P0933 or P0882 present also?

       Yes

- Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 2.

2. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 3.

      No

      - Go To 10.

3. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
   1. Ignition on, **engine not running.**
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

      Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 of a volt when the connector was pushed inward?

      Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 of a volt)

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No (value is higher than 207 kPa (30 psi) or 0.7 of a volt and did not change or the value was already 207 kPa (30 psi) or 0.7 of a volt and did not change)

      - Go To 4.

4. **CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM.

Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure during the following step.
7. Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: **All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) or 0.1 of a volt of the reading specified on the Transmission Simulator.**

Did the Line Pressure read within ±14 kPa (2.0 psi) or 0.1 of a volt in all three positions?

Yes

- Go To 5.

No

- Go To 6.

5. **CHECK THE LINE PRESSURE SENSOR CALIBRATION**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission) and reconnect all previously disconnected connectors.
   3. Install the Line Pressure Adaptor (special tool #8259, Adapter, Pressure Test), and Pressure Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.), 0 to 2000 kPa (0 to 300 psi).
   4. Start the engine in park.
   5. Monitor the Line Pressure readings on the scan tool and the pressure gauge.
   6. Compare the Line Pressure readings between the scan tool and the pressure gauge.

   Is the pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?

   Yes

   - Repair the internal transmission and inspect the Transmission Oil Pump in accordance with the Service Information and replace if necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly, possible cause is a stuck Pressure Control Solenoid.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

- Replace the Line Pressure Sensor in accordance with the Service information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK THE (T118) LP VFS CONTROL CIRCUIT FOR AN OPEN**

Fig. 60: Checking LP VFS Control Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the Powertrain Control Module C2 harness connector.

4. Measure the resistance of the (T118) LP VFS Control circuit between the Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T118) LP VFS Control circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 7.

7. **CHECK THE (T118) LP VFS CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 61: Checking LP VFS Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T118) LP VFS Control circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T118) LP VFS Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 62: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Powertrain Control Module C2 harness connector.
2. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM C2 harness connector.

Is the resistance above 5.0 Ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 63: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the PCM C2 harness connector.
2. Disconnect the Line Pressure Sensor harness connector.
3. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

10. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P0870-OD HYDRAULIC PRESSURE TEST

Fig. 64: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

WHEN MONITORED:

In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 RPM, the Powertrain Control Module (PCM) momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close two times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T9) OD PRESSURE SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUIT
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Is there any Loss of Prime, TIPM TCM Power Control circuit, TCM Power Input and/or Line Pressure Sensor DTCs present?

       Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. If the DTC, P0944-LOSS OF PRIME is present, perform its respective test first.

No

- Go To 2.

2. **CHECK IF THE DTC P0760 IS PRESENT**
   1. With the scan tool, read DTCs.

      Is the DTC P2706 also present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform diagnostics for P2706-MS SOLENOID CIRCUIT.

      No

      - Go To 3.

3. **CHECK IF OTHER DTCS ARE PRESENT**
   1. With the scan tool, read DTCs.

      Are any of the DTCs P0729, P0734, P0735, and/or P0871 present also?

      Yes

      - Go To 12.

      No

      - Go To 4.

4. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 5.

      No

      - Go To 15.

5. **CHECK IF THE LINE PRESSURE STAYS THE SAME**
   1. Start the engine.

2. Warm the transmission to 82° C (180° F).
3. Firmly apply the brakes.
4. With the scan tool, monitor the Line Pressure during the following step.
5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least five seconds in each range.

   Did the line pressure remain at a steady value between 585 and 655 kPa (85 and 95 psi) in each position?

   Yes

   - Go To 6.

   No

   - Go To 10.

6. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
   1. Ignition on, **engine not running.**
   2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inward towards the Transmission.

      Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 of a volt when the connector was pushed inward?

      Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 of a volt)

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No (value is higher than 207 kPa (30 psi) or 0.7 of a volt and did not change or the value was already 207 kPa (30 psi) or 0.7 of a volt and did not change)

      - Go To 7.

7. **CHECK THE LINE PRESSURE SENSOR OPERATION**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM.

Failure to do so can result in possible serious or fatal injury.

3. Install the (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the three line pressure positions on the Transmission Simulator.

NOTE: **All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) or 0.1 of a volt of the reading specified on the Transmission Simulator.**

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 65: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect Transmission Simulator.
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 66: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

10. **COMPARE THE SCAN TOOL TO THE PRESSURE GAUGE**
    1. Turn the ignition off to the lock position.
    2. Connect the (special tool #8259, Adapter, Pressure Test) and (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to **DIAGNOSIS AND TESTING** .

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the RPM to 1500, and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500, and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500, and compare the line pressure readings.

       Did the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

       Yes

       - Go To 11.

No

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK THE WIRING AND CONNECTORS**
    1. Turn the ignition off to the lock position.
    2. Remove the (special tool #8259, Adapter, Pressure Test) and (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
    3. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    4. Install the (special tool #8333A, Simulator, Transmission).
    5. On the Transmission Simulator, turn the Pressure Switch selector switch to OD.
    6. Ignition on, engine not running.
    7. With the scan tool, monitor the OD Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the OD Pressure Switch.

    Did the OD Pressure Switch state change to closed and remain closed while wiggling the wires?

    Yes

    - Go To 12.

    No

    - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition off to the lock position.
    2. Remove the (special tool #8333A, Simulator, Transmission).
    3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

    Does the Transmission Oil Pan contain excessive debris or contamination?

    Yes

    - Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to **STANDARD**

PROCEDURE for the proper procedures.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 13.

13. **CHECK THE OD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the OD hydraulic clutch circuit (in the case) for leakage in accordance with the Service Information.

NOTE: **The OD hydraulic clutch circuit contains a small bleed orifice which connects to the Reverse hydraulic clutch circuit. A small amount of air leakage is normal.**

Was there excessive air leakage noticed during the air check?

Yes

- Repair as necessary. Check the OD/Rev clutch piston seals, bleed orifice assembly, reaction shaft support seal rings, and machining of the main mating faces on the pump housing, pump valve body, and reaction shaft support.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Disassemble and inspect the Valve Body and repair as necessary. Inspect the OD Accumulator piston and seals. Check for an extra check ball downstream from the No. 6 check ball pocket and repair as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

14. **CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 67: Checking OD Pressure Signal Circuit For Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: **Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

NOTE: **Check connectors - Clean/repair as necessary.**

3. Measure the resistance between the (T9) OD Pressure Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 Ohms between the (T9) OD Pressure Signal circuit and any other circuit (s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T9) OD Pressure Signal circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
    5. If the Event Data shows the DTC P0870 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the Event data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P0871-OD PRESSURE SWITCH RATIONALITY

Fig. 68: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

The appropriate DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
LINE PRESSURE DTCS PRESENT
NO. 4 OR NO. 6 CHECK BALL CUT OR DAMAGED
WORN SOLENOID SWITCH VALVE BORE IN MAIN VALVE BODY
(T9) OD PRESSURE SIGNAL CIRCUIT OPEN
(T9) OD PRESSURE SIGNAL CIRCUIT SHORTED TO GROUND
(T9) OD PRESSURE SIGNAL CIRCUIT SHORTED TO OTHER CIRCUITS
LOW LINE PRESSURE
WIRING AND CONNECTORS
CUT OD/REV PISTON SEAL
BROKEN OR MISSING OD/REV PISTON BLEED ORIFICE
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE
BROKEN OR MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
TRANSMISSION SOLENOID/TRS ASSEMBLY
CUT OD ACCUMULATOR PISTON SEAL
CRACKED OD ACCUMULATOR PISTON
BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN
1ST	CLOSED*	OPEN	OPEN	CLOSED	OPEN
2ND	OPEN	CLOSED	OPEN	CLOSED	OPEN

3RD	OPEN	OPEN	CLOSED	CLOSED	OPEN
4TH	OPEN	OPEN	OPEN	CLOSED	CLOSED
5TH	OPEN	OPEN	CLOSED	OPEN	CLOSED
6TH	OPEN	CLOSED	OPEN	OPEN	CLOSED
*L/R is closed if output speed is below 100 rpm in Drive. L/R is closed in Manual (ERS) 1st gear.					
**May be open when rolling in Neutral or at low oil temperatures.					

DIAGNOSTIC TEST

1. **CHECK DTCS**
    1. With the scan tool, read DTCs.

       Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF LINE PRESSURE DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Are there any Line Pressure DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 3.
3. **CHECK FOR OTHER PRESSURE SWITCH DTCS**
    1. With the scan tool, read DTCs.

       Are there two or more other pressure switch rationality DTCs present in addition to P0871?

       Yes

       - Go To 5.

       No

       - Go To 4.

4. **CHECK IF DTC IS CURRENT**
   1. With the scan tool, check and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Does the Event Data show data for P0871?

      Yes

      - Go To 8.

      No

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.
5. **CHECK IF RELATED DTC IS PRESENT**
   1. With the scan tool, check and record the Event Data.

      NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

      Do all the pressure switches read CLOSED in the Event Data?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform diagnostics for P0882. Follow instructions as if the DTC is current.

      No

      - Go To 6.
6. **CHECK IF PRESSURE SWITCHES READ OPEN**

   In the Event Data recorded earlier, do all the pressure switches read open?

   Yes

   - Go To 7.

   No

   - Go To 8.
7. **CHECK FOR LOW LINE PRESSURE**

In the Event Data recorded earlier, is the (actual) Line Pressure less than 276 kPa (40 psi), and significantly below the Desired (target) Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter weal for a spit, crack, or improperly installed. If the filer and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to **STANDARD PROCEDURE** for the above procedures.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

8. **CHECK IF IN PARK, NEUTRAL, OR REVERSE**

In the Event Data recorded earlier, does the Event Data show the OD Pressure Switch DTC set while in Park, Neutral, or Reverse?

Yes

- Go To 19.

No

- Go To 9.

9. **CHECK IF THE OD PRESSURE SWITCH WAS OPEN**

In the Event Data recorded earlier, did the OD Pressure Switch read OPEN?

Yes

- Go To 10.

No

- Go To 15.

10. **CHECK FOR LOW LINE PRESSURE**

In the Event Data recorded earlier, is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check the fluid level. Check the Primary Oil Filter seal for a split, crack, or improperly installed. Refer to **STANDARD PROCEDURE** for the proper installation procedure. If the fluid level and filter are OK, check the Main Regulator Valve in the Oil Pump.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 11.

11. **CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 69: Checking OD Pressure Signal Circuit For Short To Another Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect all PCM harness connectors.
3. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Measure the resistance between the (T9) OD Pressure Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T9) OD Pressure Signal circuit and any other circuit (s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T9) OD Pressure Signal circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 12.

12. **CHECK TO SEE IF THE DTC RESETS**
    1. Reconnect all previously disconnected connectors.
    2. With the scan too, erase transmission DTCs.
    3. Test drive the vehicle, use the Event Data recorded earlier to help duplicate the conditions when the DTC originality set.

       Does the DTC P0871 reset?

       Yes

       - Go To 13.

       No

       - Go To 23.

13. **CHECK THE POWERTRAIN CONTROL MODULE**
    1. Remove the PCM/TCM Relay.
    2. Operate the vehicle in Drive.

       Is the transmission slipping while in Drive?

       Yes

       - Go To 14.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

14. **AIR CHECK TRANSMISSION CLUTCH OPERATION**
    1. Refer to **STANDARD PROCEDURE** and perform an Air Check Transmission Clutch Operation procedure.

NOTE: The OD/Rev piston contains a small bleed orifice, a small amount of leakage between the OD and Reverse hydraulic clutch circuits is considered normal.

Is there excessive air leakage in any clutch circuit?

Yes

- Check the OD/Rev piston seals and bleed orifice, reaction shaft support seal rings, dribbler orifice assemblies in the reaction shaft support and for poor machine on the pump valve body faces. Refer to **STANDARD PROCEDURE** .
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Repair the Valve Body. Check the OD Accumulator piston and seals, OD bleed orifice, and No. 6 check ball cuts or damage. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly. Refer to **STANDARD PROCEDURE** for proper repair procedures.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK THE PCM AND WIRING**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. Ignition on, engine not running.
5. With the Transmission Simulator, turn the Pressure Switch selector switch to OD.
6. With the scan tool, monitor the OD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

   Did the state of the OD Pressure Switch change from OPEN to CLOSED while pressing the Test button?

   Yes

   - Go To 16.

   No

   - Go To 19.

16. **CHECK IF THE NO. 4 AND/OR NO. 6 CHECK BALL IS CUT OR DAMAGED**
    1. With the scan tool, erase previously stored DTCs and test drive the vehicle, use the Event Data to help duplicate the conditions when the DTC originality set. Note any DTCs that may set.
    2. Remove the Transmission Valve Body in accordance with the Service Information.
    3. Check the No. 4 and No. 6 Check Balls for cuts or damage.

       Is the No. 4 and/or No. 6 Check Ball cut or damaged?

       Yes

       - Replace the No. 4 and/or No. 6 Check Ball and check for clutch debris in the transmission oil pan. If there is excessive debris, perform internal repairs to the OD Clutch Assembly. Refer to **STANDARD PROCEDURE** for proper repair procedures.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 17.

17. **CHECK THE SOLENOID SWITCH VALVE BORE IN VALVE BODY**
    1. Check the size of the Solenoid Switch Valve (SSV) plug bore in the main valve body. Check the diameter of the outer four (4) lands in the SSV bore. Maximum allowable diameter is 11.544 mm (0.454 in).

       Are any of the large SSV bore lands over the maximum allowable size?

       Yes

- Replace the valve body in accordance with the service information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 18.

18. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**

Did the DTC P0871 reset during the test drive in the previous step?

Yes

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 23.

19. **CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR AN OPEN**

Fig. 70: Checking OD Pressure Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C2 harness connector.
3. Disconnect the Transmission Solenoid /TRS Assembly harness connector.
4. Measure the resistance of the (T9) OD Pressure Signal circuit between the Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

- Repair the (T9) OD Pressure Signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 20.

20. **CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 71: Checking OD Pressure Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T9) OD Pressure Signal circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T9) OD Pressure Signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 21.

21. **CHECK WIRING AND CONNECTORS**
    1. Using the schematics as a guide, inspect the wiring and connectors. Pay particular attention to all power and ground circuits.

       Were there any problems found

       Yes

       - Repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 22.

22. **CHECK THE POWERTRAIN CONTROL MODULE**
    1. Reconnect all previously disconnected connectors.
    2. Make sure all Event Data is recorded.
    3. With the scan tool, erase previously stored DTCs and test drive the vehicle, use the Event Data to help duplicate the conditions when the DTC originality set.

       Does the DTC P0871 reset?

       Yes

       - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 23.

23. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P0875-UD HYDRAULIC PRESSURE TEST

Fig. 72: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

WHEN MONITORED:

In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 RPM, the Powertrain Control Module (PCM) momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close two times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
(T29) UD PRESSURE SWITCH SENSE CIRCUIT OPEN
TRANSMISSION CONTROL RELAY DTCS PRESENT
(T29) UD PRESSURE SWITCH SENSE CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(T29) UD PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T29) UD PRESSURE SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Is there any Loss of Prime, TIPM TCM Power Control circuit, TCM Power Input and/or Line Pressure Sensor DTCs present?

Yes

- For the TIPM DTCs, Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. If the DTC, P0944-LOSS OF PRIME is present, perform its respective test first.

No

- Go To 2.

2. **CHECK IF THE DTC P0765 IS PRESENT**
   1. With the scan tool, read DTCs.

      Is the DTC P0765 also present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform diagnostics for P0765-UD SOLENOID CIRCUIT.

      No

      - Go To 3.

3. **CHECK IF OTHER DTCS ARE PRESENT**
   1. With the scan tool, read DTCs.

      Are any of the DTCs, P0731, P0732, P0733, P0734, and/or P0876 present also?

      Yes

      - Go To 12.

      No

      - Go To 4.

4. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

      Yes

      - Go To 5.

      No

      - Go To 17.

5. **CHECK IF THE LINE PRESSURE STAYS THE SAME**
    1. Start the engine.
    2. Warm the transmission to 82° C or 180° F.
    3. Firmly apply the brakes.
    4. With the scan tool, monitor the Line Pressure during the following step.
    5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least five seconds in each range.

       Did the line pressure remain at a steady value between 585 and 655 kPa or 85 and 95 psi in each position?

       Yes

       - Go To 6.

       No

       - Go To 10.
6. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
    1. Ignition on, **engine not running.**
    2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inward towards the Transmission.

       Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 of a volt when the connector was pushed inward?

       Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 of a volt)

       - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No (value is higher than 207 kPa (30 psi) or 0.7 of a volt and did not change or the value was already 207 kPa (30 psi) or 0.7 of a volt and did not change)

       - Go To 7.
7. **CHECK THE LINE PRESSURE SENSOR OPERATION**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

       CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 psi or 0.2 of a volt of the reading specified on the Transmission Simulator.

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 73: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect Transmission Simulator.
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (F856) 5-volt Supply circuit from the Line Pressure Sensor harness connector to the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 74: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

10. **COMPARE THE SCAN TOOL READING TO PRESSURE GAUGE READING**
    1. Turn the ignition off to the lock position.
    2. Connect the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to **STANDARD PROCEDURE** for proper installation procedure.

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the RPM to 1500, and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500, and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500, and compare the line pressure readings.

       Did the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

       Yes

- Go To 11.

No

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK THE WIRING AND CONNECTORS**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    3. Remove the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
    4. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    5. On the Transmission Simulator, turn the Pressure Switch selector switch to UD.
    6. Ignition on, engine not running.
    7. With the scan tool, monitor the UD Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the UD Pressure Switch.

    Did the UD Pressure Switch state change to closed and remain closed while wiggling the wires?

    Yes

    - Go To 12.

    No

    - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition off to the lock position.
    2. Remove the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

    Does the Transmission Oil Pan contain excessive debris or contamination?

Yes

- Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to **STANDARD PROCEDURE** for the proper procedures.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 13.

13. **CHECK THE UD HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) for leakage in accordance with the Service Information.

    NOTE: The UD hydraulic clutch circuit contains a small bleed orifice. A small amount of air leakage is normal.

    Was there excessive air leakage noticed during the air check?

    Yes

    - Repair as necessary. Check the UD clutch piston, piston seals and bleed orifice, reaction shaft support seal rings, and machining of the main mating faces of the pump housing, pump valve body, and reaction shaft support.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Disassemble and inspect the Valve Body and repair as necessary. Inspect the UD Accumulator piston and seals. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

14. **CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 75: Checking UD Pressure Switch Sense & Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Remove the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (T29) UD Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T29) UD Pressure Switch Sense circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 15.

15. **CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 76: Checking UD Pressure Switch Sense & Signal Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T29) UD Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T29) UD Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 16.

16. **CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 77: Checking UD Pressure Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.

3. Measure the resistance between the (T29) UD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T29) UD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T29) UD Pressure Switch Sense circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

17. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
    5. If the Event Data shows the DTC P0875 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P0876-UD PRESSURE SWITCH RATIONALITY

Fig. 78: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC is set if the UD pressure switch is in the wrong state for the current gear. For example, this code would be set if the UD pressure switch remained off while the transmission was in second gear.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
LOW FLUID LEVEL
NO. 2 CHECK BALL CUT OR DAMAGED
LOW LINE PRESSURE
CRACKED OR MIS-INSTALLED SUMP FILTER OR SEAL
LOOSE COOLER RETURN SPIN ON FILTER (IF EQUIPPED)
STICKING MAIN REGULATOR VALVE IN PUMP VALVE BODY
(T29) UD PRESSURE SIGNAL CIRCUIT OPEN
(T29) UD PRESSURE SIGNAL CIRCUIT SHORTED TO GROUND
(T29) UD PRESSURE SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUITS
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN
1ST	CLOSED*	OPEN	OPEN	CLOSED	OPEN
2ND	OPEN	CLOSED	OPEN	CLOSED	OPEN
3RD	OPEN	OPEN	CLOSED	CLOSED	OPEN
4TH	OPEN	OPEN	OPEN	CLOSED	CLOSED
5TH	OPEN	OPEN	CLOSED	OPEN	CLOSED
6TH	OPEN	CLOSED	OPEN	OPEN	CLOSED
*L/R is closed if output speed is below 100 rpm in Drive. L/R is closed in Manual (ERS) 1st gear.					
**May be open when rolling in Neutral or at low oil temperatures.					

DIAGNOSTIC TEST

1. **CHECK IF RELATED DTCS ARE PRESENT**
    1. With the scan tool, read DTCs.

       Is there any Loss of Prime, TIPM TCM Power Control circuit, TCM Power Input and/or Line Pressure Sensor DTCs present?

       Yes

       - For the TIPM DTCs, Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. If a Loss of Prime DTC is present, perform its respective test first.

       No

       - Go To 2.
2. **CHECK FOR PRESSURE SWITCH DTCS**
    1. With the scan tool, read DTCs.

       Are there two or more other pressure switch rationality DTCs present in addition to P0876?

       Yes

       - Go To 3.

       No

       - Go To 4.
3. **CHECK IF ALL PRESSURE SWITCHES READ CLOSED**
    1. With the scan tool, read and record all Event Data.

       NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

       Does the Event Data show all pressure switches reading CLOSED?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the diagnostics for P0882. Perform the diagnostics as if the DTC is current.

       No

       - Go To 4.
4. **CHECK FOR OTHER DTCS**

1. With the scan tool, read DTCs.

   Is the DTC P2704 present also?

   Yes

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 5.

5. **CHECK THE Event Data**

   In the Event Data recorded earlier, does the Event Data display information for the DTC P0876?

   Yes

   - Go To 6.

   No

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the diagnostics for the DTC listed in the Event Data.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK IF EVENT DATA WAS SET IN PARK, NEUTRAL OR REVERSE**

   In the Event Data recorded earlier, did the DTC P0876 set in Park, Neutral, or Reverse?

   Yes

   - Go To 10.

   No

   - Go To 7.

7. **CHECK THE UD PRESSURE SWITCH STATUS**

   In the Event Data recorded earlier, did the DTC P0876 set with the UD Pressure Switch closed?

   Yes

   - Go To 10.

No

- Go To 8.

8. **CHECK THE LINE PRESSURE**

   In the Event Data recorded earlier, is the (actual) Line Pressure less than 276 kPa (40 psi), and significantly below the Desired (target) Line Pressure?

   Yes

   - Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to **STANDARD PROCEDURE** for the above procedures.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 9.

9. **CHECK THE (T29) UD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 79: Checking UD Pressure Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect all PCM harness connectors.
3. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Measure the resistance between the (T29) UD Pressure Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T29) UD Pressure Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T29) UD Pressure Signal circuit for a short to another circuit(s).

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

10. **CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    4. Ignition on, engine not running.
    5. With the Transmission Simulator, turn the Pressure Switch selector switch to the UD position.
    6. With the scan tool, monitor the UD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

    Did the state of the UD Pressure Switch change while pressing the Pressure Switch Test button?

    Yes

    - Go To 14.

    No

    - Go To 11.

11. **CHECK THE (T29) UD PRESSURE SIGNAL CIRCUIT FOR AN OPEN**

Fig. 80: Checking UD Pressure Switch Sense & Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (T29) UD Pressure Signal circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T29) UD Pressure Signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 12.

12. **CHECK THE (T29) UD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 81: Checking UD Pressure Switch Sense & Signal Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T29) UD Pressure Signal circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T29) UD Pressure Signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 13.

13. **CHECK THE (T29) UD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 82: Checking UD Pressure Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.

   NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.

2. Measure the resistance between the (T29) UD Pressure Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T29) UD Pressure Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

- Repair the (T29) UD Pressure Signal circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

14. **PERFORM A WIGGLE TEST USING THE TRANSMISSION SIMULATOR**
    1. Perform the steps in the previous test while wiggling the wiring harness and connectors pertaining to the UD Pressure Switch.

       Did the state of the UD Pressure Switch change while pressing the Pressure Switch Test button?

       Yes

       - Repair the wiring harness and/or connectors as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No

       - Go To 15.

15. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY FOR A SHORT TO GROUND**

Fig. 83: Checking Transmission Solenoid/TRS Assembly For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Transmission Simulator and reconnect the Transmission Solenoid/TRS Assembly harness connector.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (T29) UD Pressure Signal circuit in the appropriate terminal of the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 16.

16. **CHECK IF THE DTC RESETS**
    1. Reconnect all previously disconnected connectors.
    2. With the scan tool, erase all transmission DTCs.
    3. Test drive the vehicle. Using the Event Data recorded earlier, try to duplicate the conditions in which the DTC originally set.

    Does the DTC P0876 reset?

    Yes

    - Go To 17.

    No

    - Go To 18.

17. **CHECK FOR A CUT NO. 2 CHECK BALL**
    1. Remove the Valve Body in accordance with the Service Information.
    2. Check the No. 2 check ball for cuts or damage.

    Is the No. 2 check ball cut or damaged?

    Yes

    - Replace the No. 2 check ball. Check for excessive clutch debris in the oil pan. If excessive debris is present, check the UD Clutch and repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. Check for excessive clutch debris in the oil pan. If excessive debris is present, check the UD Clutch and repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

18. **CHECK FOR CHECK THE WIRING AND CONNECTORS**

1. The conditions necessary to set this DTC are not present at this time.
2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
3. Wiggle the wires while checking for shorted and open circuits.
4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0882-TCM POWER INPUT LOW

Fig. 84: PCM Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Relay is used to supply power to the Transmission Solenoid/TRS Assembly and to the PCM when in normal operating mode. The purpose of the Transmission Output circuit is to allow the Transmission Control System to turn off the power to the Transmission Solenoid/TRS Assembly in event that the transmission should need to be placed into "limp-in" mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position, or after cranking the engine) the Transmission Control System verifies that the Transmission Output circuit is open by checking for voltage on the Transmission Output circuits before the Transmission Control System request for the circuit to be powered up. The request is sent by a direct circuit control from the PCM to the TIPM. If the Transmission Control System detects less that 3.0 volts when the output is commanded on, the DTC will set after two consecutive failed tests. The MIL will turn off after two consecutive passing tests. **Note: Inadequate Transmission Control Output voltage can also cause DTCs P0846, P0869, P0871, P0876 or P0988 to set. Repairing the P0882 fault should also eliminate the related DTCs.**

WHEN MONITORED:

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

SET CONDITION:

This DTC is set when there is less than 3.0 volts present, two consecutive times, at the transmission control output circuits located in the Powertrain Control Module (PCM) when the Transmission Control System request the power up of those circuits.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
(T15) TRANSMISSION CONTROL CIRCUIT SHORTED TO GROUND
(T15) TRANSMISSION CONTROL CIRCUIT OPEN
PCM/TCM RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC P0882 IS CURRENT**
    1. With the scan tool, Check the Starts Since Set counter for P0882.

NOTE: **This counter only applies to the last DTC set.**

Is the Starts Since Set counter equal to 0?

Yes

- Go To 2.

No

- Go To 9.

2. **CHECK THE INTERNAL FUSED B(+) CIRCUIT FOR AN OPEN**

Fig. 85: Checking Internal Fused B(+) Circuit For Open

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Remove the PCM/TCM Relay.

NOTE: Check connectors - Clean/repair as necessary.

3. Ignition on, engine not running.
4. Using a 12-volt test light connected to ground, check the internal Fused B(+) circuit in the PCM/TCM Relay connection.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 3.

No

- Repair the internal Fused B(+) circuit for an open. If the fuse is open make sure to check for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

3. **CHECK THE TRANSMISSION CONTROL RELAY**
   1. Turn the ignition off to the lock position.
   2. Install a substitute relay in place of the PCM/TCM Relay.
   3. Start the vehicle.
   4. With the scan tool, read DTCs.

   Did the DTC P0882 reset?

   Yes

   - Go To 4.

   No

   - Replace the PCM/TCM Relay.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

4. **(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN TO PCM**

Fig. 86: Checking Transmission Control Output Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TIPM C2 harness connector.

3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (T16) Transmission Control Output circuit between the TIPM C2 harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the (T16) Transmission Control Output circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN TO THE TRANSMISSION SOLENOID ASSEMBLY**

Fig. 87: Checking Transmission Control Output Circuit For Open To Transmission Solenoid Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

2. Measure the resistance of the (T16) Transmission Control Output circuit between the TIPM C2 harness connector and the Transmission Solenoid/TRS harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6.

   No

   - Repair the (T16) Transmission Control Output circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR A SHORT TO GROUND**

Fig. 88: Checking Transmission Control Output Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T16) Transmission Control Output circuit between ground and the TIPM C2 harness connector.

Is the resistance below 100k Ohms?

Yes

- Repair the (T16) Transmission Control Output circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

7. **CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 89: Checking Transmission Control Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T15) Transmission Control circuit at the PCM C2 harness connector.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T15) Transmission Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 8.

8. **CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR AN OPEN**

Fig. 90: Checking Transmission Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T15) Transmission Control circuit between the TIPM C1 harness connector and the appropriate terminal of the PCM C2 harness connector.

Is the resistance above 5.0 Ohms?

Yes

- Repair the (T15) Transmission Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Totally Integrated Power Module (TIPM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TIPM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0883-TCM POWER INPUT HIGH

Fig. 91: PCM Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The PCM/TCMl Relay is used to supply power (Transmission Control Output) to the Transmission Solenoid/TRS Assembly when in normal operating mode and to pins C4-19, C4-28 and C4-38 of the PCM. The purpose of the PCM/TCM Relay is to allow the Powertrain Control Module (PCM) to turn off the power to the Transmission Solenoid/TRS Assembly in event that the transmission should need to be placed into "limp-in" mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position, or after cranking engine) the PCM verifies that the PCM/TCM Relay contacts are open by checking for voltage on the Transmission Control Output circuit before the PCM/TCM Relay is energized. If voltage is detected, the DTC will set.

WHEN MONITORED:

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

SET CONDITION:

This DTC is set if the Powertrain Control Module (PCM) senses greater than 3.0 volts on the Transmission Control Relay Output circuits prior to a request from the PCM to TIPM to energize the Transmission Output circuits.

POSSIBLE CAUSES

Possible Causes
(T15) TRANSMISSION CONTROL CIRCUIT SHORTED TO VOLTAGE
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORTED VOLTAGE
PCM/TCM RELAY
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 0 for this DTC?

       Yes

       - Go To 2.

       No

- Go To 6.

2. **CHECK THE PCM/TCM RELAY**
    1. Turn the ignition off to the lock position.
    2. Disconnect the PCM/TCM Relay.
    3. Install a substitute relay.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the status Active or is the Starts Since Set counter 0 for this DTC?

    Yes

    - Go To 3.

    No

    - Replace the PCM/TCM Relay.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.
3. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 92: Checking Transmission Control Output Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Remove the Transmission Control Relay.
2. Disconnect the PCM C2 harness connector.
3. Ignition on, engine not running.
4. Measure the voltage at the (T16) Transmission Control Output circuit in the Transmission Control Relay connector.

   Is the voltage above 0.5 of a volt?

   Yes

- Go To 4.

No

- Go To 5.

4. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**

Fig. 93: Checking Transmission Output Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (T16) Transmission Control Output circuit on the appropriate terminal of the PCM C2 harness connector.

Is the voltage above 0.5 of a volt?

Yes

- Repair the (T16) Transmission Control Output circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 94: Checking Transmission Control Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (T15) Transmission Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T15) Transmission Control circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P0884-POWER UP AT SPEED

Fig. 95: PCM Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

If a vehicle loses power to the Transmission Control System, the solenoids (L/R, 2C, OD, UD, 4C) will go to their respective power off state. Some solenoids are normally vented and some are normally applied in their power off state. The transmission is designed to be in 4th gear with all of the solenoids in this state. However, if power is restored, the Transmission Control System will power-up and normal operation will be restored.

This code identifies that power to the Transmission Control System was restored when the gear selector was in a "Drive" position while the vehicle was moving at speeds above 32 Km/h (20 mph). **This DTC does not indicate a problem with the transmission or Transmission Control System,** instead, it suggests intermittent problems in the fused ignition switch output, fused B(+), or ground circuits to the PCM. Alternately, if a person performs a rolling restart maneuver, the DTC can be set. Therefore it is critical that this DTC be investigated if the vehicle is experiencing intermittent 4th gear operation and a subsequent return to normal operation.

WHEN MONITORED:

When Powertrain Control Module (PCM) initially powers up.

SET CONDITION:

This DTC will set if the PCM powers up and senses the vehicle in a valid forward gear, with no PRNDL DTCs, and an output speed above 800 rpm, approximately 32 Km/h or 20 mph.

POSSIBLE CAUSES

Possible Causes
POWER UP AT SPEED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK THE POWER AND GROUND CIRCUITS**
    1. This DTC is set when the Transmission portion of the Powertrain Control Module is initialized while the vehicle is moving down the road in a valid forward gear.
    2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
    3. Check all of the Fused B(+), Fused Ignition Switch Output, and ground circuits to the PCM for an intermittent open or short to ground.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Repair

    - Check all power and ground circuits to the PCM and repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0890-SWITCHED BATTERY

Fig. 96: PCM Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Output circuit is used to supply power to the solenoids and pressure switches (Transmission Solenoid/TRS Assembly) when the transmission is in normal operating mode. When the Transmission Control Output circuit is off, no power is supplied and the transmission.

Immediately after a controller reset (ignition key turned to the "run" position or after cranking engine), the PCM verifies that the Transmission Control Output circuits are open by checking for no voltage at the transmission control output terminals at the PCM. After this is verified, the voltage at the pressure switches are checked. There should be no voltage on the pressure switches at this time.

WHEN MONITORED:

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

SET CONDITION:

This DTC is set if the Powertrain Control Module (PCM) senses voltage on any of the pressure switch inputs prior to the Transmission Control Output circuit being energized.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
PRESSURE SIGNAL CIRCUITS SHORTED TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check DTCs.

       Are there any TIPM TCM Power Control Circuit and/or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

- Go To 2.

2. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, read DTCs.

      Is the status Active or is the Starts Since Set counter 0 for this DTC?

      Yes

      - Go To 3.

      No

      - Go To 5.

3. **CHECK THE PRESSURE SIGNAL CIRCUITS FOR A SHORT TO VOLTAGE**

Fig. 97: Checking Pressure Signal Circuits For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C2 harness connector.
3. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Ignition on, engine not running.
5. With the scan tool under TIPM, actuate the Transmission.
6. Measure the voltage of the (T147) 2C, (T48) 4C, (T50) L/R, (T9) OD, and (T29) UD Pressure Signal circuits.

   Is the voltage above 0.5 of a volt on any of the measured circuits?

   Yes

   - Repair the (T147) 2C, (T48) 4C, (T50) L/R, (T9) OD, and/or (T29) UD Pressure Signal circuit(s) for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**

Fig. 98: Checking Pressure Signal Circuits For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool under TIPM, stop the Transmission actuation.
2. Turn the ignition off to the lock position.
3. Reconnect the Transmission Solenoid/TRS Assembly harness connector.
4. Ignition on, engine not running.
5. Measure the voltage of the (T147) 2C, (T48) 4C, (T50) L/R, (T9) OD, and (T29) UD Pressure Signal circuits.

   Is the voltage above 0.5 of a volt on any of the measured circuits?

   Yes

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service

Information.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0933-HYDRAULIC PRESSURE SENSOR RANGE/PERFORMANCE

Fig. 99: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and

is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 1034 to 1103 kPa (150 to 160 psi) during shifts to ensure consistent shift quality.

WHEN MONITORED:

Continuously with the ignition on, engine running, with the transmission in gear.

SET CONDITION:

The Powertrain Control Module (PCM) continuously monitors (actual) Line Pressure and compares it to Desired (target) Line Pressure. If the Line Pressure reading is more than 172.4 kPa (25 psi) higher than the Desired Line Pressure, but is less than the highest Line Pressure ever used in the current gear, the DTC sets.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
LINE PRESSURE CONNECTOR AND WIRING
LINE PRESSURE SENSOR
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are there any other line pressure DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure. Perform the test for P0934 and/or P0935 first if they are present.

       No

       - Go To 2.
2. **COMPARE ACTUAL LINE PRESSURE TO DESIRED LINE PRESSURE**

CAUTION: Apply Parking Brake

1. Start the engine.

   CAUTION: Firmly apply the brakes.

2. With the scan tool, monitor the Line Pressure, Desired Line Pressure and the TPS degrees.
3. While firmly applying the brakes, place the shifter in reverse, then slowly press the accelerator pedal to a TPS degree of 15°.
4. Compare the Line Pressure reading to the Desired Line Pressure reading on the scan tool.

   Does the Line Pressure stay within ± 34 kPa (5 psi) of the Desired Line Pressure?

   No

   - Go To 3.

   Yes

   - Go To 6.

3. **CHECK LINE PRESSURE CONNECTOR AND WIRING**
   1. Ignition on, engine not running.
   2. With the scan tool, monitor the Line Pressure Sensor voltage while wiggling the wiring harness and connectors pertaining to the Line Pressure Sensor and the Transmission Solenoid/TRS Assembly.

      Did the voltage remain steady while wiggling the wiring harness and connectors?

      Yes

      - Go To 4.

      No

      - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

4. **CHECK PCM AND WIRING USING THE TRANSMISSION SIMULATOR**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure during the following step.
7. With the Transmission Simulator, turn the selector switch to each of the three Line Pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa (2.0 psi) or 0.1 of a volt of the reading specified on the Transmission Simulator.

Does the Line Pressure on the scan tool fluctuate up and down more than 69 kPa (10 psi) or 0.25 of a volt at any of the 3 line pressure positions on the Transmission Simulator?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE LINE PRESSURE SENSOR**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission) and reconnect all previously disconnected connectors.
   3. Install the Line Pressure Adaptor (special tool #8259, Adapter, Pressure Test), and the Pressure Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.), 0 to 2000 kPa (0 to 300 psi).
   4. Start the engine in park.
   5. Monitor the line pressure readings of both the scan tool and the pressure gauge and compare the two readings.

   Is the line pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?

Yes

- Repair internal transmission and inspect the oil pump in accordance with the Service information and replace if necessary. If no problems are found, replace the Transmission Solenoid/TRS Assembly - possible cause is the Pressure Control Solenoid is stuck.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0934-LINE PRESSURE SENSOR CIRCUIT LOW

Fig. 100: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and

is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 1034 to 1103 kPa (150 to 160 psi) during shifts to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate an Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC will set when the monitored Line Pressure Sensor voltage is less than or equal to 0.35 of a volt for 0.18 of a second.

POSSIBLE CAUSES

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 2.

       No

- Go To 7.

2. **CHECK THE PCM AND WIRING**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the scan tool, under Transmission Sensors, monitor the Line Pressure.
   6. Using the Transmission Simulator, set the rotary switch to each of the three line pressure positions.

      NOTE: The readings should be within ±14 kPa (2.0 psi) or 0.1 of a volt on the scan tool to the pressure readings specified on Transmission Simulator.

      Does the Line Pressure on the scan tool match the line pressures on the Transmission Simulator?

      Yes

      - Replace the Line Pressure Sensor in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 3.

3. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 101: Checking Line Pressure Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C2 harness connector.
3. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. Measure the resistance between ground and the (T38) Line Pressure Sensor Signal circuit.

   Is the resistance below 5.0 Ohms?

   Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 102: Checking Line Pressure Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T38) Line Pressure Sensor Signal circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T38) Line Pressure Sensor Signal circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 5.

5. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 103: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure sensor harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION

VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 104: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 Ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0935-LINE PRESSURE SENSOR CIRCUIT HIGH

Fig. 105: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and

is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 1034 to 1103 kPa (150 to 160 psi) during shifts to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate an Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

WHEN MONITORED:

Continuously with ignition on and engine running.

SET CONDITION:

This DTC will set if the monitored Line Pressure Sensor voltage is greater than or equal to 4.75 volts for the period of 0.18 of a second.

POSSIBLE CAUSES

Possible Causes
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(K400) SENSOR GROUND CIRCUIT OPEN
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, read DTCs.

       Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

       Yes

       - Go To 2.

       No

- Go To 6.

2. **CHECK THE PCM AND WIRING**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the scan tool, monitor the Line Pressure.
   6. Using the Transmission Simulator, set the rotary switch to each of the three line pressure positions.

      NOTE: The readings should be within ±14 kPa (2.0 psi) or 0.1 of a volt on the scan tool of the pressure reading specified on Transmission Simulator.

      Does the 3 line pressures on the scan tool match the Line pressure readings on the Transmission Simulator?

      Yes

      - Replace the Line Pressure Sensor in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 3.

3. **CHECK THE (K400) SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 106: Checking Sensor Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (K400) Sensor Ground circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (K400) Sensor Ground circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 107: Checking Line Pressure Sensor Signal Circuit For Open

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T38) Line Pressure Sensor Signal circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T38) Line Pressure Sensor Signal circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 5.

5. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 108: Checking Line Pressure Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. With the scan tool under TIPM, actuate the Transmission.
3. Measure the voltage of the (T38) Line Pressure Sensor Signal circuit.

   Is the voltage above 5.5 volts?

   Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0944-LOSS OF HYDRAULIC PUMP PRIME

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Loss of prime test is used to prevent transmission defaults and erroneous fault codes during temporary loss of pump prime that may occur with low transmission fluid under severe braking conditions, start-up, etc. and to point towards more subtle problems such as a plugged or cracked oil filter.

The Loss of Prime DTC is set by a loss of hydraulic pressure in the transmission system. This condition, if sustained, will result in the vehicle being unable to move.

WHEN MONITORED:

If the transmission is slipping in any forward gear and all the pressure switches are not indicating pressure, a loss of prime test is run.

SET CONDITION:

If the transmission begins to slip in a forward gear and all the pressure switches are open a loss of prime test begins. Available elements are turned on by the PCM to see if pump prime exists. The DTC sets if no pressure switches respond.

POSSIBLE CAUSES

Possible Causes
SHIFT LEVER OUT OF ADJUSTMENT
IMPROPER FLUID LEVEL
CRACKED OR IMPROPERLY INSTALLED PRIMARY OIL FILTER OR SEAL
LOOSE COOLER RETURN FILTER
STUCK OR STICKING MAIN REGULATOR VALVE
TRANSMISSION OIL PUMP

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **SHIFT LEVER POSITION TEST**
    1. Using the scan tool, perform a Shift Lever Position test. Follow the instructions on the scan tool.

       Did the Shift Lever Position Test pass?

       Yes

       - Go To 2.

       No

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.
2. **CHECK TO SEE IF DTC P0944 IS CURRENT**
    1. Place the gear selector in Park.
    2. Start the engine.
    3. The transmission must be at operating temperature prior to checking pressure. A cold transmission will give higher readings.
    4. Run the engine at 1500 rpm.

5. With the scan tool, monitor the Transmission Line Pressure.

   Does the (actual) Line Pressure match the Desired Line Pressure within ± 34 kPa (5 psi)?

   No

   - Go To 6.

   Yes

   - Go To 3.

3. **CHECK LINE PRESSURE IN DRIVE AND REVERSE**
   1. Firmly apply the brake and repeat the previous test in both Drive and the Reverse gear positions.
   2. With the scan tool, monitor the Transmission Line Pressure.

      Does the Line Pressure match the Desired Line Pressure within ± 5 psi in all gear ranges?

      Yes

      - Go To 4.

      No

      - Go To 5.

4. **REVIEW CUSTOMER COMMENTS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Verify with the customer if a delayed engagement and/or an intermittent "No Drive" condition has occurred.
   3. If the customers answer is "No" erase the DTC and return the vehicle to the customer.
   4. Make sure to check for any TSBs or controller flash updates that my apply.
   5. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

      Has the customer experienced any delayed engagement and/or "No Drive" conditions?

      Yes

      - Go To 6.

      No

      - Test Complete.

5. **DTC VERIFICATION**
   1. Read and record the DTC and the Event Data information.
   2. Test drive the vehicle and attempt to operate the vehicle within the parameters in which the DTC

set.

3. With the scan tool, read DTCs.

   Did any following DTCs set, P0868, P0944, P0841, P0846, P0871, P0876, or P0988?

   Yes

   - Go To 6.

   No

   - Test Complete.

6. **CHECK TRANSMISSION OIL FILTER**
   1. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.
   2. Remove and inspect the Primary Oil Filter in accordance with the Service Information.
   3. Inspect the oil filter seal for damage and proper installation.

      Does the Oil Pan contain excessive debris, or is the oil filter plugged, loose, or damaged?

      Yes

      - Repair the cause of the plugged transmission oil filter or excessive debris. Check the Transmission Oil Filter seal for improper installation onto filter neck instead of into the pump bore, not fully seated against pump housing, filter neck not engaged into pump. Check that the spin-on cooler return filter (if equipped) is not loose, and that its gasket is in good condition and properly seated. Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Repair the Transmission Oil Pump as necessary. Check for a stuck main regulator valve and clean if necessary. Refer to **STANDARD PROCEDURE** for the proper repair procedure.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P0987-4C HYDRAULIC PRESSURE TEST

Fig. 109: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

WHEN MONITORED:

In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

SET CONDITION:

After a shift into a forward gear, with engine speed above 1000 RPM, the PCM momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

POSSIBLE CAUSES

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
RELATED TCM POWER INPUT DTCS PRESENT
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO OTHERS
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Is there any Loss of Prime, TCM Power Input, Line Pressure Sensor and/or TIPM TCM Power Control Circuit DTCs present?

Yes

- For the TIPM DTCs, Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure. If the DTC P0944 is present, perform its respective test first.

No

- Go To 2.

2. **CHECK FOR RELATED DTCS**
   1. With the scan tool, read DTCs.

      Is the DTC P0770 also present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform diagnostics for P0770.

      No

      - Go To 3.

3. **CHECK FOR RELATED DTCS**
   1. With the scan tool, read DTCs.

      Are the DTCs P0988 and/or P0733 present also?

      Yes

      - Go To 12.

      No

      - Go To 4.

4. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, check if the DTC P0987-4C HYDRAULIC PRESSURE TEST FAILURE is active or stored.

      Is the DTC P0987-4C HYDRAULIC PRESSURE TEST FAILURE active?

      Yes

      - Go To 5.

      No

      - Go To 17.

5. **CHECK IF THE LINE PRESSURE STAYS THE SAME**
    1. Start the engine.
    2. Warm the transmission to 82° C or 180° F.
    3. Firmly apply the brakes.
    4. With the scan tool, monitor the Line Pressure during the following step.
    5. Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

       Did the line pressure remain at a steady value between 585 and 655 kPa or 85 and 95 psi in each position?

       Yes

       - Go To 6.

       No

       - Go To 10.
6. **CHECK THE LINE PRESSURE SENSOR CONNECTION**
    1. Ignition on, **engine not running.**
    2. With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inward towards the Transmission.

       Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 of a volt when the connector was pushed inward?

       Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 of a volt)

       - Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
       - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

       No (value is higher than 207 kPa (30 psi) or 0.7 volts and did not change or the value was already 207 kPa (30 psi) or 0.7 volts and did not change)

       - Go To 7.
7. **CHECK THE LINE PRESSURE SENSOR OPERATION**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

       CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
5. Ignition on, engine not running.
6. With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 psi or 0.1 of a volt of the reading specified on the Transmission Simulator.

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 110: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 111: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-volt Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (F856) 5-volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

10. **COMPARE SCAN TOOL TO PRESSURE GAUGE**
    1. Turn the ignition off to the lock position.
    2. Connect the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.). Refer to **STANDARD PROCEDURE** for proper installation procedure.

       CAUTION: Apply parking brake.

    3. Start the engine.
    4. In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

       CAUTION: Do not overheat transmission.

    5. With the gear selector in park, raise the RPM to 1500, and compare line pressure readings.
    6. Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500, and compare the line pressure readings.
    7. Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500, and compare the line pressure readings.

       Did the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?

       Yes

- Go To 11.

No

- Replace the Line Pressure Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

11. **CHECK PCM AND WIRING**
    1. Turn the ignition off to the lock position.
    2. Remove the Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) and 0-300 psi Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.).
    3. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    4. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    5. On the Transmission Simulator, turn the Pressure Switch selector switch to 4C.
    6. Ignition on, engine not running.
    7. With the scan tool, monitor the 4C Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the 4C Pressure Switch.

       Did the 4C Pressure Switch state change to closed and remain closed while wiggling the wires?

       Yes

       - Go To 12.

       No

       - Go To 14.

12. **CHECK FOR EXCESSIVE DEBRIS**
    1. Turn the ignition off to the lock position.
    2. Remove the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    3. Remove and inspect the Transmission Oil Pan in accordance with the Service Information.

       Does the Transmission Oil Pan contain excessive debris or contamination?

Yes

- Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to **STANDARD PROCEDURE** for the proper procedures.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 13.

13. **CHECK 4C HYDRAULIC CLUTCH CIRCUIT**
    1. Remove the Valve Body and air check the 4C hydraulic clutch circuit (in the case) for leakage in accordance with the Service Information.

    NOTE: The 4C hydraulic clutch circuit contains a small bleed orifice. A small amount of air leakage is normal.

    Was there excessive air leakage noticed during the air check?

    Yes

    - Repair as necessary. Check the 4C clutch piston, piston seals and bleed orifice assembly.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Disassemble and inspect the Valve Body and repair as necessary. Inspect the 4C Accumulator piston and seals. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

14. **CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 112: Checking 4C Pressure Switch Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Remove the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (T48) 4C Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T48) 4C Pressure Switch Sense circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 15.

15. **CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 113: Checking 4C Pressure Switch Sense Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T48) 4C Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T48) 4C Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 16.

16. **CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 114: Checking 4C Pressure Switch Sense Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all PCM harness connectors.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.

NOTE: Check connectors - Clean/repair as necessary.

3. Measure the resistance between the (T48) 4C Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T48) 4C Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T48) 4C Pressure Switch Sense circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

17. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
    5. If the Event Data shows the DTC Pie set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

       Where there any problems found?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P0988-4C PRESSURE SWITCH RATIONALITY

Fig. 115: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

WHEN MONITORED:

Continuously with the ignition on, engine running, with the transmission in gear.

SET CONDITION:

The DTC is set if the 4C Pressure Switch reads open or closed at the wrong time in a given gear.

POSSIBLE CAUSES

Possible Causes
RELATED TCM POWER INPUT DTCS PRESENT
DTC P0871 ALSO PRESENT
LOSS OF 12-VOLT FEED
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT OPEN
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
EXCESSIVE FLUID LEAKAGE WITH 4C CLUTCH CIRCUIT
NO. 5 CHECK BALL CUT OR DAMAGED
LOW LINE PRESSURE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)
WIRING AND CONNECTORS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN
1ST	CLOSED*	OPEN	OPEN	CLOSED	OPEN
2ND	OPEN	CLOSED	OPEN	CLOSED	OPEN
3RD	OPEN	OPEN	CLOSED	CLOSED	OPEN
4TH	OPEN	OPEN	OPEN	CLOSED	CLOSED
5TH	OPEN	OPEN	CLOSED	OPEN	CLOSED
6TH	OPEN	CLOSED	OPEN	OPEN	CLOSED
*L/R is closed if output speed is below 100 rpm in Drive. L/R is closed in Manual (ERS) 1st gear.					
**May be open when rolling in Neutral or at low oil temperatures.					

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **DTC DATA SHOW CURRENT DTC**
    1. With the scan tool, check the Event Data.

       NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

       Does the Event Data show data for DTC P0988?

       Yes

       - Go To 3.

       No

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the diagnostic procedure identified in the Event Data.
3. **CHECK IF MULTIPLE DTCS ARE PRESENT**

   In the Event Data recorded earlier, are there two or more related Pressure Switch Sense DTCs present in addition to P0988?

   Yes

   - Go To 4.

   No

   - Go To 7.
4. **RELATED DTC PRESENT**

   In the Event Data recorded earlier, do all the pressure switches read CLOSED for P0988?

   Yes

- Refer to **DIAGNOSTIC CODE INDEX** and perform the diagnostic procedure for the DTC P0882.

No

- Go To 5.

5. **CHECK IF THE PRESSURE SWITCHES READ OPEN**

   In the Event Data recorded earlier, do all the pressure switches read OPEN?

   Yes

   - Go To 6.

   No

   - Go To 7.

6. **CHECK FOR LOW LINE PRESSURE**

   In the Event Data recorded earlier, is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

   Yes

   - Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to **STANDARD PROCEDURE** for the above procedures.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK IF THE DTC P0871 ALSO SET**
   1. With the scan tool, read DTCs.

      Is the DTC P0871 also present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the diagnostic procedure for P0871.

      No

- Go To 8.

8. **CHECK IF THE DTC SET IN PARK, REVERSE OR NEUTRAL**

   In the Event Data recorded earlier, does the Event Data show the DTC P0988 set in Park, Neutral, or Reverse?

   Yes

   - Go To 13.

   No

   - Go To 9.

9. **CHECK IF THE Event Data READS CLOSED**

   In the Event Data recorded earlier, does the Event Data show the 4C Pressure Switch reading CLOSED?

   Yes

   - Go To 11.

   No

   - Go To 10.

10. **CHECK THE PRIMARY OIL FILTER SEAL**

    In the Event Data recorded earlier, is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

    Yes

    - Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to **STANDARD PROCEDURE** for the above procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 15.

11. **CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. Ignition on, engine not running.
5. With the Transmission Simulator, turn the Pressure Switch selector switch to the 4C position.
6. With the scan tool, monitor the 4C Pressure Switch while pressing the Pressure Switch test button on the Transmission Simulator (special tool #8333A, Simulator, Transmission).

   Did the state of the 4C Pressure Switch change while pressing the Pressure Switch Test button?

   Yes

   - Go To 12.

   No

   - Go To 13.

12. **CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY**
    1. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    2. Wiggle the wires while checking for shorted and open circuits.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

13. **CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 116: Checking 4C Pressure Switch Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (T48) 4C Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T48) 4C Pressure Switch Sense circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 14.

14. **CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 117: Checking 4C Pressure Switch Sense Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T48) 4C Pressure Switch Sense circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T48) 4C Pressure Switch Sense circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace the Powertrain Control Module in accordance with the Service Information. With the scan tool, perform the Quick Learn procedure.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

15. **CHECK IF THE NO. 5 AND/OR NO. 7 CHECK BALL IS CUT OR DAMAGED**
    1. Turn the Ignition off to the lock position.
    2. Remove the Valve Body Assembly in accordance with the Service Information.
    3. Inspect the No. 5 and No. 7 check balls for any cuts or damage.
    4. Inspect the 4C accumulator piston and seals and also the 4C tower seal on top of the valve body. Refer to **STANDARD PROCEDURE** .

    Where there any problems found?

    Yes

    - Repair as necessary. Check for excessive clutch debris in the transmission oil pan. If excessive clutch debris is present, repair 4C clutch as necessary. Refer to **STANDARD PROCEDURE** for proper repair procedures.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 16.

16. **CHECK FOR EXCESSIVE LEAKAGE WITHIN THE 4C CLUTCH CIRCUIT**
    1. Air check the 4C Clutch hydraulic circuit. Refer to **STANDARD PROCEDURE** .

    NOTE: This hydraulic clutch circuit contains a small bleed orifice. Small leakage is considered normal.

Was there excessive air leakage in the 4C Clutch hydraulic circuit?

Yes

- Repair as necessary. Refer to **STANDARD PROCEDURE** .
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P1684-BATTERY WAS DISCONNECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The PCM uses a battery backed RAM (Random Access Memory) is used to maintain some learned values. When the battery B(+) is disconnected, the memory is lost. When the B(+) is restored, this memory loss is detected by the Transmission Control System. The DTC is set and the learned values are initialized to known constants or previously learned values from EEPROM (Electronic Erasable Programmable Read Only Memory). This results in the re-initialization of some parameters.

WHEN MONITORED:

Whenever the ignition is in the Run/Start position.

SET CONDITION:

This DTC will set whenever Powertrain Control Module is disconnected from Fused B(+) or ground. It will also be set using the scan tool to perform a Battery Disconnect and/or Quick Learn procedure.

POSSIBLE CAUSES

Possible Causes
BATTERY WAS DISCONNECTED
SCAN TOOL BATTERY DISCONNECT PERFORMED
PCM WAS REPLACED OR DISCONNECTED
QUICK LEARN WAS PERFORMED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **POSSIBLE CAUSES**
    1. This DTC is an informational DTC only.
    2. This DTC is set due to a momentary loss of power and/or the ground circuits to the PCM.
    3. Below are a list of possible causes associated with this DTC.
    4. Battery was disconnected.
    5. The battery disconnect feature (if equipped) on the scan tool was performed.
    6. The Quick Learn feature on the scan tool was performed.
    7. PCM was replaced or disconnected.

    Were any of the above possible causes performed?

    Yes

    - This is the cause of the DTC. Erase the DTC and return vehicle to customer.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 2.
2. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

    NOTE: Check all power and ground circuits to the PCM for a intermittent or high resistance condition.

    3. Wiggle the wires while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Where there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P1715-RESTRICTED MANUAL VALVE IN T3 RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the PRNDL code indicates Temp 3.

SET CONDITION:

This DTC sets when conditions for the DTC P1776 are satisfied or 3 unsuccessful attempts to engage 1st gear while the shifter is in the temp 3 zone. This indicates a restricted port at the manual valve because the shifter is not fully engaged in the drive position.

POSSIBLE CAUSES

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
CUSTOMER DRIVING HABITS
MISADJUSTED SHIFTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, read DTCs.

       Are the DTCs P0729, P0731, P0732, P0733, P0734, P0735, or P0716 present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure for the reported DTC(s).

       No

       - Go To 2.
2. **CHECK SHIFTER ADJUSTMENT**
    1. Check Shift Lever adjustment in accordance with the Service Information.

       Is the shifter properly adjusted?

       Yes

- Go To 3.

No

- Adjust the Shifter Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

3. **CHECK CUSTOMER DRIVING HABIT**
    1. This DTC can be set if the customer rests their hand on the shift lever while they are driving. The transmission can be put in the T3 position if just enough upward pressure towards neutral is exerted on the shift lever.
    2. When this occurs, the feed port to the clutch is restricted, the transmission will declare neutral, and this DTC will be set. The customer should be informed not to rest their hand on the shifter while driving.
    3. This DTC can also be set by simply bumping the shift lever toward neutral while accelerating.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    If there are no possible causes remaining, view repair.

    Repair

    - This DTC can be set by putting too much forward pressure on the shift lever while it is in the OD position. Make sure the customer is informed.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION

Fig. 118: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R Solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing the fluid to the L/R clutch circuit. In 2nd through 6th gears, it will be in the upshifted position and directing the fluid to the torque converter clutch (TCC) control circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R Pressure Switch is monitored to confirm SSV movement. If movement is not confirmed (the L/R pressure switch does not close), EMCC is inhibited until SSV operation is confirmed.

WHEN MONITORED:

During an attempted shift into 1st gear.

SET CONDITION:

This DTC is set if three unsuccessful attempts are made to shift the Solenoid Switch Valve (SSV) into the downshifted position in one given ignition start. This DTC can take up to five minutes to mature before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
RELATED DTC PRESENT
SOLENOID SWITCH VALVE STICKING
L/R PRESSURE SWITCH SENSE CIRCUIT SHORTED TO OTHER CIRCUITS
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for other transmission DTCs.

       Is the DTC P0841 present also?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**

1. With the scan tool, read DTCs.

   Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

   Yes

   - Go To 3.

   No

   - Go To 6.

3. **CHECK THE PCM AND WIRING**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Pressure Switch selector switch to L/R.
   6. With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

      Did the state of the L/R Pressure Switch change while pressing the Pressure Switch Test button?

      Yes

      - Go To 4.

      No

      - Go To 5.

4. **CHECK IF THE SOLENOID SWITCH VALVE STICKING**
   1. Turn the ignition off to the lock position.
   2. Remove the Transmission Oil Pan in accordance with the Service Information.
   3. Remove the Transmission Valve body in accordance with the Service Information.
   4. Inspect the Solenoid Switch Valve and Plugs for sticking.

      Is the Solenoid Switch Valve or Plugs sticking?

Yes

- Clean and inspect in accordance with the Service Information. Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 119: Checking L/R Pressure Switch Sense Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Disconnect all PCM harness connectors.
4. Measure the resistance between the (T50) L/R Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T50) L/R Pressure Switch Sense circuit and all other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T50) L/R Pressure Switch Sense circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

      Where there any problems found?

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Test Complete.

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION

Fig. 120: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R Solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing the fluid to the L/R clutch circuit. In 2nd through 6th gears, it will be in the upshifted position and directing the fluid into the torque converter clutch (TCC) control circuit.

When in 2nd through 6th gear, the Torque Converter Clutch (TCC) can be engaged when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the L/R solenoid until the torque converter slip difference (difference between engine and transmission input speed) is within 60 rpm. Then the L/R solenoid is fully energized (FEMCC - 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

WHEN MONITORED:

Continuously when performing partial or full EMCC - PEMCC or FEMCC.

SET CONDITION:

If the transmission senses the L/R pressure switch closing while performing PEMCC or FEMCC. This DTC will set after two unsuccessful attempts to perform PEMCC or FEMCC. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
RELATED DTC P0841 PRESENT
L/R PRESSURE SIGNAL CIRCUIT OPEN
L/R PRESSURE SIGNAL CIRCUIT SHORTED TO GROUND
SOLENOID SWITCH VALVE
POWERTRAIN CONTROL MODULE (PCM)
INTERMITTENT WIRING AND CONNECTORS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. With the scan tool, check for other transmission DTCs.

       Is the DTC P0841 present also?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

- Go To 2.

2. **CHECK TO SEE IF DTC P1776 IS CURRENT**
   1. With the scan tool, Check the Starts Since Set counter.

      NOTE: NOTE: This counter only applies to the last DTC set.

      Is the Starts Since Set counter 2 or less?

      Yes

      - Go To 3.

      No

      - Go To 7.

3. **CHECK THE PCM AND WIRING**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the Transmission Simulator, turn the Pressure Switch selector switch to the L/R position.
   6. With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

      Did the state of the L/R Pressure Switch change while pressing the Pressure Switch Test button?

      Yes

      - Go To 4.

      No

      - Go To 5.

4. **CHECK THE SOLENOID SWITCH VALVE**
   1. Remove the Valve Body in accordance with the Service Information.

2. Inspect the Solenoid Switch Valve and plugs for sticking in the bore and/or wear.

   Were there any problems found?

   Yes

   - Clean and repair as necessary in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 7.

5. **CHECK THE L/R PRESSURE SIGNAL CIRCUIT FOR AN OPEN**

Fig. 121: Checking L/R Pressure Switch Sense & Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance of the (T50) L/R Pressure Signal circuit between the Solenoid/TRS Assembly harness connector and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

- Repair the (T50) L/R Pressure Signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE (T50) L/R PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 122: Checking L/R Pressure Switch Sense & Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T50) L/R Pressure Signal circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T50) L/R Pressure Signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. This DTC can also be set by the Solenoid Switch Valve intermittently sticking in it's bore under extreme temperature conditions, or by a worn Solenoid Switch Valve or plugs.
   5. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

      Where there any problems found?

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Test Complete.

P1794-SPEED SENSOR GROUND ERROR

Fig. 123: Input/Output Speed Sensor, Line Pressure Sensor & Transmission Temperature Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified

through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0729 and P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set when at a stop.

WHEN MONITORED:

The gear ratio is monitored continuously while the Transmission is in gear.

SET CONDITION:

After a controller reset in neutral and a ratio of input to output, of 1 to 2. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES

Possible Causes
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK TO SEE IF DTC P1794 IS CURRENT**
    1. Ignition on, engine running with the Shift lever in park.
    2. With the scan tool, read the Transmission Output and Input Speed Sensor states.

    Is the Output Speed Sensor reading twice the Input Speed Sensor reading?

    Yes

    - Go To 2.

    No

- Go To 6.

2. **PCM AND WIRING**
    1. Turn the ignition off to the lock position.
    2. Remove the Ignition Switch Feed fuse from the TIPM.

        CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

        WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

    3. Install the Transmission Simulator (special tool #8333A, Simulator, Transmission).
    4. With the Transmission Simulator, set the Input/Output Speed selector switch to the "3000/1000" position. Turn the Input/Output Speed switch to "ON".
    5. Ignition on, engine not running.
    6. With the scan tool, monitor the Input and Output Speed Sensor state.

        Does the Input speed read 3000 rpm and the Output speed read 1000 rpm, within 50 rpm?

        Yes

        - Go To 6.

        No

        - Go To 3.

3. **(T13) SPEED SENSOR GROUND CIRCUIT OPEN**

Fig. 124: Checking Speed Sensor Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C2 harness connector.
3. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
4. Measure the resistance of the (T13) Speed Sensor Ground circuit between both Input and Output Speed Sensor harness connectors and the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms on any of the above measurements?

Yes

- Repair the (T13) Speed Sensor Ground circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 4.

4. **(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO GROUND**

Fig. 125: Checking Speed Sensor Ground Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 5.

5. **(T13) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE**

Fig. 126: Checking Input Speed Sensor Ground Circuit For Open Or Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. With the scan tool under TIPM, actuate the Transmission.
3. Measure the voltage of the (T13) Speed Sensor Ground circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T13) Speed Sensor Ground circuit for a short to voltage.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P2700-INADEQUATE ELEMENT VOLUME LR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

WHEN MONITORED:

Whenever the engine is running. The L/R clutch volume index (CVI) is updated during a 3-1 or 2-1 manual (ERS) downshift with throttle angle below 5 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the L/R clutch volume index (CVI) falls below 16.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN L/R CLUTCH PISTON RETURN SPRING OR SPRING RETAINERS
BROKEN L/R ACCUMULATOR SPRING(S)
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
   1. With the scan tool, check for other transmission DTCs.

      Are there any Pressure Switch Sense circuit DTCs present also?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK L/R CLUTCH VOLUME INDEX**
   1. With the scan tool, erase DTCs.
   2. Start the engine and warm the transmission.

      NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

   3. Drive the vehicle and perform at least ten 3-1 manual (ERS) downshifts at closed throttle from speeds of about 16 to 24 Km/h (10 to 15 mph).
   4. With the scan tool, read the L/R CL VOL INDEX.

      Is the L/R CL VOL INDEX below 20?

      Yes

      - Go To 3.

No

- Go To 5.

3. **L/R CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan in accordance with the Service Information.
   3. Remove the valve body in accordance with the service information.
   4. Check condition of the L/R accumulator springs.
   5. Look for possible leak paths into the L/R clutch hydraulics circuit within the valve body.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **AIR CHECK L/R CLUTCH CIRCUITS**
   1. Perform an air check on the L/R Clutch circuit in accordance with the Service Information.
   2. Watch and listen for L/R Clutch piston movement.

   Does the L/R piston stroke and return properly?

   Yes

   - Replace the Transmission/TRS Solenoid Assembly in accordance with the service information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Repair internal transmission as necessary. Pay attention to the components related to the L/R clutch. A broken or weak L/R clutch return spring, Accumulator Spring, and/or dislocated snap ring could cause this problem.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **VERIFY PCM OPERATION**

NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing

the following steps.

1. Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Km/h or 50 mph, then brake lightly to a stop. Turn off engine.
2. With the scan tool, record the CL VOL INDEX (CVI) for all clutches
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P2701-INADEQUATE ELEMENT VOLUME 2C

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

WHEN MONITORED:

Whenever the engine is running. The 2C clutch volume index (CVI) is updated during a 3-2 or 4-2 kickdown with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the 2C CVI falls below 5.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN 2C CLUTCH PISTON RETURN SPRING / DISLODGED SNAP RING
BROKEN ACCUMULATOR SPRING(S)
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
   1. With the scan tool, check for other transmission DTCs.

      Are there any Pressure Switch Sense circuit DTCs present also?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK 2C CLUTCH VOLUME INDEX**
   1. With the scan tool, erase Transmission DTCs.
   2. Drive the vehicle at about 1000 rpm on the Output Speed sensor, then use the AutoStick® (ERS) and select 3rd gear. This will put the vehicle into third gear.

      NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing the following steps.

   3. Perform at least ten 3-2 kickdowns by allowing the vehicle to coast down to 650 to 550 rpm on the Output Speed sensor, then depressing the throttle between 40 and 50 Degrees.

      NOTE: Do not exceed 54 Degrees of Throttle Angle.

   4. With the scan tool, read the 2C CL VOL INDEX.

      Is the 2C CL VOL INDEX below 10?

      Yes

      - Go To 3.

No

- Go To 5.

3. **2C CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
    1. Turn the ignition off to the lock position.
    2. Remove the transmission oil pan in accordance with the Service Information.
    3. Remove the valve body in accordance with the service information.
    4. Check condition of the 2C accumulator springs.
    5. Look for possible leak paths into the 2C clutch hydraulics circuit within the valve body.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Go To 4.

4. **AIR CHECK 2C CLUTCH CIRCUIT**
    1. Turn the ignition off to the lock position.
    2. Perform an air check on the 2C Clutch circuit in accordance with the Service Information.
    3. Watch and listen for 2C Clutch piston movement.

    Dose the piston stroke and return properly?

    Yes

    - Replace the Transmission/TRS Solenoid Assembly in accordance with the service information. With the scan tool, perform Quick Learn.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

    No

    - Repair internal transmission as necessary. Pay attention to the components related to the 2C clutch. A broken or dislodged 2C return spring, snap ring or broken 2C Accumulator Spring could cause this problem.
    - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **VERIFY PCM OPERATION**

NOTE: **The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.**

1. Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Km/h or 50 mph, then brake lightly to a stop. Turn off engine.
2. With the scan tool, record the CL VOL INDEX (CVI) for all clutches
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P2702-INADEQUATE ELEMENT VOLUME OD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

WHEN MONITORED:

Whenever the engine is running. The OD clutch volume index (CVI) is updated during a 3-4 upshift with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the OD CVI falls below 5.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN OD ACCUMULATOR SPRING
BROKEN OD/REV PISTON BELLEVILLE SPRING OR DISLODGED SNAP RING
INTERNAL LEAKAGE IN PUMP ASSEMBLY
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
   1. With the scan tool, check for other transmission DTCs.

      Are there any Pressure Switch Sense circuit DTCs present also?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK THE OD CLUTCH VOLUME INDEX**
   1. With the scan tool, erase DTCs.

      NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing the following steps.

   2. Drive the vehicle and perform at least ten 3-4 upshifts with the TPS degree between 10 and 54.
   3. With the scan tool, read the OD CL VOL INDEX.

      Is the OD CL VOL INDEX below 10?

      Yes

      - Go To 3.

      No

      - Go To 5.
3. **OD CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**

1. Turn the ignition off to the lock position.
2. Remove the transmission oil pan in accordance with the Service Information.
3. Remove the valve body in accordance with the service information.
4. Check condition of the OD accumulator spring.
5. Look for possible leak paths into the OD clutch hydraulics circuit within the valve body.

Were any problems found?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 4.

4. **AIR CHECK OD CLUTCH CIRCUIT**
   1. Perform an air check on the OD Clutch circuit in accordance with the Service Information.
   2. Watch and listen for OD Clutch piston movement.
   3. Air check all other pump passages and watch for air leakage into the OD clutch passage.

NOTE: **There is a bleed orifice between the OD and Reverse Clutch passages, so a small amount of air leakage from Reverse to OD is normal.**

Were any problems found?

Yes

- Repair internal transmission. Pay attention to the OD Clutch. Broken or weak return spring or a dislocated snap ring could cause this problem. If no problems were found in the OD clutch, or if leakage into the OD passage was noted, replace Pump Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission/TRS Solenoid Assembly in accordance with the service information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **VERIFY PCM OPERATION**

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

1. Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Kmh or 50 MPH, then brake lightly to a stop. Turn off engine.
2. With the scan tool, record the CL VOL INDEX (CVI) for all clutches.
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P2703- INADEQUATE ELEMENT VOLUME UD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

WHEN MONITORED:

Whenever the engine is running. The UD clutch volume index (CVI) is updated during a 5-4 kickdown with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the UD CVI falls below 11.

POSSIBLE CAUSES

Possible Causes
BROKEN UD ACCUMULATOR SPRING(S)
BROKEN UD CLUTCH PISTON SPRING OR DISLODGED SNAP RING
INTERNAL LEAKAGE IN PUMP OR VALVE BODY ASSEMBLIES
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **OTHER DTCS PRESENT**
    1. With the scan tool, check for other transmission DTCs.

       Are there any Pressure Switch Sense circuit DTCs present also?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK UD CLUTCH VOLUME INDEX**
    1. With the scan tool, erase Transmission DTCs.

       NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

    2. Drive the vehicle and perform at least ten 5-4 kickdowns by depressing the throttle between 40 and 50 TPS degrees at speeds about 1500 to 1700 rpm on the Output Speed sensor.
    3. With the scan tool, read the UD clutch volume index (CVI).

       Is the UD CVI below 10?

       Yes

       - Go To 3.

       No

       - Go To 5.
3. **UD CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**

1. Turn the ignition off to the lock position.
2. Remove the transmission oil pan and valve body in accordance with the Service Information.
3. Check the condition of the UD accumulator springs.
4. Look for possible leak paths into the UD clutch hydraulics circuit within the valve body.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **AIR CHECK UD CLUTCH CIRCUIT**
   1. Perform an air check on the UD Clutch circuit in accordance with the Service Information.
   2. Watch and listen for UD Clutch piston movement.
   3. Air check all other pump passages for air leakage into the UD Clutch circuit.

      Were any problems found?

      Yes

      - Repair internal transmission. Pay attention to components related to the UD clutch. Broken or weak return spring or a dislocated snap ring. If no trouble is found in UD clutch component or UD clutch leakage was noted in passage, replace the Pump Assembly.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Replace the Transmission/TRS Solenoid Assembly in accordance with the service information. With the scan tool, perform Quick Learn.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **VERIFY PCM OPERATION**

   NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

   1. Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Km/h or 50 mph, then brake lightly to a stop. Turn off engine.

2. With the scan tool, record the clutch volume index (CVI) for all clutches.
3. With the scan tool, perform a BATTERY DISCONNECT.
4. With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

   Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P2704-INADEQUATE ELEMENT VOLUME 4C

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

WHEN MONITORED:

Whenever the engine is running. The 4C clutch volume index (CVI) is updated during a 4-5 upshift with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

SET CONDITION:

When the 4C CVI falls below 5.

POSSIBLE CAUSES

Possible Causes
BROKEN 4C RETURN SPRING OR DISLODGED SNAP RING
BROKEN 4C ACCUMULATOR SPRING(S)
HYDRAULIC LEAK IN THE VALVE BODY

TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK THE 4C CLUTCH VOLUME**
   1. With the scan tool, record the 4C clutch volume index (CVI) and erase DTCs.
   2. Perform at least 10, 4-5 upshifts with the throttle between 10 and 54 degrees. The Transmission temperature must be at least 43° C or 110° F.
   3. With the scan tool, read the 4C CVI.

      Is the current 4C CVI below 10?

      Yes

      - Go To 2.

      No

      - Go To 5.
2. **DTC P0876 PRESENT**
   1. With the scan tool, read DTCs.

      NOTE: The DTC P0876 must also be set with P2704 in order for this test to be valid.

      Is the DTC P0876 also present?

      Yes

      - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 3.
3. **4C CLUTCH CIRCUIT LEAKS IN THE VALVE BODY**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan in accordance with the Service Information.

3. Remove the valve body in accordance with the Service Information.
4. Check condition of the 4C accumulator springs.
5. Look for possible leak paths into the 4C clutch hydraulics circuit within the valve body.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 4.

4. **AIR CHECK 4C CLUTCH CIRCUIT**
   1. Perform an air check on the 4C Clutch circuit in accordance with the Service Information.
   2. Listen for proper 4C Clutch piston movement.

      Were any problems found?

      Yes

      - Repair Internal transmission as necessary. Pay attention to the mechanical components related to the 4th clutch. A broken or weak return spring or a dislocated snap ring could cause this problem.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

      No

      - Replace the Transmission Solenoid/TRS Assembly in accordance with the service information. With the scan tool, perform Quick Learn.
      - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **VERIFY PCM OPERATION**
   1. Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 50 MPH, then brake lightly to a stop. Turn off engine.
   2. With the scan tool, record Transmission CL VOL INDEX (CVI) for all clutches.
   3. With the scan tool, perform a BATTERY DISCONNECT.
   4. With the scan tool, read the CVIs and compare them to the reading recorded before the BATTERY DISCONNECT.

      Are any of the CVIs less than 5 or are they different than before the battery disconnect?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P2706-MS SOLENOID CIRCUIT

Fig. 127: Solenoid Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control System uses five electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each

solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

WHEN MONITORED:

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

SET CONDITION:

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: **This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement - do not replace the Valve Body.**

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
(T140) MS SOLENOID CONTROL CIRCUIT SHORTED TO OTHER CIRCUITS
(T140) MS SOLENOID CONTROL CIRCUIT OPEN
(T140) MS SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **RELATED TCM POWER INPUT DTCS PRESENT**
    1. With the scan tool, check DTCs.

       Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 2.

2. **TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. Turn the ignition off to the lock position.
   2. Remove the Ignition Switch Feed fuse from the TIPM.

      CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

      WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in possible serious or fatal injury.

   3. Install Transmission Simulator (special tool #8333A, Simulator, Transmission).
   4. Ignition on, engine not running.
   5. With the scan tool, actuate the MS Solenoid.
   6. Monitor the MS Solenoid LED on the Transmission Simulator.

      Did the MS Solenoid LED on the Transmission Simulator blink on and off?

      Yes

      - Go To 3.

      No

      - Go To 5.

3. **TRANSMISSION SOLENOID/TRS ASSEMBLY**
   1. With the scan tool, continue to actuate the MS Solenoid for the period of two minutes with the Transmission Simulator still connected.
   2. After two minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

      Did the DTC P2706 reset during the actuation test?

      Yes

      - Go To 5.

      No

      - Go To 4.

4. **WIGGLE TEST WITH TRANSMISSION SIMULATOR**

1. With the Transmission simulator still connected, continue to actuate the 4C solenoid for another two minutes while wiggling the related wiring harness and connectors.
2. With the scan tool, stop the actuation and check for transmission DTCs.

   Did the DTC P0770 reset during the actuation test?

   Yes

   - Repair wiring harness or connectors as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Replace the Transmission Solenoid/TRS Assembly in accordance with the Service Information. **Note: Do NOT replace the entire Valve Body.**
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

5. **(T140) MS SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS**

Fig. 128: Checking MS Solenoid Control Circuit For Open Or Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Simulator (special tool #8333A, Simulator, Transmission).
3. Disconnect the PCM C2 harness connector.
4. Measure the resistance between the (T140) MS Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

   Is the resistance below 5.0 Ohms between the (T140) MS Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

   Yes

   - Repair the (T140) MS Solenoid Control circuit for a short to other circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

   No

   - Go To 6.

6. **(T140) MS SOLENOID CONTROL CIRCUIT OPEN**

Fig. 129: Checking MS Solenoid Control Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T140) MS Solenoid Control circuit from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of the PCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T140) MS Solenoid Control circuit for an open.

- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 7.

7. **(T140) MS SOLENOID CONTROL CIRCUIT SHORT TO GROUND**

Fig. 130: Checking MS Solenoid Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T140) MS Solenoid Control circuit.

Is the resistance below 5.0 Ohms?

Yes

- Repair the (T140) MS Solenoid Control circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

U0002-CAN C BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view DTCs.

    Is the DTC Active at this time?

    Yes

    - **Diagnose the U0002-CAN C BUS OFF PERFORMANCE as the U0001-CAN C BUS CIRCUIT test. Refer to DIAGNOSIS AND TESTING** and perform the U0001-CAN C Bus diagnostic procedure.

    No

    - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0100-LOST COMMUNICATION WITH THE ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Powertrain Control Module (ECM/PCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
POWERTRAIN CONTROL MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
POWERTRAIN CONTROL MODULE (ECM/PCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view DTCs.

    Is the DTC Active at this time?

    Yes

    - **Refer to DIAGNOSIS AND TESTING** and perform the U0100-Lost Communication with ECM/PCM diagnostic procedure.

    No

    - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0121-LOST COMMUNICATION WITH ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
ABS MODULE
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view DTCs.

    Is the DTC Active at this time?

    Yes

    - **Refer to DIAGNOSIS AND TESTING** and perform the U0121-Lost Communication with Anti-Lock Brake Module diagnostic procedure.

    No

    - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - **Refer to DIAGNOSIS AND TESTING** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

   No

   - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U1449-IMPLAUSIBLE ERS MESSAGE RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This message is used by the Powertrain Control Module (PCM) for Electronic Range Select (ERS) operation. The ERS switch is hard wired to the Cabin Compartment Node (CCN). The CCN then sends a CAN bus message to the PCM.

WHEN MONITORED:

Continuously with the ignition on.

SET CONDITION:

This fault is set when the ERS message is not received or invalid.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
CABIN COMPARTMENT NODE (CCN)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD

PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF CCN DTCS ARE PRESENT**
    1. With the scan tool, read CCN DTCs.

       Are there any CCN DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the appropriate TRANSMISSION VERIFICATION TEST.

       No

       - Using the schematics as a guide, check the Powertrain Control Module (PCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the appropriate TRANSMISSION VERIFICATION TEST.

STANDARD PROCEDURE

68RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **This vehicle uses a Cummins Control Module which controls the Transmission operation and the Diesel engine operation. In these procedures, the Cummins Control Module is referred to as the Powertrain Control Module (PCM).**

DIAGNOSTIC TEST

1.
    1. Perform the following before attempting any diagnostic procedures:
        1. With the scan tool check pinion factor (if equipped) for proper tire identification and program or reprogram if necessary.
        2. Check the transmission fluid level. If the fluid level is low, locate and repair any leaks and fill the transmission to the proper level. Refer to **STANDARD PROCEDURE** for procedures. Many transmission symptoms can be caused by a low fluid level.
        3. Check the battery. To avoid false diagnosis, testing should only be performed with the battery fully charged.
        4. With the scan tool, read Engine (PCM) DTCs. If DTCs are present, Refer to **DIAGNOSTIC CODE INDEX** for 5.7L, **DIAGNOSTIC CODE INDEX** for 6.7L or **DIAGNOSTIC CODE INDEX** for 6.7L (Cab & Chassis) and perform the appropriate diagnostic procedure (s) before proceeding.
        5. With the scan tool, read Transmission (PCM) DTCs. Record all Stored, Active, and Pending DTC information. Diagnose any Pending DTC as a matured DTC.
        6. With the scan tool, read and record the Event Data. Use this data to identify the conditions in which the DTC was set.

            NOTE: **DTC Event Data may exist even if no DTCs are stored. DTC Event Data is only erased by a Battery Disconnect, reflash, or QuickLearn procedure. Clearing DTCs does NOT erase the DTC Event Data. Some DTCs require two "bad trips" before they are stored (and the MIL illuminates). The transmission may enter "limp-in" mode during the first "bad trip," but if the fault condition is not present after the vehicle is restarted, the pending DTC may be cleared without lighting the MIL. Nevertheless, the DTC Event Data for the pending DTC will remain stored and can still be retrieved with the scan tool. If the customer reports a "limp-in" event but no DTCs are present, check the DTC Event Data.**

        7.
        8. Performing a Battery Disconnect will clear all Event Data and reset all learned Transmission values to the default values, which may temporarily result in erratic shift schedules.
        9. With the scan tool, perform the Shift Lever Position Test. If the test fails with an error code, refer to the diagnostic procedure for P0706 Transmission Range Sensor Rationality. If the test fails without an error code, adjust the shift linkage in accordance with the Service Information.
        10. For Gear Ratio Error DTCs or shift quality complaints, use the scan tool to view CVI Monitor data. Read and record the Clutch Volume Index information.
        11. Use the wiring diagram as a guide. Inspect the wiring and connectors related to this circuit. Repair as necessary.

12. Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, after driving under specific conditions and after diagnostic monitors have been run.
13. Perform any applicable Technical Service Bulletins (TSBs) for controller software update information. Some conditions can be corrected by upgrading the (PCM) controller software.

Were there any repairs made that fixed the vehicle?

Yes

- Testing complete.
- Refer to **STANDARD PROCEDURE** and perform the 68RFE TRANSMISSION VERIFICATION TEST.

No

- Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

68RFE TRANSMISSION VERIFICATION TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. Perform the following after completion of a diagnostic repair:
    1. With the scan tool check pinion factor (if equipped) for proper tire identification and program or reprogram if necessary.
    2. Connect the scan tool to the Data Link Connector (DLC).
    3. Reconnect any disconnected components.
    4. If the PCM has been replaced or updated (flashed), or the transmission has been repaired or replaced, using the scan tool, perform a Quick Learn Procedure.
    5. With the scan tool, erase all Transmission and Engine DTCs.
    6. With the scan tool, perform a BATTERY DISCONNECT, this will clear the Event Data
    7. With the scan tool, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT.
    8. Check the Transmission fluid level and adjust if necessary. Refer to **STANDARD PROCEDURE** for the Fluid Fill procedure.
    9. Road test the vehicle.
    10. Perform the following shifts from a standing start with a constant throttle opening of 20 to 25 degrees to the speeds of 97 km/h (60 mph); make fifteen to twenty 1 to 2, 2 to 3, 3 to 4, 4 to 5, 5 to 6 upshifts.
    11. Perform the following shifts with speeds below 40 km/h (25 mph); make five to eight wide open throttle kickdowns to 2nd gear. Allow at least 5 seconds each in 3rd and 4th gear between each kickdown.

12. Check for DTCs during and after the road test.
13. If after performing the road test, if any shift concerns are noted, perform the drive learn procedure for those affected shifts.
14. **Use the OBDII task manager to run Good Trip time in each gear, this will confirm the repair and to ensure that the DTC does not re-mature.**

Were there any Diagnostic Trouble Codes (DTCs) set during the road test?

Yes

- Refer to **DIAGNOSTIC CODE INDEX** for 5.7L, **DIAGNOSTIC CODE INDEX** for 6.7L or **DIAGNOSTIC CODE INDEX** for 6.7L (Cab & Chassis) and perform the appropriate charging related DTC diagnostic procedure.

No

- Repair is complete.

DESCRIPTION

DESCRIPTION

The BW 44-46 is an electronically controlled active part-time transfer case.

The low range provides a 2.64:1 reduction ratio.

OPERATING RANGES

BW 44-46 operating ranges are:

- 2WD HI.
- 4WD Lock.
- Neutral.
- 4WD Low.

SHIFT MECHANISM

Operating ranges are selected with a dash mounted shift selector switch. The shift selector switch provides an input to the Drive Train Control Module (DTCM) to indicate the driver's desire to change operating ranges. The DTCM uses this input, along with the input from the transfer case mounted mode sensor and information from the vehicle's CAN C bus, to determine if a shift is permitted. If the DTCM decides the shift is permitted, the DTCM controls the shift motor, mounted to the exterior of the transfer case, to perform the shift.

OPERATION

OPERATION

The input gear is splined to the transmission output shaft. The input gear drives the mainshaft through the planetary assembly and range sleeve. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. Torque is transmitted through the input shaft to the drive sprocket assembly. The torque is also transferred directly to the rear propeller shaft, to the front output shaft by the drive chain when 4WD is selected. The oil pump circulates gear lube throughout the case to provide internal lubrication and cooling.

DIAGNOSIS AND TESTING

TRANSFER CASE - BW 44-46

DIAGNOSIS CHART

Condition	Possible Cause	Correction

Transfer case difficult to shift or will not shift into desired range.	1) Transfer case electronically controlled shift system malfunction.	1) Check for Transfer Case DTCs. Refer to appropriate Electrical Diagnostic article. Depending on vehicle configuration (FCM, FDCM, or DTCM), perform the appropriate diagnostic procedure and verification test.
	2) If vehicle was operated for an extended period in 4HI mode on dry surface, driveline torque load may cause difficulty.	2) Drive the vehicle in a straight line and momentarily release the accelerator. The transfer case can then be shifted to the desired mode.
	3) Insufficient or incorrect lubricant.	3) Drain and refill transfer case with the correct quantity of fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** .
	4) Internal transfer case components binding, worn, or damaged.	4) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct quantity of fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** .
	2) Internal transfer case components binding, worn, or damaged.	2) Repair or replace components as necessary.
Transfer case noisy while in, or jumps out of, 4LO mode.	1) Transfer case not completely engaged in 4LO position.	1) While rolling 2-3 MPH and the transmission in NEUTRAL, shift transfer case to the 2WD or 4HI position, and then back into the 4LO position.
	2) Range fork damaged, inserts worn, or fork is binding on the shift rail.	2) Repair or replace components as necessary.
	3) Low range gear worn or damaged.	3) Repair or replace components as necessary.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.
Abnormal tire wear.	1) Extended operation in 4HI mode on dry surfaces,	1) Operate vehicle in 2WD mode on dry surfaces.

SPECIFICATIONS

TORQUE SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Plug, Drain/Fill	19 - 30	15 - 22	-
Bolt, Case Half	27 - 35	20 - 26	-
Breather	6.5 - 8.5	--	60 - 72
Motor Mount and Bracket	8 - 11	--	72 - 96
Motor Bracket (Bracket to Motor)	2.8 - 4	-	24 - 36
Stud	22 - 27	-	192 - 240
Nuts, Mounting	41	30	-
Output Flange Nut	241	178	-

REMOVAL

REMOVAL

Fig. 1: Transmission & Transfer Case
Courtesy of CHRYSLER GROUP, LLC

1. Raise vehicle.
2. Drain transfer case lubricant.
3. Mark front and rear propeller shafts for alignment reference.
4. Support transmission with jack stand.
5. Remove the transfer case skid plate, if equipped.
6. Disconnect front and rear propeller shafts at transfer case.

7. Disconnect transfer case shift motor and mode sensor wire connectors (3).
8. Disconnect transfer case vent hose.
9. Support transfer case with transmission jack.
10. Secure transfer case to jack with chains.
11. Remove nuts attaching transfer case (2) to transmission (1).
12. Pull transfer case and jack rearward to disengage transfer case.
13. Remove transfer case from under vehicle.

DISASSEMBLY

DISASSEMBLY

Fig. 2: Shift Motor, Mounting Bolt, Fill & Drain Plugs
Courtesy of CHRYSLER GROUP, LLC

1. Place the transfer case so that it can be drained of any remaining fluid and remove the fill (4) and drain plugs (1).
2. Remove the four shift motor mounting bolt (2) and remove the shift motor (3).

Fig. 3: Rear Output Shaft Flange Nut
Courtesy of CHRYSLER GROUP, LLC

3. Remove the rear output shaft flange nut (1), if equipped.

Fig. 4: Flange Spacer
Courtesy of CHRYSLER GROUP, LLC

4. Remove the flange spacer (1), if equipped.

Fig. 5: Flange Dust Seal
Courtesy of CHRYSLER GROUP, LLC

5. Remove the flange dust seal, if equipped.
6. Using a suitable puller, remove the output flange, if equipped.

Fig. 6: Pry Points & Case Half Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove all of the case half bolts (1).
8. Carefully using a prybar at pry points (2), separate and remove the rear case half.

Fig. 7: Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

9. Remove the retaining ring (1).

Fig. 8: Locking Collar
Courtesy of CHRYSLER GROUP, LLC

10. Remove the locking collar (1).

Fig. 9: Main Shaft, Shift Fork, Spring & Sleeve
Courtesy of CHRYSLER GROUP, LLC

11. Remove the mode shift fork, spring and sleeve (1) from the main shaft (2).

Fig. 10: Chain, Front Output Gear, & Mainshaft Gear
Courtesy of CHRYSLER GROUP, LLC

12. Remove the chain (2), the front out put gear (1) and main shaft gear (3) as an assembly.

Fig. 11: Mainshaft & Center Bearing Support Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: **There are three alignment tabs and an oil pump hose pass through incorporated into the support that prevent the structure from rotating once installed.**

13. Remove the center bearing support assembly (2) from the mainshaft (1).

Fig. 12: Oil Pump
Courtesy of CHRYSLER GROUP, LLC

14. Remove the oil pump (1).

Fig. 13: Magnet
Courtesy of CHRYSLER GROUP, LLC

15. Remove the magnet (1).

Fig. 14: Shift Assembly
Courtesy of CHRYSLER GROUP, LLC

16. Remove the shift assembly (1).

Fig. 15: Mainshaft
Courtesy of CHRYSLER GROUP, LLC

17. Remove the mainshaft.

Fig. 16: Shift Rail, Lower Shift Fork & Reduction Hub
Courtesy of CHRYSLER GROUP, LLC

18. Remove the shift rail (1), lower shift fork (3), and the reduction hub as an assembly.
19. Separate the lower shift fork (3) from the reduction hub (2).
20. Separate the lower shift fork (3) from the shift rail (1).

Fig. 17: Planetary Carrier & Annulus Gear
Courtesy of CHRYSLER GROUP, LLC

21. Lift the planetary carrier (1) straight up and out of the annulus gear (2).

Fig. 18: Thrust Bearing & Planetary
Courtesy of CHRYSLER GROUP, LLC

NOTE: Bearing tabs face upward.

22. Remove the carrier thrust bearing (1) from the center of the planetary (2).

Fig. 19: Annulus Gear Retainer
Courtesy of CHRYSLER GROUP, LLC

23. Remove the annulus gear retainer (1).

Fig. 20: Annulus Gear
Courtesy of CHRYSLER GROUP, LLC

24. Remove the annulus gear (1).

Fig. 21: Front Output Shaft & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

25. Remove the front output shaft retaining ring (1) from the front output shaft (2).

Fig. 22: Front Output Shaft & Front Case Half
Courtesy of CHRYSLER GROUP, LLC

26. Remove the front output shaft (1) from the front case half (2).

Fig. 23: Removing Front Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

27. Remove front output shaft seal.
28. Using (special tool #9622, Installer, Countershaft Plug) (1) and (special tool #C-4171, Driver Handle, Universal) (2), remove the front output shaft bearing from the case half (3).

Fig. 24: Removing Input Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

29. Remove input shaft seal.
30. Using (special tool #9622, Installer, Countershaft Plug) (1) and (special tool #C-4171, Driver Handle, Universal) (2), remove the input shaft bearing from the case half (3).

Fig. 25: Removing Rear Input Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

31. Remove rear output shaft seal.
32. Using (special tool #5066, Installer, Bushing) and (special tool #C-4171, Driver Handle, Universal) (1), remove the input shaft bearing from the case half (2).

Fig. 26: Removing Front Output Shaft Rear Bearing
Courtesy of CHRYSLER GROUP, LLC

33. Secure the rear case half.
34. Using (special tool #7794-A, Remover, Seal) (2) and (special tool #C-637, Slide Hammer, Universal) (1), remove front output shaft rear bearing (3) from rear case half.

CLEANING

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

INSPECTION

MAINSHAFT/SPROCKET/HUB INSPECTION

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

PLANETARY CARRIER

Fig. 27: Thrust Bearing & Planetary
Courtesy of CHRYSLER GROUP, LLC

Examine the planetary carrier body (2) and pinion gears for wear or damage. Check the pinion gear thrust washers on the pinon pins for damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the needle bearing in the carrier. Inspect the thrust bearing (1).

SHIFT FORK/HUBS/SLEEVES

Fig. 28: Identifying Shift Fork
Courtesy of CHRYSLER GROUP, LLC

Check condition of the shift fork and shift fork shift rail. Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads (2).

Check the shift fork sleeve (1) for wear or damage.

Fig. 29: Reduction Hub
Courtesy of CHRYSLER GROUP, LLC

Check the reduction hub (1) for wear on the shift fork collar (2).

Check the teeth and splines of the reduction hub (1). Minor nicks can be dressed off with an oilstone. Replace

the gear if any teeth are broken, cracked, or chipped.

REAR EXTENSION HOUSING

Inspect the extension housing seal and bushing. Replace both components if either show any sign of wear or damage.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

Inspect the shaft splines, sprocket teeth, and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Rough threads on the shaft can be chased if necessary. Replace the shaft if the splines are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Fig. 30: Low Range Annulus Gear
Courtesy of CHRYSLER GROUP, LLC

Inspect annulus gear (1) condition carefully.

FRONT AND REAR CASES

Inspect the cases for wear and damage.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose.

The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil® stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ASSEMBLY

ASSEMBLY

Fig. 31: Pressing Bearings Into Case
Courtesy of CHRYSLER GROUP, LLC

NOTE: When pressing bearings into case, be sure to properly support the underside of the case half.

1. Using (special tool #9598, Installer, Seal) (1) and an Arbor Press, install the front output shaft bearing (2) into the front case half (5).
2. Using (special tool #9754, Installer, Seal) (3) and an Arbor Press, install the input shaft bearing (4) into the front case half (5).

Fig. 32: Installing Rear Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: When pressing bearings into case, be sure to properly support the underside of the case half.

3. Using (special tool #9598, Installer, Seal) (1) and an Arbor Press, install the rear output shaft bearing (2) into the front case half (3).

Fig. 33: Installing Front Output Shaft Rear Support Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: When pressing bearings into case, be sure to properly support the underside of the case half.

4. Using (special tool #9598, Installer, Seal) (1) and an Arbor Press, install the front output shaft rear

support bearing (2) into the front case half (3).

Fig. 34: Installing Input Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

5. Using (special tool #9754, Installer, Seal) (2) and (special tool #C-4171, Driver Handle, Universal) (1), install input shaft seal (3).

22. Install the locking collar (1).

Fig. 52: Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

23. Install the retaining ring (1).

Fig. 53: Pry Points & Case Half Bolts
Courtesy of CHRYSLER GROUP, LLC

24. Clean mating surface of both case halves.
25. Apply a thin bead of transfer case sealant.
26. Install rear cover.
27. Install all of the case half bolts (1) and tighten in a star pattern to 31 N.m (23 ft. lbs.).

Fig. 54: Flange Dust Seal
Courtesy of CHRYSLER GROUP, LLC

28. Install the rear output flange, if equipped.
29. Install the flange dust seal (1), if equipped.

Fig. 55: Flange Spacer
Courtesy of CHRYSLER GROUP, LLC

30. Install the flange spacer (1), if equipped.

Fig. 56: Rear Output Shaft Flange Nut
Courtesy of CHRYSLER GROUP, LLC

31. Install the rear output flange nut (1) and tighten to 241 N.m (178 ft. lbs.), if equipped
32. Stake the nut to the shaft to prevent the nut from backing off, if equipped.

Fig. 57: Shift Motor, Mounting Bolt, Fill & Drain Plugs
Courtesy of CHRYSLER GROUP, LLC

33. Install the fill (4) and drain (1) plugs.
34. Install the shift motor (3), the four mounting bolts (2) and tighten to 9 N.m (84 in. lbs.).
35. Install transfer case into vehicle. Refer to **INSTALLATION**.

INSTALLATION

INSTALLATION

Fig. 58: Transmission & Transfer Case
Courtesy of CHRYSLER GROUP, LLC

1. Mount transfer case on a transmission jack.
2. Secure transfer case to jack with chains.
3. Position transfer case under vehicle.
4. Align transfer case and transmission shafts and install transfer case onto the transmission.
5. Install and tighten transfer case attaching nuts to 41 N.m (30 ft. lbs.) torque.
6. Remove transmission jack and support stand.
7. Connect the vent hose.
8. Connect the shift motor and mode sensor wiring connectors.
9. Connect the front and rear output speed sensor wire connectors.
10. Align and connect the propeller shafts. Refer to **SHAFT, DRIVE, FRONT LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, FRONT HEAVY DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR HEAVY DUTY, INSTALLATION** . .
11. Fill transfer case with correct fluid. Refer to **STANDARD PROCEDURE** .
12. Install skid plate, if equipped.
13. Lower vehicle and verify transfer case shift operation.

FLUID

STANDARD PROCEDURE

FLUID DRAIN AND REFILL

Fig. 59: Shift Motor, Mounting Bolt, Fill & Drain Plugs
Courtesy of CHRYSLER GROUP, LLC

The fill (4) and drain (1) plugs are both in the rear case.

1. Raise vehicle.
2. Position drain pan under transfer case.
3. Remove drain and fill plugs and drain lubricant completely.
4. Install drain plug (1). Tighten plug to 19 - 30 N.m (15 - 22 ft. lbs.).
5. Remove drain pan.
6. Fill transfer case to bottom edge of fill plug opening with the correct fluid for the application. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
7. Install and tighten fill plug (2) to 19 - 30 N.m (15 - 22 ft. lbs.).
8. Wipe any excess fluid that may have spilled onto the exhaust.
9. Lower vehicle.

MOTOR, SHIFT

DESCRIPTION

DESCRIPTION

The shift motor consists of a permanent magnet D.C. motor with gear reduction to convert a high speed-low torque device into a low speed-high torque device. The output of the device is coupled to a shaft which internally moves the range fork that change the transfer case operating ranges. The shift motor uses a digital encoder to monitor the shift motor position. The motor is rated at 20 amps maximum at 25° C (77° F) with 14 volts at the motor leads.

OPERATION

OPERATION

The transfer case shift motor responds to the Drive Train Control Module (DTCM) commands to move the transfer case shift range fork, as required, to obtain the correct transfer case operating range indicated by the instrument panel mounted selector switch. The motor only shifts between 1:1 ranges, 2.64:1 range, and neutral. Switch changes between 2WD, 4WD LO and 4WD HI are assisted by the transfer case coil.

REMOVAL

REMOVAL

1. Raise the vehicle on a suitable hoist.
2. Disengage the wiring connectors from the shift motor and sensor assembly.
3. Remove the bolts holding the shift motor, sensor and bracket assembly onto the transfer case.

NOTE: **The shift motor and sensor are one piece and are not to be disassembled. Do not disassemble the shift motor and sensor as this will effect shift motor and sensor functionality.**

4. Separate the shift motor and mode sensor assembly from the transfer case.

INSTALLATION

INSTALLATION

1. Clean mounting surface of any sealer.
2. Apply a thin bead of Mopar® ATF RTV to the mounting surface.

NOTE: **Verify that the shift motor position and sector shaft orientation are aligned. It may be necessary to manually shift the transfer case if the shift motor and sector shaft are not aligned.**

3. Install the shift motor (1) onto the transfer case (2).
4. Install the shift motor and mode sensor assembly (1) onto the transfer case.
5. Install the bolts to hold the shift motor and mode sensor assembly onto the transfer case. Tighten the bolts to 8-11 N.m (72 - 96 in. lbs.).
6. While holding the shift motor bracket tight against the shift motor, tighten the bracket to the transfer case to 8-11 N.m (72 - 96 in. lbs.).
7. Tighten the shift motor bracket to the shift motor to 2.8 - 4 N.m (24 - 36 in. lbs.).
8. Engage the wiring connectors to the shift motor and sensor assembly.
9. Refill the transfer case as necessary with the correct fluid for the application. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** .
10. Lower vehicle and verify transfer case operation.

DESCRIPTION

DESCRIPTION

The BW 44-47 is a manually controlled, part time transfer case.

The low range provides a 2.64:1 reduction ratio.

OPERATING RANGES

BW 44-47 operating ranges are:

- 2HI.
- 4WD Lock.
- Neutral.
- 4WD Low

SHIFT MECHANISM

Operating ranges are selected with a floor mounted shift selector lever. The lever is attached to a shift linkage rod that is attached to the transfer case mounted shift lever.

OPERATION

OPERATION

The input gear is splined to the transmission output shaft. The input gear drives the mainshaft through the planetary assembly and range sleeve. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. Torque is transmitted through the input shaft to the drive sprocket assembly, and is transferred directly to the rear propeller shaft. Torque to the front output shaft is accomplished through the chain assembly. The oil pump circulates gear lube throughout the case to provide lubrication and cooling.

DIAGNOSIS AND TESTING

TRANSFER CASE - BW 44-47

DIAGNOSIS CHART

Condition	Possible Cause	Correction
	2) If vehicle was operated for an extended period in 4HI mode on dry surface, driveline torque load	2) Drive the vehicle in a straight line and momentarily release the accelerator. The transfer case can

	may cause difficulty.	then be shifted to the desired mode.
Transfer case difficult to shift or will not shift into desired range.	3) Insufficient or incorrect lubricant.	3) Drain and refill transfer case with the correct quantity of fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** .
	4) Internal transfer case components binding, worn, or damaged.	4) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct quantity of fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** .
	2) Internal transfer case components binding, worn, or damaged.	2) Repair or replace components as necessary.
Transfer case noisy while in, or jumps out of, 4LO mode.	1) Transfer case not completely engaged in 4LO position.	1) While rolling 2-3 MPH and the transmission in NEUTRAL, shift transfer case to the 2WD or 4HI position, and then back into the 4LO position.
	2) Range fork damaged, inserts worn, or fork is binding on the shift rail.	2) Repair or replace components as necessary.
	3) Low range gear worn or damaged.	3) Repair or replace components as necessary.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.
Abnormal tire wear.	1) Extended operation in 4HI mode on dry surfaces,	1) Operate vehicle in 2WD mode on dry surfaces.

SPECIFICATIONS

TORQUE SPECIFICATIONS

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.

REMOVAL

REMOVAL

Fig. 1: Transmission & Transfer Case
Courtesy of CHRYSLER GROUP, LLC

1. Raise vehicle.
2. Mark front and rear propeller shafts for alignment reference.
3. Support transmission with jack stand.
4. Remove the transfer case skid plate, if equipped.
5. Disconnect front and rear propeller shafts at transfer case.
6. Disconnect transfer case vent hose.
7. Disconnect the shift linkage at the transfer case lever.
8. Unplug the transfer case position indicator switch (3).
9. Support transfer case with transmission jack.
10. Secure transfer case to jack with jack straps or chains.
11. Remove nuts attaching transfer case (2) to transmission (1).
12. Pull transfer case and jack rearward to disengage transfer case.
13. Remove transfer case from under vehicle.

DISASSEMBLY

DISASSEMBLY

Fig. 2: Fill & Drain Plugs
Courtesy of CHRYSLER GROUP, LLC

1. Place the transfer case so that it can be drained of any remaining fluid and remove the fill (2) and drain plugs (1).

Fig. 3: Rear Output Shaft Flange Nut
Courtesy of CHRYSLER GROUP, LLC

2. Remove the rear output shaft flange nut (1), if equipped.

Fig. 4: Flange Spacer
Courtesy of CHRYSLER GROUP, LLC

3. Remove the flange spacer (1), if equipped.

Fig. 5: Flange Dust Seal
Courtesy of CHRYSLER GROUP, LLC

4. Remove the flange dust seal, if equipped.
5. Using a suitable puller, remove the output flange, if equipped.

Fig. 6: Position Switch
Courtesy of CHRYSLER GROUP, LLC

6. Remove the position switch (1).

Fig. 7: Pry Points & Case Half Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove all of the case half bolts (2).
8. Using a prybar at pry points (1), carefully separate and remove the rear case half.

Fig. 8: Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

9. Remove the retaining ring (1).

Fig. 9: Locking Collar
Courtesy of CHRYSLER GROUP, LLC

10. Remove the locking collar (1).

Fig. 10: Main Shaft, Shift Fork, Spring & Sleeve
Courtesy of CHRYSLER GROUP, LLC

11. Remove the mode shift fork, spring and sleeve (1) from the main shaft (2).

Fig. 11: Chain, Front Output Gear, & Mainshaft Gear

Courtesy of CHRYSLER GROUP, LLC

28. Remove the shift fork lever (1).

Fig. 27: Front Output Shaft & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

29. Remove the front output shaft retaining ring (1) from the front output shaft (2).

Fig. 28: Front Output Shaft & Front Case Half
Courtesy of CHRYSLER GROUP, LLC

30. Remove the front output shaft (1) from the front case half (2).

Fig. 29: Removing Front Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

31. Remove front output shaft seal.
32. Using (special tool #9622, Installer, Countershaft Plug) (1) and (special tool #C-4171, Driver Handle, Universal) (2), remove the front output shaft bearing from the case half (3).

Fig. 30: Removing Input Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

33. Remove input shaft seal.
34. Using (special tool #9622, Installer, Countershaft Plug) (1) and (special tool #C-4171, Driver Handle, Universal) (2), remove the input shaft bearing from the case half (3).

Fig. 31: Removing Rear Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

35. Remove rear output shaft seal.
36. Using (special tool #5066, Installer, Bushing) and (special tool #C-4171, Driver Handle, Universal) (1), remove the input shaft bearing from the case half (2).

Fig. 32: Removing Front Output Shaft Rear Bearing
Courtesy of CHRYSLER GROUP, LLC

37. Secure the rear case half.
38. Using (special tool #7794-A, Remover, Seal) (2) and (special tool #C-637, Slide Hammer, Universal) (1), remove front output shaft rear bearing (3) from rear case half.

CLEANING

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

INSPECTION

MAINSHAFT/SPROCKET/HUB INSPECTION

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

PLANETARY CARRIER

Fig. 33: Thrust Bearing & Planetary
Courtesy of CHRYSLER GROUP, LLC

Examine the planetary carrier body (2) and pinion gears for wear or damage. Check the pinion gear thrust washers on the pinon pins for damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the needle bearing in the carrier. Inspect the thrust bearing (1).

SHIFT FORK/HUBS/SLEEVES

Fig. 34: Identifying Shift Fork
Courtesy of CHRYSLER GROUP, LLC

Check condition of the shift fork and shift fork shift rail. Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads (2).

Check the shift fork sleeve (1) for wear or damage.

Fig. 35: Reduction Hub
Courtesy of CHRYSLER GROUP, LLC

Check the reduction hub (1) for wear on the shift fork collar (2).

Check the teeth and splines of the reduction hub (1). Minor nicks can be dressed off with an oilstone. Replace the gear if any teeth are broken, cracked, or chipped.

REAR EXTENSION HOUSING

Inspect the extension housing seal and bushing. Replace both components if either show any sign of wear or damage.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

Inspect the shaft splines, sprocket teeth, and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Rough threads on the shaft can be chased if necessary. Replace the shaft if the splines are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Fig. 36: Low Range Annulus Gear
Courtesy of CHRYSLER GROUP, LLC

Inspect the annulus gear (2) condition carefully.

FRONT AND REAR CASES

Inspect the cases for wear and damage.

Check the case condition. If leaks were a problem, look for gouges and severe scoring of the case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check the condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil® stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ASSEMBLY

ASSEMBLY

Fig. 37: Pressing Bearings Into Case
Courtesy of CHRYSLER GROUP, LLC

NOTE: When pressing bearings into the case, be sure to properly support the underside of the case half.

1. Using (special tool #9598, Installer, Seal) (1) and an Arbor Press, install the front output shaft bearing (2) into the front case half (5).
2. Using (special tool #9754, Installer, Seal) (3) and an Arbor Press, install the input shaft bearing (4) into the front case half (5).

Fig. 38: Installing Rear Output Shaft Bearing

40. Install the transfer case into vehicle. Refer to **INSTALLATION**.

INSTALLATION

INSTALLATION

Fig. 71: Transmission & Transfer Case
Courtesy of CHRYSLER GROUP, LLC

1. Mount transfer case on a transmission jack.
2. Secure transfer case to jack with chains.
3. Position transfer case under vehicle.
4. Align transfer case and transmission shafts and install transfer case onto the transmission.
5. Install and tighten transfer case attaching nuts to 41 N.m (30 ft. lbs.) torque.
6. Remove transmission jack and support stand.
7. Connect the vent hose.
8. Connect the shift position sensor connector.
9. Connect the shift linkage.
10. Align and connect the propeller shafts. Refer to **SHAFT, DRIVE, FRONT LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, FRONT HEAVY DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR HEAVY DUTY, INSTALLATION** . .
11. Fill transfer case with correct fluid. Refer to **STANDARD PROCEDURE** .
12. Install skid plate, if equipped.
13. Lower vehicle and verify transfer case shift operation.

Fig. 72: Fill & Drain Plugs
Courtesy of CHRYSLER GROUP, LLC

The fill (2) and drain (1) plugs are both in the rear case.

1. Raise vehicle.
2. Position drain pan under transfer case.

3. Remove drain and fill plugs and drain lubricant completely.
4. Install drain plug (1). Tighten plug to 19 - 30 N.m (15 - 22 ft. lbs.).
5. Remove drain pan.
6. Fill transfer case to bottom edge of fill plug opening with the correct fluid for the application. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
7. Install and tighten fill plug (2) to 19 - 30 N.m (15 - 22 ft. lbs.).
8. Wipe any excess fluid that may have spilled onto the exhaust.
9. Lower vehicle.

DESCRIPTION

DESCRIPTION

Fig. 1: Transfer Case - Front View
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSFER CASE
2 - MANUAL LEVER
3 - POSITION SENSOR

The NV271 transfer case (1) is a part-time transfer case with a low-range gear system. Refer to **Fig. 1**. It provides three operating ranges plus a NEUTRAL position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability.

The gear cases and extension are all of aluminum. Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

IDENTIFICATION

Fig. 2: Transfer Case - Rear View
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSFER CASE
2 - IDENTIFICATION TAG

An identification tag (2) is attached to the rear case of every transfer case. Refer to **Fig. 2**. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

OPERATION

OPERATION

OPERATING RANGE

Transfer case operating ranges are:

- 2H (2-wheel drive).
- 4H (4-wheel drive).
- 4LO (4-wheel drive low range.

The 2H range is for use on any road surface at any time.

The 4H and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is covered by ice and snow.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

SHIFT MECHANISM

The transfer case is operated by an adjustable floor mounted shift linkage. The transfer case shift lever is directly attached to the shift sector. The sector operates the range and mode forks within the transfer case.

A straight line shift pattern is used with a NEUTRAL detent. Lever range positions are imprinted in the shift knob.

SHIFTING

The transfer case can be shifted between the 2H and 4H operating ranges while the vehicle is in motion. The vehicle must have the transmission placed in NEUTRAL, or the clutch depressed in the case of a manual transmission, and be moving less than 2-3 MPH when shifting into and out of the 4L operating range.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TRANSFER CASE - NV271

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Diagnosis Chart for further information.

DIAGNOSIS CHART

Condition	Possible Cause	Correction
Transfer Case difficult to shift or will not shift into desired range.	1) Vehicle speed too great to permit shifting.	1) Stop vehicle and shift into desired range. Or, reduce speed to below 3-4 km/h (2-3 mph) before attempting the shift.
	2) If vehicle was operated for an extended period in 4H on a dry paved surface, the driveline torque load may be causing a bind.	2) Stop vehicle and shift the transmission into neutral. Shift the transfer case to 2H and operate vehicle in 2H on dry paved surfaces.
	3) Transfer case external shift linkage binding.	3) Lubricate, repair, or replace linkage bushings, or tighten loose components as necessary.
	4) Insufficient or incorrect lubricant.	4) Drain and refill to edge of fill hole with Mopar® ATF +4, Automatic Transmission fluid.
	5) Internal components binding, worn, or damaged.	5) Disassemble the transfer case and replace worn or damaged components as necessary.
Transfer Case noisy in all operating ranges.	1) Insufficient or incorrect lubricant.	1) Drain and refill to edge of fill hole with Mopar® ATF +4, Automatic Transmission fluid.

Noisy in, or jumps out of, four wheel drive low range.	1) Transfer case not completely engaged in 4L position.	1) With the transmission in NEUTRAL, or the clutch depressed in the case of a manual transmission and the vehicle moving under 3-4 km/h (2-3 mph), shift the transfer case to NEUTRAL and then shift into the 4L position.
	2) Shift linkage out of adjustment.	2) Adjust linkage.
	3) Shift linkage loose or binding.	3) Tighten, lubricate, or repair linkage as necessary.
	4) Range fork damaged, inserts worn, or fork is binding on the shift rail.	4) Disassemble unit and repair as necessary.
	5) Low range gear worn or damaged.	5) Disassemble unit and repair as necessary.
Lubricant leaking from output shaft seal or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Vent closed or restricted.	2) Clear or replace vent as necessary.
	3) Output shaft seals damaged or installed incorrectly.	3) Replace seal as necessary. Check to ensure that another component, the propeller shaft slip yoke for example, is not causing damage to seal.
Abnormal tire wear.	1) Extended operation on hard, dry surfaces in the 4H position.	1) Operate vehicle in the 2H position on hard, dry surfaces.

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.
Plug, Detent	16-25	12-18	-
Plug, Drain/Fill	20-34	15-25	-
Bolt, Extension Housing	27-34	20-25	-
Bolt, Case Half	27-34	20-25	-
Nut, Range Lever	27-34	20-25	-
Sector Support	27-34	20-25	-
Nuts, Mounting	30-41	20-30	-
Position Sensor	20-34	15-25	-
Nut, Companion Flange	176-271	130-200	-

REMOVAL

REMOVAL

1. Raise and support vehicle.
2. Remove skid plate, if equipped. Refer to **PLATE, SKID, TRANSFER CASE, REMOVAL** .
3. Position drain oil container under transfer case.
4. Remove transfer case drain plug and drain lubricant into container.
5. Disconnect vent hose and transfer case position sensor connector.
6. Disconnect shift rod from grommet in transfer case shift lever, or from floor shift arm whichever provides easy access. Use channel lock style pliers to press rod out of lever grommet.
7. Support transmission with jack stand.
8. Mark front and rear propeller shafts for assembly reference.
9. Remove front and rear propeller shafts. Refer to **SHAFT, DRIVE, FRONT LIGHT DUTY, REMOVAL** or **SHAFT, DRIVE, FRONT HEAVY DUTY, REMOVAL** or **SHAFT, DRIVE, REAR LIGHT DUTY, REMOVAL** or **SHAFT, DRIVE, REAR HEAVY DUTY, REMOVAL** .
10. Support transfer case with suitable jack. Secure transfer case to jack with safety chains.
11. Remove nuts attaching transfer case to transmission.
12. Move transfer case assembly rearward until free of transmission output shaft.
13. Lower jack and move transfer case from under vehicle.

DISASSEMBLY

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

COMPANION FLANGE AND EXTENSION HOUSING

Fig. 3: Remove/Install Companion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

1 - YOKE HOLDER 6719
2 - BOLTS

1. Install two bolts 180° apart into the front output shaft companion flange.
2. Place holder (1) over the bolts (2) and against the companion flange. Refer to **Fig. 3**.
3. Remove and discard the front companion flange nut.
4. Remove the companion flange from the front output shaft. It may be necessary to use Pinion Flange Remover (special tool #8992, Remover, Pinion Flange) to remove the companion flange.

Fig. 4: Removing Extension Housing Dust Boot
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - DUST BOOT

5. Use a suitable chisel or pry tool to remove the rear extension housing (1) dust boot (2). Refer to **Fig. 4**.
6. Use a suitable chisel or pry tool to remove the rear extension housing seal.

Fig. 5: Extension Housing & Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - BOLTS

7. Remove rear extension (1) bolts (2). Refer to **Fig. 5**.

Fig. 6: Rear Case Half & Extension Housing
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - EXTENSION HOUSING

8. Remove rear extension housing (2) from the rear case half. Refer to **Fig. 6**. Tap extension once or twice with a plastic mallet to break sealer bead and loosen it.

OIL PUMP AND REAR CASE

Fig. 7: Oil Pump Pick-Up Tube & Oil Pump
Courtesy of CHRYSLER GROUP, LLC

1 - OIL PUMP
2 - OIL PICK-UP TUBE

1. Disengage the oil pump pick-up tube (2) from the oil pump (1). Refer to **Fig. 7**.

NOTE: **The oil pump pick-up tube seals to the oil pump with an o-ring. Verify that the o-ring was removed with the tube and is in good condition. Replace the o-ring if necessary.**

Fig. 8: Rear Case Half, Rear Output Shaft & Oil Pump
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - REAR OUTPUT SHAFT
3 - OIL PUMP

2. Remove the oil pump (3) from the rear output shaft (2). Refer to **Fig. 8**.

Fig. 9: Identifying Case Half Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - REAR CASE HALF
3 - BOLTS

3. Remove rear case (2)-to-front case (1) bolts (3). Refer to **Fig. 9**.

Fig. 10: Output Shaft, Rear Case Half & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT

2 - REAR CASE HALF
3 - SNAP-RING

4. Remove the rear output shaft bearing inner snap-ring (3) from the output shaft (1) using suitable snap-ring pliers. Refer to **Fig. 10**.

Fig. 11: Output Shaft, Rear Case Half & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT
2 - REAR CASE HALF
3 - SNAP-RING

5. Remove the rear output shaft bearing inner snap-ring (3) from the output shaft (1). Refer to **Fig. 11**.

Fig. 12: Separating Front & Rear Case Halves
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - REAR CASE HALF

6. Loosen rear case (2) with pry tool to break sealer bead. Insert tool at each end of case. Refer to **Fig. 12**.

Fig. 13: Front & Rear Case Halves
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - REAR CASE HALF

7. Unseat rear case from alignment dowels.
8. Remove the rear case (2) from the front case (1). Refer to **Fig. 13**.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

Fig. 14: Removing Oil Pick-Up Tube and Screen
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - OIL SCREEN
3 - PICK-UP TUBE

1. Remove the oil pick-up tube (3) and screen (2) from the front case half (1). Refer to **Fig. 14**.

Fig. 15: Shift Rail & Spring
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT RAIL
2 - SPRING

2. Remove the shift rail spring (2) from the shift rail (1). Refer to **Fig. 15**.

Fig. 16: Front Output Shaft, Drive Sprocket & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT OUTPUT SHAFT
2 - DRIVE SPROCKET

3 - RETAINING RING

3. Remove the front output shaft (1) drive sprocket (2) retaining ring (3). Refer to **Fig. 16**.

Fig. 17: Rear Output Shaft, Drive Sprocket & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - REAR OUTPUT SHAFT
2 - DRIVE SPROCKET
3 - RETAINING RING

4. Remove the rear output shaft (1) drive sprocket (2) retaining ring (3). Refer to **Fig. 17**.

Fig. 18: Front Case Half, Chain & Drive Sprockets
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - CHAIN
3 - DRIVE SPROCKETS

5. Pull front sprocket (3), rear sprocket, and chain (2) upward until clear of the front and rear output shaft sprocket splines. Refer to **Fig. 18**.
6. Remove chain and sprockets as an assembly.

SHIFT FORKS AND MAINSHAFT

Fig. 19: Shift Sector, Sector Support & Manual Shift Lever
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT SECTOR
2 - SECTOR SUPPORT
3 - MANUAL SHIFT LEVER

1. Shift transfer case into NEUTRAL.
2. Remove nut that retains the shift lever to sector shaft. Then remove shift lever (3) and spacer from the shaft. Refer to **Fig. 19**.
3. Remove the sector support (2) with Socket (special tool #9033, Socket, Sector Support).

Fig. 20: Position Sensor Or Switch
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - POSITION SENSOR

4. Remove the transfer case position sensor or switch (2) from the front case half (1). Refer to **Fig. 20**.

Fig. 21: Identifying Detent Plug
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - DETENT PLUG

5. Loosen detent plug (2). Refer to **Fig. 21**.

Fig. 22: Detent plug, Spring & Plunger
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - DETENT PLUG
3 - SPRING
4 - PLUNGER

6. Remove detent plug (2), spring (3), and plunger (4). Refer to **Fig. 22**. Note that the plug has an O-ring seal. Remove and discard this seal.

Fig. 23: Front Output Shaft Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - SNAP-RING

7. Using a screw mounted in a slide hammer, remove the front output shaft seal.
8. Remove the front output shaft snap-ring (2). Refer to **Fig. 23**.

Fig. 24: Front Output Shaft
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - FRONT OUTPUT SHAFT

9. Remove front output shaft (2) from bearing in the front case (1). Refer to **Fig. 24**.

Fig. 25: Mainshaft Assembly

Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - MAINSHAFT ASSEMBLY

10. Pull mainshaft assembly (2) out of input gear, mode sleeve, and case. Refer to **Fig. 25**.

Fig. 26: Mode Fork, Sleeve & Shift Rail
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT RAIL
2 - MODE FORK
3 - MODE SLEEVE

11. Remove mode fork (2), mode sleeve (3), and shift rail (1) as assembly. Refer to **Fig. 26**. Note which way the sleeve fits in the fork (long side of sleeve goes to front or the points on the sleeve teeth go to the rear of case).

Fig. 27: Range Fork & Hub
Courtesy of CHRYSLER GROUP, LLC

1 - RANGE HUB
2 - RANGE FORK

12. Remove range fork (2) and hub (1) as an assembly. Refer to **Fig. 27**. Note fork position for installation reference.

Fig. 28: Identifying Shift Sector
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT SECTOR

13. Remove shift sector (1). Refer to **Fig. 28**.

MAINSHAFT

Fig. 29: Output Shaft, Clutch Gear & Mode Hub
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT
2 - CLUTCH GEAR
3 - MODE HUB

1. Remove the clutch gear (2) from the output shaft (1). Refer to **Fig. 29**.

Fig. 30: Mainshaft, Mode Hub & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - MODE HUB
3 - RETAINING RING

2. Remove the mode hub retaining ring (3) from the mainshaft (1). Refer to **Fig. 30**.

Fig. 31: Mainshaft & Mode Hub
Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - MODE HUB

3. Remove the mode hub (2) from the mainshaft (1). Refer to **Fig. 31**.

Fig. 32: Mainshaft & Drive Sprocket Drive Hub
Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - DRIVE SPROCKET DRIVE HUB

4. Remove the drive sprocket drive hub (2) from the mainshaft. Refer to **Fig. 32**.

INPUT AND PLANETARY GEAR

Fig. 33: Input Gear Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINING RING

1. Remove input gear seal with suitable screw and slide hammer.
2. Remove input gear retaining ring (2) with heavy duty snap-ring pliers. Refer to **Fig. 33**.

Fig. 34: Front Case & Input Planetary Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - INPUT PLANETARY ASSEMBLY

3. Place front case in horizontal position. Then remove input gear and low range gear as an assembly (2). Refer to **Fig. 34**. Tap gear out of bearing with plastic mallet, if necessary.

Fig. 35: Input Gear & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINING RING

4. Remove snap-ring (2) that retains input gear in the low range gear (1). Refer to **Fig. 35**.

Fig. 36: Input Gear & Retainer
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINER

5. Remove retainer (2). Refer to **Fig. 36**.

Fig. 37: Input Gear & Thrust Plate
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - THRUST PLATE

6. Remove front thrust plate (2) from the input gear (1). Refer to **Fig. 37**.

Fig. 38: Input Gear & Low Range Planetary
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - LOW RANGE PLANETARY

7. Remove input gear (1) from the low range planetary (2). Refer to **Fig. 38**.

Fig. 39: Thrust Plate & Planetary
Courtesy of CHRYSLER GROUP, LLC

1 - PLANETARY
2 - THRUST PLATE

8. Remove bottom tabbed thrust washer (2) from low range planetary (1). Refer to **Fig. 39**.

CLEANING

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

INSPECTION

MAINSHAFT/SPROCKET/HUB

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone, however, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

INPUT GEAR AND PLANETARY CARRIER

Fig. 40: Input Gear & Carrier Components
Courtesy of CHRYSLER GROUP, LLC

1 - PLANETARY CARRIER	4 - CARRIER LOCK RING
2 - REAR THRUST WASHER	5 - CARRIER LOCK RETAINING RING
3 - FRONT THRUST WASHER	6 - INPUT GEAR

Check the teeth on the gear (6). Refer to **Fig. 40**. Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. Check the pinion gear thrust washers on the pinon pins for damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

SHIFT FORKS/HUBS/SLEEVES

Fig. 41: Identifying Shift Forks
Courtesy of CHRYSLER GROUP, LLC

1 - RANGE FORK
2 - MODE FORK AND RAIL
3 - MODE SPRING

Check condition of the shift forks and mode fork shift rail (2). Refer to **Fig. 41**. Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Fig. 42: Shift Forks & Wear Pads
Courtesy of CHRYSLER GROUP, LLC

1 - RANGE FORK
2 - MODE FORK
3 - WEAR PADS (SERVICEABLE)
4 - WEAR PADS (SERVICEABLE)

Inspect the shift fork wear pads (3). Refer to **Fig. 42**. The mode and range fork pads are serviceable and can be

replaced if necessary.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

DRIVE CHAIN

Examine the drive chain and shaft bearings. replace the chain if stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Fig. 43: Low Range Annulus Gear
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - LOW RANGE ANNULUS GEAR

Inspect annulus gear (2) condition carefully. The gear is only serviced as part of the front case (1). If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (2). Refer to **Fig. 43**.

FRONT CASE AND REAR CASE

Inspect the cases for wear and damage.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ASSEMBLY

ASSEMBLY

BEARINGS AND SEALS

Fig. 44: Removing Input Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - UNIVERSAL HANDLE C-4171
3 - BEARING REMOVER/INSTALLER 6953

1. Remove the input shaft bearing snap-ring from the front case half with suitable snap-ring pliers.
2. Remove the input shaft bearing from the front case half with Bearing Installer (special tool #6953, Remover/Installer, Bearing) (3) and Universal Handle (special tool #C-4171, Driver Handle, Universal) (2). Refer to **Fig. 44**.

Fig. 45: Installing Input Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - UNIVERSAL HANDLE C-4171
3 - BEARING CUP INSTALLER 8151 (INVERTED)

3. Install the input shaft bearing into the front case half with Bearing Cup Installer (special tool #8151, Installer, Bearing Cup) (3) inverted on Universal Handle (special tool #C-4171, Driver Handle, Universal) (2). Refer to **Fig. 45**.
4. Install the input shaft bearing snap-ring into the front case half with suitable snap-ring pliers.

Fig. 46: Removing Front Output Shaft Front Bearing

Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - SEAL INSTALLER 7888

17. Remove the rear output shaft bearing from the rear case (1) using Seal Installer (special tool #7888, Installer, Seal) (2). Refer to **Fig. 54**.

Fig. 55: Installing Rear Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - UNIVERSAL HANDLE C-4171
3 - SEAL INSTALLER 8152

18. Install the rear output shaft bearing into the rear case (1) using Seal Installer (special tool #8152, Installer, Seal) (3) and Universal Handle (special tool #C-4171, Driver Handle, Universal) (2). Refer to **Fig. 55**.
19. Install the rear output shaft bearing snap-ring into the rear case half.

INPUT AND PLANETARY GEAR

Fig. 56: Thrust Plate & Planetary
Courtesy of CHRYSLER GROUP, LLC

1 - PLANETARY
2 - THRUST PLATE

1. Lubricate gears and thrust washers with recommended transmission fluid.
2. Install bottom thrust washer (2) in low range gear planetary (1). Refer to **Fig. 56**. Be sure washer tabs are properly aligned in gear notches.

Fig. 57: Input Gear & Low Range Planetary
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - LOW RANGE PLANETARY

3. Install input gear (1) in low range gear (2). Refer to **Fig. 57**. Be sure input gear is fully seated.

Fig. 58: Input Gear & Thrust Plate
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - THRUST PLATE

4. Install remaining thrust washer (2) in low range gear and on top of input gear (1). Refer to **Fig. 58**.

Fig. 59: Input Gear & Retainer
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINER

5. Install retainer (2) on input gear (1). Refer to **Fig. 59**.

Fig. 60: Input Gear & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINING RING

6. Install snap-ring (2). Refer to **Fig. 60**.

Fig. 61: Front Case & Input Planetary Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - INPUT PLANETARY ASSEMBLY

7. Align and install low range/input gear assembly (2) in front case (1). Refer to **Fig. 61**. Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

Fig. 62: Input Gear Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINING RING

8. Install snap-ring (2) to hold input/low range gear (1) into front bearing. Refer to **Fig. 62**.
9. Install a new input gear oil seal with Seal Installer (special tool #9036, Installer, Seal) and Universal Handle (special tool #C-4171, Driver Handle, Universal).

SHIFT FORKS AND MAINSHAFT

Fig. 63: Mainshaft & Drive Sprocket Drive Hub
Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - DRIVE SPROCKET DRIVE HUB

1. Lubricate mainshaft splines with recommended transmission fluid.
2. Coat the interior of the drive sprocket hub with ATF+4 and install the drive sprocket drive hub (2) onto the mainshaft (1). Refer to **Fig. 63**.

Fig. 64: Mainshaft & Mode Hub
Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - MODE HUB

3. Install the mode hub (2) onto the mainshaft (1). Refer to **Fig. 64**.

Fig. 65: Mainshaft, Mode Hub & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - MODE HUB
3 - RETAINING RING

4. Install the mode hub retaining ring (3) onto the mainshaft (1). Refer to **Fig. 65**.

Fig. 66: Output Shaft, Clutch Gear & Mode Hub
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT
2 - CLUTCH GEAR
3 - MODE HUB

5. Install the clutch gear (2) onto the output shaft (1). Refer to **Fig. 66**. Verify that the pointed ends of the clutch gear teeth are pointing to the front of the mainshaft.

Fig. 67: Identifying Shift Sector
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT SECTOR

6. Lubricate sector shaft with transmission fluid and install shift sector (1) in case. Refer to **Fig. 67**. Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.
7. Apply Loctite™ 242, or equivalent, to the threads of the sector support to replenish the factory applied

patch. Install the shift sector support. Tighten the sector support with Socket (special tool #9033, Socket, Sector Support) to 27-34 N.m (20-25 ft.lbs.).

Fig. 68: Range Fork & Hub
Courtesy of CHRYSLER GROUP, LLC

1 - RANGE HUB
2 - RANGE FORK

8. Assemble and install range fork (2) and hub (1). Refer to **Fig. 68**. Be sure hub is properly seated in low range gear and engaged to the input gear.
9. Align and insert range fork pin in shift sector slot.

Fig. 69: Mode Fork, Sleeve & Shift Rail
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT RAIL
2 - MODE FORK
3 - MODE SLEEVE

10. Install mode fork (2) and shift rail (1) onto the mode sleeve.
11. Install the mode fork (2), sleeve (3), and shift rail (1) into the transfer case. Refer to **Fig. 69**.

Fig. 70: Mainshaft Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - MAINSHAFT ASSEMBLY

12. Install mainshaft (2) into the transfer case (1). Refer to **Fig. 70**. Guide mainshaft through the mode and range sleeves and into the input gear.

Fig. 71: Position Sensor Or Switch
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - POSITION SENSOR

13. Install the transfer case position sensor or switch (2). Refer to **Fig. 71**. Tighten the sensor or switch to 20-34 N.m (15-25 ft. lbs.) torque.

Fig. 72: Shift Sector, Sector Support & Manual Shift Lever
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT SECTOR
2 - SECTOR SUPPORT
3 - MANUAL SHIFT LEVER

14. Install manual shift lever (3) and spacer onto sector shaft (1). Refer to **Fig. 72**.
15. Install washer and nut on sector shaft to secure shift lever. Apply 1-2 drops Mopar® Lock N' Seal, or equivalent, to nut threads before installation. Then tighten nut to 27-34 N.m (20-25 ft. lbs.) torque.

Fig. 73: O-Ring Installation On Detent Plug
Courtesy of CHRYSLER GROUP, LLC

1 - O-RING
2 - DETENT PLUG

16. Install new o-ring (1) on detent plug (2). Refer to **Fig. 73**.

Fig. 74: Detent plug, Spring & Plunger
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - DETENT PLUG
3 - SPRING

4 - PLUNGER

17. Install detent plunger (4), spring (3), and plug (2). Refer to **Fig. 74**. Tighten the plug to 16-25 N.m (12-18 ft. lbs.).

FRONT OUTPUT SHAFT AND DRIVE CHAIN

Fig. 75: Front Output Shaft
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - FRONT OUTPUT SHAFT

1. Install the front output shaft (2) into the front output shaft front bearing. Refer to **Fig. 75**.

Fig. 76: Front Output Shaft Snap-Ring

Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - SNAP-RING

2. Install the front output shaft bearing inner snap-ring (2) onto the output shaft. Refer to **Fig. 76**.
3. Install the new front output shaft seal with Seal Installer (special tool #MB-991168-A, Installer, Seal)

Fig. 77: Front Case Half, Chain & Drive Sprockets
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - CHAIN
3 - DRIVE SPROCKETS

4. Insert front drive sprocket in drive chain.
5. Install drive chain around rear drive sprocket.
6. Position rear drive sprocket (3) over the output shaft and lower the sprocket and chain assembly until the front sprocket is positioned over the front output shaft. Refer to **Fig. 77**.
7. Align the splines in the sprockets to the splines on the output shafts and install the sprockets onto the output shafts.

Fig. 78: Front Output Shaft, Drive Sprocket & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT OUTPUT SHAFT
2 - DRIVE SPROCKET
3 - RETAINING RING

8. Install front sprocket retaining ring (3). Refer to **Fig. 78**.

Fig. 79: Rear Output Shaft, Drive Sprocket & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - REAR OUTPUT SHAFT

2 - DRIVE SPROCKET
3 - RETAINING RING

9. Install rear sprocket retaining ring (3). Refer to **Fig. 79**.

Fig. 80: Shift Rail & Spring
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT RAIL
2 - SPRING

10. Install spring (2) onto shift rail (1). Refer to **Fig. 80**.

Fig. 81: Case Magnet Installation
Courtesy of CHRYSLER GROUP, LLC

1 - MAGNET
2 - CASE POCKET

11. Insert magnet (1) in front case pocket (2). Refer to **Fig. 81**.

REAR CASE

Fig. 82: Front & Rear Case Halves
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - REAR CASE HALF

1. Install the oil pick-up tube and screen into the rear case half.
2. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.
3. Align mainshaft with he rear output shaft bearing and align shift rail with bore in rear case. Then install rear case (2). Refer to **Fig. 82**. Verify that the case alignment dowels correctly seat into their mating recesses.

Fig. 83: Identifying Case Half Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - REAR CASE HALF
3 - BOLTS

4. Install 4-5 rear case (2) -to- front case (1) bolts (3) to hold rear case in position. Refer to **Fig. 83**. Tighten bolts snug but not to specified torque at this time.

CAUTION: Verify that shift rail, and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.

Fig. 84: Output Shaft, Rear Case Half & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT
2 - REAR CASE HALF
3 - SNAP-RING

5. Tighten bolts to 27-34 N.m (20-25 ft. lbs.).
6. Install rear output bearing inner snap-ring (3) to output shaft (1). Refer to **Fig. 84**.

OIL PUMP AND REAR EXTENSION

Fig. 85: Rear Case Half, Rear Output Shaft & Oil Pump

Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - REAR OUTPUT SHAFT
3 - OIL PUMP

1. Install the oil pump (3) onto the output shaft (2). Refer to **Fig. 85**.

Fig. 86: Oil Pump Pick-Up Tube & Oil Pump
Courtesy of CHRYSLER GROUP, LLC

1 - OIL PUMP
2 - OIL PICK-UP TUBE

2. Engage the oil pump pick-up tube (2) into the oil pump (1). Refer to **Fig. 86**. Verify that the pick-up tube o-ring is on the tube and is correctly installed to the oil pump.

Fig. 87: Rear Case Half & Extension Housing
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - EXTENSION HOUSING

3. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.
4. Install extension housing (2) onto the rear case half (1). Refer to **Fig. 87**.

Fig. 88: Extension Housing & Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - BOLTS

5. Install rear extension bolts (2). Refer to **Fig. 88**. Tighten the bolts to 27-34 N.m (20-25 ft.lbs.).

Fig. 89: Installing Extension Housing Seal
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - UNIVERSAL HANDLE C-4171
3 - SEAL INSTALLER 9037

6. Install the extension housing boot and seal assembly with Seal Installer (special tool #9037, Installer, Dust Boot/Seal) (3) and Universal Handle (special tool #C-4171, Driver Handle, Universal) (2). Refer to **Fig. 89**.

Fig. 90: Remove/Install Companion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

1 - YOKE HOLDER 6719
2 - BOLTS

7. Install the front companion flange onto the front output shaft.
8. Install two bolts 180° apart into the front output shaft companion flange.
9. Place holder (1) over the bolts (2) and against the companion flange. Refer to **Fig. 90**.
10. Install a new front companion flange nut. Tighten the companion flange nut to 176-271 N.m (130-200 ft.lbs.).

INSTALLATION

INSTALLATION

1. Align and seat transfer case on transmission. Be sure transfer case input gear splines are aligned with transmission output shaft. Align splines by rotating transfer case rear output shaft yoke if necessary. Do not install any transfer case attaching nuts until the transfer case is completely seated against the transmission.
2. Install and tighten transfer case attaching nuts. Tighten nuts to 30-41 N.m (20-30 ft.lbs.).
3. Remove jack stand from under transmission.
4. Align and connect propeller shafts. Refer to **SHAFT, DRIVE, FRONT LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, FRONT HEAVY DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR HEAVY DUTY, INSTALLATION** .
5. Connect vent hose and transfer case position sensor connector.
6. Connect shift rod to transfer case lever or floor shift arm. Use channel lock style pliers to press rod back

into lever grommet.

7. Adjust shift linkage, if necessary.
8. Fill transfer case with recommended transmission fluid and install fill plug.
9. Install skid plate, if equipped. Refer to **PLATE, SKID, TRANSFER CASE, INSTALLATION** .
10. Lower vehicle.

FLUID

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID DRAIN AND REFILL

Fig. 91: Drain & Fill Holes
Courtesy of CHRYSLER GROUP, LLC

1 - FILL HOLE
2 - DRAIN HOLE

The fill (1) and drain (2) plugs are both in the rear case. Refer to **Fig. 91**.

1. Raise vehicle.
2. Position drain pan under transfer case.

NOTE: **It may be necessary to remove the exhaust y-pipe at the exhaust manifold to properly access the fill and drain plugs. Lowering the exhaust will allow the plugs to be accessed for torquing during installation. Refer to PIPE, EXHAUST, REMOVAL .**

3. Remove drain and fill plugs and drain lubricant completely.
4. Install drain plug. Tighten plug to 20-34 N.m (15-25 ft. lbs.).
5. Remove drain pan.
6. Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, Automatic Transmission fluid.
7. Install and tighten fill plug to 20-34 N.m (15-25 ft. lbs.).

8. Install the exhaust y-pipe to the exhaust manifold, if removed. Refer to **PIPE, EXHAUST, INSTALLATION** .
9. Wipe any excess fluid that may have spilled onto the exhaust.
10. Lower vehicle.

LEVER, TRANSFER CASE

ADJUSTMENTS

ADJUSTMENTS

Fig. 92: Transfer Case Shifter Components
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFTER BOOT	4 - SHIFTER MECHANISM
2 - SHIFTER KNOB	5 - ALIGNMENT PIN
3 - SHIFTER CONSOLE	6 - TRANSFER CASE

1. Move shift lever into 2H position.
2. Raise vehicle.
3. Loosen shift rod lock bolt at trunnion.
4. Check shift rod fit in trunnion. Be sure rod does not bind in trunnion. Lubricate the shift rod and trunnion if necessary.
5. Verify that transfer case shift lever is in 2H detent position. The 2H detent position on the transfer case shift arm is the second position from full forward.

6. Align the adjustment locating hole on the lower shifter lever with the adjustment channel on the shifter bracket assembly. Refer to **Fig. 92**.
7. Insert an appropriately sized pin through into the adjustment channel and through the locating hole to hold the shifter in the correct position.
8. Tighten shift rod lock bolt to 10 N.m (90 in. lbs.) torque.
9. Remove the locating pin from the adjustment channel and locating hole.
10. Check shift linkage operation. Be sure transfer case shifts into and operates properly in all ranges.

REMOVAL

REMOVAL

Fig. 93: Transfer Case Shifter Components
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFTER BOOT	4 - SHIFTER MECHANISM
2 - SHIFTER KNOB	5 - ALIGNMENT PIN
3 - SHIFTER CONSOLE	6 - TRANSFER CASE

1. Shift transfer case into 2H.
2. Raise and support the vehicle.
3. Loosen adjusting trunnion lock bolt and slide shift rod out of trunnion. If rod lacks enough travel to come out of trunnion, push trunnion out of shift lever.
4. Lower vehicle.
5. Remove transfer case shifter knob cap.

6. Remove nut holding shifter knob (2) to shift lever. Refer to **Fig. 93**.
7. Remove shifter knob.
8. Remove the shift boot from the shifter console.
9. Remove the bolts securing the shifter mechanism to the floor pan.
10. Separate shift lever mechanism from the vehicle.

INSTALLATION

INSTALLATION

Fig. 94: Transfer Case Shifter Components
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFTER BOOT	4 - SHIFTER MECHANISM
2 - SHIFTER KNOB	5 - ALIGNMENT PIN
3 - SHIFTER CONSOLE	6 - TRANSFER CASE

1. If the shifter mechanism does not have a adjustment locating pin installed, align the adjustment channel on the shifter assembly to the locating hole in the lower shift lever and install an appropriately sized pin to retain the position.
2. Position shift lever in vehicle.
3. Install the bolts to hold the shifter mechanism (4) to the floor pan. Refer to **Fig. 94**.
4. Raise vehicle.
5. Verify that the transfer case is still in the 2H position. The 2H detent position on the transfer case shift arm is the second position from full forward.

6. Install trunnion to shift lever, if necessary.
7. Install shift rod to trunnion, if necessary.
8. Tighten the shift rod lock bolt to 10 N.m (90 in.lbs.).
9. Remove the shifter adjustment locating pin from the adjustment channel and the locating hole.
10. Lower vehicle.
11. Install the transfer case shifter console.
12. Install the shifter boot and the shifter knob onto the shifter lever.
13. Install nut to hold shifter knob to shift lever.
14. Install shifter knob cap.
15. Verify transfer case operation.

SEAL, OUTPUT SHAFT, FRONT

REMOVAL

REMOVAL

Fig. 95: Remove/Install Companion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

1 - YOKE HOLDER 6719
2 - BOLTS

1. Remove the front propeller shaft. Refer to **SHAFT, DRIVE, FRONT LIGHT DUTY, REMOVAL** or **SHAFT, DRIVE, FRONT HEAVY DUTY, REMOVAL** .
2. Install two bolts 180° apart into the front output shaft companion flange.
3. Place Yoke Holder (special tool #6719A, Holder, Yoke) (1) over the bolts (2) and against the companion

flange. Refer to **Fig. 95**.

4. Remove and discard the front companion flange nut.
5. Remove the companion flange from the front output shaft. It may be necessary to use Pinion Flange Remover (special tool #8992, Remover, Pinion Flange) to remove the companion flange.
6. Using a screw and a slide hammer, remove the front output shaft seal.

INSTALLATION

INSTALLATION

Fig. 96: Remove/Install Companion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

1 - YOKE HOLDER 6719
2 - BOLTS

1. Install the new front output shaft seal with Seal Installer (special tool #MB-991168-A, Installer, Seal).
2. Install the front companion flange onto the front output shaft.
3. Install two bolts 180° apart into the front output shaft companion flange.
4. Place Yoke Holder (special tool #6719A, Holder, Yoke) (1) over the bolts (2) and against the companion flange. Refer to **Fig. 96**.
5. Install a new front companion flange nut. Tighten the companion flange nut to 176-271 N.m (130-200 ft.lbs.).
6. Install front propeller shaft. Refer to **SHAFT, DRIVE, FRONT LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, FRONT HEAVY DUTY, INSTALLATION** .

SEAL, OUTPUT SHAFT, WITH DUST BOOT

REMOVAL

REMOVAL

Fig. 97: Removing Extension Housing Dust Boot
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - DUST BOOT

1. Raise and support vehicle.
2. Remove rear propeller shaft. Refer to **SHAFT, DRIVE, REAR LIGHT DUTY, REMOVAL** or **SHAFT, DRIVE, REAR HEAVY DUTY, REMOVAL** .
3. Use a suitable chisel or pry tool to remove the rear extension housing dust boot (2). Refer to **Fig. 97**.
4. Use a suitable chisel or pry tool to remove the rear extension housing seal.

INSTALLATION

INSTALLATION

Fig. 98: Installing Extension Housing Seal
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - UNIVERSAL HANDLE C-4171
3 - SEAL INSTALLER 9037

1. Clean fluid residue from sealing surface and inspect for defects.
2. Install the extension housing dust boot and seal assembly with Seal Installer (special tool #9037, Installer, Dust Boot/Seal) (3) and Universal Handle (special tool #C-4171, Driver Handle, Universal) (2). Refer to **Fig. 98**.
3. Install rear propeller shaft. Refer to **SHAFT, DRIVE, REAR LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR HEAVY DUTY, INSTALLATION** .
4. Verify proper transfer case fluid level.
5. Lower vehicle.

SENSOR, POSITION

DESCRIPTION

DESCRIPTION

The transfer case position sensor is an electronic device whose output can be interpreted to indicate the transfer case's current operating mode. The sensor consists of a five position, resistive multiplexed circuit which returns a specific resistance value to the Powertrain Control Module (PCM) for each transfer case operating mode. The sensor is located on the top of the transfer case, just left of the transfer case centerline and rides against the

sector plate roostercomb. The PCM supplies 5VDC (+/- 0.5V) to the sensor and monitors the return voltage to determine the sector plate, and therefore the transfer case, position.

OPERATION

OPERATION

OPERATING MODE VERSUS RESISTANCE

SENSOR POSITION	OPERATING MODE	SENSOR RESISTANCE (ohms)
1	2H	1172-1195
2	4H	677-691
3	NEUTRAL	406-415
4	4L	208-213
5	NOT USED	60-61

Fig. 99: Identifying Position Sensor Linear Movement
Courtesy of CHRYSLER GROUP, LLC

1 - POSITION 1 - 10mm ±0.5mm
2 - POSITION 2 - 12mm ±0.5mm
3 - POSITION 3 - 14mm ±0.5mm
4 - POSITION 4 - 16mm ±0.5mm
5 - POSITION 5 - 18mm ±0.5mm
6 - POSITION 6 - 20mm±0.5mm - FULL EXTENSION

During normal vehicle operation, the Powertrain Control Module (PCM) monitors the transfer case position sensor return voltage to determine the operating mode of the transfer case. For the correct resistance for each position, refer to **OPERATING MODE VERSUS RESISTANCE** and **Fig. 99**.

REMOVAL

REMOVAL

1. Raise and support the vehicle.
2. Disengage the transfer case position sensor connector from the position sensor.
3. Remove the position sensor from the transfer case.

INSTALLATION

INSTALLATION

1. Inspect the o-ring seal on the transfer case position sensor. Replace the o-ring if necessary.
2. Install the transfer case position sensor into the transfer case. Torque the sensor to 27 N.m (20 ft.lbs.).
3. Engage the transfer case position sensor connector to the position sensor.
4. Lower vehicle.
5. Verify proper sensor operation.

DESCRIPTION

DESCRIPTION

The NV273 is an electronically controlled part-time transfer case with a low range gear reduction system. The NV273 has three operating ranges plus a NEUTRAL position. The low range system provides a gear reduction ratio for increased low speed torque capability.

The geartrain is mounted in two aluminum case halves attached with bolts. The mainshaft front and rear bearings are mounted in aluminum case halves.

OPERATING RANGES

Transfer case operating ranges are:

- 2WD (2-wheel drive).
- 4HI (4-wheel drive).
- 4LO (4-wheel drive low range).
- NEUTRAL.

The 2WD range is for use on any road surface at any time.

The 4HI and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is wet or slippery or covered by ice and snow.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

SHIFT MECHANISM

Operating ranges are selected with a dash mounted shift selector switch. The shift selector switch provides a input to the Transfer Case Control Module (TCCM) to indicate the driver's desire to change operating ranges. The TCCM uses this input, along with input from the transfer case mounted mode sensor and information from the vehicle's bus, to determine if a shift is permitted. If the TCCM decides the shift is permitted, the TCCM controls the shift motor, mounted to the exterior of the transfer case, to perform the shift.

IDENTIFICATION

Fig. 1: Transfer Case - Rear View
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSFER CASE
2 - IDENTIFICATION TAG

A circular ID tag (2) is attached to the rear case of each transfer case. The ID tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

OPERATION

OPERATION

The input gear is splined to the transmission output shaft. The input gear drives the mainshaft through the planetary assembly and range sleeve. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. The drive sprocket is engaged/disengaged by the mode fork, which operates the mode sleeve and hub. The sleeve and hub are not equipped with a synchronizer mechanism for shifting.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TRANSFER CASE - NV273

DIAGNOSIS CHART

Condition	Possible Cause	Correction
Transfer case difficult to shift or will not shift into desired range.	1) Transfer case electronically controlled shift system malfunction.	1) Check for Transfer Case DTCs. Refer to the appropriate Electrical Diagnostic article. Depending on vehicle configuration (FCM, FDCM, or DTCM), perform the

		appropriate diagnostic procedure and verification test.
	2) If vehicle was operated for an extended period in 4HI mode on dry surface, driveline torque load may cause difficulty.	2) Drive the vehicle in a straight line and momentarily release the accelerator. The transfer case can then be shifted to the desired mode.
	3) Insufficient or incorrect lubricant.	3) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, Automatic Transmission Fluid.
	4) Internal transfer case components binding, worn, or damaged.	4) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, type 9602, Automatic Transmission Fluid.
	2) Internal transfer case components binding, worn, or damaged.	2) Repair or replace components as necessary.
Transfer case noisy while in, or jumps out of, 4LO mode.	1) Transfer case not completely engaged in 4LO position.	1) While rolling 2-3 MPH and the transmission in NEUTRAL, or clutch depressed on vehicles equipped with a manual transmission, shift transfer case to the 2WD or 4HI position, and then back into the 4LO position.
	2) Range fork damaged, inserts worn, or fork is binding on the shift rail.	2) Repair or replace components as necessary.
	3) Low range gear worn or damaged.	3) Repair or replace components as necessary.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.
Abnormal tire wear.	1) Extended operation in 4HI mode on dry surfaces,	1) Operate vehicle in 2WD mode on dry surfaces.

REMOVAL

REMOVAL

Fig. 2: Transmission, Transfer Case & Mode Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSMISSION
2 - TRANSFER CASE
3 - MODE SENSOR CONNECTOR

1. Shift transfer case into 2WD.
2. Raise vehicle.
3. Drain transfer case lubricant.
4. Remove the transfer case skid plate, if equipped.
5. Support transmission with jack stand.

6. Remove crossmember and transmission mount.
7. Mark front and rear propeller shafts for alignment reference.
8. Remove front and rear propeller shafts.
9. Disconnect transfer case shift motor and mode sensor wire connectors (3). Refer to **Fig. 2**.
10. Disconnect transfer case vent hose.
11. Support transfer case with transmission jack.
12. Secure transfer case to jack with chains.
13. Remove nuts attaching transfer case (2) to transmission (1).
14. Pull transfer case and jack rearward to disengage transfer case.
15. Remove transfer case from under vehicle.

DISASSEMBLY

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

COMPANION FLANGE AND EXTENSION HOUSING

Fig. 3: Removing/Installing Companion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

1 - YOKE HOLDER 6719
2 - BOLTS

1. Install two bolts 180° apart into the front output shaft companion flange.

2. Place holder (1) over the bolts (2) and against the companion flange. Refer to **Fig. 3**.
3. Remove and discard the front companion flange nut.
4. Remove the companion flange from the front output shaft. It may be necessary to use Pinion Flange Remover (special tool #8992, Remover, Pinion Flange) to remove the companion flange.

Fig. 4: Removing Extension Housing Dust Boot
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - DUST BOOT

5. Use a suitable chisel or pry tool to remove the rear extension housing (1) dust boot (2). Refer to **Fig. 4**.
6. Use a suitable chisel or pry tool to remove the rear extension housing seal.

Fig. 5: Extension Housing & Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - BOLTS

7. Remove rear extension (1) bolts (2). Refer to **Fig. 5**.

Fig. 6: Rear Case Half & Extension Housing
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - EXTENSION HOUSING

8. Remove rear extension housing (2). Refer to **Fig. 6**. Tap extension once or twice with a plastic mallet to break sealer bead and loosen it.

OIL PUMP AND REAR CASE

Fig. 7: Oil Pump Pick-Up Tube & Oil Pump
Courtesy of CHRYSLER GROUP, LLC

1 - OIL PUMP
2 - OIL PICK-UP TUBE

1. Disengage the oil pump pick-up tube (2) from the oil pump (1). Refer to **Fig. 7**.

NOTE: **The oil pump pick-up tube seals to the oil pump with an o-ring. Verify that the o-ring was removed with the tube and is in good condition. Replace the o-ring if necessary.**

Fig. 8: Rear Case Half, Rear Output Shaft & Oil Pump
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - REAR OUTPUT SHAFT
3 - OIL PUMP

2. Remove the oil pump (3). Refer to **Fig. 8**.

Fig. 9: Front Case Half, Rear Case Half & Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF

2 - REAR CASE HALF
3 - BOLTS

3. Remove rear case (2) -to-front case (1) bolts (3). Refer to **Fig. 9**.

Fig. 10: Output Shaft, Rear Case Half & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT
2 - REAR CASE HALF
3 - SNAP-RING

4. Remove the rear output shaft bearing inner snap-ring (3) from the output shaft (1) using suitable snap-ring pliers. Refer to **Fig. 10**.

Fig. 11: Output Shaft, Rear Case Half & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT
2 - REAR CASE HALF
3 - SNAP-RING

5. Remove the rear output shaft bearing inner snap-ring (3) from the output shaft (1). Refer to **Fig. 11**.

Fig. 12: Separating Front & Rear Case Halves
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF

2 - REAR CASE HALF

6. Loosen rear case (2) from front case (1) with pry tool to break sealer bead. Refer to **Fig. 12**. Insert tool at each end of case.

Fig. 13: Front & Rear Case Halves
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - REAR CASE HALF

7. Unseat rear case from alignment dowels.
8. Remove the rear case (2) from the front case (1). Refer to **Fig. 13**.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

Fig. 14: Oil Pick-Up Tube & Screen
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - OIL SCREEN
3 - PICK-UP TUBE

1. Remove the oil pick-up tube (3) and screen from the front case half (1). Refer to **Fig. 14**.

Fig. 15: Front Output Shaft, Drive Sprocket & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT OUTPUT SHAFT

2 - DRIVE SPROCKET
3 - RETAINING RING

2. Remove the front output shaft (1) drive sprocket (2) retaining ring (3). Refer to **Fig. 15**.

Fig. 16: Rear Output Shaft, Drive Sprocket & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - REAR OUTPUT SHAFT
2 - DRIVE SPROCKET
3 - RETAINING RING

3. Remove the rear output shaft (1) drive sprocket (2) retaining ring (3). Refer to **Fig. 16**.

Fig. 17: Drive Chain & Sprockets
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - CHAIN
3 - DRIVE SPROCKETS

4. Pull front sprocket (3), rear sprocket, and chain (2) upward until clear of the front and rear output shaft sprocket splines. Refer to **Fig. 17**.
5. Remove chain and sprockets as an assembly.

SHIFT FORKS AND MAINSHAFT

Fig. 18: Shift Motor Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSFER CASE
2 - SHIFT MOTOR ASSEMBLY
3 - BOLTS

1. Remove the bolts (3) that hold the shift motor assembly (2) to the transfer case (1). Refer to **Fig. 18**.

Fig. 19: Transfer Case & Shift Motor Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSFER CASE
2 - SHIFT MOTOR ASSEMBLY

2. Remove the shift motor assembly (2) from the transfer case (1). Refer to **Fig. 19**.

Fig. 20: Identifying Detent Plug
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - DETENT PLUG

3. Remove the sector support with Socket (special tool #9033, Socket, Sector Support).
4. Loosen detent plug (2). Refer to **Fig. 20**.

Fig. 21: Detent plug, Spring & Plunger
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF

2 - DETENT PLUG
3 - SPRING
4 - PLUNGER

5. Remove detent plug (2), spring (3), and plunger (4). Refer to **Fig. 21**. Note that the plug has an O-ring seal. Remove and discard this seal.

Fig. 22: Front Output Shaft Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - SNAP-RING

6. Using a screw mounted in a slide hammer, remove the front output shaft seal.
7. Remove the front output shaft snap-ring (2). Refer to **Fig. 22**.

Fig. 23: Front Output Shaft
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - FRONT OUTPUT SHAFT

8. Remove front output shaft (2) from bearing in front case (1). Refer to **Fig. 23**.

Fig. 24: Mainshaft Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - MAINSHAFT ASSEMBLY

9. Pull mainshaft assembly (2) out of input gear, mode sleeve, and front case (1). Refer to **Fig. 24**.

Fig. 25: Mode Fork, Mode Sleeve & Shift Rail
Courtesy of CHRYSLER GROUP, LLC

1 - MODE SLEEVE
2 - MODE FORK AND RAIL

10. Remove mode fork, mode sleeve (1), and shift rail (2) as assembly. Note which way the sleeve fits in the fork (long side of sleeve goes to front or the points on the sleeve teeth go to the rear of case).

Fig. 26: Range Fork & Hub
Courtesy of CHRYSLER GROUP, LLC

1 - RANGE HUB
2 - RANGE FORK

11. Remove range fork (2) and hub (1) as an assembly. Refer to **Fig. 26**. Note fork position for installation reference.

Fig. 27: Identifying Shift Sector
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT SECTOR

12. Remove the shift sector (1). Refer to **Fig. 27**.

MAINSHAFT

Fig. 28: Output Shaft, Clutch Gear & Mode Hub
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT
2 - CLUTCH GEAR
3 - MODE HUB

1. Remove the clutch gear (2) from the output shaft (1). Refer to **Fig. 28**.

Fig. 29: Mainshaft, Mode Hub & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - MODE HUB
3 - RETAINING RING

2. Remove the mode hub (2) retaining ring (3) from the mainshaft (1). Refer to **Fig. 29**.

Fig. 30: Mainshaft & Mode Hub

Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - MODE HUB

3. Remove the mode hub (2) from the mainshaft (1). Refer to **Fig. 30**.

Fig. 31: Mainshaft & Drive Sprocket Drive Hub
Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - DRIVE SPROCKET DRIVE HUB

4. Remove the drive sprocket drive hub (2) from the mainshaft (1). Refer to **Fig. 31**.

INPUT AND PLANETARY GEAR

Fig. 32: Input Gear Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINING RING

1. Remove input gear seal with suitable screw and slide hammer.
2. Remove input gear (1) retaining ring (2) with heavy duty snap-ring pliers. Refer to **Fig. 32**.

Fig. 33: Front Case & Input Planetary Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - INPUT PLANETARY ASSEMBLY

3. Place front case in horizontal position. Then remove input gear and low range gear as an assembly (2). Refer to **Fig. 33**. Tap gear out of bearing with plastic mallet, if necessary.

Fig. 34: Input Gear & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINING RING

4. Remove snap-ring (2) that retains input gear (1) in the low range gear. Refer to **Fig. 34**.

Fig. 35: Input Gear & Retainer
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINER

5. Remove retainer (2). Refer to **Fig. 35**.

Fig. 36: Input Gear & Thrust Plate
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - THRUST PLATE

6. Remove front thrust plate (2). Refer to **Fig. 36**.

Fig. 37: Input Gear & Low Range Planetary
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - LOW RANGE PLANETARY

7. Remove input gear (1). Refer to **Fig. 37**.

Fig. 38: Thrust Plate & Planetary
Courtesy of CHRYSLER GROUP, LLC

1 - PLANETARY
2 - THRUST PLATE

8. Remove bottom tabbed thrust washer (2) from low range planetary (1). Refer to **Fig. 38**.

CLEANING

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

INSPECTION

MAINSHAFT/SPROCKET/HUB INSPECTION

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

INPUT GEAR AND PLANETARY CARRIER

Fig. 39: Input Gear & Carrier Components
Courtesy of CHRYSLER GROUP, LLC

1 - PLANETARY CARRIER	4 - CARRIER LOCK RING
2 - REAR THRUST WASHER	5 - CARRIER LOCK RETAINING RING
3 - FRONT THRUST WASHER	6 - INPUT GEAR

Check the teeth on the input gear (6). Refer to **Fig. 39**. Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the planetary carrier body (1) and pinion gears for wear or damage. Check the pinion gear thrust washers on the pinon pins for damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the carrier lock ring (4) and both thrust washers (2, 3) for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

SHIFT FORKS/HUBS/SLEEVES

Fig. 40: Shift Forks
Courtesy of CHRYSLER GROUP, LLC

1 - RANGE FORK
2 - MODE FORK AND RAIL
3 - MODE SPRING

Check condition of the shift forks (1) and mode fork shift rail (2). Refer to **Fig. 40**. Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Fig. 41: Range Fork, Mode Fork & Wear Pads
Courtesy of CHRYSLER GROUP, LLC

1 - RANGE FORK
2 - MODE FORK
3 - WEAR PADS (SERVICEABLE)
4 - WEAR PADS (SERVICEABLE)

Inspect the shift fork wear pads (3, 4). Refer to **Fig. 41**. The mode (2) and range fork (1) pads are serviceable and can be replaced if necessary.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

REAR EXTENSION HOUSING

Inspect the extension housing seal and bushing. Replace both components if either show any sign of wear or damage.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

Inspect the shaft threads, sprocket teeth, and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Rough threads on the shaft can be chased if necessary. Replace the shaft if the threads are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Fig. 42: Low Range Annulus Gear
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - LOW RANGE ANNULUS GEAR

Inspect annulus gear (2) condition carefully. Refer to **Fig. 42**. The gear is only serviced as part of the front case (1). If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear.

FRONT AND REAR CASES

Inspect the cases for wear and damage.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil® stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ASSEMBLY

ASSEMBLY

BEARINGS AND SEALS

Fig. 43: Removing Input Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - UNIVERSAL HANDLE C-4171
3 - BEARING REMOVER/INSTALLER 6953

1. Remove the input shaft bearing snap-ring from the front case half with suitable snap-ring pliers.
2. Remove the input shaft bearing from the front case half with Bearing Remover/Installer (special tool #6953, Remover/Installer, Bearing) (3) and Universal Handle (special tool #C-4171, Driver Handle, Universal) (2). Refer to **Fig. 43**.

Fig. 44: Installing Input Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - UNIVERSAL HANDLE C-4171
3 - BEARING CUP INSTALLER 8151 (INVERTED)

3. Install the input shaft bearing into the front case half with Bearing Cup Installer (special tool #8151, Installer, Bearing Cup) (3) inverted on Universal Handle (special tool #C-4171, Driver Handle, Universal) (2). Refer to **Fig. 44**.
4. Install the input shaft bearing snap-ring into the front case half with suitable snap-ring pliers.

Fig. 45: Removing Front Output Shaft Front Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - UNIVERSAL HANDLE C-4171
3 - BEARING INSTALLER 6953

5. Remove the front output shaft front bearing snap-ring from the front case half.
6. Using Bearing Remover/Installer (special tool #6953, Remover/Installer, Bearing) (3) and Universal Handle (special tool #C-4171, Driver Handle, Universal) (2), remove the front output shaft front bearing. Refer to **Fig. 45**.

Fig. 46: Installing Front Output Shaft Front Bearing

Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - SEAL INSTALLER 8891

7. Start front output shaft front bearing in case. Then seat bearing with Seal Installer (special tool #8891, Installer, Seal) (2). Refer to **Fig. 46**.
8. Install front output shaft bearing retaining ring.

Fig. 47: Removing Input Gear Pilot Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - DRIFT
2 - INPUT GEAR

9. Remove input gear pilot bearing by inserting a suitably sized drift (1) into the splined end of the input gear (2) and driving the bearing out with the drift and a hammer. Refer to **Fig. 47**.
10. Install new pilot bearing with Pilot Bearing Installer (special tool #9035, Installer, Bearing).

Fig. 48: Removing Front Output Shaft Rear Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE
2 - REMOVER L-4454-1 AND L-4454-3
3 - CUP 8148

11. Remove the front output shaft rear bearing with the screw and jaws from Remover (special tool #L-4454A, Remover, Bearing Cup) (2) and Cup (special tool #8148, Cup) (3). Refer to **Fig. 48**.

Fig. 49: Installing Front Output Shaft Rear Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - UNIVERSAL HANDLE C-4171
3 - BEARING INSTALLER 8128

12. Install new bearing with Universal Handle (special tool #C-4171, Driver Handle, Universal) (2) and Bearing Installer (special tool #8128, Installer, Bearing) (3). Refer to **Fig. 49**.

Fig. 50: Output Shaft Rear Bearing Installation Depth
Courtesy of CHRYSLER GROUP, LLC

1 - BEARING (SEATED) AT LOWER EDGE OF CHAMFER
2 - CHAMFER

13. The bearing bore is chamfered at the top. Install the bearing so it is flush (1) with the lower edge of this chamfer (2). Refer to **Fig. 50**.

Fig. 51: Installing Oil Pump Seal
Courtesy of CHRYSLER GROUP, LLC

1 - HOUSING SEAL
2 - SEAL INSTALLER 7888
3 - OIL PUMP FEED HOUSING

14. Remove seal from oil pump with suitable pry tool.
15. Install new seal in oil pump with Seal Installer (special tool #7888, Installer, Seal) (2). Refer to **Fig. 51**.

Fig. 52: Removing Rear Output Bearing Outer Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - REAR OUTPUT SHAFT BEARING

3 - SNAP-RING

16. Remove the rear output shaft bearing (2) snap-ring (3) from the rear case half (1). Refer to **Fig. 52**.

Fig. 53: Removing Rear Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - SEAL INSTALLER 7888

17. Remove the rear output shaft bearing from the rear case (1) using Seal Installer (special tool #7888, Installer, Seal) (2). Refer to **Fig. 53**.

Fig. 54: Installing Rear Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - UNIVERSAL HANDLE C-4171
3 - SEAL INSTALLER 8152

18. Install the rear output shaft bearing into the rear case (1) using Seal Installer (special tool #8152, Installer, Seal) (3) and Universal Handle (special tool #C-4171, Driver Handle, Universal) (2). Refer to **Fig. 54**.
19. Install the rear output shaft bearing snap-ring into the rear case half.

INPUT AND PLANETARY GEAR

Fig. 55: Thrust Plate & Planetary
Courtesy of CHRYSLER GROUP, LLC

1 - PLANETARY
2 - THRUST PLATE

1. Lubricate gears and thrust washers with recommended transmission fluid.
2. Install bottom thrust washer (2) in low range gear planetary (1). Refer to **Fig. 55**. Be sure washer tabs are properly aligned in gear notches.

Fig. 56: Input Gear & Low Range Planetary
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - LOW RANGE PLANETARY

3. Install input gear (1) in low range gear (2). Refer to **Fig. 56**. Be sure input gear is fully seated.

Fig. 57: Input Gear & Thrust Plate
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - THRUST PLATE

4. Install remaining thrust washer (2) in low range gear and on top of input gear (1). Refer to **Fig. 57**.

Fig. 58: Input Gear & Retainer
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINER

5. Install retainer (2) on input gear (1). Refer to **Fig. 58**.

Fig. 59: Input Gear & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINING RING

6. Install snap-ring (2). Refer to **Fig. 59**.

Fig. 60: Front Case & Input Planetary Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - INPUT PLANETARY ASSEMBLY

7. Align and install low range/input gear assembly (2) in front case (1). Refer to **Fig. 60**. Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

Fig. 61: Input Gear Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT GEAR
2 - RETAINING RING

8. Install snap-ring (2) to hold input/low range gear (1) into front bearing. Refer to **Fig. 61**.
9. Install a new input gear oil seal with Seal Installer (special tool #9036, Installer, Seal) and Universal Handle (special tool #C-4171, Driver Handle, Universal).

SHIFT FORKS AND MAINSHAFT

Fig. 62: Mainshaft & Drive Sprocket Drive Hub
Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - DRIVE SPROCKET DRIVE HUB

1. Lubricate mainshaft splines with recommended transmission fluid.
2. Coat the interior of the drive sprocket hub with ATF+4 and install the drive sprocket drive hub (2) onto the mainshaft (1). Refer to **Fig. 62**.

Fig. 63: Mainshaft & Mode Hub
Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - MODE HUB

3. Install the mode hub (2) onto the mainshaft (1). Refer to **Fig. 63**.

Fig. 64: Mainshaft, Mode Hub & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - MAINSHAFT
2 - MODE HUB
3 - RETAINING RING

4. Install the mode hub (2) retaining ring (3) onto the mainshaft (1). Refer to **Fig. 64**.

Fig. 65: Output Shaft, Clutch Gear & Mode Hub
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT
2 - CLUTCH GEAR
3 - MODE HUB

5. Install the clutch gear (2) onto the output shaft (1). Refer to **Fig. 65**. Verify that the pointed ends of the clutch gear teeth are pointing to the front of the mainshaft.

Fig. 66: Identifying Shift Sector
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT SECTOR

6. Lubricate sector shaft with transmission fluid and install shift sector (1) in case. Refer to **Fig. 66**. Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.
7. Apply Loctite™ 242, or equivalent, to the threads of the sector support to replenish the factory applied

patch. Install the shift sector support. Tighten the sector support with Socket (special tool #9033, Socket, Sector Support) to 27-34 N.m (20-25 ft.lbs.).

Fig. 67: Range Fork & Hub Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - RANGE HUB
2 - RANGE FORK

8. Assemble and install range fork (2) and hub (1). Refer to **Fig. 67**. Be sure hub is properly seated in low range gear and engaged to the input gear.
9. Align and insert range fork pin in shift sector slot.

Fig. 68: Mode Fork, Mode Sleeve & Shift Rail
Courtesy of CHRYSLER GROUP, LLC

1 - MODE SLEEVE
2 - MODE FORK AND RAIL

10. Install mode fork and shift rail onto the mode sleeve.
11. Install the mode fork and sleeve (1), and shift rail (2) into the transfer case.

Fig. 69: O-Ring Installation On Detent Plug
Courtesy of CHRYSLER GROUP, LLC

1 - O-RING
2 - DETENT PLUG

12. Install new o-ring (1) on detent plug (2). Refer to **Fig. 69**.

Fig. 70: Detent plug, Spring & Plunger
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - DETENT PLUG
3 - SPRING
4 - PLUNGER

13. Install detent plunger (4), spring (3), and plug (2). Refer to **Fig. 70**. Tighten the plug to 16-24 N.m (12-18 ft. lbs.).

Fig. 71: Transfer Case & Shift Motor Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSFER CASE
2 - SHIFT MOTOR ASSEMBLY

14. Position the shift motor and mode sensor assembly (2) onto the transfer case (1). Refer to **Fig. 71**.

Fig. 72: Shift Motor Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSFER CASE
2 - SHIFT MOTOR ASSEMBLY
3 - BOLTS

15. Install the bolts (3) to hold the shift motor and mode sensor assembly (2) to the transfer case (1). Refer to **Fig. 72**. Tighten the bolts to 16-25 N.m (12-18 ft. lbs.).

Fig. 73: Mainshaft Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - MAINSHAFT ASSEMBLY

16. Install mainshaft (2) into the transfer case (1). Refer to **Fig. 73**. Guide mainshaft through the mode and range sleeves and into the input gear.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

Fig. 74: Front Output Shaft
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE
2 - FRONT OUTPUT SHAFT

1. Install the front output shaft (2) into the front output shaft front bearing. Refer to **Fig. 74**.

Fig. 75: Front Output Shaft Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - SNAP-RING

2. Install the front output shaft bearing inner snap-ring (2) onto the output shaft. Refer to **Fig. 75**.

3. Install the new front output shaft seal with Seal Installer (special tool #MB-991168-A, Installer, Seal).

Fig. 76: Drive Chain & Sprockets
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - CHAIN
3 - DRIVE SPROCKETS

4. Insert front drive sprocket (3) in drive chain (2). Refer to **Fig. 76**.
5. Install drive chain around rear drive sprocket.
6. Position rear drive sprocket over the output shaft and lower the sprocket and chain assembly until the front sprocket is positioned over the front output shaft.
7. Align the splines in the sprockets to the splines on the output shafts and install the sprockets onto the output shafts.

Fig. 77: Front Output Shaft, Drive Sprocket & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT OUTPUT SHAFT
2 - DRIVE SPROCKET
3 - RETAINING RING

8. Install front sprocket (2) retaining ring (3). Refer to **Fig. 77**.

Fig. 78: Rear Output Shaft, Drive Sprocket & Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - REAR OUTPUT SHAFT

2 - DRIVE SPROCKET
3 - RETAINING RING

9. Install rear sprocket (2) retaining ring (3). Refer to **Fig. 78**.

Fig. 79: Case Magnet Installation
Courtesy of CHRYSLER GROUP, LLC

1 - MAGNET
2 - CASE POCKET

10. Insert magnet (1) in front case pocket (2). Refer to **Fig. 79**.

REAR CASE

Fig. 80: Front & Rear Case Halves
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF

2 - REAR CASE HALF

1. Install the oil pick-up tube and screen into the rear case half.
2. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.
3. Align mainshaft with the rear output shaft bearing and align shift rail with bore in rear case. Then install rear case (2). Refer to **Fig. 80**. Verify that the case alignment dowels correctly seat into their mating recesses.

Fig. 81: Front Case Half, Rear Case Half & Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT CASE HALF
2 - REAR CASE HALF
3 - BOLTS

4. Install 4-5 rear case (2) to front case (1) bolts (3) to hold rear case in position. Refer to **Fig. 81**. Tighten bolts snug but not to specified torque at this time.

CAUTION: Verify that shift rail, and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.

5. Tighten bolts to 27-34 N.m (20-25 ft. lbs.).

1 - OUTPUT SHAFT
2 - REAR CASE HALF
3 - SNAP-RING

6. Install rear output bearing inner snap-ring (3) to output shaft (1). Refer to **Fig. 82**.

OIL PUMP AND REAR EXTENSION

Fig. 83: Rear Case Half, Rear Output Shaft & Oil Pump
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - REAR OUTPUT SHAFT
3 - OIL PUMP

1. Install the oil pump (3) onto the output shaft (2). Refer to **Fig. 83**.

Fig. 84: Oil Pump Pick-Up Tube & Oil Pump
Courtesy of CHRYSLER GROUP, LLC

1 - OIL PUMP
2 - OIL PICK-UP TUBE

2. Engage the oil pump pick-up tube (2) into the oil pump (1). Refer to **Fig. 84**. Verify that the pick-up tube o-ring is on the tube and is correctly installed to the oil pump.

Fig. 85: Rear Case Half & Extension Housing
Courtesy of CHRYSLER GROUP, LLC

1 - REAR CASE HALF
2 - EXTENSION HOUSING

3. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.
4. Install extension housing (2) onto the rear case half (1). Refer to **Fig. 85**.

Fig. 86: Extension Housing & Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - BOLTS

5. Install rear extension bolts (2). Refer to **Fig. 86**. Tighten the bolts to 27-34 N.m (20-25 ft.lbs.).

Fig. 87: Installing Extension Housing Seal
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - UNIVERSAL HANDLE C-4171
3 - SEAL INSTALLER 9037

6. Install the extension housing dust boot and seal assembly with Seal Installer (special tool #9037, Installer, Dust Boot/Seal) (3) and Universal Handle (special tool #C-4171, Driver Handle, Universal) (2). Refer to **Fig. 87**.

Fig. 88: Removing/Installing Companion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

1 - YOKE HOLDER 6719
2 - BOLTS

7. Install the front companion flange onto the front output shaft.
8. Install two bolts 180° apart into the front output shaft companion flange.
9. Place holder (1) over the bolts (2) and against the companion flange. Refer to **Fig. 88**.
10. Install a new front companion flange nut. Tighten the companion flange nut to 176-271 N.m (130-200 ft.lbs.).

INSTALLATION

INSTALLATION

1. Mount transfer case on a transmission jack.
2. Secure transfer case to jack with chains.
3. Position transfer case under vehicle.
4. Align transfer case and transmission shafts and install transfer case onto the transmission.
5. Install and tighten transfer case attaching nuts to 27-34 N.m (20-25 ft. lbs.) torque.
6. Connect the vent hose.
7. Connect the shift motor and mode sensor wiring connectors. Secure wire harness to clips on transfer case.
8. Align and connect the propeller shafts. Refer to **SHAFT, DRIVE, FRONT LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, FRONT HEAVY DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR HEAVY DUTY, INSTALLATION** .

9. Fill transfer case with correct fluid. Refer to **STANDARD PROCEDURE**. .
10. Install skid plate, if equipped.
11. Remove transmission jack and support stand.
12. Lower vehicle and verify transfer case shift operation.

L-4454A - Remover, Bearing Cup (Originally Shipped In Kit Number(s) 9975.) MB-991168-A - Installer, Seal (Originally Shipped In Kit Number(s) 8847, 8853, 8854, 8854CC, 9975.)

FLUID

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID DRAIN AND REFILL

Fig. 89: Drain & Fill Holes
Courtesy of CHRYSLER GROUP, LLC

1 - FILL HOLE
2 - DRAIN HOLE

The fill (1) and drain (2) plugs are both in the rear case. Refer to **Fig. 89**.

1. Raise vehicle.
2. Position drain pan under transfer case.

NOTE: **It may be necessary to remove the exhaust y-pipe at the exhaust manifold to properly access the fill and drain plugs. Lowering the exhaust will allow the plugs to be accessed for torquing during installation. Refer to PIPE, EXHAUST, REMOVAL .**

3. Remove drain and fill plugs and drain lubricant completely.
4. Install drain plug. Tighten plug to 20-34 N.m (15-25 ft. lbs.).
5. Remove drain pan.
6. Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, Automatic Transmission fluid.
7. Install and tighten fill plug to 20-34 N.m (15-25 ft. lbs.).
8. Install the exhaust y-pipe to the exhaust manifold, if removed. Refer to **PIPE, EXHAUST, INSTALLATION** .

9. Wipe any excess fluid that may have spilled onto the exhaust.
10. Lower vehicle.

MOTOR, SHIFT

DESCRIPTION

DESCRIPTION

Fig. 90: Identifying Shift Motor & Mode Sensor Assembly Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSFER CASE
2 - SHIFT MOTOR AND MODE SENSOR ASSEMBLY
3 - BOLT

The shift motor (2) consists of a permanent magnet D.C. motor with gear reduction to convert a high speed-low torque device into a low speed-high torque device. The output of the device is coupled to a shaft which internally moves the mode and range forks that change the transfer case operating ranges. The motor is rated at 25 amps maximum at 23° C (72° F) with 10 volts at the motor leads.

OPERATION

OPERATION

The transfer case shift motor responds to the Transfer Case Control Module (TCCM) commands to move the transfer case shift sector bi-directionally, as required, to obtain the transfer case operating mode indicated by the instrument panel mounted selector switch.

REMOVAL

REMOVAL

NOTE: **New shift motor assemblies are shipped in the 2WD/AWD position. If a new shift motor assembly will be installed, it will be necessary to shift the transfer case to the 2WD/AWD position prior to motor removal.**

Fig. 91: Identifying Shift Motor & Mode Sensor Assembly Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSFER CASE
2 - SHIFT MOTOR AND MODE SENSOR ASSEMBLY
3 - BOLT

1. Raise the vehicle on a suitable hoist.
2. Disengage the wiring connectors from the shift motor and mode sensor.
3. Remove the bolts (3) holding the shift motor and mode sensor assembly (2) onto the transfer case (1).
4. Separate the shift motor and mode sensor assembly (2) from the transfer case.

INSTALLATION

INSTALLATION

Fig. 92: Identifying Shift Motor & Mode Sensor Assembly Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSFER CASE
2 - SHIFT MOTOR AND MODE SENSOR ASSEMBLY
3 - BOLT

1. Verify that the shift sector o-ring is clean and properly positioned over the shift sector and against the transfer case.

NOTE: Verify that the shift motor position and sector shaft orientation are aligned. It may be necessary to manually shift the transfer case if the shift motor and sector shaft are not aligned.

2. Position the shift motor and mode sensor assembly (2) onto the transfer case (1).
3. Install the bolts (3) to hold the assembly onto the transfer case. Tighten the bolts to 16-24 N.m (12-18 ft.lbs.).

CAUTION: If the original shift motor and mode sensor assembly bolts are reused, be sure to use Mopar® Lock AND Seal or Loctite™ 242 to replenish the lock patch material originally found on the bolts

4. Engage the wiring connectors to the shift motor and mode sensor.
5. Refill the transfer case as necessary.
6. Lower vehicle and verify transfer case operation.

SEAL, OUTPUT SHAFT, FRONT

REMOVAL

REMOVAL

Fig. 93: Removing/Installing Companion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

1 - YOKE HOLDER 6719
2 - BOLTS

1. Remove the front propeller shaft. Refer to **SHAFT, DRIVE, FRONT LIGHT DUTY, REMOVAL** or **SHAFT, DRIVE, FRONT HEAVY DUTY, REMOVAL** .
2. Install two bolts 180° apart into the front output shaft companion flange.
3. Place Yoke Holder (special tool #6719A, Holder, Yoke) (1) over the bolts (2) and against the companion flange. Refer to **Fig. 93**.
4. Remove and discard the front companion flange nut.
5. Remove the companion flange from the front output shaft. It may be necessary to use Pinion Flange Remover (special tool #8992, Remover, Pinion Flange) to remove the companion flange.
6. Using a screw and a slide hammer, remove the front output shaft seal.

INSTALLATION

INSTALLATION

Fig. 94: Removing/Installing Companion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

1 - YOKE HOLDER 6719
2 - BOLTS

1. Install the new front output shaft seal with Seal Installer (special tool #MB-991168-A, Installer, Seal).
2. Install the front companion flange onto the front output shaft.
3. Install two bolts 180° apart into the front output shaft companion flange.
4. Place Yoke Holder (special tool #6719A, Holder, Yoke) (1) over the bolts (2) and against the companion flange. Refer to **Fig. 94**.
5. Install a new front companion flange nut. Tighten the companion flange nut to 176-271 N.m (130-200 ft.lbs.).
6. Install front propeller shaft. Refer to **SHAFT, DRIVE, FRONT LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, FRONT HEAVY DUTY, INSTALLATION** .

SEAL, OUTPUT SHAFT, WITH DUST BOOT

REMOVAL

REMOVAL

Fig. 95: Removing Extension Housing Dust Boot
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - DUST BOOT

1. Raise and support vehicle.
2. Remove rear propeller shaft. Refer to **SHAFT, DRIVE, REAR LIGHT DUTY, REMOVAL** or **SHAFT, DRIVE, REAR HEAVY DUTY, REMOVAL** .
3. Use a suitable chisel or pry tool to remove the rear extension housing dust boot (2). Refer to **Fig. 95**.
4. Use a suitable chisel or pry tool to remove the rear extension housing seal.

INSTALLATION

INSTALLATION

Fig. 96: Installing Extension Housing Seal
Courtesy of CHRYSLER GROUP, LLC

1 - EXTENSION HOUSING
2 - UNIVERSAL HANDLE C-4171
3 - SEAL INSTALLER 9037

1. Clean fluid residue from sealing surface and inspect for defects.
2. Install the extension housing dust boot and seal assembly with Seal Installer (special tool #9037, Installer, Dust Boot/Seal) (3) and Universal Handle (special tool #C-4171, Driver Handle, Universal) (2). Refer to **Fig. 96**.
3. Install rear propeller shaft. Refer to **SHAFT, DRIVE, REAR LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR HEAVY DUTY, INSTALLATION** .
4. Verify proper transfer case fluid level.
5. Lower vehicle.

SENSOR, MODE

DESCRIPTION

DESCRIPTION

Fig. 97: Mode Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - MODE SENSOR

The transfer case mode sensor (1) is an electronic device whose output can be interpreted to indicate the shift motor shaft's rotary position. Refer to **Fig. 97**. The sensor consists of a magnetic ring and four Hall Effect Transistors to create a 4 channel digital device (non-contacting) whose output converts the motor shaft position into a coded signal. The TCCM must supply 5VDC (+/- 0.5v) to the sensor and monitor the shift motor position. The four channels are denoted A, B, C, and D. The sensor is mechanically linked to the shaft of the cam which causes the transfer case shifting. The mode sensor draws less than 53 mA.

OPERATION

OPERATION

During normal vehicle operation, the Transfer Case Control Module (TCCM) monitors the mode sensor outputs at least every 250 (+/-50) milliseconds when the shift motor is stationary and 400 microseconds when the shift motor is active. A mode sensor signal between 3.8 Volts and 0.8 Volts is considered to be undefined.

Refer to **SECTOR ANGLES VS. TRANSFER CASE POSITION** for the relative angles of the transfer case shift sector versus the interpreted transfer case gear operating mode. Refer to **MODE SENSOR CHANNEL STATES** for the sensor codes returned to the TCCM for each transfer case mode sensor position. The various between gears positions can also be referred as the transfer case's coarse position. These coarse positions come into play during shift attempts.

SECTOR ANGLES VS. TRANSFER CASE POSITION

Shaft Angle (Degrees)	Transfer Case Position
+40	4LO
+20	N

0	2WD/AWD
-20	4HI

MODE SENSOR CHANNEL STATES

Transfer Case Angle (degrees)	Sensor Channel A	Sensor Channel B	Sensor Channel C	Sensor Channel D
Between Gears	H	H	L	H
+40 (4LO)	H	H	L	L
Between Gears	H	H	L	H
Between Gears	H	L	L	H
+20 (NEUTRAL)	H	L	L	L
Between Gears	H	L	L	H
Between Gears	H	L	H	H
0 (2WD/AWD)	H	L	H	L
Between Gears	H	L	H	H
Between Gears	L	L	H	H

Between Gears	L	L	H	H
Between Gears	L	H	H	H

SWITCH, TRANSFER CASE

DESCRIPTION

DESCRIPTION

Fig. 98: Transfer Case Selector Switch
Courtesy of CHRYSLER GROUP, LLC

1 - SELECTOR SWITCH

The selector switch assembly is mounted in the left side of the vehicle's Instrument Panel (IP) and consists of a rotary knob connected to a resistive network for the mode and range shift selections. Refer to **Fig. 98**. Also located in this assembly is a recessed, normally open momentary switch for making shifts into and out of transfer case NEUTRAL. A pen, or similar instrument, is used to make a NEUTRAL shift selection, thus reducing the likelihood of an inadvertent shift request.

The selector switch also contains four light emitting diode's (LED's) to indicate the transfer case position and whether a shift is in progress.

OPERATION

OPERATION

As the position of the selector switch varies, the resistance between the Mode Sensor supply voltage pin and the Mode Sensor output will vary. Hardware, software, and calibrations within the Transfer Case Control Module (TCCM) are provided that interpret the selector switch resistance as given in the table below: Refer to **SELECTOR SWITCH INTERPRETATION**.

SELECTOR SWITCH INTERPRETATION

Step	Resistance Range (ohms)	Required Interpretation
A	<200	Shorted
B	400-700	NEUTRAL
C	1050-1450	4LO
D	1850-2300	4HI
E	3050-5950	2WD (Default)
F	9.5-12.5K	In between positions
G	>15.5K	Open

For resistances between the ranges B-E shown for each valid position (T-Case NEUTRAL, 4LO, 4HI, 2WD), the TCCM may interpret the resistance as:

- either of the neighboring valid positions.
- as an invalid fault position.

For resistances between the ranges E and F shown for 2WD and in-between positions, the TCCM may interpret the resistance as:

- the 2WD position.
- an invalid fault position.
- a valid in-between position.

For resistances between the ranges F and G shown for in-between positions and fault condition (open), the TCCM may interpret the resistance as:

- a valid in-between position.
- an invalid fault position.

For resistances between the ranges A and B shown for the fault condition (short) and T-Case NEUTRAL, the TCCM may interpret the resistance as:

- the T-Case NEUTRAL position.
- an invalid fault position.

The LED's in the selector assembly are illuminated/flashed in the following manner to indicate a particular condition or state.

- A solidly illuminated LED indicates a successfully completed shift and the current operating mode of the transfer case. While a shift has been requested but not yet completed, the LED for the desired transfer case position is flashed.
- A flashing operating mode LED for the desired gear indicates that a shift to that position has been requested, but all of the driver controllable conditions have not been met. This is in an attempt to notify the driver that the transmission needs to be put into NEUTRAL, the vehicle speed is too great, or some other condition outlined (other than a diagnostic failure that would prevent this shift) elsewhere is not met. Refer to **MODULE, DRIVETRAIN CONTROL, OPERATION** . Note that this flashing will continue indefinitely until the conditions are eventually met, or the selector switch position is changed, or if diagnostic routines no longer allow the requested shift.
- If the driver attempts to make a shift into transfer case NEUTRAL, and any of the driver controllable conditions are not met, the request will be ignored until all of the conditions are met or until the NEUTRAL select button is released. Additionally the neutral lamp will flash, or begin to flash while the button is depressed and operator controllable conditions are not being met. All of the LED's except the Neutral will flash if any of the operator controllable conditions for shifting are not met while the Neutral button is depressed. This "toggle" type of feature is necessary because the TCCM would interpret another request immediately after the shift into transfer case NEUTRAL has completed.
- No LED's illuminated indicate a fault in the transfer case control system.

DIAGNOSIS AND TESTING

C1400-TRANSFER CASE RANGE SELECT SWITCH PERFORMANCE

Fig. 1: Transfer Case Range Select Switch Supply Voltage Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Drive conditions.

SET CONDITION:

The transfer case selector switch is not reporting a valid voltage for any switch position.

POSSIBLE CAUSES

Possible Causes
TOTALLY INTEGRATED POWER MODULE (TIPM) CONFIGURED INCORRECTLY
TRANSFER CASE SELECTOR SWITCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: Repair all other DTCs first before proceeding with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, record and erase DTCs.
   3. Test drive the vehicle in each Transfer Case Selector Switch position.
   4. With the scan tool, read DTCs.

      Is the DTC status Active at this time?

      Yes

      - Go To 2.

      No

      - Go To 5.
2. **TRANSFER CASE RANGE SELECT SWITCH VOLTAGE 4WD HIGH**
   1. Place the Transfer Case Selector Switch in 4WD HI.
   2. With the scan tool under Data Display, read the Transfer Case Range Select Switch voltage in the CCN.

      Is the voltage approximately 1 volt (±.02 of a volt)?

      Yes

      - Go To 3.

No

- Go To 4.

3. **TRANSFER CASE RANGE SELECT SWITCH VOLTAGE 4WD LO**
   1. Place the Transfer Case Selector Switch in 4WD LO.
   2. With the scan tool under Data Display, read the Transfer Case Range Select Switch voltage in the CCN.

   Is the voltage approximately 2.72 volts (±.02 of a volt)?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

   No

   - Go To 4.

4. **TRANSFER CASE SELECTOR SWITCH**

Fig. 2: Transfer Case Selector Switch Connector Terminals
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transfer Case Selector Switch harness connector.
3. Connect a jumper wire between the (K77) Transfer Case Position Sensor Input circuit and the (K977) Mode Select circuit in the Transfer Case Selector Switch harness connector.
4. Ignition on, engine not running.

5. With the scan tool in Data Display, read the Range Switch voltage in the CCN.

NOTE: The switch voltage should be approximately 5.0 volts (±.05 of a volt).

Does the voltage display as described?

Yes

- Replace the Transfer Case Selector Switch in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the TRANSFER CASE VERIFICATION TEST.

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

5. **INTERMITTENT TRANSFER CASE RANGE SELECT SWITCH PERFORMANCE**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
   4. Look for the data to change or for the DTC to reset during the wiggle test.
   5. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   6. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the TRANSFER CASE VERIFICATION TEST.

   No

   - Test complete.

P0560-BATTERY SYSTEM VOLTAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Battery voltage is supplied to the controller and is used to write to the controller EEPROM after vehicle shutdown.

WHEN MONITORED:

- Continuously with the Ignition on and the engine running.

SET CONDITION:

- Controller detects EEPROM was not correctly written at key off. If the controller detects an error on two consecutive key cycles, this DTC will set.

Possible Causes
RELATED TIPM DTCS
BATTERY DISCONNECTED WITH THE KEY ON
(A104) B(+) CIRCUIT OPEN
(A104) B(+) SHORT TO GROUND
(Z133) GROUND CIRCUIT OPEN
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **BATTERY DISCONNECTED**

   Was the battery disconnected while the key was ON?

   Yes

   - Disconnecting the battery with the Ignition on can set this DTC. Always turn the key to the Lock position before disconnecting the battery.

   No

   - Go To 2.
2. **CHECK IF DTC IS CURRENT**
   1. Using the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. Clear DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. Read TCM DTCs.

Did the DTC reset?

Yes

- Go To 3.

No

- Go To 7.

3. **CHECK TIPM FOR DTCS**
   1. With the scan tool, view TIPM DTCs.

      Are there any TIPM power output codes stored?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 4.

4. **CHECK THE (A104) FUSED B(+) CIRCUIT FOR AN OPEN**

Fig. 3: Checking Fused B(+) Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C2 harness connector.
3. Disconnect the TIPM C10 harness connector.
4. Measure the resistance of the (A104) Fused B(+) circuit between the TCM C2 harness connector and TIPM C10 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (A104) Fused B(+) circuit for an open.

- Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (A104) FUSED B(+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 4: Checking Fused B(+) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (A104) Fused B(+) circuit.

   Is the resistance below 100k Ohms?

Yes

- Repair the (A104) Fused B(+) circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE (Z133) GROUND CIRCUIT FOR AN OPEN**

Fig. 5: Checking Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.

2. Using a 12-volt test light connected to 12-volts, check the (Z133) Ground circuits in the TCM C2 harness connector and ground.

   NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly for all of the Ground circuits?

   Yes

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the TCM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

   No

   - Repair the (Z133) Ground circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

   No

   - Test Complete.

P0613-INTERNAL TRANSMISSION PROCESSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) performs several internal checks on the processor. The controller

checks the Check Sum of the ROM, the Read/Write integrity of the RAM, and the Check Sum of the EEPROM.

WHEN MONITORED:

Continuously with the Ignition on and the engine running.

SET CONDITION:

Transmission Control Module (TCM) detects an error in the RAM, ROM, or EEPROM.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **TCM INTERNAL ERROR**

   Repair

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the TCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

P0702-TRANSMISSION CONTROL SYSTEM ELECTRICAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Output is used to supply the primary power to the Transmission Control Module (TCM). When the ignition switch is in the unlock, run or crank position, the ignition switch provides and input to the Totally Integrated Power Module (TIPM). The TIPM then energizes the Transmission Control relay which provides voltage to the TCM.

WHEN MONITORED:

Continuously with the Ignition on and the engine running.

SET CONDITION:

The TCM detects low voltage on the Transmission Control Output while the engine speed is greater than 0 rpm for 15 seconds.

POSSIBLE CAUSES

Possible Causes
RELATED TIPM DTCS
A916 BATTERY FEED CIRCUIT
T16 TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
T16 TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO GROUND
TRANSMISSION CONTROL RELAY
TRANSMISSION CONTROL MODULE (TCM)
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 8.
2. **CHECK FOR RELATED TIPM DTCS**
    1. With the scan tool, view TIPM DTCs.

    Are there any TIPM power output codes stored?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 3.

3. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT**

Fig. 6: Checking Transmission Control Output Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C2 harness connector.
3. Ignition on, engine not running.
4. Using the scan tool, actuate the Transmission Control Output in the TIPM.
5. Using a 12-volt test light connected to ground, check both of the (T16) Transmission Control Output circuits on the appropriate terminal of TCM C2 harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly on both of the TCM (T16) Transmission Control Output circuits?

Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT**

Fig. 7: Checking Transmission Control Output Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Install a substitute Transmission Control relay.
3. Ignition on, engine not running.
4. Using the scan tool, actuate the Transmission Control Output in the TIPM.
5. Using a 12-volt test light connected to ground, check both of the (T16) Transmission Control Output circuits on the appropriate terminal of TCM C2 harness connector.

   Does the test light illuminate brightly on both of the TCM (T16) Transmission Control Output circuits?

   Yes

- Replace the Transmission Control Relay.
- Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (A916) BATTERY FEED CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Remove Transmission Control relay.
   3. Ignition on, engine not running.
   4. Using a 12-volt test light connected to ground, check the (A916) Battery Feed circuit at the Transmission Control relay harness connector.

      Does the test light illuminate brightly on the (A916) Battery Feed circuit?

      Yes

      - Go To 6.

      No

      - Check the (A916) Battery Feed circuit for and open or short to ground. If no problems are found, replace the TIPM in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.
6. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN**

Fig. 8: Checking Transmission Control Output Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance of the (T16) Transmission Control Output circuit between the TCM C2 harness connector and the Transmission Control relay harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T16) Transmission Control Output circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

   No

- Go To 7.

7. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR A SHORT TO GROUND**

Fig. 9: Checking Transmission Control Output Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T16) Transmission Control Output circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T16) Transmission Control Output circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

No

- Using the schematics as a guide, check the Totally Integrated Power Module (TIPM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the TIPM in accordance with the Service Information.

8. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

    No

    - Test Complete.

P0706-TRANSMISSION RANGE SENSOR RATIONALITY

Fig. 10: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Range Sensor (TRS) is a multiple position selector switch which changes the signal path by redirecting a 12-volt signal source to seven different TRS signal circuits (P, R, N, D, 3, 2, 1) and also houses a Park/Neutral (P/N) switch circuit. These circuits are monitored by the Transmission Control Module and used in conjunction with various pressure switches to validate proper operation of the transmission and diagnose any possible problem. In a normal operating mode, pressure switch 8, is in an "Open" state in P, R, or N. and in a

"Closed" state in any forward gear (engine running).

CONDITION ONE:

When Monitored:

- Continuously with the Ignition on and the engine running.

Set Condition:

- Pressure switch 8 is "Closed" in Park or Neutral lever positions for the period of 50 ms or greater.

CONDITION TWO:

When Monitored:

- Continuously with the Ignition on and the engine running.

Set Condition:

- Pressure Switch 8 is "Closed" in P, R, or N for the period of 500 ms or greater.

CONDITION THREE:

When Monitored:

- Ignition on, engine running with a engine speed greater than 550 rpm.

Set Condition:

- Pressure Switch 8 is "Open" in D, 3, 2, or 1 for the period of 7.0 seconds for 2 consecutive tests.

CONDITION FOUR:

When Monitored:

- Ignition on.

Set Condition:

- Shift Lever is reading other than Park or Neutral during the first 50 ms of startup.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION RANGE SENSOR NOT PROPERLY CALIBRATED
(T807) PRESSURE SIGNAL 8 SHORT TO VOLTAGE

(T807) PRESSURE SIGNAL 8 SHORT TO ANOTHER CIRCUIT
(T807) PRESSURE SIGNAL 8 SHORT TO GROUND
(T807) PRESSURE SIGNAL 8 OPEN
PRESSURE SWITCH 8
TRANSMISSION RANGE SENSOR NOT PROPERLY CALIBRATED
TRANSMISSION RANGE SENSOR
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**

   NOTE: This DTC may set if the Transmission Range Sensor has been replaced or reinstalled and not properly adjusted (calibrated). Make sure the TRS is properly adjusted in accordance to the Service Information before attempting to perform this diagnostic procedure. If the TRS was improperly adjusted, adjust as necessary and Refer to STANDARD PROCEDURE and perform the AS68RC VERIFICATION TEST.

   1. Using the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. Clear DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 2.

   No

   - Go To 8.

2. **CHECK PRESSURE SWITCH 8 READING ON THE SCAN TOOL**
   1. Ignition on, engine not running.
   2. With the scan tool, monitor the Pressure Switch 8 state (Open-Closed) in the next step.
   3. Move the shift lever to each of the shift lever positions (P, R, N, D, 3, 2, and 1).

   Does the Pressure Switch 8 read "Closed" in all shift positions?

Yes

- Go To 4.

No

- Go To 3.

3. **COMPARE PRESSURE SWITCH 8 STATE TO SHIFT LEVER POSITION**
   1. With the scan tool, monitor the Pressure Switch 8 state (Open-Closed) in the following step(s).

      CAUTION: Apply the parking brake.

   2. Start the engine and with the brakes firmly applied, move the shift lever to each of the shift lever positions (P, R, N, D, 3, 2, 1) and record your findings.

      Select the answer that best describes your readings:

      Pressure Switch 8 reads "Closed" in P, R, or N.

      - This is an indication of a hydraulic leak into the Pressure Solenoid 8 hydraulic oil circuit. Inspect the Valve Body and control valves for internal hydraulic leakage, sticking, scored etc. and repair or replace as necessary.
      - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

      Pressure Switch 8 reads "Open" in all shift positions.

      - Go To 6.

4. **CHECK THE PRESSURE SWITCH 8**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid C1 harness connector.
   3. Ignition on, engine not running.
   4. With the scan tool, read the Pressure Switch 8 state (Open-Closed).

      Does the Pressure Switch 8 state read as "Closed"?

      Yes

      - Go To 5.

      No

      - Inspect the transmission internal wiring from the Transmission Solenoid C1 connector to the Pressure Switch 8 harness connector for damage, chafing or a short to ground and repair or

replace as necessary. If no problems are found, replace the Pressure Switch 8 in accordance with the Service Information.

- Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

5. **CHECK THE (T807) PRESSURE SIGNAL 8 CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off to the lock position.
    2. Disconnect the TCM C3 harness connector.
    3. Ignition on, engine not running.
    4. With the scan tool, read the Pressure Switch 8 state (Open-Closed).

    Does the Pressure Switch 8 state read as "Closed"?

    Yes

    - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the TCM in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

    No

    - Repair the (T807) Pressure Signal 8 circuit for a short to ground.
    - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

6. **CHECK THE PRESSURE SWITCH**

Fig. 11: Checking Pressure Switch
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid C1 harness connector.
3. Ignition on, engine not running.
4. With the scan tool, monitor the Pressure Switch 8 state (Open-Closed) in the following step.
5. Using a 12-volt test light connected to ground, probe the (T807) Pressure Switch 8 Signal circuit in the Transmission Solenoid C1 harness connector while monitoring the Pressure Switch 8 state on the scan tool.

   Does the scan tool show the Pressure Switch 8 state change from "Open" to "Closed" when probing the Pressure Switch 8 Signal circuit?

   Yes

   - Check the transmission internal wiring and connectors for the (T807) Pressure Switch 8 Signal circuit between the Transmission Solenoid C1 connector and the Pressure Switch 8 harness connector for an open and repair or replace as necessary. Also check if the Pressure Switch 8 is properly torqued in the valve body. If no problems are found, replace the Pressure Switch 8 in accordance with the Service Information.

- Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

No

- Go To 7.

7. **CHECK THE (T807) PRESSURE SIGNAL 8 CIRCUIT FOR AN OPEN**

Fig. 12: Checking Pressure Signal No. 8 Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid C1 harness connector.
3. Measure the resistance of the (T807) Pressure Signal 8 circuit between the TCM C3 harness connector and Transmission Solenoid C1 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T807) Pressure Signal 8 circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the TCM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

8. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform AS68RC VERIFICATION TEST.

      No

      - Test Complete.

P0707-TRANSMISSION RANGE SENSOR CIRCUIT LOW

Fig. 13: Transmission Range Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Range Sensor (TRS) is a multiple position selector switch which changes the signal path by redirecting a 12-volt signal source to seven different TRS signal circuits (P, R, N, D, 3, 2, 1) and also houses a Park/Neutral (P/N) switch circuit. These circuits are monitored by the Transmission Control Module and used in conjunction with various pressure switches to validate proper operation of the transmission and diagnose any possible problem. In a normal operating mode, pressure switch 8, is in an "Open" state in P, R, or N. and in an "Closed" state in any forward gear (engine running).

CONDITION ONE:

When Monitored:

- Ignition on in the run position.
- Pressure Switch 8 detected as "Open"
- Output speed greater than or equal to 250 rpm.

Set Condition:

- If the Transmission Control Module (TCM) detects no shift lever position for the period of 2.0 seconds for two consecutive key cycles.

CONDITION TWO:

When Monitored:

- Ignition on in the run position.
- Shift lever position in P, R, D, 3, 2, or 1.

Set Condition:

- If the Transmission Control Module (TCM) detects shift lever positions P, R, D, 3, 2, or 1 up or down past N but does not detect N position for 4 or more times in one ignition cycle for the period of 500 msec.

CONDITION THREE:

When Monitored:

- Ignition on in the run position.
- Shift lever position in P, N, D, 3, 2, or 1.

Set Condition:

- If the Transmission Control Module (TCM) detects shift lever positions P, N, D, 3, 2, or 1 up or down past R but does not detect the R position for 4 or more times in one ignition cycle for the period of 500 msec.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION RANGE SENSOR IMPROPERLY CALIBRATED
TRS HARNESS CONNECTOR
(F1) FUSED IGNITION SWITCH OUTPUT (OFF-RUN-START) OPEN
(T826) TRS REVERSE SIGNAL CIRCUIT OPEN
(T825) TRS NEUTRAL SIGNAL CIRCUIT OPEN
(T826) TRS REVERSE SIGNAL CIRCUIT SHORT TO GROUND
(T825) TRS NEUTRAL SIGNAL CIRCUIT SHORT TO GROUND
TRANSMISSION RANGE SENSOR
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**

   NOTE: This DTC may set if the Transmission Range Sensor has been replaced or reinstalled and not properly adjusted (calibrated). Make sure the TRS is properly adjusted in accordance to the Service Information before attempting to perform this diagnostic procedure. If the TRS was improperly adjusted, adjust as necessary and Refer to STANDARD PROCEDURE and perform the AS68RC VERIFICATION TEST.

   1. Using the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. Clear DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 2.

   No

   - Go To 12.

2. **CHECK IF DTC CONDITIONS**
   1. Ignition on, engine not running.
   2. With the scan tool, monitor the TRS circuits while moving the shift lever several times to each gear

position (P, R, N, D, 3, 2, and 1).

Pick the answer that best describes your findings:

No TRS circuits change from "Open" to "Closed"

- Go To 3.

The Reverse (R) TRS position does not change from "Open" to "Closed"

- Go To 6.

The Neutral (N) TRS position does not change from "Open" to "Closed"

- Go To 9.

All TRS circuits seem to be working properly

- Go To 12.

3. **CHECK THE TRS CONNECTOR**
   1. Turn the ignition off to the lock position.
   2. Inspect the TRS harness connector.

   Is the TRS harness connector unplugged or not fully seated?

   Yes

   - Repair or replace the TRS harness connector as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (F1) FUSED IGNITION SWITCH OUTPUT (OFF-RUN-START) CIRCUIT FOR AN OPEN**

Fig. 14: Checking Fused Ignition Switch Output (Off-Run-Start) Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TRS harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Ignition on, engine not running.
4. Using a test light connected to ground, check the (F1) Fused Ignition Switch Output (Off-Run-Start) circuit.

NOTE: The test light must illuminate brightly. Compare the brightness to

that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 5.

No

- Repair the (F1) Fused Ignition Switch Output (Off-Run-Start) circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK THE TRANSMISSION RANGE SENSOR**

Fig. 15: Checking Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. With the scan tool, monitor the TRS circuits in the following steps.
3. Using a jumper wire, jump each TRS circuit one at a time to the (F1) Fused Ignition Switch Output (Off-Run-Start) circuit in the TRS harness connector.

   Do the TRS circuits read as "Closed" on each circuit when connected with a jumper wire?

   Yes

- Replace the Transmission Range Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

6. **CHECK THE (T826) TRS REVERSE SIGNAL CIRCUIT**

Fig. 16: Checking TRS Reverse Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TRS harness connector.
3. Using a jumper wire, connect the (F1) Fused Ignition Switch Output (Off-Run-Start) circuit to the (T826) TRS Reverse Signal circuit in the TRS harness connector.
4. Ignition on, engine not running.
5. With the scan tool, read the TRS Reverse state.

Does the scan tool read as "Closed"?

Yes

- Replace the Transmission Range Sensor in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 7.

7. **CHECK THE (T826) TRS REVERSE CIRCUIT FOR AN OPEN**

Fig. 17: Checking TRS Reverse Circuit For An Open

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C3 harness connector
3. Measure the resistance of the (T826) TRS Reverse Signal circuit between TRS harness connector and the TCM C3 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (T826) TRS Reverse Signal circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 8.

8. **CHECK THE (T826) TRS REVERSE SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 18: Checking TRS Reverse Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T826) TRS Reverse Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T826) TRS Reverse Signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes

that may apply. If no problems are found, replace and program the TCM in accordance with the Service Information.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

9. **CHECK THE (T825) TRS NEUTRAL SIGNAL CIRCUIT**

Fig. 19: Checking TRS Neutral Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TRS harness connector.

3. Using a jumper wire, connect the (F1) Fused Ignition Switch Output (Off-Run-Start) circuit to the (T825) TRS Neutral Signal circuit in the TRS harness connector.
4. Ignition on, engine not running.
5. With the scan tool, read the TRS Neutral state.

   Does the scan tool read as "Closed"?

   Yes

   - Replace the Transmission Range Sensor in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 10.

10. **CHECK THE (T825) TRS NEUTRAL CIRCUIT FOR AN OPEN**

Fig. 20: Checking TRS Neutral Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C3 harness connector
3. Measure the resistance of the (T825) TRS Neutral Signal circuit between TRS harness connector and the TCM C3 harness connector.

   Is the resistance above 5.0 Ohms?

Yes

- Repair the (T825) TRS Neutral Signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 11.

11. **CHECK THE (T825) TRS NEUTRAL SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 21: Checking TRS Neutral Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T825) TRS Neutral Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

- Repair the (T825) TRS Neutral Signal circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

12. **CHECK WIRING AND CONNECTORS**
    1. With the scan tool, erase Transmission DTCs.
    2. Test Drive the vehicle while perform multiple upshifts, downshifts, stops, shift to park then to drive.
    3. With the scan tool, read Transmission DTCs.

    Did the DTC reset?

    Yes

    - Go To 3.

    No

    - Go To 13.

13. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

    No

    - Test Complete.

P0708-TRANSMISSION RANGE SENSOR CIRCUIT HIGH

Fig. 22: Transmission Range Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Range Sensor (TRS) is a multiple position selector switch which changes the signal path by redirecting a 12-volt signal source to seven different TRS signal circuits (P, R, N, D, 3, 2, 1) and also houses a Park/Neutral (P/N) switch circuit. These circuits are monitored by the Transmission Control Module and used in conjunction with various pressure switches to validate proper operation of the transmission and diagnose any possible problem. In a normal operating mode, pressure switch 8, is in an "Open" state in P, R, or N. and in an "Closed" state in any forward gear (engine running).

DIAGNOSTIC TEST

When Monitored:

- Ignition on in the run position.

Set Condition:

- When the Transmission Control Module (TCM) detects two or more Shift Lever positions registering "CLOSED" for the period of 500 msec.

POSSIBLE CAUSES

Possible Causes
TRS SIGNAL CIRCUITS SHORT TO VOLTAGE
TRS SIGNAL CIRCUIT SHORT TO ANOTHER TRS SIGNAL CIRCUIT
TRANSMISSION RANGE SENSOR
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**

NOTE: **This DTC may set if the Transmission Range Sensor has been replaced or reinstalled and not properly adjusted (calibrated). Make sure the TRS is properly adjusted in accordance to the Service Information before attempting to perform this diagnostic procedure. If the TRS was improperly adjusted, adjust as necessary and Refer to STANDARD PROCEDURE and perform the AS68RC VERIFICATION TEST.**

   1. Using the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. Clear DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.

5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 2.

   No

   - Go To 6.

2. **CHECK THE TRANSMISSION RANGE SENSOR STATES**
   1. Ignition on, engine not running.
   2. With the scan tool, monitor the TRS states (Open-Closed) in the following steps:
   3. Slowly move the shift lever to all positions (P, R, N, D, 3, 2, 1) while noting the TRS states.

      Is there a shift position that shows more than one TRS position as "Closed"?

      Yes

      - Go To 4.

      No

      - Go To 3.

3. **CHECK THE CONNECTORS**
   1. Turn the ignition off to the lock position.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.

      Was there any problems found?

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

      No

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the TCM in accordance with the Service Information.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

4. **CHECK THE TRANSMISSION RANGE SENSOR**
    1. Turn the ignition off to the lock position.
    2. Disconnect the TRS harness connector.
    3. Ignition on, engine not running.
    4. With the scan tool read the TRS states (P, R, N, D, 3, 2, 1).

    Did any of the TRS positions show as "Closed"?

    Yes

    - Repair the identified (P, R, N, D, 3, 2, 1) TRS Signal circuit for a short to voltage.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

    No

    - Go To 5.

5. **CHECK THE TRS SIGNAL CIRCUIT FOR A SHORT TO ANOTHER TRS SIGNAL CIRCUIT**
    1. Turn the ignition off to the lock position.
    2. Disconnect the TCM C3 harness connector.
    3. Measure the resistance between the two identified TRS signal circuits (P, R, N, D, 3, 2, 1) confirmed earlier.

    Is the resistance below 100k ohms?

    Yes

    - Repair the identified TRS Signal circuit for a short to another TRS Signal circuit.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

    No

    - Replace and adjust the Transmission Range Sensor in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

6. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Test Complete.

Fig. 23: Transmission Temperature Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Oil Temperature Sensor is used to determine shift schedule selection. Transmission Oil Temperature is also used in TCC operation. The Transmission Control Module (TCM) monitors the transmission temperature by comparing Transmission Oil Temperature to Ambient and Engine Coolant Temperature after a cold soak, by comparing Transmission Oil temperature increases in relation to Engine temperature increases, and abnormal changes over time.

CONDITION ONE:

When Monitored:

- System voltage between 10.0 and 16.0 volts.
- Engine coolant temperature data (CAN) is normal and greater than or equal to 70° C (158° F).
- Engine coolant temperature increase is greater than 50° C (90° F).
- Output speed sensor greater than 300 rpm for 410 sec.
- Start up transmission oil temperature is between -40° C and 40° C (-40° F and 104° F).
- No Output Speed Sensor errors are detected.

Set Condition:

- Change in Transmission Oil Temperature is less than or equal to 2° C (4° F).

CONDITION TWO:

When Monitored:

- System voltage between 10.0 and 16.0 volts.
- Engine coolant temperature data and output speed sensor is normal.
- Output speed sensor greater than 300 rpm for 410 seconds.

Set Condition:

- Change in transmission oil temperature is greater than 20° C (36° F) in 100 msec and transmission oil temperature is less than 70° C (158° F) for more than five seconds.

CONDITION THREE:

When Monitored:

- Ambient temperature is less than 43° C (109° F)

- Engine coolant temp is equal to Ambient temperature within ± 10° C (18° F)

Set Condition:

- Transmission oil temperature is greater than Engine Ambient temperature by a calibrated value (see chart below).

Difference of Transmission Temperature compared to Engine Ambient Temperature	
ENGINE AMBIENT TEMPERATURE	**TRANSMISSION TEMPERATURE DIFFERENCE**
-30° C (-22° F)	±20° C (± 36° F)
-10° C (14° F)	±20° C (± 36° F)
0° C (32° F)	±20° C (± 36° F)
20° C (68° F)	±10° C (± 18° F)

CONDITION FOUR:

When Monitored:

- Transmission oil temperature is less than or equal to 20° C (68° F) at Ignition on.

Set Condition:

- Transmission oil temperature is less than 20° C (68° F) after a calibrated time (see chart below).

Drive time above 48 mph based on Transmission Temperature at Ignition on	
TRANSMISSION TEMPERATURE AT IGNITION ON	**DRIVE TIME ABOVE 48 MPH**
-40° C (-40° F)	40 MINUTES
-30° C (-22° F)	30 MINUTES
-20° C (-4° F)	20 MINUTES
-10° C (14° F)	15 MINUTES
0° C (32° F)	13 MINUTES
10° C (50° F)	6 MINUTES
15° C (59° F)	6 MINUTES

POSSIBLE CAUSES

Possible Causes
RELATED ENGINE TEMPERATURE SENSOR DTCS
RELATED TRANSMISSION TEMPERATURE SENSOR DTCS
INTERMITTENT TRANSMISSION TEMPERATURE SENSOR
TRANSMISSION TEMPERATURE SENSOR
TRANSMISSION CONTROL MODULE (TCM)

DIAGNOSTIC TEST

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED ENGINE DTCs**
    1. With the scan tool, view Engine DTCs.

       Are there any Engine Coolant and/or Ambient DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK FOR RELATED TRANSMISSION DTCs**
    1. With the scan tool, view Transmission DTCs.
    2. Record any Transmission Freeze Frame data.

       Are there any other Transmission temperature sensor DTCs?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 3.
3. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

       Did the DTC reset?

       Yes

- Go To 4.

No

- Go To 9.

4. **COMPARE THE TRANSMISSION TEMPERATURE TO ENGINE COOLANT TEMPERATURE**

NOTE: **To test the transmission temperature sensor, the engine and transmission temperature must be at or below 29.4° C (85° F).**

1. With the scan tool, read the Transmission and Engine temperatures.

   Is the transmission temperature within 5° C (9° F) of the engine coolant temperature?

   Yes

   - Go To 5.

   No

   - Go To 8.

5. **CHECK IF THE TRANSMISSION TEMPERATURE INCREASES 15 DEGREES OVER 10 MINUTE PERIOD**

NOTE: **To test the transmission temperature sensor, the engine and transmission temperature must be at or below 29.4° C (85° F).**

CAUTION: Apply the parking brake.

1. Start the engine, firmly apply the brakes and allow the engine to idle in Drive.
2. With the scan tool, monitor the Transmission Temperature.

   NOTE: **If the transmission temperature sensor is working properly, the transmission temperature should rise at least 8° C (15° F) within a ten minute period.**

3. Did the transmission temperature increase at a steady rate and rise at least 8° C (15° F) over a 10 minute period?

   Yes

   - Go To 9.

No

- Go To 6.

6. **CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C1 harness connector.

      NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, monitor the Transmission Oil Temperature.

      Does the Transmission Oil Temperature read -40° C (-40° F) ± 2° C (4° F)?

      Yes

      - Go To 7.

      No

      - Refer to **DIAGNOSTIC CODE INDEX** and perform P0713-TRANSMISSION TEMPERATURE SENSOR 1 HIGH as if the DTC is active.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 24: Checking Transmission Temperature Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Connect a jumper wire between the (T54) Transmission Temperature Signal circuit and the (T820) Sensor Ground circuit in the Transmission Solenoid Assembly C1 harness connector.
3. Ignition on, engine not running.
4. With the scan tool, monitor the Transmission Oil Temperature.

   Does the Transmission Oil Temperature read 200° C (392° F) ± 2° C (4° F)?

Yes

- Go To 8.

No

- Refer to **DIAGNOSTIC CODE INDEX** and perform the diagnostic procedure for P0712-TRANSMISSION TEMPERATURE SENSOR 1 LOW as if the DTC is active.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

8. **CHECK THE TRANSMISSION TEMPERATURE SENSOR**

Fig. 25: Checking Transmission Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

TYPICAL VALUES FOR TRANSMISSION TEMPERATURE SENSOR	
TEMPERATURE	**APPROXIMATE OHM**
-30° C (-22° F)	44000 Ohms ± 6600
10° C (50° F)	6455 Ohms ± 645
110° C (230° F)	247 Ohms ± 16

145° C (293° F)	111 Ohms ± 6

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid harness connector.
3. Disconnect the TCM C2 and C3 harness connectors.

NOTE: Check connectors - Clean/repair as necessary

4. Measure the resistance of the Transmission Temperature Sensor between the (T54) Transmission Temperature Signal circuit in the TCM C2 harness connector and the (T820) Sensor Ground circuit in the TCM C3 harness connector.
5. Using the chart at the chart above, compare the Temperature Sensor temperature to the correlating resistance value.

   Is the resistance within the specified range when the sensor is at the given temperature?

   Yes

   - Go To 9.

   No

   - Remove the Transmission Oil Pan and inspect the internal Transmission harness, pins, terminals, and connectors for corrosion, damage, or terminal push out. If no problems are found, replace the Transmission Temperature Sensor in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

9. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Test Complete.

THEORY OF OPERATION

The Transmission Oil Temperature Sensor is used to determine shift schedule selection. Transmission Oil Temperature is also used in TCC operation.

WHEN MONITORED:

Continuously with the ignition on and the engine running.

SET CONDITION:

The Diagnostic Trouble Code (DTC) will set if the monitored Transmission Temperature Sensor Signal circuit is greater than 200° C (392° F) for more than 500 ms.

POSSIBLE CAUSES

Possible Causes
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO (T820) SENSOR GROUND CIRCUIT
TRANSMISSION TEMPERATURE SENSOR
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

No

- Go To 5.

2. **CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 27: Checking Transmission Temperature Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C2 harness connector.
3. Disconnect the Transmission Solenoid Assembly C1 harness connector.
4. Measure the resistance between ground and the (T54) Transmission Temperature Sensor Signal circuit.

Is the resistance above 100k Ohms?

Yes

- Go To 3.

No

- Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO (T820) SENSOR GROUND CIRCUIT**

Fig. 28: Checking Transmission Temperature Sensor Signal Circuit For A Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the TCM C3 harness connectors.
2. Measure the resistance between the (T54) Transmission Temperature Sensor Signal circuit and (T820) Sensor Ground circuit in the Transmission Solenoid Assembly C1 harness connector.

   Is the resistance above 100k Ohms?

   Yes

   - Go To 4.

   No

   - Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to the (T820) Sensor Ground circuit.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

4. **CHECK THE TRANSMISSION TEMPERATURE SENSOR**

Fig. 29: Checking Transmission Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

TYPICAL VALUES FOR TRANSMISSION TEMPERATURE SENSOR	
TEMPERATURE	**APPROXIMATE OHM**
-30° C (-22° F)	44000 Ohms ± 6600
10° C (50° F)	6455 Ohms ± 645
110° C (230° F)	247 Ohms ± 16

145° C (293° F)	111 Ohms ± 6

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid harness connector.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary

4. Measure the resistance of the Transmission Temperature Sensor between the (T54) Transmission Temperature Signal circuit and the (T820) Sensor Ground circuit in the TCM C3 harness connector.
5. Using the chart at the chart above, compare the Temperature Sensor temperature to the correlating resistance value.

   Is the resistance within the specified range when the sensor is at the given temperature?

   Yes

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.

   No

   - Remove the Transmission Oil Pan and inspect the internal Transmission harness, pins, terminals, and connectors for corrosion, damage, or terminal push out. If no problems are found, replace the Transmission Temperature Sensor in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.

THEORY OF OPERATION

The Transmission Oil Temperature Sensor is used to determine shift schedule selection. Transmission Oil Temperature is also used in TCC operation.

WHEN MONITORED:

Continuously with the ignition on and the engine running.

SET CONDITION:

The Diagnostic Trouble Code (DTC) will set if the monitored Transmission Temperature Sensor Signal circuit is greater than -40° C (-40° F) for more than 500 ms.

POSSIBLE CAUSES

Possible Causes
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
(T820) SENSOR GROUND CIRCUIT OPEN
INTERNAL TRANSMISSION HARNESS
TRANSMISSION TEMPERATURE SENSOR
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

- Go To 2.

No

- Go To 6.

2. **CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 31: Checking Transmission Temperature Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connectors.
3. Disconnect the Transmission Solenoid Assembly C1 harness connector.
4. Ignition on, engine not running.
5. Measure the voltage of the (T54) Transmission Temperature Sensor Signal circuit in the TCM C1 harness connector.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 3.

3. **CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 32: Checking Transmission Temperature Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T54) Transmission Temperature Sensor Signal circuit between the PCM C2 harness connector and the Transmission Solenoid Assembly harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4.

   No

- Repair the (T54) Transmission Temperature Sensor Signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

4. **CHECK THE (T820) SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 33: Checking Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T820) Sensor Ground circuit between the TCM C3 harness connector and the Transmission Solenoid Assembly C1 harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 5.

No

- Repair the (T820) Sensor Ground circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK THE TRANSMISSION TEMPERATURE SENSOR**

Fig. 34: Checking Transmission Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

TYPICAL VALUES FOR TRANSMISSION TEMPERATURE SENSOR	
TEMPERATURE	**APPROXIMATE OHM**
-30° C (-22° F)	44000 Ohms ± 6600
10° C (50° F)	6455 Ohms ± 645
110° C (230° F)	247 Ohms ± 16

145° C (293° F)	111 Ohms ± 6

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid harness connector.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary

4. Measure the resistance of the Transmission Temperature Sensor between the (T54) Transmission Temperature Signal circuit and the (T820) Sensor Ground circuit in the TCM C3 harness connector.
5. Using the chart at the chart above, compare the Temperature Sensor temperature to the correlating resistance value.

   Is the resistance within the specified range when the sensor is at the given temperature?

   Yes

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Remove the Transmission Oil Pan and inspect the internal Transmission harness, pins, terminals, and connectors for corrosion, damage, or terminal push out. If no problems are found, replace the Transmission Temperature Sensor in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Test Complete.

Fig. 35: Transmission Temperature Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Input Speed sensor is used to calculate torque converter speed ratio. The Input Speed sensor is also used together with Output Speed sensor to calculate gear ratios.

CONDITION ONE:

When Monitored:

- Output Speed is greater than 250 rpm for four seconds.
- Transmission Range is not in Park or Neutral.
- Engine Speed is greater than 300 rpm.
- Transmission is not currently in a gear change.

Set Condition:

- 32, 000 consecutive Output Speed sensor pulses without Input Speed sensor pulses for two consecutive Ignition cycles.

CONDITION TWO:

When Monitored:

- Wheel Speed is greater than 360 rpm.
- Transmission Range is not in Park or Neutral.
- Engine Speed is greater than 550 rpm.
- Transmission is not currently in a gear change.

Set Condition:

- 500 consecutive Wheel Speed sensor pulses without Input Speed sensor pulses for two consecutive Ignition cycles.

POSSIBLE CAUSES

Possible Causes
(T52) INPUT SPEED SIGNAL CIRCUIT OPEN
(T52) INPUT SPEED SIGNAL CIRCUIT SHORT TO GROUND
(T52) INPUT SPEED SIGNAL CIRCUIT SHORT TO VOLTAGE
(T52) INPUT SPEED SIGNAL CIRCUIT SHORT TO ANOTHER CIRCUIT

(T72) 8 VOLT SUPPLY CIRCUIT OPEN
(T72) 8 VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T72) 8 VOLT SUPPLY CIRCUIT SHORT TO ANOTHER CIRCUIT
INPUT SPEED SENSOR
DAMAGED OR MAGNETIZED TONE RING
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.

    NOTE: It may be necessary to road test the vehicle to duplicate the original set conditions.

    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 11.
2. **CHECK THE (T72) 8 VOLT SUPPLY CIRCUIT**

Fig. 36: Checking 8 Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Input Speed Sensor harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (T72) 8 Volt Supply circuit in the Input Speed Sensor harness connector.

   Is the voltage 8.0 volts (± 0.2 of a volt)?

   Yes

   - Go To 3.

   No

   - Go To 4.

3. **LOAD TEST THE (T72) 8 VOLT SUPPLY CIRCUIT**

Fig. 37: Checking 8 Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C2 harness connector.
3. Disconnect the Input Speed Sensor and the Output Speed Sensor harness connectors.
4. Using a jumper wire, ground the (T72) 8 Volt Supply circuit in the Input Speed Sensor harness connector.
5. Using a 12-volt test light connected to B (+), probe the (T72) 8 Volt Supply circuit on the appropriate terminal of TCM C2 harness connector.

Does the test light illuminate brightly?

Yes

- Go To 6.

No

- Go To 4.

4. **CHECK THE (T72) 8 VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 38: Checking 8 Volt Supply Circuit For An Open

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C2 harness connector.
3. Measure the resistance of the (T72) 8 Volt Supply circuit between the TCM C2 harness connector and the Input Speed Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the (T72) 8 Volt Supply circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK THE (T72) 8 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 39: Checking 8 Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T72) 8 Volt Supply Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T72) 8 Volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

6. **CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 40: Checking Input Speed Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the TCM C1 harness connector.

2. Disconnect the Input Speed Sensor harness connector.
3. Measure the resistance of the (T52) Input Speed Sensor Signal circuit between the TCM C1 harness connector and the Input Speed Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7.

   No

   - Repair the (T52) Input Speed Sensor Signal circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 41: Checking Input Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T52) Input Speed Sensor Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T52) Input Speed Sensor Signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 42: Checking Input Speed Sensor Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (T52) Input Speed Sensor Signal circuit and all other circuits in the TCM C1 harness connector.

Is the resistance below 100k Ohms between the (T52) Input Speed Sensor Signal circuit and any other circuit(s) in the TCM C1 harness connector?

Yes

- Repair the (T52) Input Speed Sensor Signal circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 43: Checking Input Speed Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T52) Input Speed Sensor Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (T52) Input Speed Sensor Signal circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 10.

10. **REPLACE THE INPUT SPEED SENSOR**
    1. Turn the ignition off to the lock position.
    2. Replace the Input Speed Sensor.
    3. Inspect the internal tone ring for damaged or missing teeth.
    4. Reconnect all connectors.
    5. Clear DTCs and road test the vehicle under the conditions in which the original DTC set.

    Did the Input Speed Sensor DTC reset?

    Yes

    - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

    No

    - Test complete.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

11. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load
    3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
    4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
    5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
    6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

    No

- Test Complete.

Fig. 44: Transmission Temperature Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Output Speed sensor is used to determine gear position by applying the signal to a static shift schedule map. The Output Speed sensor is also used together with Input Speed sensor to calculate gear ratios. The Transmission Control Module (TCM) compares Output shaft speed to Vehicle speed buss messages to diagnosis the system. If the TCM detects a fault with the Output speed signal, it switches to vehicle speed to determine gear position.

CONDITION ONE:

When Monitored:

- The calculated Output Speed based on Input Speed is greater than 250 rpm.
- Transmission Range is not in Park or Neutral.

Set Condition:

- 48, 500 consecutive Input Speed sensor pulses without Output Speed sensor pulses for two consecutive Ignition cycles.

CONDITION TWO:

When Monitored:

- Wheel Speed is greater than 250 rpm for tour seconds.
- Engine Speed is greater than 300 rpm.

Set Condition:

- 500 consecutive Wheel Speed sensor pulses without Output Speed sensor pulses for two consecutive Ignition cycles.

POSSIBLE CAUSES

Possible Causes
(T14) OUTPUT SPEED SIGNAL CIRCUIT OPEN
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORT TO GROUND
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORT TO VOLTAGE
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORT TO ANOTHER CIRCUIT
(T72) 8 VOLT SUPPLY CIRCUIT OPEN
(T72) 8 VOLT SUPPLY CIRCUIT SHORT TO GROUND

(T72) 8 VOLT SUPPLY CIRCUIT SHORT TO ANOTHER CIRCUIT
OUTPUT SPEED SENSOR
DAMAGED TONE RING
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.

    NOTE: It may be necessary to road test the vehicle to duplicate the original set conditions.

    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 11.
2. **CHECK THE (T72) 8 VOLT SUPPLY CIRCUIT**

Fig. 45: Checking 8 Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Output Speed Sensor harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (T72) 8 Volt Supply circuit in the Output Speed Sensor harness connector.

   Is the voltage 8.0 volts (± 0.2 of a volt)?

   Yes

   - Go To 3.

   No

   - Go To 4.

3. **LOAD TEST THE (T72) 8 VOLT SUPPLY CIRCUIT**

Fig. 46: Checking 8 Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C2 harness connector.
3. Disconnect the Input Speed Sensor and the Output Speed Sensor harness connectors.
4. Using a jumper wire, ground the (T72) 8 Volt Supply circuit in the Output Speed Sensor harness connector.
5. Using a 12-volt test light connected to B (+), probe the (T72) 8 Volt Supply circuit on the appropriate terminal of TCM C2 harness connector.

Does the test light illuminate brightly?

Yes

- Go To 6.

No

- Go To 4.

4. **CHECK THE (T72) 8 VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 47: Checking Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C2 harness connector.
3. Measure the resistance of the (T72) 8 Volt Supply circuit between the TCM C2 harness connector and the Output Speed Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the (T72) 8 Volt Supply circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK THE (T72) 8 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 48: Checking 8 Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T72) 8 Volt Supply Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T72) 8 Volt Supply circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

6. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 49: Checking Output Speed Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the TCM C2 harness connector.
2. Disconnect the Output Speed Sensor harness connector.

3. Measure the resistance of the (T14) Output Speed Sensor Signal circuit between the TCM C2 harness connector and the Output Speed Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7.

   No

   - Repair the (T14) Output Speed Sensor Signal circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 50: Checking Output Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T14) Output Speed Sensor Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T14) Output Speed Sensor Signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 51: Checking Output Speed Sensor Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (T14) Output Speed Sensor Signal circuit and all other circuits in the TCM C2 harness connector.

   Is the resistance below 100k Ohms between the (T14) Output Speed Sensor Signal circuit and any other circuit(s) in the TCM C2 harness connector?

Yes

- Repair the (T14) Output Speed Sensor Signal circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 52: Checking Output Speed Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T14) Output Speed Sensor Signal circuit.

   Is there any voltage present?

   Yes

- Repair the (T14) Output Speed Sensor Signal circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 10.

10. **REPLACE THE OUTPUT SPEED SENSOR**
    1. Turn the ignition off to the lock position.
    2. Replace the Output Speed Sensor.
    3. Inspect the internal tone ring for damaged or missing teeth.
    4. Reconnect all connectors.
    5. Clear DTCs and road test the vehicle under the conditions in which the original DTC set.

    Did the Output Speed Sensor DTC reset?

    Yes

    - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

    No

    - Test complete.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

11. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load
    3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
    4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
    5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
    6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Test Complete.

P0730-INCORRECT GEAR RATIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) constantly calculates what the output shaft speed should be in any given gear based on the input speed sensor, output speed sensor and the current gear state.

DIAGNOSTIC TEST

When Monitored:

- Output rpm is greater than 250 rpm, Transmission is in Drive, no electrical DTCs present, transmission not currently in a gear shift.

Set Condition:

- If the calculated ratio does not match the predetermined ratio for the current gear for more than 2.5 seconds, this DTC will set.

POSSIBLE CAUSES

Possible Causes
INTERNAL TRANSMISSION PROBLEM TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR INTERNAL TRANSMISSION PROBLEM**
    1. Determine if there are any Transmission mechanical problems present.
    2. Remove the Transmission Oil Pan and inspect for excessive debris or a plugged Transmission Oil Filter.
    3. Inspect valve body for foreign material.

    Is there any Transmission mechanical problems present?

Yes

- Repair as necessary in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

P0745-LINE PRESSURE SOLENOID CIRCUIT

Fig. 53: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Linear Solenoid 4 is used to control overall transmission line pressure. The Transmission Control Module (TCM) monitors the Solenoid current load and resistance. If a fault is detected, the transmission will go into limp in mode, the Torque Converter Clutch (TCC) will be disabled, and the MIL will be illuminated.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid current is greater than or equal to 4 amps for more than 100 ms or Solenoid resistance is greater than or equal to 100k Ohms for more than 65 ms.

POSSIBLE CAUSES

Possible Causes
(T821) LINEAR SOLENOID 4 CONTROL CIRCUIT OPEN
(T821) LINEAR SOLENOID 4 CONTROL CIRCUIT SHORT TO GROUND
(T821) LINEAR SOLENOID 4 CONTROL CIRCUIT SHORT TO VOLTAGE
(T821) LINEAR SOLENOID 4 CONTROL CIRCUIT SHORT TO ANOTHER CIRCUIT
(T818) LINEAR SOLENOID 4 GROUND CIRCUIT OPEN
(T818) LINEAR SOLENOID 4 GROUND CIRCUIT SHORT TO GROUND
(T818) LINEAR SOLENOID 4 GROUND CIRCUIT SHORT TO VOLTAGE
(T818) LINEAR SOLENOID 4 GROUND CIRCUIT SHORT TO ANOTHER CIRCUIT
LINEAR SOLENOID 4
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

- Go To 2.

No

- Go To 11.

2. **CHECK THE (T821) LINEAR SOLENOID 4 CONTROL CIRCUIT FOR AN OPEN**

Fig. 54: Checking Linear Solenoid 4 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C2 harness connectors.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T821) Linear Solenoid 4 Control circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3.

   No

   - Repair the (T821) Linear Solenoid 4 Control circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T821) LINEAR SOLENOID 4 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 55: Checking Linear Solenoid 4 Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T821) Linear Solenoid 4 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

- Repair the (T821) Linear Solenoid 4 Control circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (T821) LINEAR SOLENOID 4 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 56: Checking Linear Solenoid 4 Control Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T821) Linear Solenoid 4 Control circuit.

Is the voltage above 0.5 volt?

Yes

- Repair the (T821) Linear Solenoid 4 Control circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (T821) LINEAR SOLENOID 4 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 57: Checking Linear Solenoid 4 Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T821) Linear Solenoid 4 Control circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

   Is the resistance below 100k Ohms between the (T821) Linear Solenoid 4 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

   Yes

   - Repair the (T821) Linear Solenoid 4 Control circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 6.

6. **CHECK THE (T818) LINEAR SOLENOID 4 GROUND CIRCUIT FOR AN OPEN**

Fig. 58: Checking Linear Solenoid 4 Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T818) Linear Solenoid 4 Ground circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7.

No

- Repair the (T818) Linear Solenoid 4 Ground circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK THE (T818) LINEAR SOLENOID 4 GROUND CIRCUIT FOR A SHORT TO GROUND**

Fig. 59: Checking Linear Solenoid 4 Ground Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T818) Linear Solenoid 4 Ground circuit.

Is the resistance below 100k Ohms?

Yes

- Repair the (T818) Linear Solenoid 4 Ground circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (T818) LINEAR SOLENOID 4 GROUND CIRCUIT SHORT TO VOLTAGE**

Fig. 60: Checking Linear Solenoid 4 Ground Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T818) Linear Solenoid 4 Ground circuit.

   Is the voltage above 0.5 volt?

   Yes

- Repair the (T818) Linear Solenoid 4 Ground circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (T818) LINEAR SOLENOID 4 GROUND CIRCUIT SHORT TO ANOTHER CIRCUIT**

Fig. 61: Checking Linear Solenoid 4 Ground Circuit Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.

2. Measure the resistance between the (T818) Linear Solenoid 4 Ground circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

   Is the resistance below 100k Ohms between the (T818) Linear Solenoid 4 Ground circuit and any other circuit in the Transmission Solenoid Assembly C2 harness connector?

   Yes

   - Repair the (T818) Linear Solenoid 4 Ground circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 10.

10. **CHECK THE LINEAR SOLENOID 4**

Fig. 62: Checking Linear Solenoid 4

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C2 Harness connector.
3. Measure the resistance between the (T821) Linear Solenoid 4 Control and the (T818) Linear Solenoid 4 Ground circuit on the appropriate terminals of the TCM C3 harness connector.

   Is the resistance of the Linear Solenoid 4 5.5 Ohms (± 0.5 of an Ohm)?

   Yes

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Linear Solenoid 4 in accordance with the Service Information.

11. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

    No

    - Test Complete.

P0746-PRESSURE CONTROL SOLENOID A PERFORMANCE

Fig. 63: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Linear Solenoid 1 is used to control input pressure to the Control Valve 1. The Control Valve 1 uses the input to modulate the line pressure to the appropriate supply pressure for the clutch. The Transmission Control Module (TCM) verifies the operation of the Control Valve 1 by monitoring the Pressure Switch 1. If a fault is detected, the transmission will go into limp in mode, the Torque Converter Clutch (TCC) will be disabled, the limp in gear will vary based on the current gear and other conditions, and the MIL will be illuminated.

CONDITION ONE:

When Monitored:

- Ignition on, engine running.

Set Condition:

- Pressure switch 1 is closed for more than 310 ms after the transition of the Control Valve 1 from on to off.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION TWO:

When Monitored:

- Ignition on, engine running.
- TRS is in the D, 3, 2, or 1 position and Pressure Switch 8 is Closed.

Set Condition:

- Pressure switch 1 is Open for more than 510 ms after the transition of the Control Valve 1 from off to on.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds and the Pressure Switch 8 is Open in Park, Neutral, or Reverse for 500 ms.

CONDITION THREE:

When Monitored:

- Ignition on, engine running.
- TRS is in the D, 3, 2, or 1 position and Pressure Switch 8 is Closed.

Set Condition:

- Pressure Switch 1 is Open for more than 310 ms after a transition of the Control Valve 1 from on to off when the gear ratio is Neutral for more than 2 seconds.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds and the Pressure Switch 8 is Open in Park, Neutral, or Reverse for 500 ms.

CONDITION FOUR:

When Monitored:

- Ignition on, engine running.
- Control Valve 1 continuous operation is off.

Set Condition:

- Pressure Switch 1 is Closed for more than 100 ms.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION FIVE:

When Monitored:

- Ignition on, engine running.
- TRS is in the D, 3, 2, or 1 position and Pressure Switch 8 is Closed.
- Control Valve 1 continuous operation is on.

Set Condition:

- Pressure Switch 1 is Open for more than 2 seconds.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

POSSIBLE CAUSES

Possible Causes
PRESSURE SWITCH 1 SIGNAL CIRCUIT OPEN
PRESSURE SWITCH 1 SIGNAL CIRCUIT SHORT TO GROUND
PRESSURE SWITCH 1
CONTROL VALVE 1
INTERNAL WIRING
LOW TRANSMISSION FLUID LEVEL
INTERNAL TRANSMISSION
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

Did the DTC reset?

Yes

- Go To 2.

No

- Go To 8.

2. **CHECK PRESSURE SWITCH 1 STATE**
   1. Ignition on, engine not running.
   2. With the scan tool, view the Pressure Switch 1 state.

   Does the scan tool display the Pressure Switch 1 as "Closed"?

   Yes

   - Go To 3.

   No

   - Go To 5.

3. **CHECK PRESSURE SWITCH 1**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C2 harness connector

   NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, view the Pressure Switch 1 state.

   Does the scan tool display the Pressure Switch 1 as "Closed"?

   Yes

   - Go To 4.

   No

   - Inspect the internal wiring harness and connectors for shorts, corrosion, damage, or terminal push out. If no problems found, replace the Pressure Switch 1 in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

4. **CHECK THE (T800) PRESSURE SWITCH 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 64: Checking Pressure Switch 1 Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Measure the resistance of the (T800) Pressure Switch 1 signal circuit to ground.

   Is the resistance below 100k Ohms?

Yes

- Repair the (T800) Pressure Switch 1 signal circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK PRESSURE SWITCH 1 SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C2 harness connector

      NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, monitor the Pressure Switch 1 state in the following step.
   5. Using a test light connected to ground, probe the (T800) Pressure Switch 1 signal circuit in the Transmission Solenoid Assembly C2 Harness connector.

      Does the scan tool display the Pressure Switch 1 as "Closed" when the (T800) Pressure Switch 1 signal circuit is grounded with the test light?

      Yes

      - Go To 7.

      No

      - Go To 6.

6. **CHECK THE (T800) PRESSURE SWITCH 1 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 65: Checking Pressure Switch 1 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connector.
3. Measure the resistance of the (T800) Pressure Switch 1 signal circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Repair the (T800) Pressure Switch 1 signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK INTERNAL TRANSMISSION**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan.
   3. Check the internal transmission harness, pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out.
   4. Visually inspect the valve body for debris, damage or leaking hydraulic paths.
   5. Visually inspect for sticking or binding Control Valve(s).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Pressure Switch 1 in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

8. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Test Complete.

P0748-PRESSURE CONTROL SOLENOID A CIRCUIT

Fig. 66: Transmission Solenoid Assembly Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Linear Solenoid 1 is used to control input pressure to the Control Valve 1. The Control Valve 1 uses the input to modulate the line pressure to the appropriate supply pressure for the clutch. The Transmission Control Module (TCM) monitors the Solenoid current load and resistance. If a fault is detected, the transmission will go into limp in mode, the Torque Converter Clutch (TCC) will be disabled, the limp in gear will vary based on the current gear and other conditions, and the MIL will be illuminated.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid current is greater than or equal to 4 amps for more than 100 ms or Solenoid resistance is greater than or equal to 100k Ohms for more than 65 ms.

POSSIBLE CAUSES

Possible Causes
(T813) LINEAR SOLENOID 1 CONTROL CIRCUIT OPEN
(T813) LINEAR SOLENOID 1 CONTROL CIRCUIT SHORT TO GROUND
(T813) LINEAR SOLENOID 1 CONTROL CIRCUIT SHORT TO VOLTAGE
(T813) LINEAR SOLENOID 1 CONTROL CIRCUIT SHORT TO ANOTHER CIRCUIT
(T812) LINEAR SOLENOID 1 GROUND CIRCUIT OPEN
(T812) LINEAR SOLENOID 1 GROUND CIRCUIT SHORT TO GROUND
(T812) LINEAR SOLENOID 1 GROUND CIRCUIT SHORT TO VOLTAGE
(T812) LINEAR SOLENOID 1 GROUND CIRCUIT SHORT TO ANOTHER CIRCUIT
LINEAR SOLENOID 1
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.

3. Clear DTCs.
4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 2.

   No

   - Go To 11.

2. **CHECK THE (T813) LINEAR SOLENOID 1 CONTROL CIRCUIT FOR AN OPEN**

Fig. 67: Checking Linear Solenoid 1 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C1 harness connectors.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T813) Linear Solenoid 1 Control circuit between the Transmission Solenoid Assembly C1 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

- Go To 3.

No

- Repair the (T813) Linear Solenoid 1 Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T813) LINEAR SOLENOID 1 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 68: Checking Linear Solenoid 1 Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T813) Linear Solenoid 1 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T813) Linear Solenoid 1 Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T813) LINEAR SOLENOID 1 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 69: Checking Linear Solenoid 1 Control Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T813) Linear Solenoid 1 Control circuit.

   Is the voltage above 0.5 volt?

   Yes

- Repair the (T813) Linear Solenoid 1 Control circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (T813) LINEAR SOLENOID 1 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

ASSEMBLY-
TRANSMISSION
SOLENOID C1
(RC)

186382

Fig. 70: Checking Linear Solenoid 1 Control Circuit For A Short To Another Circuit

2. Measure the resistance between the (T813) Linear Solenoid 1 Control circuit and all other circuits in the Transmission Solenoid Assembly C1 harness connector.

   Is the resistance below 100k Ohms between the (T813) Linear Solenoid 1 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

   Yes

   - Repair the (T813) Linear Solenoid 1 Control circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 6.

6. **CHECK THE (T812) LINEAR SOLENOID 1 GROUND CIRCUIT FOR AN OPEN**

Fig. 71: Checking Linear Solenoid 1 Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T812) Linear Solenoid 1 Ground circuit between the Transmission Solenoid Assembly C1 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7.

   No

- Repair the (T812) Linear Solenoid 1 Ground circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK THE (T812) LINEAR SOLENOID 1 GROUND CIRCUIT FOR A SHORT TO GROUND**

Fig. 72: Checking Linear Solenoid 1 Ground Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T812) Linear Solenoid 1 Ground circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T812) Linear Solenoid 1 Ground circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (T812) LINEAR SOLENOID 1 GROUND CIRCUIT SHORT TO VOLTAGE**

Fig. 73: Checking Linear Solenoid 1 Ground Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T812) Linear Solenoid 1 Ground circuit.

   Is the voltage above 0.5 volt?

Yes

- Repair the (T812) Linear Solenoid 1 Ground circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 9.

9. **CHECK THE (T812) LINEAR SOLENOID 1 GROUND CIRCUIT SHORT TO ANOTHER CIRCUIT**

Fig. 74: Checking Linear Solenoid 1 Ground Circuit Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T812) Linear Solenoid 1 Ground circuit and all other circuits in the Transmission Solenoid Assembly C1 harness connector.

   Is the resistance below 100k Ohms between the (T812) Linear Solenoid 1 Ground circuit and any other circuit in the Transmission Solenoid Assembly C1 harness connector?

   Yes

- Repair the (T812) Linear Solenoid 1 Ground circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 10.

10. **CHECK THE LINEAR SOLENOID 1**

Fig. 75: Checking Linear Solenoid 1 Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C1 Harness connector.

3. Measure the resistance between the (T813) Linear Solenoid 1 Control and the (T812) Linear Solenoid 1 Ground circuit on the appropriate terminals of the TCM C3 harness connector.

   Is the resistance of the Linear Solenoid 1 5.5 Ohms (± 0.5 of an Ohm)?

   Yes

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Linear Solenoid 1 in accordance with the Service Information.

11. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

    No

    - Test Complete.

P0751-SHIFT SOLENOID A PERFORMANCE

Fig. 76: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) verifies the operation of the Shift (On/Off) Valve 1 by monitoring the Pressure Switch 3. If a fault is detected, the transmission will go into limp in mode, the Torque Converter Clutch (TCC) will be disabled, the limp in gear will vary based on the current gear and other conditions, and the MIL will be illuminated.

CONDITION ONE:

When Monitored:

- Ignition on, engine running.

Set Condition:

- Pressure Switch 3 is Closed for more than 1780 ms after the transition of the Shift (On/Off) Valve 1 from on to off.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION TWO:

When Monitored:

- Ignition on, engine running.

Set Condition:

- Pressure Switch 3 is Open for more than 1400 ms after the transition of the Shift (On/Off) Valve 1 from off to on.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION THREE:

When Monitored:

- Ignition on, engine running.
- Shift (On/Off) Valve 1 continuous operation is off.

Set Condition:

- Pressure Switch 3 is Closed for more than 450 ms.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION FOUR:

When Monitored:

- Ignition on, engine running.
- Shift (On/Off) Valve 1 continuous operation is on.

Set Condition:

- Pressure Switch 3 is Open for more than 450 ms.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

POSSIBLE CAUSES

Possible Causes
PRESSURE SWITCH 3 SIGNAL CIRCUIT OPEN
PRESSURE SWITCH 3 SIGNAL CIRCUIT SHORT TO GROUND
PRESSURE SWITCH 3
SHIFT (ON/OFF) VALVE 1
INTERNAL WIRING
LOW TRANSMISSION FLUID LEVEL
INTERNAL TRANSMISSION
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 8.
2. **CHECK PRESSURE SWITCH 3 STATE**
    1. Ignition on, engine not running.
    2. With the scan tool, view the Pressure Switch 3 state.

Does the scan tool display the Pressure Switch 3 as "Closed"?

Yes

- Go To 3.

No

- Go To 5.

3. **CHECK PRESSURE SWITCH 3**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C2 harness connector

      NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, view the Pressure Switch 3 state.

      Does the scan tool display the Pressure Switch 3 as "Closed"?

      Yes

      - Go To 4.

      No

      - Inspect the internal wiring harness and connectors for shorts, corrosion, damage, or terminal push out. If no problems found, replace the Pressure Switch 3 in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.
4. **CHECK THE (T802) PRESSURE SWITCH 3 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 77: Checking Pressure Switch 3 Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Measure the resistance of the (T802) Pressure Switch 3 signal circuit to ground.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T802) Pressure Switch 3 signal circuit for a short to ground.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK PRESSURE SWITCH 3 SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C2 harness connector

      NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, monitor the Pressure Switch 3 state in the following step.
   5. Using a test light connected to ground, probe the (T802) Pressure Switch 3 signal circuit in the Transmission Solenoid Assembly C2 Harness connector.

      Does the scan tool display the Pressure Switch 3 as "Closed" when the (T802) Pressure Switch 3 signal circuit is grounded with the test light?

      Yes

      - Go To 7.

      No

      - Go To 6.

6. **CHECK THE (T802) PRESSURE SWITCH 3 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 78: Checking Pressure Switch 3 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connector.
3. Measure the resistance of the (T802) Pressure Switch 3 signal circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.

No

- Repair the (T802) Pressure Switch 3 signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK INTERNAL TRANSMISSION**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan.
   3. Check the internal transmission harness, pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out.
   4. Visually inspect the valve body for debris, damage or leaking hydraulic paths.
   5. Visually inspect for sticking or binding Control Valve(s).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Pressure Switch 3 in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

8. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Test Complete.

P0756-SHIFT SOLENOID B PERFORMANCE

Fig. 79: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) verifies the operation of the Shift (On/Off) Valve 2 by monitoring the Pressure Switch 4. If a fault is detected, the transmission will go into limp in mode, the Torque Converter Clutch (TCC) will be disabled, the limp in gear will vary based on the current gear and other conditions, and the MIL will be illuminated.

CONDITION ONE:

When Monitored:

- Ignition on, engine running.

Set Condition:

- Pressure Switch 4 is Closed for more than 1780 ms after the transition of the Shift (On/Off) Valve 2 from on to off.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION TWO:

When Monitored:

- Ignition on, engine running.

Set Condition:

- Pressure Switch 4 is Open for more than 1400 ms after the transition of the Shift (On/Off) Valve 2 from off to on.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION THREE:

When Monitored:

- Ignition on, engine running.
- Shift (On/Off) Valve 2 continuous operation is off.

Set Condition:

- Pressure Switch 4 is Closed for more than 450 ms.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION FOUR:

When Monitored:

- Ignition on, engine running.
- Shift (On/Off) Valve 2 continuous operation is on.

Set Condition:

- Pressure Switch 4 is Open for more than 450 ms.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

POSSIBLE CAUSES

Possible Causes
PRESSURE SWITCH 4 SIGNAL CIRCUIT OPEN
PRESSURE SWITCH 4 SIGNAL CIRCUIT SHORT TO GROUND
PRESSURE SWITCH 4
SHIFT (ON/OFF) VALVE 2
INTERNAL WIRING
INTERNAL TRANSMISSION
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 8.
2. **CHECK PRESSURE SWITCH 4 STATE**
    1. Ignition on, engine not running.

2. With the scan tool, view the Pressure Switch 4 state.

   Does the scan tool display the Pressure Switch 4 as "Closed"?

   Yes

   - Go To 3.

   No

   - Go To 5.

3. **CHECK PRESSURE SWITCH 4**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C2 harness connector

      NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, view the Pressure Switch 4 state.

      Does the scan tool display the Pressure Switch 4 as "Closed"?

      Yes

      - Go To 4.

      No

      - Inspect the internal wiring harness and connectors for shorts, corrosion, damage, or terminal push out. If no problems found, replace the Pressure Switch 4 in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

4. **CHECK THE (T803) PRESSURE SWITCH 4 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 80: Checking Pressure Switch 4 Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Measure the resistance of the (T803) Pressure Switch 4 signal circuit to ground.

   Is the resistance below 100k ohms?

Yes

- Repair the (T803) Pressure Switch 4 signal circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK PRESSURE SWITCH 4 SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C2 harness connector

      NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, monitor the Pressure Switch 4 state in the following step.
   5. Using a test light connected to ground, probe the (T803) Pressure Switch 4 signal circuit in the Transmission Solenoid Assembly C2 Harness connector.

      Does the scan tool display the Pressure Switch 4 as "Closed" when the (T803) Pressure Switch 4 signal circuit is grounded with the test light?

      Yes

      - Go To 7.

      No

      - Go To 6.

6. **CHECK THE (T803) PRESSURE SWITCH 4 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 81: Checking Pressure Switch 4 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connector.
3. Measure the resistance of the (T803) Pressure Switch 4 signal circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C1 harness connector.

   Is the resistance below 5.0 ohms?

   Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.

No

- Repair the (T803) Pressure Switch 4 signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK INTERNAL TRANSMISSION**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan.
   3. Check the internal transmission harness, pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out.
   4. Visually inspect the valve body for debris, damage or leaking hydraulic paths.
   5. Visually inspect for sticking or binding Control Valve(s).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Pressure Switch 4 in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

8. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Test Complete.

P0761-SHIFT SOLENOID C PERFORMANCE

Fig. 82: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) verifies the operation of the Shift (On/Off) Valve 3 by monitoring

the Pressure Switch 5. If a fault is detected, the transmission will go into limp in mode, the Torque Converter Clutch (TCC) will be disabled, the limp in gear will vary based on the current gear and other conditions, and the MIL will be illuminated.

CONDITION ONE:

When Monitored:

- Ignition on, engine running.

Set Condition:

- Pressure Switch 5 is Closed for more than 1780 ms after the transition of the Shift (On/Off) Valve 3 from on to off.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION TWO:

When Monitored:

- Ignition on, engine running.

Set Condition:

- Pressure Switch 5 is Open for more than 1400 ms after the transition of the Shift (On/Off) Valve 3 from off to on.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION THREE:

When Monitored:

- Ignition on, engine running.
- Shift (On/Off) Valve 3 continuous operation is off.

Set Condition:

- Pressure Switch 5 is Closed for more than 450 ms.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION FOUR:

When Monitored:

- Ignition on, engine running.
- Shift (On/Off) Valve 3 continuous operation is on.

Set Condition:

- Pressure Switch 5 is Open for more than 450 ms.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

POSSIBLE CAUSES

Possible Causes
PRESSURE SWITCH 5 SIGNAL CIRCUIT OPEN
PRESSURE SWITCH 5 SIGNAL CIRCUIT SHORT TO GROUND
PRESSURE SWITCH 5
SHIFT (ON/OFF) VALVE 3
INTERNAL WIRING
INTERNAL TRANSMISSION
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 8.
2. **CHECK PRESSURE SWITCH 5 STATE**
    1. Ignition on, engine not running.

2. With the scan tool, view the Pressure Switch 5 state.

   Does the scan tool display the Pressure Switch 5 as "Closed"?

   Yes

   - Go To 3.

   No

   - Go To 5.

3. **CHECK PRESSURE SWITCH 5**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C1 harness connector

      NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, view the Pressure Switch 5 state.

      Does the scan tool display the Pressure Switch 5 as "Closed"?

      Yes

      - Go To 4.

      No

      - Inspect the internal wiring harness and connectors for shorts, corrosion, damage, or terminal push out. If no problems found, replace the Pressure Switch 5 in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

4. **CHECK THE (T804) PRESSURE SWITCH 5 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 83: Checking Pressure Switch 5 Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Measure the resistance of the (T804) Pressure Switch 5 signal circuit to ground.

   Is the resistance below 100k Ohms?

Yes

- Repair the (T804) Pressure Switch 5 signal circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK PRESSURE SWITCH 5 SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C1 harness connector

      NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, monitor the Pressure Switch 5 state in the following step.
   5. Using a test light connected to ground, probe the (T804) Pressure Switch 5 signal circuit in the Transmission Solenoid Assembly C1 Harness connector.

      Does the scan tool display the Pressure Switch 5 as "Closed" when the (T804) Pressure Switch 5 signal circuit is grounded with the test light?

      Yes

      - Go To 7.

      No

      - Go To 6.

6. **CHECK THE (T804) PRESSURE SWITCH 5 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 84: Checking Pressure Switch 5 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connector.
3. Measure the resistance of the (T804) Pressure Switch 5 signal circuit between the Transmission Solenoid Assembly C1 harness connector and the TCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the

TCM in accordance with the Service Information.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Repair the (T804) Pressure Switch 5 signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK INTERNAL TRANSMISSION**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan.
   3. Check the internal transmission harness, pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out.
   4. Visually inspect the valve body for debris, damage or leaking hydraulic paths.
   5. Visually inspect for sticking or binding Control Valve(s).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Pressure Switch 5 in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

8. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Test Complete.

P0766-SHIFT SOLENOID D PERFORMANCE

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connector.
3. Measure the resistance of the (T805) Pressure Switch 6 signal circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Repair the (T805) Pressure Switch 6 signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK INTERNAL TRANSMISSION**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan.
   3. Check the internal transmission harness, pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out.
   4. Visually inspect the valve body for debris, damage or leaking hydraulic paths.
   5. Visually inspect for sticking or binding Control Valve(s).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Pressure Switch 6 in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

8. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Test Complete.

P0776-PRESSURE CONTROL SOLENOID B PERFORMANCE

Fig. 88: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Linear Solenoid 2 is used to control input pressure to the Control Valve 2. The Control Valve 2 uses the

input to modulate the line pressure to the appropriate supply pressure for the clutch. The Transmission Control Module (TCM) verifies the operation of the Control Valve 2 by monitoring the Pressure Switch 2. If a fault is detected, the transmission will go into limp in mode, the Torque Converter Clutch (TCC) will be disabled, the limp in gear will vary based on the current gear and other conditions, and the MIL will be illuminated.

CONDITION ONE:

When Monitored:

- Ignition on, engine running.

Set Condition:

- Pressure switch 2 is Closed for more than 310 ms after the transition of the Control Valve 2 from on to off 3 times.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION TWO:

When Monitored:

- Ignition on, engine running.
- TRS is in the D, 3, 2, or 1 position and Pressure Switch 8 is Closed.

Set Condition:

- Pressure switch 2 is Open for more than 310 ms after the transition of the Control Valve 2 from off to on.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION THREE:

When Monitored:

- Ignition on, engine running.
- TRS is in the D, 3, 2, or 1 position and Pressure Switch 8 is Closed.

Set Condition:

- Pressure Switch 2 is Open for more than 310 ms after a transition of the Control Valve 2 from on to off when the gear ratio is Neutral for more than 2 seconds.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION FOUR:

When Monitored:

- Ignition on, engine running.
- Control Valve 2 continuous operation is off.

Set Condition:

- Pressure Switch 2 is Closed for more than 100 ms.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION FIVE:

When Monitored:

- Ignition on, engine running.
- TRS is in the D, 3, 2, or 1 position and Pressure Switch 8 is Closed.
- Control Valve 2 continuous operation is on.

Set Condition:

- Pressure Switch 2 is Open for more than 2 seconds.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

POSSIBLE CAUSES

Possible Causes
PRESSURE SWITCH 2 SIGNAL CIRCUIT OPEN
PRESSURE SWITCH 2 SIGNAL CIRCUIT SHORT TO GROUND
PRESSURE SWITCH 2
CONTROL VALVE 2
INTERNAL WIRING
INTERNAL TRANSMISSION
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.

3. Clear DTCs.
4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 2.

   No

   - Go To 8.

2. **CHECK PRESSURE SWITCH 2 STATE**
   1. Ignition on, engine not running.
   2. With the scan tool, view the Pressure Switch 2 state.

      Does the scan tool display the Pressure Switch 2 as "Closed"?

      Yes

      - Go To 3.

      No

      - Go To 5.

3. **CHECK PRESSURE SWITCH 2**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C2 harness connector

      NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, view the Pressure Switch 2 state.

      Does the scan tool display the Pressure Switch 2 as "Closed"?

      Yes

      - Go To 4.

      No

- Inspect the internal wiring harness and connectors for shorts, corrosion, damage, or terminal push out. If no problems found, replace the Pressure Switch 2 in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

4. **CHECK THE (T801) PRESSURE SWITCH 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 89: Checking Pressure Switch 2 Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Measure the resistance of the (T801) Pressure Switch 2 signal circuit to ground.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T801) Pressure Switch 2 signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK PRESSURE SWITCH 2 SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C2 harness connector

      NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, monitor the Pressure Switch 2 state in the following step.
   5. Using a test light connected to ground, probe the (T801) Pressure Switch 2 signal circuit in the Transmission Solenoid Assembly C2 Harness connector.

      Does the scan tool display the Pressure Switch 2 as "Closed" when the (T801) Pressure Switch 2 signal circuit is grounded with the test light?

      Yes

      - Go To 7.

      No

      - Go To 6.

6. **CHECK THE (T801) PRESSURE SWITCH 2 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 90: Checking Pressure Switch 2 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C1 harness connector.
3. Measure the resistance of the (T801) Pressure Switch 2 signal circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Repair the (T801) Pressure Switch 2 signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK INTERNAL TRANSMISSION**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan.
   3. Check the internal transmission harness, pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out.
   4. Visually inspect the valve body for debris, damage or leaking hydraulic paths.
   5. Visually inspect for sticking or binding Control Valve(s).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Pressure Switch 2 in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

8. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Test Complete.

P0778-PRESSURE CONTROL SOLENOID B CIRCUIT

Fig. 91: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Linear Solenoid 2 is used to control input pressure to the Control Valve 2. The Control Valve 2 uses the input to modulate the line pressure to the appropriate supply pressure for the clutch. The TCM monitors the Solenoid current load and resistance. If a fault is detected, the transmission will go into limp in mode, the Torque Converter Clutch (TCC) will be disabled, the limp in gear will vary based on the current gear and other conditions, and the MIL will be illuminated.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid current is greater than or equal to 4 amps for more than 100 ms or Solenoid resistance is greater than or equal to 100k Ohms for more than 65 ms.

POSSIBLE CAUSES

Possible Causes
(T815) LINEAR SOLENOID 2 CONTROL CIRCUIT OPEN
(T815) LINEAR SOLENOID 2 CONTROL CIRCUIT SHORT TO GROUND
(T815) LINEAR SOLENOID 2 CONTROL CIRCUIT SHORT TO VOLTAGE
(T815) LINEAR SOLENOID 2 CONTROL CIRCUIT SHORT TO ANOTHER CIRCUIT
(T814) LINEAR SOLENOID 2 GROUND CIRCUIT OPEN
(T814) LINEAR SOLENOID 2 GROUND CIRCUIT SHORT TO GROUND
(T814) LINEAR SOLENOID 2 GROUND CIRCUIT SHORT TO VOLTAGE
(T814) LINEAR SOLENOID 2 GROUND CIRCUIT SHORT TO ANOTHER CIRCUIT
LINEAR SOLENOID 2
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions

above, operate the vehicle in the conditions that set the DTC.

5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 2.

   No

   - Go To 11.

2. **CHECK THE (T815) LINEAR SOLENOID 2 CONTROL CIRCUIT FOR AN OPEN**

Fig. 92: Checking Linear Solenoid 2 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C2 harness connectors.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T815) Linear Solenoid 2 Control circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 3.

No

- Repair the (T815) Linear Solenoid 2 Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T815) LINEAR SOLENOID 2 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 93: Checking Linear Solenoid 2 Control Circuit For A Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T815) Linear Solenoid 2 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T815) Linear Solenoid 2 Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T815) LINEAR SOLENOID 2 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 94: Checking Linear Solenoid 2 Control Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T815) Linear Solenoid 2 Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T815) Linear Solenoid 2 Control circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Go To 5.

5. **CHECK THE (T815) LINEAR SOLENOID 2 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 95: Checking Linear Solenoid 2 Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T815) Linear Solenoid 2 Control circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

Is the resistance below 100k Ohms between the (T815) Linear Solenoid 2 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

Yes

- Repair the (T815) Linear Solenoid 2 Control circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE (T814) LINEAR SOLENOID 2 GROUND CIRCUIT FOR AN OPEN**

Fig. 96: Checking Linear Solenoid 2 Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T814) Linear Solenoid 2 Ground circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7.

No

- Repair the (T814) Linear Solenoid 2 Ground circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK THE (T814) LINEAR SOLENOID 2 GROUND CIRCUIT FOR A SHORT TO GROUND**

Fig. 97: Checking Linear Solenoid 2 Ground Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T814) Linear Solenoid 2 Ground circuit.

   Is the resistance below 100k Ohms?

Yes

- Repair the (T814) Linear Solenoid 2 Ground circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (T814) LINEAR SOLENOID 2 GROUND CIRCUIT SHORT TO VOLTAGE**

Fig. 98: Checking Linear Solenoid 2 Ground Circuit Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T814) Linear Solenoid 2 Ground circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T814) Linear Solenoid 2 Ground circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 9.

9. **CHECK THE (T814) LINEAR SOLENOID 2 GROUND CIRCUIT SHORT TO ANOTHER CIRCUIT**

Fig. 99: Checking Linear Solenoid 2 Ground Circuit Short To Another Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T814) Linear Solenoid 2 Ground circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

   Is the resistance below 100k Ohms between the (T814) Linear Solenoid 2 Ground circuit and any other circuit in the Transmission Solenoid Assembly C2 harness connector?

   Yes

   - Repair the (T814) Linear Solenoid 2 Ground circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 10.

10. **CHECK THE LINEAR SOLENOID 2**

Fig. 100: Checking Linear Solenoid 2 Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C2 Harness connector.
3. Measure the resistance between the (T815) Linear Solenoid 2 Control and the (T814) Linear Solenoid 2 Ground circuit on the appropriate terminals of the TCM C3 harness connector.

   Is the resistance of the Linear Solenoid 2 5.5 Ohms (± 0.5 of an Ohm)?

Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Replace the Linear Solenoid 2 in accordance with the Service Information.

11. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

    No

    - Test Complete.

P0796-PRESSURE CONTROL SOLENOID C PERFORMANCE

Fig. 101: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Linear Solenoid 3 is used to control input pressure to the Control Valve 3. The Control Valve 3 uses the input to modulate the line pressure to the appropriate supply pressure for the clutch. The TCM verifies the operation of the Control Valve 3 by monitoring the Pressure Switch 7. If a fault is detected, the transmission will go into limp in mode, the Torque Converter Clutch (TCC) will be disabled, the limp in gear will vary based on the current gear and other conditions, and the MIL will be illuminated.

CONDITION ONE:

When Monitored:

- Pressure Switch 6 is Closed and Pressure Switches 1 through 6 are not currently failed.

Set Condition:

- Pressure Switch 7 is Closed for more than 160 ms after the transition of the Control Valve 3 from off to on 3 times.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION TWO:

When Monitored:

- Pressure Switch 6 is Closed and Pressure Switches 1 through 6 are not currently failed.
- During Garage Shift.

Set Condition:

- Pressure Switch 7 is Open for Control Valve 3 at maximum commanded pressure.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

CONDITION THREE:

When Monitored:

- Pressure Switch 6 is Closed and Pressure Switches 1 through 6 are not currently failed.
- Control Valve 3 operation is continuously off.

Set Condition:

- Pressure Switch 7 is Closed for more than 160 ms.
- The electric fault of the Solenoid has not been detected after the above condition has been established within 10 seconds.

POSSIBLE CAUSES

Possible Causes
PRESSURE SWITCH 7 SIGNAL CIRCUIT OPEN
PRESSURE SWITCH 7 SIGNAL CIRCUIT SHORT TO GROUND
PRESSURE SWITCH 7

CONTROL VALVE 3
INTERNAL WIRING
INTERNAL TRANSMISSION
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 8.
2. **CHECK PRESSURE SWITCH 7 STATE**
    1. Ignition on, engine not running.
    2. With the scan tool, view the Pressure Switch 7 state.

    Does the scan tool display the Pressure Switch 7 as "Closed"?

    Yes

    - Go To 3.

    No

    - Go To 5.
3. **CHECK PRESSURE SWITCH 7**
    1. Turn the ignition off to the lock position.
    2. Disconnect the Transmission Solenoid Assembly C1 harness connector

NOTE: Check connectors - Clean/repair as necessary.

3. Ignition on, engine not running.
4. With the scan tool, view the Pressure Switch 7 state.

   Does the scan tool display the Pressure Switch 7 as "Closed"?

   Yes

   - Go To 4.

   No

   - Inspect the internal wiring harness and connectors for shorts, corrosion, damage, or terminal push out. If no problems found, replace the Pressure Switch 7 in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

4. **CHECK THE (T806) PRESSURE SWITCH 7 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 102: Checking Pressure Switch 7 Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Measure the resistance of the (T806) Pressure Switch 7 signal circuit to ground.

   Is the resistance below 100k Ohms?

Yes

- Repair the (T806) Pressure Switch 7 signal circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK PRESSURE SWITCH 7 SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Transmission Solenoid Assembly C1 harness connector

      NOTE: Check connectors - Clean/repair as necessary.

   3. Ignition on, engine not running.
   4. With the scan tool, monitor the Pressure Switch 7 state in the following step.
   5. Using a test light connected to ground, probe the (T806) Pressure Switch 7 signal circuit in the Transmission Solenoid Assembly C1 Harness connector.

      Does the scan tool display the Pressure Switch 7 as "Closed" when the (T806) Pressure Switch 7 signal circuit is grounded with the test light?

      Yes

      - Go To 7.

      No

      - Go To 6.

6. **CHECK THE (T806) PRESSURE SWITCH 7 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 103: Checking Pressure Switch 7 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C3 harness connector.
3. Measure the resistance of the (T806) Pressure Switch 7 signal circuit between the Transmission Solenoid Assembly C1 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins,

terminals, and connectors for shorts, corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Repair the (T806) Pressure Switch 7 signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK INTERNAL TRANSMISSION**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan.
   3. Check the internal transmission harness, pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out.
   4. Visually inspect the valve body for debris, damage or leaking hydraulic paths.
   5. Visually inspect for sticking or binding Control Valve(s).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Pressure Switch 7 in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

8. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Test Complete.

P0798-PRESSURE CONTROL SOLENOID C CIRCUIT

Fig. 104: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Linear Solenoid 3 is used to control input pressure to the Control Valve 3. The Control Valve 3 uses the input to modulate the line pressure to the appropriate supply pressure for the clutch. The Transmission Control Module (TCM) monitors the Solenoid current load and resistance. If a fault is detected, the transmission will go into limp in mode, the Torque Converter Clutch (TCC) will be disabled, the limp in gear will vary based on the current gear and other conditions, and the MIL will be illuminated.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid current is greater than or equal to 4 amps for more than 100 ms or Solenoid resistance is greater than or equal to 100k Ohms for more than 65 ms.

POSSIBLE CAUSES

Possible Causes
(T817) LINEAR SOLENOID 3 CONTROL CIRCUIT OPEN
(T817) LINEAR SOLENOID 3 CONTROL CIRCUIT SHORT TO GROUND
(T817) LINEAR SOLENOID 3 CONTROL CIRCUIT SHORT TO VOLTAGE
(T817) LINEAR SOLENOID 3 CONTROL CIRCUIT SHORT TO ANOTHER CIRCUIT
(T816) LINEAR SOLENOID 3 GROUND CIRCUIT OPEN
(T816) LINEAR SOLENOID 3 GROUND CIRCUIT SHORT TO GROUND
(T816) LINEAR SOLENOID 3 GROUND CIRCUIT SHORT TO VOLTAGE
(T816) LINEAR SOLENOID 3 GROUND CIRCUIT SHORT TO ANOTHER CIRCUIT
LINEAR SOLENOID 3
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions

above, operate the vehicle in the conditions that set the DTC.

5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 2.

   No

   - Go To 11.

2. **CHECK THE (T817) LINEAR SOLENOID 3 CONTROL CIRCUIT FOR AN OPEN**

Fig. 105: Checking Linear Solenoid 3 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C2 harness connectors.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T817) Linear Solenoid 3 Control circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3.

   No

   - Repair the (T817) Linear Solenoid 3 Control circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T817) LINEAR SOLENOID 3 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 106: Checking Linear Solenoid 3 Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T817) Linear Solenoid 3 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T817) Linear Solenoid 3 Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Go To 4.

4. **CHECK THE (T817) LINEAR SOLENOID 3 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 107: Checking Linear Solenoid 3 Control Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T817) Linear Solenoid 3 Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T817) Linear Solenoid 3 Control circuit for a short to voltage.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (T817) LINEAR SOLENOID 3 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 108: Checking Linear Solenoid 3 Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T817) Linear Solenoid 3 Control circuit and all other circuits

in the Transmission Solenoid Assembly C2 harness connector.

Is the resistance below 100k Ohms between the (T817) Linear Solenoid 3 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

Yes

- Repair the (T817) Linear Solenoid 3 Control circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE (T816) LINEAR SOLENOID 3 GROUND CIRCUIT FOR AN OPEN**

Fig. 109: Checking Linear Solenoid 3 Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T816) Linear Solenoid 3 Ground circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7.

No

- Repair the (T816) Linear Solenoid 3 Ground circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK THE (T816) LINEAR SOLENOID 3 GROUND CIRCUIT FOR A SHORT TO GROUND**

Fig. 110: Checking Linear Solenoid 3 Ground Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T816) Linear Solenoid 3 Ground circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T816) Linear Solenoid 3 Ground circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 8.

8. **CHECK THE (T816) LINEAR SOLENOID 3 GROUND CIRCUIT SHORT TO VOLTAGE**

Fig. 111: Checking Linear Solenoid 3 Ground Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T816) Linear Solenoid 3 Ground circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T816) Linear Solenoid 3 Ground circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 9.

9. **CHECK THE (T816) LINEAR SOLENOID 3 GROUND CIRCUIT SHORT TO ANOTHER CIRCUIT**

Fig. 112: Checking Linear Solenoid 3 Ground Circuit Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T816) Linear Solenoid 3 Ground circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

   Is the resistance below 100k Ohms between the (T816) Linear Solenoid 3 Ground circuit and any other circuit in the Transmission Solenoid Assembly C2 harness connector?

   Yes

   - Repair the (T816) Linear Solenoid 3 Ground circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 10.

10. **CHECK THE LINEAR SOLENOID 3**

Fig. 113: Checking Linear Solenoid 3 Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C2 Harness connector.
3. Measure the resistance between the (T817) Linear Solenoid 3 Control and the (T816) Linear Solenoid 3 Ground circuit on the appropriate terminals of the TCM C3 harness connector.

   Is the resistance of the Linear Solenoid 3 5.5 Ohms (± 0.5 of an Ohm)?

   Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Replace the Linear Solenoid 3 in accordance with the Service Information.

11. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

    No

    - Test Complete.

P0973-SHIFT SOLENOID A CONTROL CIRCUIT LOW

Fig. 114: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Shift (On/Off) Solenoid 1 is used to switch hydraulic paths on the Shift Valve 1 which will direct a gear shift.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid current is greater than or equal to 4 amps for more than 100 ms.

POSSIBLE CAUSES

Possible Causes
(T808) SHIFT (ON/OFF) SOLENOID 1 SHORT TO GROUND
(T808) SHIFT (ON/OFF) SOLENOID 1 SHORT TO ANOTHER CIRCUIT
SHIFT (ON/OFF) SOLENOID 1
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 7.
2. **CHECK THE (T808) SHIFT (ON/OFF) SOLENOID 1 CONTROL CIRCUIT FOR AN OPEN**

Fig. 115: Checking Shift (On/Off) Solenoid 1 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C2 harness connectors.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T808) Shift (On/Off) Solenoid 1 Control circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 3.

No

- Repair the (T808) Shift (On/Off) Solenoid 1 Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T808) SHIFT (ON/OFF) SOLENOID 1 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 116: Checking Shift (On/Off) Solenoid 1 Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T808) Shift (On/Off) Solenoid 1 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T808) Shift (On/Off) Solenoid 1 Control circuit for a short to ground.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (T808) SHIFT (ON/OFF) SOLENOID 1 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 117: Checking Shift (On/Off) Solenoid 1 Control Circuit Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T808) Shift (On/Off) Solenoid 1 Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T808) Shift (On/Off) Solenoid 1 Control circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 5.

5. **CHECK THE (T808) SHIFT (ON/OFF) SOLENOID 1 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 118: Checking Shift (On/Off) Solenoid 1 Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T808) Shift (On/Off) Solenoid 1 Control circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

   Is the resistance below 100k Ohms between the (T808) Shift (On/Off) Solenoid 1 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

   Yes

   - Repair the (T808) Shift (On/Off) Solenoid 1 Control circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE SHIFT (ON/OFF) SOLENOID 1**

Fig. 119: Checking Shift (On/Off) Solenoid 1 And Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C2 Harness connector.
3. Measure the resistance of the Shift (On/Off) Solenoid 1 between the (T808) Shift (On/Off) Solenoid 1 and ground at the TCM C3 harness connector.

   Is the resistance of the Shift (On/Off) Solenoid 1 13.0 Ohms (± 2.0 Ohms)?

Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Replace the Shift (On/Off) Solenoid 1 in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Test Complete.

P0974-SHIFT SOLENOID A CONTROL CIRCUIT HIGH

Fig. 120: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Shift (On/Off) Solenoid 1 is used to switch hydraulic paths on the Shift Valve 1 which will direct a gear shift.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid resistance is greater than or equal to 100k Ohms for more than 100 ms.

POSSIBLE CAUSES

Possible Causes
(T808) SHIFT (ON/OFF) SOLENOID 1 OPEN
(T808) SHIFT (ON/OFF) SOLENOID 1 SHORT TO VOLTAGE
SHIFT (ON/OFF) SOLENOID 1
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 7.
2. **CHECK THE (T808) SHIFT (ON/OFF) SOLENOID 1 CONTROL CIRCUIT FOR AN OPEN**

Fig. 121: Checking Shift (On/Off) Solenoid 1 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C2 harness connectors.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T808) Shift (On/Off) Solenoid 1 Control circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 3.

No

- Repair the (T808) Shift (On/Off) Solenoid 1 Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T808) SHIFT (ON/OFF) SOLENOID 1 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 122: Checking Shift (On/Off) Solenoid 1 Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T808) Shift (On/Off) Solenoid 1 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T808) Shift (On/Off) Solenoid 1 Control circuit for a short to ground.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (T808) SHIFT (ON/OFF) SOLENOID 1 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 123: Checking Shift (On/Off) Solenoid 1 Control Circuit Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T808) Shift (On/Off) Solenoid 1 Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T808) Shift (On/Off) Solenoid 1 Control circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 5.

5. **CHECK THE (T808) SHIFT (ON/OFF) SOLENOID 1 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 124: Checking Shift (On/Off) Solenoid 1 Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T808) Shift (On/Off) Solenoid 1 Control circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

   Is the resistance below 100k Ohms between the (T808) Shift (On/Off) Solenoid 1 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

   Yes

   - Repair the (T808) Shift (On/Off) Solenoid 1 Control circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE SHIFT (ON/OFF) SOLENOID 1**

Fig. 125: Checking Shift (On/Off) Solenoid 1 And Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C2 Harness connector.
3. Measure the resistance of the Shift (On/Off) Solenoid 1 between the (T808) Shift (On/Off) Solenoid 1 and ground at the TCM C3 harness connector.

   Is the resistance of the Shift (On/Off) Solenoid 1 13.0 Ohms (± 2.0 Ohms)?

Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Replace the Shift (On/Off) Solenoid 1 in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Test Complete.

P0976-SHIFT SOLENOID B CONTROL CIRCUIT LOW

Fig. 126: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Shift (On/Off) Solenoid 2 is used to switch hydraulic paths on the Shift Valve 2 which will direct a gear shift.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid current is greater than or equal to 4 amps for more than 100 ms.

POSSIBLE CAUSES

Possible Causes
(T809) SHIFT (ON/OFF) SOLENOID 2 SHORT TO GROUND
(T809) SHIFT (ON/OFF) SOLENOID 2 SHORT TO ANOTHER CIRCUIT
SHIFT (ON/OFF) SOLENOID 2
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 7.
2. **CHECK THE (T809) SHIFT (ON/OFF) SOLENOID 2 CONTROL CIRCUIT FOR AN OPEN**

Fig. 127: Checking Shift (On/Off) Solenoid 2 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C2 harness connectors.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T809) Shift (On/Off) Solenoid 2 Control circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 3.

No

- Repair the (T809) Shift (On/Off) Solenoid 2 Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T809) SHIFT (ON/OFF) SOLENOID 2 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 128: Checking Shift (On/Off) Solenoid 2 Control Circuit For A Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T809) Shift (On/Off) Solenoid 2 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T809) Shift (On/Off) Solenoid 2 Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T809) SHIFT (ON/OFF) SOLENOID 2 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 129: Checking Shift (On/Off) Solenoid 2 Control Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T809) Shift (On/Off) Solenoid 2 Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T809) Shift (On/Off) Solenoid 2 Control circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Go To 5.

5. **CHECK THE (T809) SHIFT (ON/OFF) SOLENOID 2 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 130: Checking Shift (On/Off) Solenoid 2 Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T809) Shift (On/Off) Solenoid 2 Control circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

   Is the resistance below 100k Ohms between the (T809) Shift (On/Off) Solenoid 2 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

Yes

- Repair the (T809) Shift (On/Off) Solenoid 2 Control circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE SHIFT (ON/OFF) SOLENOID 2**

Fig. 131: Checking Shift (On/Off) Solenoid 2 And Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C2 Harness connector.

3. Measure the resistance of the Shift (On/Off) Solenoid 2 between the (T809) Shift (On/Off) Solenoid 2 and ground at the TCM C3 harness connector.

   Is the resistance of the Shift (On/Off) Solenoid 2 13.0 Ohms (± 2.0 Ohms)?

   Yes

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Shift (On/Off) Solenoid 2 in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Test Complete.

P0977-SHIFT SOLENOID B CONTROL CIRCUIT HIGH

Fig. 132: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Shift (On/Off) Solenoid 2 is used to switch hydraulic paths on the Shift Valve 2 which will direct a gear shift.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid resistance is greater than or equal to 100k Ohms for more than 100 ms.

POSSIBLE CAUSES

Possible Causes
(T809) SHIFT (ON/OFF) SOLENOID 2 OPEN
(T809) SHIFT (ON/OFF) SOLENOID 2 SHORT TO VOLTAGE
(T809) SHIFT (ON/OFF) SOLENOID 2
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 7.
2. **CHECK THE (T809) SHIFT (ON/OFF) SOLENOID 2 CONTROL CIRCUIT FOR AN OPEN**

Fig. 133: Checking Shift (On/Off) Solenoid 2 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C2 harness connectors.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T809) Shift (On/Off) Solenoid 2 Control circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 3.

No

- Repair the (T809) Shift (On/Off) Solenoid 2 Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T809) SHIFT (ON/OFF) SOLENOID 2 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 134: Checking Shift (On/Off) Solenoid 2 Control Circuit For A Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T809) Shift (On/Off) Solenoid 2 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T809) Shift (On/Off) Solenoid 2 Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T809) SHIFT (ON/OFF) SOLENOID 2 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 135: Checking Shift (On/Off) Solenoid 2 Control Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T809) Shift (On/Off) Solenoid 2 Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T809) Shift (On/Off) Solenoid 2 Control circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Go To 5.

5. **CHECK THE (T809) SHIFT (ON/OFF) SOLENOID 2 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 136: Checking Shift (On/Off) Solenoid 2 Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T809) Shift (On/Off) Solenoid 2 Control circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

   Is the resistance below 100k Ohms between the (T809) Shift (On/Off) Solenoid 2 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

Yes

- Repair the (T809) Shift (On/Off) Solenoid 2 Control circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE SHIFT (ON/OFF) SOLENOID 2**

Fig. 137: Checking Shift (On/Off) Solenoid 2 And Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C2 Harness connector.

3. Measure the resistance of the Shift (On/Off) Solenoid 2 between the (T809) Shift (On/Off) Solenoid 2 and ground at the TCM C3 harness connector.

   Is the resistance of the Shift (On/Off) Solenoid 2 13.0 Ohms (± 2.0 Ohms)?

   Yes

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Shift (On/Off) Solenoid 2 in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Test Complete.

P0979-SHIFT SOLENOID C CONTROL CIRCUIT LOW

Fig. 138: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Shift (On/Off) Solenoid 3 is used to switch hydraulic paths on the Shift Valve 3 which will direct a gear shift.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid current is greater than or equal to 4 amps for more than 100 ms.

POSSIBLE CAUSES

Possible Causes
(T810) SHIFT (ON/OFF) SOLENOID 3 SHORT TO GROUND
(T810) SHIFT (ON/OFF) SOLENOID 3 SHORT TO ANOTHER CIRCUIT
SHIFT (ON/OFF) SOLENOID 3
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 7.
2. **CHECK THE (T810) SHIFT (ON/OFF) SOLENOID 3 CONTROL CIRCUIT FOR AN OPEN**

Fig. 139: Checking Shift (On/Off) Solenoid 3 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C2 harness connectors.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T810) Shift (On/Off) Solenoid 3 Control circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 3.

No

- Repair the (T810) Shift (On/Off) Solenoid 3 Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T810) SHIFT (ON/OFF) SOLENOID 3 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 140: Checking Shift (On/Off) Solenoid 3 Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T810) Shift (On/Off) Solenoid 3 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T810) Shift (On/Off) Solenoid 3 Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T810) SHIFT (ON/OFF) SOLENOID 3 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 141: Checking Shift (On/Off) Solenoid 3 Control Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T810) Shift (On/Off) Solenoid 3 Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T810) Shift (On/Off) Solenoid 3 Control circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Go To 5.

5. **CHECK THE (T810) SHIFT (ON/OFF) SOLENOID 3 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 142: Checking Shift (On/Off) Solenoid 3 Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T810) Shift (On/Off) Solenoid 3 Control circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

Is the resistance below 100k Ohms between the (T810) Shift (On/Off) Solenoid 3 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

Yes

- Repair the (T810) Shift (On/Off) Solenoid 3 Control circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE SHIFT (ON/OFF) SOLENOID 3**

Fig. 143: Checking Shift (On/Off) Solenoid 3 And Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C2 Harness connector.
3. Measure the resistance of the Shift (On/Off) Solenoid 3 between the (T810) Shift (On/Off) Solenoid 3 and ground at the TCM C3 harness connector.

   Is the resistance of the Shift (On/Off) Solenoid 3 13.0 Ohms (± 2.0 Ohms)?

   Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Replace the Shift (On/Off) Solenoid 3 in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Test Complete.

P0980-SHIFT SOLENOID C CONTROL CIRCUIT HIGH

Fig. 144: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Shift (On/Off) Solenoid 3 is used to switch hydraulic paths on the Shift Valve 3 which will direct a gear shift.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid resistance is greater than or equal to 100k Ohms for more than 100 ms.

POSSIBLE CAUSES

Possible Causes
(T810) SHIFT (ON/OFF) SOLENOID 3 SHORT TO GROUND
(T810) SHIFT (ON/OFF) SOLENOID 3 SHORT TO ANOTHER CIRCUIT
SHIFT (ON/OFF) SOLENOID 3
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 7.
2. **CHECK THE (T810) SHIFT (ON/OFF) SOLENOID 3 CONTROL CIRCUIT FOR AN OPEN**

Fig. 145: Checking Shift (On/Off) Solenoid 3 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C2 harness connectors.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T810) Shift (On/Off) Solenoid 3 Control circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C3 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 3.

No

- Repair the (T810) Shift (On/Off) Solenoid 3 Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T810) SHIFT (ON/OFF) SOLENOID 3 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 146: Checking Shift (On/Off) Solenoid 3 Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T810) Shift (On/Off) Solenoid 3 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T810) Shift (On/Off) Solenoid 3 Control circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (T810) SHIFT (ON/OFF) SOLENOID 3 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 147: Checking Shift (On/Off) Solenoid 3 Control Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T810) Shift (On/Off) Solenoid 3 Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T810) Shift (On/Off) Solenoid 3 Control circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

- Go To 5.

5. **CHECK THE (T810) SHIFT (ON/OFF) SOLENOID 3 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 148: Checking Shift (On/Off) Solenoid 3 Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T810) Shift (On/Off) Solenoid 3 Control circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

Is the resistance below 100k Ohms between the (T810) Shift (On/Off) Solenoid 3 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

Yes

- Repair the (T810) Shift (On/Off) Solenoid 3 Control circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE SHIFT (ON/OFF) SOLENOID 3**

Fig. 149: Checking Shift (On/Off) Solenoid 3 And Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C2 Harness connector.
3. Measure the resistance of the Shift (On/Off) Solenoid 3 between the (T810) Shift (On/Off) Solenoid 3 and ground at the TCM C3 harness connector.

   Is the resistance of the Shift (On/Off) Solenoid 3 13.0 Ohms (± 2 Ohms)?

   Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Replace the Shift (On/Off) Solenoid 3 in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Test Complete.

P0982-SHIFT SOLENOID D CONTROL CIRCUIT LOW

Fig. 150: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Shift (On/Off) Solenoid 4 is used to switch hydraulic paths on the Control Valves 1 and 2.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid current is greater than or equal to 4 amps for more than 100 ms.

POSSIBLE CAUSES

Possible Causes
(T811) SHIFT (ON/OFF) SOLENOID 4 SHORT TO GROUND
(T811) SHIFT (ON/OFF) SOLENOID 4 SHORT TO ANOTHER CIRCUIT
SHIFT (ON/OFF) SOLENOID 4
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 7.
2. **CHECK THE (T811) SHIFT (ON/OFF) SOLENOID 4 CONTROL CIRCUIT FOR AN OPEN**

Fig. 151: Checking Shift (On/Off) Solenoid 4 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C2 harness connectors.
3. Disconnect the TCM C2 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T811) Shift (On/Off) Solenoid 4 Control circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C2 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 3.

No

- Repair the (T811) Shift (On/Off) Solenoid 4 Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T811) SHIFT (ON/OFF) SOLENOID 4 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 152: Checking Shift (On/Off) Solenoid 4 Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T811) Shift (On/Off) Solenoid 4 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

- Repair the (T811) Shift (On/Off) Solenoid 4 Control circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (T811) SHIFT (ON/OFF) SOLENOID 4 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 153: Checking Shift (On/Off) Solenoid 4 Control Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T811) Shift (On/Off) Solenoid 4 Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T811) Shift (On/Off) Solenoid 4 Control circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 5.

5. **CHECK THE (T811) SHIFT (ON/OFF) SOLENOID 4 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 154: Checking Shift (On/Off) Solenoid 4 Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T811) Shift (On/Off) Solenoid 4 Control circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

   Is the resistance below 100k Ohms between the (T811) Shift (On/Off) Solenoid 4 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

   Yes

   - Repair the (T811) Shift (On/Off) Solenoid 4 Control circuit for a short to another circuit(s).

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE SHIFT (ON/OFF) SOLENOID 4**

Fig. 155: Checking Shift (On/Off) Solenoid 4 And Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C2 Harness connector.
3. Measure the resistance of the Shift (On/Off) Solenoid 4 between the (T811) Shift (On/Off) Solenoid 4 and ground at the TCM C2 harness connector.

Is the resistance of the Shift (On/Off) Solenoid 4 13.0 Ohms (± 2 Ohms)?

Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Replace the Shift (On/Off) Solenoid 4 in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Test Complete.

P0983-SHIFT SOLENOID D CONTROL CIRCUIT HIGH

Fig. 156: Transmission Solenoid Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Shift (On/Off) Solenoid 4 is used to switch hydraulic paths on the Control Valves 1 and 2.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Solenoid resistance is greater than or equal to 100k Ohms for more than 100 ms.

POSSIBLE CAUSES

Possible Causes
(T811) SHIFT (ON/OFF) SOLENOID 4 SHORT TO GROUND
(T811) SHIFT (ON/OFF) SOLENOID 4 SHORT TO ANOTHER CIRCUIT
SHIFT (ON/OFF) SOLENOID 4
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 7.
2. **CHECK THE (T811) SHIFT (ON/OFF) SOLENOID 4 CONTROL CIRCUIT FOR AN OPEN**

Fig. 157: Checking Shift (On/Off) Solenoid 4 Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid Assembly C2 harness connectors.
3. Disconnect the TCM C2 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the (T811) Shift (On/Off) Solenoid 4 Control circuit between the Transmission Solenoid Assembly C2 harness connector and the TCM C2 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 3.

No

- Repair the (T811) Shift (On/Off) Solenoid 4 Control circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T811) SHIFT (ON/OFF) SOLENOID 4 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 158: Checking Shift (On/Off) Solenoid 4 Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T811) Shift (On/Off) Solenoid 4 Control circuit.

   Is the resistance below 100k Ohms?

   Yes

- Repair the (T811) Shift (On/Off) Solenoid 4 Control circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (T811) SHIFT (ON/OFF) SOLENOID 4 CONTROL CIRCUIT SHORT TO VOLTAGE**

Fig. 159: Checking Shift (On/Off) Solenoid 4 Control Circuit Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T811) Shift (On/Off) Solenoid 4 Control circuit.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T811) Shift (On/Off) Solenoid 4 Control circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 5.

5. **CHECK THE (T811) SHIFT (ON/OFF) SOLENOID 4 CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 160: Checking Shift (On/Off) Solenoid 4 Control Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (T811) Shift (On/Off) Solenoid 4 Control circuit and all other circuits in the Transmission Solenoid Assembly C2 harness connector.

   Is the resistance below 100k Ohms between the (T811) Shift (On/Off) Solenoid 4 Control circuit and any other circuit in the Transmission Solenoid Assembly harness connector?

   Yes

   - Repair the (T811) Shift (On/Off) Solenoid 4 Control circuit for a short to another circuit(s).

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE SHIFT (ON/OFF) SOLENOID 4**

Fig. 161: Checking Shift (On/Off) Solenoid 4 And Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Reconnect the Transmission Solenoid Assembly C2 Harness connector.
3. Measure the resistance of the Shift (On/Off) Solenoid 4 between the (T811) Shift (On/Off) Solenoid 4 and ground at the TCM C2 harness connector.

Is the resistance of the Shift (On/Off) Solenoid 4 13.0 Ohms (± 2 Ohms)?

Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Replace the Shift (On/Off) Solenoid 4 in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Test Complete.

P1679-CALIBRATION NOT LEARNED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) needs to learn certain values to properly control Transmission operation. This DTC indicates that these values are not currently learned in the TCM. If the TCM or Transmission is replaced, the Quick Learn Procedure must be performed.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.

Set Condition:

- Transmission Control Module (TCM) detects learned values are not currently in memory.

POSSIBLE CAUSES

Possible Causes
TCM REPLACED
TRANSMISSION REPLACED

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **PERFORM TCM Quick Learn**
    1. This DTC will set if the TCM or the Transmission have been replaced.

       Repair

       - With the scan tool, perform the Quick Learn Procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

Fig. 162: Transmission Temperature Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Output Speed sensor is used to determine gear position by applying the signal to a static shift schedule map. The Output Speed sensor is also used together with Input Speed sensor to calculate gear ratios. The Transmission Control Module (TCM) compares Output shaft speed to Vehicle speed buss messages to diagnosis the system. If the TCM detects a fault with the Output speed signal, it switches to vehicle speed to determine gear position.

DIAGNOSTIC TEST

When Monitored:

- Output speed is greater than 807 rpm and the PRNDL is not in Park or Neutral.
- Input Speed sensor is reporting as failed or CAN wheel speed not available.

Set Condition:

- If Output speed is greater than 3227 rpm and the TCM detects a decrease of Output speed greater than 141 rpm in 5 ms.
- If Output speed is greater than 2017 rpm and the TCM detects a decrease of Output speed greater than 202 rpm in 5 ms.
- If Output speed is greater than 807 rpm and the TCM detects a decrease of Output speed greater than 303 rpm in 5 ms.

POSSIBLE CAUSES

Possible Causes
(T14) OUTPUT SPEED SIGNAL CIRCUIT OPEN
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORTED TO GROUND
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUIT
(T72) SPEED SENSOR GROUND CIRCUIT OPEN
(T72) SPEED SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(T72) SPEED SENSOR GROUND CIRCUIT SHORTED TO ANOTHER CIRCUIT
OUTPUT SPEED SENSOR
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.

    NOTE: **It may be necessary to road test the vehicle to duplicate the original set conditions.**

    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 10.
2. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 163: Checking Output Speed Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C2 harness connector.
3. Disconnect the Output Speed Sensor harness connector.
4. Measure the resistance of the (T14) Output Speed Sensor Signal circuit between the TCM C2 harness connector and the Output Speed Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

- Go To 3.

No

- Repair the (T14) Output Speed Sensor Signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

3. **CHECK THE (T72) SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 164: Checking Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T72) Sensor Ground circuit between the TCM C2 harness connector and the Output Speed Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4.

   No

   - Repair the (T72) Sensor Ground circuit for an open.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

4. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 165: Checking Output Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (T14) Output Speed Sensor Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T14) Output Speed Sensor Signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 166: Checking Output Speed Sensor Signal Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (T14) Output Speed Sensor Signal circuit and all other circuits in the TCM C2 harness connector.

   Is the resistance below 100k Ohms between the (T14) Output Speed Sensor Signal circuit and any other circuit(s) in the TCM C2 harness connector?

Yes

- Repair the (T14) Output Speed Sensor Signal circuit for a short to another circuit(s).
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 6.

6. **CHECK THE (T72) SENSOR GROUND CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 167: Checking Sensor Ground Circuit For A Short To Another Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (T72) Sensor Ground circuit and all other circuits in the TCM C2 harness connector.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T72) Sensor Ground circuit for a short to another circuit(s).
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 7.

7. **CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 168: Checking Output Speed Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage of the (T14) Output Speed Sensor Signal circuit in the Output Speed Sensor harness connector.

   Is there any voltage present?

Yes

- Repair the (T14) Output Speed Sensor Signal circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 8.

8. **CHECK THE (T72) SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 169: Checking Sensor Ground Circuit For A Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (T72) Sensor Ground circuit in the Output Speed Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (T72) Sensor Ground circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 9.

9. **REPLACE THE OUTPUT SPEED SENSOR**
   1. Replace the Output Speed Sensor.
   2. Reconnect all connectors.
   3. Clear DTCs and road test the vehicle under the conditions in which the original DTC set.

      Did the loss of Output Speed Sensor/wheel speed DTC reset?

      Yes

      - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

      No

      - Test complete.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

10. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load
    3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
    4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
    5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
    6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Test Complete.

Fig. 170: Transmission Temperature Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Oil Temperature Sensor is used to determine shift schedule selection. Transmission Oil Temperature is also used in TCC operation. The Transmission Control Module (TCM) monitors the transmission temperature by comparing Transmission Oil Temperature to Ambient and Engine Coolant Temperature after a cold soak, by comparing Transmission Oil temperature increases in relation to Engine temperature increases, and abnormal changes over time.

CONDITION ONE:

When Monitored:

- System voltage between 10.0 and 16.0 volts.
- Engine coolant temperature data (CAN) is normal and greater than or equal to 70° C (158° F).
- Engine coolant temperature increase is greater than 50° C (90° F).
- Output speed sensor greater than 300 rpm for 410 seconds.
- Start up transmission oil temperature is between -40° C and 40° C (-40° F and 104° F).
- Output Speed sensor fault is not detected.

Set Condition:

- Change in Torque Converter Out Oil Temperature is less than or equal to 2° C (4° F).

CONDITION TWO:

When Monitored:

- System voltage between 10.0 and 16.0 volts.
- Engine coolant temperature data and output speed sensor is normal.
- Output speed sensor greater than 300 rpm for 410 seconds.

Set Condition:

- Change in Torque Converter Out Oil Temperature is greater than 20° C (36° F) in 100 msec and transmission oil temperature is less than 70° C (158° F) for more than five seconds.

CONDITION THREE:

When Monitored:

- Ambient temperature is less than 43° C (109° F)

- Engine coolant temp is equal to Ambient temperature within ± 10° C (18° F)

Set Condition:

- Torque Converter Out Oil Temperature is greater than Engine Ambient temperature by a calibrated value (see chart below).

Difference of Transmission Temperature compared to Engine Ambient Temperature	
ENGINE AMBIENT TEMPERATURE	**TRANSMISSION TEMPERATURE DIFFERENCE**
-30° C (-22° F)	±20° C (± 36° F)
-10° C (14° F)	±20° C (± 36° F)
0° C (32° F)	±20° C (± 36° F)
20° C (68° F)	±10° C (± 18° F)

CONDITION FOUR:

When Monitored:

- Torque Converter Out Oil Temperature is less than or equal to 20° C (68° F) at ignition on.

Set Condition:

- Torque Converter Out Oil Temperature is less than 20° C (68° F) after a calibrated time (see chart below).

Drive time above 48 mph based on Transmission Temperature at Ignition on	
TRANSMISSION TEMPERATURE AT IGNITION ON	**DRIVE TIME ABOVE 48 MPH**
-40° C (-40° F)	40 MINUTES
-30° C (-22° F)	30 MINUTES
-20° C (-4° F)	20 MINUTES
-10° C (14° F)	15 MINUTES
0° C (32° F)	13 MINUTES
10° C (50° F)	6 MINUTES
15° C (59° F)	6 MINUTES

POSSIBLE CAUSES

Possible Causes
RELATED ENGINE TEMPERATURE SENSOR DTCS
RELATED TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR DTCS
INTERMITTENT TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR
TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED ENGINE DTCs**
    1. With the scan tool, view Engine DTCs.

       Are there any Engine Coolant and/or Ambient DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK FOR RELATED TRANSMISSION DTCs**
    1. With the scan tool, view Transmission DTCs.

       Are there any other Transmission temperature sensor DTCs?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate DTC diagnostic procedure.

       No

       - Go To 3.
3. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

       Did the DTC reset?

       Yes

       - Go To 4.

No

- Go To 9.

4. **COMPARE THE TORQUE CONVERTER OUT OIL TEMPERATURE TO ENGINE COOLANT TEMPERATURE**

NOTE: **To test the torque converter out oil temperature sensor, the engine and transmission temperature must be at or below 29.4° C (85° F).**

1. With the scan tool, read the Torque Converter Out Oil Temperature and Engine temperatures.

   Is the torque converter out oil temperature within 5° C (9° F) of the engine coolant temperature?

   Yes

   - Go To 5.

   No

   - Go To 8.

5. **CHECK IF THE TORQUE CONVERTER OUT OIL TEMPERATURE INCREASES 15 DEGREES OVER 10 MINUTE PERIOD**

NOTE: **To test the torque converter out oil temperature sensor, the engine and transmission temperature must be at or below 29.4° C (85° F).**

CAUTION: Apply the parking brake.

1. Start the engine, firmly apply the brakes and allow the engine to idle in Drive.
2. With the scan tool, monitor the Torque Converter Out Oil Temperature.

NOTE: **If the torque converter out oil temperature sensor is working properly, the transmission temperature should rise at least 8° C (15° F) within a ten minute period.**

3. Did the torque converter out oil temperature increase at a steady rate and rise at least 8° C (15° F) over a 10 minute period?

   Yes

   - Go To 9.

   No

- Go To 6.

6. **CHECK THE (T819) TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Torque Converter Out Oil Temperature sensor harness connector.

      NOTE: Check connectors - Clean/repair as necessary

   3. Ignition on, engine not running.
   4. With the scan tool, monitor the Torque Converter Out Oil Temperature.

      Does the Torque Converter Out Oil Temperature read -40° C (-40° F) ± 2° C (4° F)?

      Yes

      - Go To 7.

      No

      - Refer to **DIAGNOSTIC CODE INDEX** and perform P2743-TRANSMISSION FLUID TEMPERATURE SENSOR 2 HIGH as if the DTC is active.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

7. **CHECK THE (T819) TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 171: Checking Torque Converter Out Oil Temperature Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Connect a jumper wire between the (T819) Torque Converter Out Oil Signal circuit and the (T820) Sensor Ground circuit in the Torque Converter Out Oil Temperature sensor harness connector.
3. Ignition on, engine not running.
4. With the scan tool, monitor the Torque Converter Out Oil Temperature.

Does the Torque Converter Out Oil Temperature read 200° C (392° F) ± 2° C (4° F)?

Yes

- Go To 8.

No

- Refer to **DIAGNOSTIC CODE INDEX** and perform P2742-TRANSMISSION FLUID TEMPERATURE SENSOR 2 LOW as if the DTC is active.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

8. **CHECK THE TRANSMISSION TEMPERATURE SENSOR**

Fig. 172: Checking Transmission Temperature Sensor And Circuits

Courtesy of CHRYSLER GROUP, LLC

TYPICAL VALUES FOR TRANSMISSION TEMPERATURE SENSOR	
TEMPERATURE	**APPROXIMATE OHM**
-30° C (-22° F)	44000 Ohms
10° C (50° F)	6400 Ohms
110° C (230° F)	200 Ohms
145° C (293° F)	100 Ohms

1. Turn the ignition off to the lock position.
2. Reconnect the Torque Converter Out Oil Temperature sensor harness connector.
3. Disconnect the TCM C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary

4. Measure the resistance of the Torque Converter Out Oil Temperature Sensor between the (T819) Transmission Temperature Signal circuit and the (T820) Sensor Ground circuit in the TCM C3 harness connector.
5. Using the chart at the chart above, compare the Torque Converter Out Oil temperature to the correlating resistance value.

   Is the resistance within the specified range when the sensor is at the given temperature?

   Yes

   - Go To 9.

   No

   - Replace the Torque Converter Out Oil Temperature Sensor in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

9. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Test Complete.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Torque Converter Out Oil Temperature sensor is used to determine if the transmission needs to go into high temperature shift strategy to protect the transmission.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, the engine running.

Set Condition:

- The Diagnostic Trouble Code (DTC) will set if the monitored Transmission Temperature Sensor Signal circuit is greater than 200° C (392° F) for more than 500 ms.

POSSIBLE CAUSES

Possible Causes
(T819) TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(T819) TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO (T820) SENSOR GROUND CIRCUIT
TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

Yes

- Go To 2.

No

- Go To 5.

2. **CHECK THE (T819) TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 174: Checking Torque Converter Out Oil Temperature Sensor Signal Circuit For A Short To

Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C2 harness connector.
3. Disconnect the Torque Converter Out Oil Temperature sensor harness connector.
4. Measure the resistance between ground and the (T819) Torque Converter Out Oil Temperature Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T819) Torque Converter Out Oil Temperature Signal circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 3.

3. **CHECK THE (T819) TORQUE CONVERTER OUT OIL TEMPERATURE SIGNAL CIRCUIT FOR A SHORT TO (T820) SENSOR GROUND CIRCUIT**

Fig. 175: Checking Torque Converter Out Oil Temperature Signal Circuit For A Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the TCM C3 harness connector.
2. Measure the resistance between the (T819) Torque Converter Out Oil Temperature Signal circuit and (T820) Sensor Ground circuit in the Torque Converter Out Oil Temperature sensor harness connector.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (T819) Torque Converter Out Oil Temperature Signal circuit for a short to the (T820) Sensor Ground circuit.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE TRANSMISSION TEMPERATURE SENSOR**

Fig. 176: Checking Transmission Temperature Sensor And Circuits
Courtesy of CHRYSLER GROUP, LLC

TYPICAL VALUES FOR TRANSMISSION TEMPERATURE SENSOR	
TEMPERATURE	**APPROXIMATE OHM**

-30° C (-22° F)	44000 Ohms
10° C (50° F)	6400 Ohms
110° C (230° F)	200 Ohms
145° C (293° F)	100 Ohms

1. Turn the ignition off to the lock position.
2. Reconnect the Torque Converter Out Oil Temperature sensor harness connector.
3. Disconnect the TCM C2 and C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Measure the resistance of the Transmission Temperature Sensor between the (T819) Torque Converter Out Oil Temperature Signal circuit in the TCM C2 harness connector and the (T820) Sensor Ground circuit in the TCM C3 harness connector.
5. Using the chart at the chart above, compare the Torque Converter Out Oil Temperature Sensor temperature to the correlating resistance value.

   Is the resistance within the specified range when the sensor is at the given temperature?

   Yes

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Transmission Temperature Sensor in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Test Complete.

THEORY OF OPERATION

The Torque Converter Out Oil Temperature sensor is used to determine if the transmission needs to go into high temperature shift strategy to protect the transmission.

DIAGNOSTIC TEST

When Monitored:

- Ignition on, the engine running.

Set Condition:

- The Diagnostic Trouble code (DTC) will set if the monitored Transmission Temperature Sensor Signal circuit is greater than -50° C (-58° F) for more than 500 ms.

POSSIBLE CAUSES

Possible Causes
(T819) TORQUE CONVERTER OUT OIL TEMPERATURE SIGNAL CIRCUIT SHORT TO VOLTAGE
(T819) TORQUE CONVERTER OUT OIL TEMPERATURE SIGNAL CIRCUIT OPEN
(T820) SENSOR GROUND CIRCUIT OPEN
TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

Yes

- Go To 2.

No

- Go To 6.

2. **CHECK THE (T819) TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 178: Checking Torque Converter Out Oil Temperature Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TCM C2 harness connectors.
3. Disconnect the Torque Converter Out Oil Temperature sensor harness connector.
4. Ignition on, engine not running.
5. Measure the voltage of the (T819) Torque Converter Out Oil Temperature Signal circuit in the TCM C2 harness connector.

   Is the voltage above 0.5 of a volt?

   Yes

   - Repair the (T819) Torque Converter Out Oil Temperature Signal circuit for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Go To 3.

3. **CHECK THE (T819) TORQUE CONVERTER OUT OIL TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 179: Checking Torque Converter Out Oil Temperature Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T819) Torque Converter Out Oil Temperature Signal circuit between the TCM C2 harness connector and the Torque Converter Out Oil Temperature sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4.

   No

- Repair the (T819) Torque Converter Out Oil Temperature Signal circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

4. **CHECK THE (T820) SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 180: Checking Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T820) Sensor Ground circuit between the TCM C3 harness connector and the Torque Converter Out Oil Temperature sensor harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5.

No

- Repair the (T820) Sensor Ground circuit for an open.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

5. **CHECK THE TRANSMISSION TEMPERATURE SENSOR**

Fig. 181: Checking Transmission Temperature Sensor And Circuits
Courtesy of CHRYSLER GROUP, LLC

TYPICAL VALUES FOR TRANSMISSION TEMPERATURE SENSOR	
TEMPERATURE	**APPROXIMATE OHM**
-30° C (-22° F)	44000 Ohms
10° C (50° F)	6400 Ohms
110° C (230° F)	200 Ohms
145° C (293° F)	100 Ohms

1. Turn the ignition off to the lock position.
2. Reconnect the Torque Converter Out Oil Temperature sensor harness connector.
3. Disconnect the TCM C2 and C3 harness connector.

NOTE: Check connectors - Clean/repair as necessary

4. Measure the resistance of the Torque Converter Out Oil Temperature sensor between the (T819) Torque Converter Out Oil Temperature Signal circuit in the TCM C2 and the (T820) Sensor Ground circuit in the TCM C3 harness connector.
5. Using the chart at the chart above, compare the Temperature Sensor temperature to the correlating resistance value.

   Is the resistance within the specified range when the sensor is at the given temperature?

   Yes

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Transmission Temperature Sensor in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

- Repair as necessary.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Test Complete.

P2757-TCC PRESSURE CONTROL SOLENOID CONTROL CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This Diagnostic Trouble Code (DTC) checks the mechanical operation of the Torque Converter Clutch (TCC). When the TCC is commanded on, there should be little or no difference between Engine speed and Input speed. If the TCM detects the TCC is slipping greater than a calibrated value, for two consecutive ignition cycles, this DTC will set.

DIAGNOSTIC TEST

When Monitored:

- No other DTCs set.
- TCC is commanded on.

Set Condition:

- Engine speed minus Input speed is greater than or equal to 200 rpm for five seconds for two consecutive ignition cycles.

POSSIBLE CAUSES

Possible Causes
TORQUE CONVERTER
INTERNAL TRANSMISSION HARNESS
STICKING OR LEAKING LINEAR SOLENOID 3
VALVE BODY
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.

2. Record the Environmental Data and any DTCs.
3. Clear DTCs.
4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
5. Read TCM DTCs.

NOTE: **If there are any other Engine and/or Transmission DTCs, diagnosis those first.**

Did the DTC reset?

Yes

- Go To 2.

No

- Go To 4.

2. **CHECK THE TORQUE CONVERTER CLUTCH (TCC) OPERATION**
   1. Clear Transmission DTCs.
   2. Road test the vehicle in a condition that will enable TCC lock up.
   3. Using the scan tool, record the Engine speed and the Transmission Input speed during TCC lock up.
   4. Using the set condition listed above, calculate the TCC slip rpm.

   Is the TCC slip rpm greater than or equal to 200 rpm?

   Yes

   - Go To 3.

   No

   - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
3. **CHECK INTERNAL TRANSMISSION**
   1. Turn the ignition off to the lock position.
   2. Remove the transmission oil pan.
   3. Check the internal transmission harness, pins, terminals, and connectors for shorts, corrosion, damage, or terminal push out.
   4. Visually inspect the valve body for debris, damage or leaking hydraulic paths.

5. Visually inspect for sticking or binding Control Valve(s).

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

   No

   - Replace the Torque Converter in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

4. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

      No

      - Test Complete.

P2806-TRANSMISSION RANGE SENSOR ALIGNMENT

Fig. 182: Transmission Range Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Range Sensor (TRS) is a multiple position selector switch which changes the signal path by redirecting a 12-volt signal source to seven different TRS signal circuits (P, R, N, D, 3, 2, 1) and also houses a Park/Neutral (P/N) switch circuit. These circuits are monitored by the Transmission Control Module (TCM) and used in conjunction with various pressure switches to validate proper operation of the transmission and diagnose any possible problem. In a normal operating mode, pressure switch 8, is in an "Open" state in P, R, or N. and in a "Closed" state in any forward gear (engine running). If the TCM detects all of shift lever positions registering "OPEN", the code will set and the PRNDL display will have all of the Shift Lever positions boxed. This DTC will not illuminate the MIL

DIAGNOSTIC TEST

When Monitored:

- Ignition on, engine running.
- Pressure Switch 8 is Open.

Set Condition:

- When the Transmission Control Module (TCM) detects all of the Shift Lever positions registering "OPEN" for the period of two seconds.

POSSIBLE CAUSES

Possible Causes
SHIFT LEVER HELD IN BETWEEN GATE POSITIONS

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR OTHER DTCS**

   NOTE: This DTC is supplemental and requires no diagnostic troubleshooting. Typically, if this code is set without P0706, P0707, or P0708 it is caused by the column shifter placement between gate stop positions, positioning the gear range indicator switch between gear positions for more than 2 seconds. Only diagnose the range sensor as instructed in P0706, P0707, or P0708 if they are present.

   Are there any other TRS DTCs set?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

- Clear DTC.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U0001-CAN C BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) continuously monitors the Bus activity and receives the messages it needs.

DIAGNOSTIC TEST

When Monitored:

- Test is enabled 1050 ms after start of CAN communication.

Set Condition:

- TCM detects a CAN Bus error.

Refer to DIAGNOSIS AND TESTING and DIAGNOSIS AND TESTING for diagnostic procedures and other possible causes.

U0100-LOST COMMUNICATION WITH ECM / PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) continuously monitors the Bus activity and receives the messages it needs. The CAN C Bus is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, the Engine Controller will light the MIL.

DIAGNOSTIC TEST

When Monitored:

- No CAN Bus performance codes present. Input speed is greater than 300 rpm when the shift lever is in Park or Neutral or the Transmission range sensor indicates drive and pressure switch 8 is closed when the shift lever is in Drive, Third, Second, or Low. Battery voltage greater than 10 volts but less than 16 volts. Conditions must be present continuously for 5 seconds.

Set Condition:

- PCM CAN C Bus message has not been received for 500 ms.

Refer to DIAGNOSIS AND TESTING and DIAGNOSIS AND TESTING for diagnostic procedures and other possible causes.

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) continuously monitors the Bus activity and receives the messages it needs.

DIAGNOSTIC TEST

When Monitored:

- No CAN Bus performance codes present. Input speed is greater than 300 rpm when the shift lever is in Park or Neutral or the Transmission range sensor indicates drive and pressure switch 8 is closed when the shift lever is in Drive, Third, Second, or Low. Battery voltage greater than 10 volts but less than 16 volts. Conditions must be present continuously for 5 seconds.

Set Condition:

- ABS CAN C Bus message has not been received for 500 ms.

Refer to DIAGNOSIS AND TESTING and DIAGNOSIS AND TESTING for diagnostic procedures and other possible causes.

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) continuously monitors the Bus activity and receives the messages it needs.

DIAGNOSTIC TEST

When Monitored:

- No CAN Bus performance codes present. Battery voltage greater than 10 volts but less than 16 volts. Conditions must be present continuously for 5 seconds.

Set Condition:

- Totally Integrated Power Module (TIPM) CAN C Bus message has not been received for 500 ms.

Refer to DIAGNOSIS AND TESTING and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

U1111-LOST ODOMETER MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) continuously monitors the Bus activity and receives the messages it needs.

DIAGNOSTIC TEST

When Monitored:

- Ignition ON with no CAN bus performance codes present, battery between 10 and 16 volts with the engine running.

Set Condition:

- PCM Odometer message is not received for more than 500 ms.
- Odometer message stays unchanged for 10.5 seconds.
- Odometer at key-on stays unchanged after the vehicle has been driven over 3 miles.

Refer to DIAGNOSIS AND TESTING and DIAGNOSIS AND TESTING for diagnostic procedures and other possible causes.

U1400-IMPLAUSIBLE TPS SIGNAL RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The messages sent on the CAN bus are distinguished by an identifier (ID). Each CAN ID is defined to contain a certain number of bytes. The Transmission Control Module (TCM) verifies that it has received the proper number of bytes for each ID.

DIAGNOSTIC TEST

When Monitored:

- Continuously with the ignition on, one valid CAN ID received at least once, and no U0001-CAN C Bus DTC present.

Set Condition:

- When the TCM detects an incorrect CAN ID from the ECM/PCM.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
ECM/PCM DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Go To 2.
2. **CHECK IF ECM/PCM DTCS ARE PRESENT**
    1. With the scan tool, read engine DTCs.

       Are there any engine DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U1401-IMPLAUSIBLE ENGINE SPEED SIGNAL RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The messages sent on the CAN bus are distinguished by an identifier (ID). Each CAN ID is defined to contain a certain number of bytes. The Transmission Control Module (TCM) verifies that it has received the proper number of bytes for each ID.

DIAGNOSTIC TEST

When Monitored:

- Continuously with the ignition on, one valid CAN ID received at least once, and no U0002-CAN Bus Off Performance DTC present.

Set Condition:

- When the TCM detects an incorrect CAN ID from the ECM/PCM.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
ECM DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

- Go To 2.

2. **CHECK IF ENGINE DTCS ARE PRESENT**
    1. With the scan tool, read engine DTCs.

       Are there any engine DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U1402-IMPLAUSIBLE ENGINE TEMPERATURE SIGNAL RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This message is used by the TCM in the transmission temperature sensor and transmission fluid temperature sensor performance detections.

DIAGNOSTIC TEST

When Monitored:

- Continuously with the ignition on.

Set Condition:

- When the message is not received or stays unchanged for 10.5 seconds or more for two consecutive key-cycles.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
ECM DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Go To 2.
2. **CHECK IF ENGINE DTCS ARE PRESENT**
    1. With the scan tool, read engine DTCs.

       Are there any engine DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U1407-IMPLAUSIBLE ENGINE TORQUE REQUEST RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This message is used by the TCM as part of the torque management strategy between the PCM and the TCM.

DIAGNOSTIC TEST

When Monitored:

- Continuously with the key-on.

Set Condition:

- When the message is not received or stays unchanged for 10.5 seconds or more for two consecutive ignition cycles.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
ECM DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
   1. With the scan tool, read TIPM DTCs.

      Are there any TIPM CAN BUS DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

      No

      - Go To 2.
2. **CHECK IF ENGINE DTCS ARE PRESENT**
   1. With the scan tool, read engine DTCs.

      Are there any engine DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

      No

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U1408-IMPLAUSIBLE BRAKE SIGNAL RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This message is used by the TCM to switch to Coast-Down strategy just prior to vehicle coming to a halt.

DIAGNOSTIC TEST

When Monitored:

- Continuously with the key-on.

Set Condition:

- When the message is not received or stays unchanged for 10.5 seconds or more for two consecutive key-cycles.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
ECM DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 2.

2. **CHECK IF ENGINE DTCS ARE PRESENT**
   1. With the scan tool, read engine DTCs.

      Are there any engine DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

      No

      - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U140D-IMPLAUSIBLE WHEEL SPEED SIGNALS RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The messages sent on the CAN bus are distinguished by an identifier (ID). Each CAN ID is defined to contain a certain number of bytes. The Transmission Control Module (TCM) verifies that it has received the proper number of bytes for each ID.

DIAGNOSTIC TEST

When Monitored:

- Continuously with the ignition on, one valid CAN ID received at least once, and no U0002-CAN Bus Off Performance DTC present.

Set Condition:

- When the TCM detects an incorrect CAN ID from the ABS control module.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT

ABS CONTROL MODULE DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Go To 2.
2. **CHECK IF ABS DTCS ARE PRESENT**
    1. With the scan tool, read ABS DTCs.

       Are there any ABS DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U1424-IMPLAUSIBLE ENGINE TORQUE RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This message is used by the TCM as part of the torque management strategy between the PCM and the TCM.

DIAGNOSTIC TEST

When Monitored:

- Continuously with the ignition on.

Set Condition:

- When the message is not received or stays unchanged for 10.5 seconds or more for two consecutive ignition cycles.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
ECM DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
   1. With the scan tool, read TIPM DTCs.

      Are there any TIPM CAN BUS DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

      No

      - Go To 2.
2. **CHECK IF ENGINE DTCS ARE PRESENT**
   1. With the scan tool, read engine DTCs.

      Are there any engine DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U1437-IMPLAUSIBLE INTAKE AIR TEMPERATURE MESSAGE RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This message is used by the TCM in the transmission temperature sensor and transmission fluid temperature sensor performance detections.

DIAGNOSTIC TEST

When Monitored:

- Continuously with the ignition on.

Set Condition:

- When the message is not received or stays unchanged for 10.5 seconds or more for two consecutive ignition cycles.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
ECM DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM CAN BUS DTCs present?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Go To 2.

2. **CHECK IF ENGINE DTCS ARE PRESENT**
   1. With the scan tool, read engine DTCs.

      Are there any engine DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

      No

      - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U1439-IMPLAUSIBLE/MISSING PROGRAMMED AXLE RATIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This programmed axle ratio information is received from the TIPM to be used by the TCM as part of speed sensor diagnostics.

DIAGNOSTIC TEST

When Monitored:

- Continuously with the key-on.

Set Condition:

- This fault is set when any other values other than 4.88, 4.44, 4.10, or 3.73 is received, or the message is not received for more than 10.5 seconds.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
ECM DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Go To 2.
2. **CHECK IF ENGINE DTCS ARE PRESENT**
    1. With the scan tool, read engine DTCs.

       Are there any engine DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U1440-IMPLAUSIBLE/MISSING PROGRAMMED TRANSFER CASE HI RATIO

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This programmed Transfer Case Hi Ratio information is received from the TIPM to be used by the TCM as part of speed sensor diagnostics.

DIAGNOSTIC TEST

When Monitored:

- Continuously with the key-on.

Set Condition:

- This fault is set when any other values other than 1.0 is received, or the message is not received for more than 10.5 seconds.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
ECM DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
   1. With the scan tool, read TIPM DTCs.

      Are there any TIPM CAN BUS DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate symptom(s).
      - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

      No

      - Go To 2.
2. **CHECK IF ENGINE DTCS ARE PRESENT**
   1. With the scan tool, read engine DTCs.

Are there any engine DTCs present?

Yes

- Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate diagnostic procedure.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U1441-IMPLAUSIBLE/MISSING PROGRAMMED TRANSFER CASE LOW RATIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This programmed Transfer Case Low Ratio information is received from the TIPM to be used by the TCM as part of speed sensor diagnostics.

DIAGNOSTIC TEST

When Monitored:

- Continuously with the ignition on.

Set Condition:

- This fault is set when any other values other than 2.72 is received, or the message is not received for more than 10.5 seconds.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
ECM DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate symptom(s).
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Go To 2.
2. **CHECK IF ENGINE DTCS ARE PRESENT**
    1. With the scan tool, read engine DTCs.

       Are there any engine DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

U1449-IMPLAUSIBLE ERS MESSAGE RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This message is used by the Transmission Control Module (TCM) for Electronic Range Select (ERS) operation. The ERS switch is hard wired to the Cabin Compartment Node (CCN). The CCN then sends a CAN bus message to the TCM.

WHEN MONITORED:

Continuously with the ignition on.

SET CONDITION:

This fault is set when the ERS message is not received or invalid.

POSSIBLE CAUSES

Possible Causes
TIPM CAN BUS DTCS PRESENT
CABIN COMPARTMENT NODE (CCN)
TRANSMISSION CONTROL MODULE (TCM)

Always perform the AS68RC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR TIPM CAN BUS DTCS**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF CCN DTCS ARE PRESENT**
    1. With the scan tool, read CCN DTCs.

       Are there any CCN DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
       - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

       No

       - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the TCM in accordance with the Service Information.

- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

STANDARD PROCEDURE

AS68RC TRANSMISSION VERIFICATION TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. Perform the following after completion of a diagnostic repair:
    1. Reconnect any disconnected components.
    2. Connect the scan tool to the Data Link Connector (DLC).
    3. With the scan tool, erase all Transmission and Engine DTCs.
    4. With the scan tool, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT.
    5. Check the Transmission fluid level and adjust if necessary. Refer to **STANDARD PROCEDURE** for the Fluid Fill procedure.
    6. With the scan tool, perform the TCM Quick learn procedure if a transmission component has been replaced, or the TCM has been replaced or flashed. Perform AS68RC TCM Quick Learn.
    7. Road test the vehicle allowing the vehicle to shift through all gears.
    8. Check for DTCs during and after the road test.

    Were there any Diagnostic Trouble Codes (DTCs) set during the road test?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Repair is complete.

AS68RC PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1.
    1. Many transmission symptoms can be caused by a low fluid level. If the fluid level is low, locate and repair any leaks and fill the transmission to the proper fluid level. Refer to **STANDARD PROCEDURE** for the proper repair and fluid fill procedures.
    2. Testing should only be performed with the battery fully charged to avoid false diagnosis.

3. With the scan tool, read Engine (PCM) DTCs. If Engine DTCs are present, Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate diagnostic procedure.
4. With the scan tool, read Transmission (TCM) DTCs. Record all Stored, Active, and Pending DTC information. Diagnose any Pending DTC as a matured DTC.
5. Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, driving under specific conditions, or after controller diagnostic monitors have run.
6. Perform any applicable Service Bulletins for controller software update information. Some conditions can be corrected by upgrading the Engine (ECM) or Transmission (TCM) controller software.
7. Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any repairs made that fixed the vehicle?

Yes

- Testing complete.
- Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.

No

- Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

AS86RC TCM PROGRAMMING PROCEDURE

DIAGNOSTIC TEST

1. **PROGRAMMING THE TRANSMISSION CONTROL MODULE (TCM)**

NOTE: **When replacing a Transmission Control Module (TCM), the TCM must be programmed.**

NOTE: **Failure to properly program the TCM may result in the illumination of the Malfunction Indicator Lamp (MIL) and setting DTC(s).**

NOTE: **While performing the TCM programming procedure, the vehicle battery must be maintained between 10 and 16 volts. Ambient temperature must be between 0° C (32° F) 60° C (140° F). Vehicle must be in Park with brake pedal depressed.**

NOTE: **The total number of TCM reflashes and/or reflash attempts must be limited to a maximum of 50 times. The TCM is considered defective if more than 50 reflashes and/or reflash attempts have occurred.**

NOTE: **After installing a generic TCM into the vehicle and before the software flash has been performed, it is possible to illuminate the MIL and set a P0602 - TCM Not Programmed if the engine is started before the flash is completed. If DTC P0602 sets during programming, clear DTCs after the flash has completed.**

1. Using the scan tool and Dealer Connect, download the appropriate TCM flash file to the scan tool.
2. Ignition on, engine not running.
3. Vehicle in park with the brake pedal depressed.
4. Following the menu on the scan tool, program the TCM.
5. After the TCM has been programmed, a TCM Quick Lean must be performed. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** and perform TCM QUICK LEARN - AS68RC TRANSMISSION.

   NOTE: **TCM Quick lean must be performed to prevent setting DTC P1679 - Calibration Not Learned after TCM programming.**

6. With the scan tool, perform PTO Configuration (if equipped).
7. Clear any stored DTCs.
8. Road test the vehicle above 40 m.p.h. for at least two minutes.
9. With the scan tool, select View DTCs in the TCM.

   Are there any DTCs present?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure (s).

   No

   - Test Complete
   - Refer to **STANDARD PROCEDURE** and perform the AS68RC VERIFICATION TEST.
