connector of the steering wheel wire harness.

The odometer switch pod cannot be adjusted or repaired. If any function of the switch is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

OPERATION

The odometer switch pod is a resistor multiplexed unit that receives source current from and provides hard wired inputs to the Local Interface Network (LIN) slave node integral to the speed control switch pod in the right spoke of the steering wheel spoke bezel. The LIN slave node communicates the switch states of the odometer switch pod, the remote radio switches and the horn switch over the LIN data bus to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), which is the LIN master node.

The odometer switch pod (also known as the odometer switch) is used only for vehicles not equipped with the Electronic Vehicle Information Center (EVIC) system and contains two switch push buttons whose functions are:

- **Reset -** This switch button allows the operator to reset the trip odometer (A or B) currently displayed in the odometer display unit of the instrument cluster.
- **Step -** This switch button allows the operator to step through the total odometer, trip odometer A and trip odometer B display options of the odometer display of the instrument cluster.

For vehicles equipped with the Uconnect™ Hands-Free Communication System, the odometer switch pod contains two additional switch push buttons whose functions are:

- **VR (Voice Recognition) -** This switch button activates the Uconnect™ Voice Command system.
- **Phone -** This switch push button activates the Uconnect™ Hands-Free Phone system.

The EMIC LIN master node provides a clean ground and fused B(+) current for all of the switches and sensors on the rotating steering wheel through the LIN slave node circuitry of the speed control switch pod as well as for the Light Emitting Diode (LED) back lighting of both the speed control and the odometer switch pods. The EMIC continually monitors the LIN bus data and will store a Signal Not Available (SNA) code for any LIN bus input errors. The EMIC also communicates with other electronic modules over the Controller Area Network (CAN) data bus. Therefore, any EMIC DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

The analog resistor multiplexed circuits of the odometer switch pod as well as the hard wired circuits between the switch pod and the LIN slave node within the speed control switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LIN slave or

master nodes, the EMIC or the electronic controls and communication between modules and other devices that provide some features of the odometer system. The most reliable, efficient, and accurate means to diagnose the odometer switch pod, the LIN slave or master nodes, the EMIC or the electronic controls and communication related to odometer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

The odometer switch pod is serviced in exactly the same manner as the Electronic Vehicle Information Center (EVIC) control switch. Refer to **SWITCH, EVIC CONTROL, REMOVAL** .

INSTALLATION

INSTALLATION

The odometer switch pod is serviced in exactly the same manner as the Electronic Vehicle Information Center (EVIC) control switch. Refer to **SWITCH, EVIC CONTROL, INSTALLATION** .

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B1D56	ADJUSTABLE PEDAL SENSOR CIRCUIT LOW
B1D57	ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH
B1D5B	ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE
B1D5C	ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD
B1D5D	ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD
B1D62	POWER SEAT SWITCH STUCK
B1D63	POWER SEAT SWITCH OPEN
B1D67	ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE
B1D6D	SEAT HORIZONTAL POSITION SENSOR CIRCUIT LOW
B1D6E	SEAT HORIZONTAL POSITION SENSOR CIRCUIT HIGH
B1D71	SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT LOW
B1D72	SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT HIGH
B1D75	SEAT REAR VERTICAL POSITION SENSOR CIRCUIT LOW
B1D76	SEAT REAR VERTICAL POSITION SENSOR CIRCUIT HIGH
B1D79	SEAT RECLINER POSITION SENSOR CIRCUIT LOW
B1D7A	SEAT RECLINER POSITION SENSOR CIRCUIT HIGH
B1D7B	SEAT HORIZONTAL MOTOR CONTROL CIRCUIT PERFORMANCE
B1D7F	SEAT FRONT VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE
B1D83	SEAT REAR VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE
B1D87	SEAT BACKREST MOTOR CONTROL CIRCUIT PERFORMANCE
B1D9B	SEAT HORIZONTAL FRONT STOP NOT LEARNED
B210D	BATTERY VOLTAGE LOW
B210E	BATTERY VOLTAGE HIGH
B221C	MEMORY SEAT MODULE INTERNAL
U0011	CAN INTERIOR BUS OFF PERFORMANCE
U0014	CAN INTERIOR BUS (+) CIRCUIT HIGH
U0016	CAN INTERIOR BUS (-) CIRCUIT LOW
U0141	LOST COMMUNICATION WITH IPM (FCM/TIPM)
U0155	LOST COMMUNICATION WITH CLUSTER/CCN
U0203	LOST COMMUNICATION WITH DOOR MODULE FRONT LEFT
U0204	LOST COMMUNICATION WITH DOOR MODULE FRONT RIGHT

DIAGNOSIS AND TESTING

B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW

Fig. 1: Adjustable Pedal Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Voltage on the (G13) Adjustable Pedals Sensor Supply circuit is not within a specified range. The Memory Seat Module (MSM) will not be able to detect pedal position. When the Adjustable Pedals switch is pressed, the pedals will move for approximately two seconds then the module turns off the output.

POSSIBLE CAUSES

Possible Causes
(G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO THE (G493) POSITION SENSOR GROUND CIRCUIT
(G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO THE (P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT
(G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO THE (P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT
ADJUSTABLE PEDALS SENSOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE FAULT WITH PEDALS STATIONARY**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase DTC's.
    3. Cycle the ignition from on to off.
    4. Turn the ignition on.
    5. Using a scan tool, read DTC's.

    Does the scan tool display DTC B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW?

    Yes

    - Go To 3.

    No

    - Go To 2.
2. **CHECK FOR ACTIVE FAULT WHILE ADJUSTING THE PEDALS**
    1. Operate the Adjustable Pedals switch in both positions then wait five seconds.
    2. Using a scan tool, read DTC's.

    Does the scan tool display DTC B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW?

Yes

- Go To 3.

No

- The conditions that caused this code to set are not present at this time. Perform the APS INTERMITTENT CONDITION TEST. Refer to **APS INTERMITTENT CONDITION TEST**.

3. **CHECK THE (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 2: Checking Adjustable Pedals Sensor Supply Circuit For A Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MSM C2 harness connector.
3. Disconnect the Adjustable Pedals Motor harness connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Measure the resistance of the (G13) Adjustable Pedals Sensor Supply circuit between ground and the Adjustable Pedals Motor harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (G13) Adjustable Pedals Sensor Supply circuit for a short to ground.
   - Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR A SHORT TO THE (G493) POSITION SENSOR GROUND CIRCUIT, THE (P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT, OR THE (P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT**

Fig. 3: Measuring Resistance Of Adjustable Pedals Sensor Supply Circuit For A Short
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G13) Adjustable Pedals Sensor Supply circuit and the (G493) Position Sensor Ground circuit at the Adjustable Pedals Motor harness connector.
2. Measure the resistance between the (G13) Adjustable Pedals Sensor Supply circuit and the (P205) Adjustable Pedals Motor Forward circuit at the Adjustable Pedals Motor harness connector.
3. Measure the resistance between the (G13) Adjustable Pedals Sensor Supply circuit and the (P206) Adjustable Pedals Motor Rearward circuit at the Adjustable Pedals Motor harness connector.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (G13) Adjustable Pedals Sensor Supply circuit.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK THE (G13) ADJUSTABLE PEDALS SENSOR SUPPLY AND (G493) POSITION SENSOR GROUND CIRCUIT FUNCTION**

Fig. 4: Checking Adjustable Pedals Sensor Supply & Position Sensor Ground Circuit Function
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the MSM C2 harness connector.
2. Disconnect the scan tool.
3. Turn off all vehicle interior and exterior lighting.
4. Mark sure all doors are closed then wait 10 seconds.
5. Connect a 12-Volt test light between the (G13) Adjustable Pedals Sensor Supply circuit and the (G493) Position Sensor Ground circuit at the Adjustable Pedals Motor harness connector.
6. While monitoring the test light, press the Adjustable Pedals switch in either direction then release the switch.

Does the test light illuminate for approximately six seconds then turn off?

Yes

- Replace the Adjustable Pedals Sensor in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH

Fig. 5: Adjustable Pedal Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

If Voltage on the (G13) Adjustable Pedals Sensor Supply circuit is not within a specified range. The Memory Seat Module (MSM) will not be able to detect pedal position. When the Adjustable Pedals switch is pressed, the pedals will move for approximately two seconds then the module turns off the output.

POSSIBLE CAUSES

Possible Causes
(G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO THE (P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT
(G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO THE (P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT
(G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT OPEN
(G493) POSITION SENSOR GROUND CIRCUIT OPEN
ADJUSTABLE PEDALS SENSOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase DTC's.
    3. Cycle the ignition from on to off.
    4. Turn the ignition on.
    5. Operate the Adjustable Pedals switch in both positions then wait five seconds.
    6. Using a scan tool read DTC's.

    Does the scan tool display DTC B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - The conditions that caused this code to set are not present at this time. Perform the APS INTERMITTENT CONDITION TEST. Refer to **APS INTERMITTENT CONDITION TEST**.
2. **CHECK THE (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 6: Checking Adjustable Pedals Sensor Supply Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Adjustable Pedals Motor harness connector.
3. Disconnect the MSM C2 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Turn the ignition on.
5. Measure the Voltage of the (G13) Adjustable Pedals Sensor Supply circuit between the Adjustable Pedals Motor harness connector and ground.

   Is there any Voltage present?

Yes

- Repair the (G13) Adjustable Pedals Sensor Supply circuit for a short to Voltage.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR A SHORT TO THE (P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT OR THE (P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT**

Fig. 7: Checking Adjustable Pedals Sensor Supply Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MSM C1 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance between the (G13) Adjustable Pedals Sensor Supply circuit and the (P205) Adjustable Pedals Motor Forward circuit at the Adjustable Pedals Motor harness connector.
4. Measure the resistance between the (G13) Adjustable Pedals Sensor Supply circuit and the (P206) Adjustable Pedals Motor Rearward circuit at the Adjustable Pedals Motor harness connector.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (G13) Adjustable Pedals Sensor Supply circuit.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Fig. 8: Checking Adjustable Pedals Sensor Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G13) Adjustable Pedals Sensor Supply circuit between the MSM C2 connector and the Adjustable Pedals Motor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

No

- Repair the (G13) Adjustable Pedals Sensor Supply circuit for an open.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

5. **CHECK THE (G493) POSITION SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 9: Checking Adjustable Pedals Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G493) Position Sensor Ground circuit between the MSM C2

connector and the Adjustable Pedals Motor harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 6.

No

- Repair the (G493) Position Sensor Ground circuit for an open.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

6. **CHECK THE (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FUNCTION**

Fig. 10: Checking Adjustable Pedals Sensor Supply Circuit Function
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the MSM C1 harness connector.
2. Reconnect the MSM C2 harness connector.
3. Disconnect the scan tool.
4. Turn off all vehicle interior and exterior lighting.
5. Mark sure all doors are closed then wait 10 seconds.
6. Connect the positive lead of a voltmeter to the (G13) Adjustable Pedals Sensor Supply circuit and the negative lead to the (G493) Position Sensor Ground circuit at the Adjustable Pedals Motor harness connector.
7. While monitoring the voltmeter, press the Adjustable Pedals switch in either direction then release

the switch.

Does the Voltage drop to 0 Volts after approximately 6 second?

Yes

- Replace the Adjustable Pedals Sensor in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Check the (G13) Adjustable Pedals Sensor Supply circuit for a short to Voltage from another circuit and repair as necessary. If circuit is okay, replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE

Fig. 11: Adjustable Pedal Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Memory Seat Module (MSM) receives a conflicting input from the Adjustable Pedals switch following an Adjustable Pedals switch activation.

POSSIBLE CAUSES

Possible Causes
(Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO THE (Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT AND TO GROUND OR TO (Z910) GROUND CIRCUIT
(Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT SHORTED TO THE (Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT
(Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT SHORTED TO GROUND
ADJUSTABLE PEDALS SWITCH
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Cycle the ignition from on to off.
    4. Turn the ignition on.
    5. Operate the Adjustable Pedals switch in both directions then wait 5 seconds.
    6. With the scan tool, read DTC's.

    Does the scan tool display DTC B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE?

    Yes

    - Go To 2.

    No

    - The conditions that caused this code to set are not present at this time. Perform the APS INTERMITTENT CONDITION TEST. Refer to **APS INTERMITTENT CONDITION TEST**.
2. **CHECK THE (Q102)/(Q103) ADJUSTABLE PEDALS SWITCH FORWARD/REARWARD CIRCUITS FOR A SHORT TOGETHER, TO GROUND, OR TO (Z910) GROUND CIRCUIT**
    1. Turn the ignition off.
    2. Disconnect the MSM C5 harness connector.
    3. Disconnect the Adjustable Pedals switch harness connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Measure the resistance between the (Q102) Adjustable Pedals Switch Forward circuit and the (Q103) Adjustable Pedals Switch Rearward circuit at the Adjustable Pedals switch harness connector.
5. Measure the resistance of the (Q102) Adjustable Pedals Switch Forward circuit between ground and the Adjustable Pedals switch harness connector.
6. Measure the resistance of the (Q103) Adjustable Pedals Switch Rearward circuit between ground and the Adjustable Pedals switch harness connector.
7. Measure the resistance between the (Q102) Adjustable Pedals Switch Forward circuit and the (Z910) Ground circuit at the Adjustable Pedals switch harness connector.
8. Measure the resistance between the (Q103) Adjustable Pedals Switch Rearward circuit and the (Z910) Ground circuit at the Adjustable Pedals switch harness connector.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to one another/to ground or (Z910) Ground circuit.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK FOR A SHORTED ADJUSTABLE PEDALS SWITCH**
   1. Remove the Adjustable Pedals Switch in accordance with the Service Information.
   2. Measure the resistance between the (Q102) Adjustable Pedals Switch Forward circuit and the (Q103) Adjustable Pedals Switch Rearward circuit at the Adjustable Pedals Switch (component) connector.
   3. Measure the resistance between the (Q102) Adjustable Pedals Switch Forward circuit and the (Z910) Ground circuit at the Adjustable Pedals Switch (component) connector.
   4. Measure the resistance between the (Q103) Adjustable Pedals Switch Rearward circuit and the (Z910) Ground circuit at the Adjustable Pedals Switch (component) connector.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Replace the Adjustable Pedals Switch in accordance with the Service Information.
   - Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

   No

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

B1D5C-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD

Fig. 12: Adjustable Pedal Switch Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Memory Seat Module (MSM) detects that the Adjustable Pedals Switch has been activated for more than 50 seconds.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING ADJUSTABLE PEDALS SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING ADJUSTABLE PEDALS SWITCH TO GET STUCK IN A PUSHED POSITION
(Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO GROUND
(Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO THE (Z910) GROUND CIRCUIT
ADJUSTABLE PEDALS SWITCH
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **INSPECT THE ADJUSTABLE PEDALS SWITCH FOR DAMAGE**
    1. Turn the ignition off.
    2. Inspect the Adjustable Pedals switch for damage.

       Is the switch damaged?

       Yes

       - Replace the Adjustable Pedals switch in accordance with the Service Information.
       - Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

       No

       - Go To 2.
2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE ADJUSTABLE PEDALS SWITCH TO STAY OR STICK IN A PUSHED POSITION**
    1. Inspect the Adjustable Pedals switch for anything that would cause it to stay or stick in a pushed position.

       Is anything present that would cause the Adjustable Pedals switch to stay or stick in a pushed position?

Yes

- Repair as necessary.
- Perform the APS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
   3. Cycle the ignition from on to off.
   4. Turn the ignition on.
   5. Operate the Adjustable Pedals switch in both directions then wait one minute.
   6. With the scan tool, read DTC's.

   Does the scan tool display DTC B1D5-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD?

   Yes

   - Go To 4.

   No

   - The conditions that caused this code to set are not present at this time. Perform the APS INTERMITTENT CONDITION TEST. Refer to **APS INTERMITTENT CONDITION TEST**.

4. **CHECK THE (Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT FOR A SHORT TO GROUND**

Fig. 13: Checking Adjustable Pedals Switch Forward Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MSM C5 harness connector.
3. Disconnect the Adjustable Pedals switch harness connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Measure the resistance of the (Q102) Adjustable Pedals Switch Forward circuit between ground and the Adjustable Pedals switch harness connector.

   Is the resistance below 10K Ohms?

   Yes

- Repair the (Q102) Adjustable Pedals Switch Forward circuit for a short to ground.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK THE (Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT FOR A SHORT TO THE (Z910) GROUND CIRCUIT**

Fig. 14: Checking Adjustable Pedals Switch Forward Circuit For A Short To The Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q102) Adjustable Pedals Switch Forward circuit and the (Z910) Ground circuit at the Adjustable Pedals switch harness connector.

Is the resistance below 10K Ohms?

Yes

- Repair the short between the (Q102) Adjustable Pedals Switch Forward circuit and the (Z910) Ground circuit.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Go To 6.

6. **CHECK FOR A SHORTED ADJUSTABLE PEDALS SWITCH**

Fig. 15: Checking Adjustable Pedals Switch Forward Circuit For A Short To The Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Remove the Adjustable Pedals Switch in accordance with the Service Information.

   NOTE: Adjustable Pedals Switch (harness) connector shown in illustration. Mirror image for Adjustable Pedals Switch (component) connector.

2. Measure the resistance between the (Q102) Adjustable Pedals Switch Forward circuit and the (Z910) Ground circuit at the Adjustable Pedals Switch (component) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Replace the Adjustable Pedals Switch in accordance with the Service Information.
   - Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

   No

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD

Fig. 16: Adjustable Pedal Switch Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Memory Seat Module (MSM) detects that the Adjustable Pedals Switch has been activated for more than 50 seconds.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING ADJUSTABLE PEDALS SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING ADJUSTABLE PEDALS SWITCH TO GET STUCK IN A PUSHED POSITION
(Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT SHORTED TO GROUND
(Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT SHORTED TO (Z910) GROUND CIRCUIT
ADJUSTABLE PEDALS SWITCH
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **INSPECT THE ADJUSTABLE PEDALS SWITCH FOR DAMAGE**
    1. Turn the ignition off.
    2. Inspect the Adjustable Pedals switch for damage.

       Is the switch damaged?

       Yes

       - Replace the Adjustable Pedals switch in accordance with the Service Information.
       - Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

       No

       - Go To 2.
2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE ADJUSTABLE PEDALS SWITCH TO STAY OR STICK IN A PUSHED POSITION**
    1. Inspect the Adjustable Pedals switch for anything that would cause it to stay or stick in a pushed position.

       Is anything present that would cause the Adjustable Pedals switch to stay or stick in a pushed position?

Yes

- Repair as necessary.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
   3. Cycle the ignition from on to off.
   4. Turn the ignition on.
   5. Operate the Adjustable Pedals switch in both directions then wait one minute.
   6. With the scan tool, read DTC's.

   Does the scan tool display DTC B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD?

   Yes

   - Go To 4.

   No

   - The conditions that caused this code to set are not present at this time. Perform the APS INTERMITTENT CONDITION TEST. Refer to **APS INTERMITTENT CONDITION TEST**.

4. **CHECK THE (Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT FOR A SHORT TO GROUND**

Fig. 17: Checking Adjustable Pedals Switch Rearward Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MSM C5 harness connector.
3. Disconnect the Adjustable Pedals switch harness connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Measure the resistance of the (Q103) Adjustable Pedals Switch Rearward circuit between ground and the Adjustable Pedals switch harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (Q103) Adjustable Pedals Switch Rearward circuit for a short to ground.

- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK THE (Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT FOR A SHORT TO THE (Z910) GROUND CIRCUIT**

Fig. 18: Checking Adjustable Pedals Switch Rearward Circuit For A Short To The Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q103) Adjustable Pedals Switch Rearward circuit and the (Z910) Ground circuit at the Adjustable Pedals switch connector.

   Is the resistance below 10K Ohms?

Yes

- Repair the (Q103) Adjustable Pedals Switch Rearward circuit for a short to the (Z910) Ground circuit.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Go To 6.

6. **CHECK FOR A SHORTED ADJUSTABLE PEDALS SWITCH**

Fig. 19: Checking Adjustable Pedals Switch Rearward Circuit For A Short To The Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Remove the Adjustable Pedals Switch in accordance with the Service Information.

NOTE: **Adjustable Pedals Switch (harness) connector shown in illustration. Mirror image for Adjustable Pedals Switch (component) connector.**

2. Measure the resistance between the (Q103) Adjustable Pedals Switch Rearward circuit and the (Z910) Ground circuit at the Adjustable Pedals Switch (component) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Replace the Adjustable Pedals Switch in accordance with the Service Information.
   - Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

   No

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

B1D62-POWER SEAT SWITCH STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

When the Memory Seat Module (MSM) detects the Driver Seat Switch engaged in an active position for more than 50 seconds.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING DRIVER SEAT SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING DRIVER SEAT SWITCH TO GET STUCK IN A PUSHED POSITION
DRIVER SEAT SWITCH

DIAGNOSTIC TEST

1. **INSPECT DRIVER SEAT SWITCH FOR DAMAGE**
   1. Turn the ignition off.
   2. Inspect the Driver Seat Switch for damage.

      Is the switch damaged?

Yes

- Replace the Driver Seat Switch in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 2.

2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING DRIVER SEAT SWITCH TO STAY OR STICK IN A PUSHED POSITION**
   1. Inspect the Driver Seat Switch for anything that would cause it to stay or stick in a pushed position.

      Is anything present that would cause the switch to stay or stick in a pushed position?

      Yes

      - Repair as necessary.
      - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

      No

      - Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
   3. Press the Driver Seat Switch in all directions several times then wait one minute.
   4. Using a scan tool, read DTC's.

      Does the scan tool display DTC B1D62-POWER SEAT SWITCH STUCK?

      Yes

      - Replace the Driver Seat Switch in accordance with the Service Information.
      - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

      No

      - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

When the Memory Seat Module (MSM) detects an open Driver Seat Switch MUX circuit.

POSSIBLE CAUSES

Possible Causes
(P309) DRIVER SEAT REAR VERTICAL/HORIZONTAL SWITCH MUX CIRCUIT OPEN
(P311) DRIVER SEAT FRONT VERTICAL/RECLINER SWITCH MUX CIRCUIT OPEN
(P28) DRIVER SEAT SWITCH MUX RETURN CIRCUIT OPEN
DRIVER SEAT SWITCH
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Press the seat switch in all directions several times then wait one minute.
    4. Using a scan tool, read DTC's.

    Does the scan tool display DTC B1D63-POWER SEAT SWITCH OPEN?

    Yes

    - Go To 2.

    No

    - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.
2. **CHECK THE (P309) DRIVER SEAT REAR VERTICAL/HORIZONTAL SWITCH MUX**

CIRCUIT RESISTANCE

13696

Fig. 21: Checking Driver Seat Rear Vertical/Horizontal Switch Mux Circuit Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Memory Seat Module C4 connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Measure the resistance between the (P309) Driver Seat Rear Vertical/Horizontal Switch MUX circuit and the (P28) Driver Seat Switch MUX Return circuit at the Memory Seat Module C4 connector.

   Is the resistance 47.0 Ohms + or - 1.0?

   Yes

- Go To 3.

No

- Go To 5.

3. **CHECK THE (P311) DRIVER SEAT FRONT VERTICAL/RECLINER SWITCH MUX CIRCUIT RESISTANCE**

Fig. 22: Checking Driver Seat Front Vertical/Recliner Switch Mux Circuit Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P311) Driver Seat Front Vertical/Recliner Switch MUX circuit and the (P28) Driver Seat Switch MUX Return circuit at the Memory Seat Module C4 connector.

   Is the resistance 47.0 Ohms + or - 1.0?

   Yes

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (P311) DRIVER SEAT FRONT VERTICAL/RECLINER SWITCH MUX CIRCUIT FOR AN OPEN**

Fig. 23: Checking Driver Seat Front Vertical/Recliner Switch Mux Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Driver Seat Switch connector.

   NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (P311) Driver Seat Front Vertical/Recliner Switch MUX circuit between the Memory Seat Module C4 connector and the Driver Seat Switch connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Driver Seat Switch in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Repair the (P311) Driver Seat Front Vertical/Recliner Switch MUX circuit for an open.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

5. **CHECK THE (P309) DRIVER SEAT REAR VERTICAL/HORIZONTAL SWITCH MUX CIRCUIT FOR AN OPEN**

Fig. 24: Checking Driver Seat Rear Vertical/Horizontal Switch Mux Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (P309) Driver Seat Rear Vertical/Horizontal Switch MUX circuit between the Memory Seat Module C4 connector and the Driver Seat Switch connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6.

No

- Repair the (P309) Driver Seat Rear Vertical/Horizontal Switch MUX circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

6. **CHECK THE (P28) DRIVER SEAT SWITCH MUX RETURN CIRCUIT FOR AN OPEN**

Fig. 25: Checking Driver Seat Switch Mux Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (P28) Driver Seat Switch MUX Return circuit between the Memory

Seat Module C4 connector and the Driver Seat Switch connector.

Is the resistance below 5.0 Ohms?

Yes

- Replace the Driver Seat Switch in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Repair the (P28) Driver Seat Switch MUX Return circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE

Fig. 26: Adjustable Pedal Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Adjustable Pedals switch is pressed three times in opposite directions (e.g. either, forward, rearward, forward, or rearward, forward, rearward) and each switch activation is for at least one second and the Memory Seat Module (MSM) does not detect Adjustable Pedals Motor rotation in either direction.

POSSIBLE CAUSES

Possible Causes
ADJUSTABLE PEDALS ASSEMBLY DAMAGED
OBSTRUCTION IN PATH OF ADJUSTABLE PEDALS
(P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT OPEN
(P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT OPEN
ADJUSTABLE PEDALS SENSOR
ADJUSTABLE PEDALS MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **INSPECT THE ADJUSTABLE PEDALS ASSEMBLY FOR DAMAGE**

   NOTE: If present, diagnose and repair Diagnostic Trouble Code (DTC) B1D56-Adjustable Pedal Sensor Circuit Low or B1D57-Adjustable Pedal Sensor Circuit High before proceeding.

   1. Turn the ignition off.
   2. Inspect the Adjustable Pedals assembly for damage.

      Is the assembly damaged?

      Yes

      - Replace the Adjustable Pedals assembly in accordance with the Service Information.
      - Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

      No

      - Go To 2.
2. **INSPECT FOR OBSTRUCTION IN PATH OF ADJUSTABLE PEDALS**
   1. Inspect for anything that would prevent the Adjustable Pedals from moving to each end-stop.

      Is anything present that would prevent the Adjustable Pedals from moving to each end-stop?

      Yes

- Repair as necessary.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. Using a scan tool, record and erase DTC's.
   3. Cycle the ignition from on to off.
   4. Turn the ignition on.

      NOTE: Do not adjust the pedals against an end-stop when performing the following.

   5. Press the Adjustable Pedals switch in one direction for at least one second then release the switch. Repeat three times consecutively, but press the switch in the opposite direction each time.
   6. Using a scan tool, read DTC's.

      Does the scan tool display DTC B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE?

      Yes

      - Go To 4.

      No

      - The conditions that caused this code to set are not present at this time. Repeat Step 5, beginning in direction opposite of that previously selected. If DTC now is active, Go To 4. Otherwise, perform the APS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

4. **CHECK (P205) ADJUSTABLE PEDALS MOTOR FORWARD AND (P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT FUNCTION**

Fig. 27: Checking Adjustable Pedals Motor Forward & Rearward Function
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Adjustable Pedals Motor harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Connect a 12-volt test light between the (P205) Adjustable Pedals Motor Forward circuit and the (P206) Adjustable Pedals Motor Rearward circuit at the Adjustable Pedals Motor harness

connector.

4. Turn the ignition on.
5. While monitoring the test light, operate the Adjustable Pedals switch in both directions.

   Does the test light illuminate with the Adjustable Pedals switch engaged?

   Yes

   - Go To 5.

   No

   - Go To 8.

5. **CHECK ADJUSTABLE PEDALS MOTOR OPERATION**

Fig. 28: Checking Adjustable Pedals Motor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the Adjustable Pedals Motor harness connector.
3. Disconnect the MSM C1 connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Check motor operation in both directions as follows:

NOTE: **Do not adjust the pedals against an end-stop when performing the following.**

To drive pedals forward:

- Connect one end of a fused jumper wire to battery voltage and the other end to the (P205) Adjustable Pedals Motor Forward circuit at the MSM C1 harness connector.
- Connect an ammeter between ground and the (P206) Adjustable Pedals Motor Rearward circuit at the MSM C1 harness connector.
- Disconnect before reaching the end-stop.

To drive pedals rearward:

- Connect one end of a fused jumper wire to battery voltage and the other end to the (P206) Adjustable Pedals Motor Rearward circuit at the MSM C1 harness connector.
- Connect an ammeter between ground and the (P205) Adjustable Pedals Motor Forward circuit at the MSM C1 harness connector.
- Disconnect before reaching the end-stop.

NOTE: **The Adjustable Pedals Motor should be operational in both directions and the ammeter should read 0.9 to 1.5 amps.**

Does the motor operate as specified?

Yes

- Go To 6.

No

- Check (P205) Adjustable Pedals Motor Forward circuit and (P206) Adjustable Pedals Motor Rearward circuit for high resistance. If circuits are okay, replace the Adjustable Pedals Motor in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

6. **CHECK ADJUSTABLE PEDALS SENSOR OPERATION**

Fig. 29: Checking Adjustable Pedals Sensor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the MSM C1 harness connector.
2. Turn the ignition on.
3. Using a scan tool, erase DTC's.
4. Cycle the ignition from on to off.
5. Connect the positive lead of a lab scope to the (G13) Adjustable Pedals Sensor Supply circuit and the negative lead to the (G493) Position Sensor Ground circuit the MSM C2 harness connector. Set the lab scope range to 20 volts and time to 20 ms divisions.
6. Turn the ignition on.

NOTE: **Do not adjust the pedals against an end-stop when performing the following.**

7. Operate the Adjustable Pedals switch in one direction.

NOTE: **If the sensor is functioning normally the scope will display a continuously cycling square wave when operating the pedals. If the module fails to detect sensor operation it will stop pedal operation in approximately two seconds.**

Does the sensor operate as specified?

Yes

- Leave Scope Connected. Go To 7.

No

- Replace the Adjustable Pedals Sensor in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

7. **CHECK ADJUSTABLE PEDALS SENSOR OPERATION IN OPPOSITE DIRECTION**

Fig. 30: Checking Adjustable Pedals Sensor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Using a scan tool, erase DTC's if present.
2. Cycle the ignition from on to off.
3. Turn the ignition on.

NOTE: **Do not adjust the pedals against an end-stop when performing the following.**

4. Operate the Adjustable Pedals switch in the direction opposite of that previously selected.

NOTE: **If the sensor is functioning normally the scope will display a continuously cycling square wave when operating the pedals. If the module fails to detect sensor operation it will stop pedal operation in approximately two seconds.**

Does the sensor operate as specified?

Yes

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Replace the Adjustable Pedals Sensor in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

8. **CHECK THE (P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT FOR AN OPEN**

Fig. 31: Checking Adjustable Pedals Motor Forward Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MSM C1 harness connector.
3. Measure the resistance of the (P205) Adjustable Pedals Motor Forward circuit between the MSM C1 harness connector and the Adjustable Pedals Motor connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 9.

No

- Repair the (P205) Adjustable Pedals Motor Forward circuit for an open.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

9. **CHECK THE (P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT FOR AN OPEN**

Fig. 32: Checking Adjustable Pedals Motor Rearward Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (P206) Adjustable Pedals Motor Rearward circuit between the MSM C1 connector and the Adjustable Pedals Motor connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

   No

   - Repair the (P206) Adjustable Pedals Motor Rearward circuit for an open.
   - Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

B1D6D-SEAT HORIZONTAL POSITION SENSOR CIRCUIT LOW

MOTOR-
SEAT
ADJUSTER-
DRIVER

Fig. 33: Seat Horizontal Position Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

If Voltage on the (G401) Driver Seat Horizontal Position Sense circuit is not within a specified range.

POSSIBLE CAUSES

Possible Causes
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO GROUND
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO THE (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO THE (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO THE (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT
DRIVER HORIZONTAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE FAULT WITH SEAT STATIONARY**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on and wait 30 seconds.
    5. Using a scan tool, read DTC's.

    Is DTC B1D6D-SEAT HORIZONTAL POSITION SENSOR CIRCUIT LOW active?

    Yes

    - Go To 3.

    No

    - Go To 2.
2. **CHECK FOR ACTIVE FAULT WHILE ADJUSTING THE SEAT**

1. Move the seat switch in the horizontal adjust position three times.
2. Using a scan tool, read DTC's.

   Is DTC B1D6D-SEAT HORIZONTAL POSITION SENSOR CIRCUIT LOW active?

   Yes

   - Go To 3.

   No

   - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

3. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 34: Checking Driver Seat Horizontal Position Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MSM C3 connector.
3. Disconnect the Driver Horizontal Seat Adjuster Motor connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Measure the resistance of the (G401) Driver Seat Horizontal Position Sense circuit between ground and the Driver Horizontal Seat Adjuster Motor connector.

   Is the resistance below 10K Ohms?

Yes

- Repair the (G401) Driver Seat Horizontal Position Sense circuit for a short to ground.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR A SHORT TO (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT, (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT, AND (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT**

Fig. 35: Checking Driver Seat Horizontal Position Sense Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G401) Driver Seat Horizontal Position Sense circuit and the (G491) Driver Seat Horizontal Sensor Ground circuit at the Driver Horizontal Seat Adjuster Motor connector.
2. Measure the resistance between the (G401) Driver Seat Horizontal Position Sense circuit and the (P115) Driver Seat Horizontal Forward Driver circuit at the Driver Horizontal Seat Adjuster Motor connector.
3. Measure the resistance between the (G401) Driver Seat Horizontal Position Sense circuit and the

(P117) Driver Seat Horizontal Rearward Driver circuit at the Driver Horizontal Seat Adjuster Motor connector.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (G401) Driver Seat Horizontal Position Sense circuit.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT AND THE (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT FUNCTION**

Fig. 36: Checking Driver Seat Horizontal Position Sense Function
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the MSM C3 connector.
2. Disconnect the scan tool.
3. Turn off all vehicle interior and exterior lighting.
4. Mark sure all doors are closed then wait 10 seconds.
5. Connect a 12-Volt test light between the (G401) Driver Seat Horizontal Position Sense circuit and the (G491) Driver Seat Horizontal Sensor Ground circuit at the Driver Horizontal Seat Adjuster Motor connector.
6. Move the seat switch in the horizontal adjust position then release the switch.

Does the test light illuminate for approximately five seconds then turn off?

Yes

- Replace the Seat Track Horizontal Motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D6E-SEAT HORIZONTAL POSITION SENSOR CIRCUIT HIGH

MOTOR-
SEAT
ADJUSTER-
DRIVER

Fig. 37: Seat Horizontal Position Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

When the seat motor is activated (sensor supply Voltage is switched on whenever motor is activated).

SET CONDITION:

If the sensor Voltage is not within a specified range and the seat switch is moved in the same direction three consecutive times.

POSSIBLE CAUSES

Possible Causes
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO VOLTAGE
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT OPEN
(G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT OPEN
DRIVER HORIZONTAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Move the seat switch in the horizontal adjust position three times.
    4. Using a scan tool, read DTC's.

    Does the scan tool display DTC B1D6E-SEAT HORIZONTAL POSITION SENSOR CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT**

SYSTEM VERIFICATION TEST.

2. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 38: Checking Driver Seat Horizontal Position Sense Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Horizontal Seat Adjuster Motor connector.
3. Disconnect the MSM C3 connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Turn the ignition on.
5. Measure the Voltage of the (G401) Driver Seat Horizontal Position Sense circuit between the Driver Horizontal Seat Adjuster Motor connector and ground.

   Is there any Voltage present?

   Yes

   - Repair the (G401) Driver Seat Horizontal Position Sense circuit for a short to Voltage.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT AND THE (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT FUNCTION**

Fig. 39: Checking Driver Seat Horizontal Position Sense Function
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the MSM C3 connector.
3. Disconnect the scan tool.
4. Turn off all vehicle interior and exterior lighting.
5. Mark sure all doors are closed then wait 10 seconds.
6. Connect a 12-Volt test light connect between the (G401) Driver Seat Horizontal Position Sense circuit and the (G491) Driver Seat Horizontal Sensor Ground circuit at the Driver Horizontal Seat Adjuster Motor connector.
7. Move the seat switch in the horizontal adjust position then release the switch.

Does the test light illuminate for approximately five seconds then turn off?

Yes

- Replace the Seat Track Horizontal Motor Assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 40: Checking Driver Seat Horizontal Position Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C3 connector.

   NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (G401) Driver Seat Horizontal Position Sense circuit between the Driver Horizontal Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 5.

No

- Repair the (G401) Driver Seat Horizontal Position Sense circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

5. **CHECK THE (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 41: Checking Driver Seat Horizontal Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G491) Driver Seat Horizontal Sensor Ground circuit between the Driver Horizontal Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Repair the (G491) Driver Seat Horizontal Senor Ground circuit for an open.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D71-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT LOW

Fig. 42: Driver Seat Front Vertical Motor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

If Voltage on the (G404) Driver Seat Front Vertical Position Sense circuit is not within a specified range.

POSSIBLE CAUSES

Possible Causes
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT SHORTED TO GROUND
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT SHORTED TO THE (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT SHORTED TO THE (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT SHORTED TO THE (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT
FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE FAULT WITH SEAT STATIONARY**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on and wait 30 seconds.
    5. Using a scan tool, read DTC's.

    Is DTC B1D71-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT LOW active?

    Yes

    - Go To 3.

    No

    - Go To 2.
2. **CHECK FOR ACTIVE FAULT WHILE ADJUSTING THE SEAT**
    1. Move the seat switch in the front vertical adjust position three times.
    2. Using a scan tool, read DTC's.

    Is DTC B1D71-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT LOW active?

Yes

- Go To 3.

No

- The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

3. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 43: Checking Driver Seat Front Vertical Position Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MSM C3 connector.
3. Disconnect the Front Driver Vertical Seat Adjuster Motor connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Measure the resistance of the (G404) Driver Seat Front Vertical Position Sense circuit between

ground and the Front Driver Vertical Seat Adjuster Motor connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (G404) Driver Seat Front Vertical Position Sense circuit for a short to ground.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT, (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT, AND (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT**

Fig. 44: Checking Driver Seat Front Vertical Position Sense Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G404) Driver Seat Front Vertical Position Sense circuit and the (G494) Driver Seat Front Vertical Sensor Ground circuit at the Front Driver Vertical Seat Adjuster Motor connector.
2. Measure the resistance between the (G404) Driver Seat Front Vertical Position Sense circuit and the (P119) Driver Seat Front Vertical Up Driver circuit at the Front Driver Vertical Seat Adjuster Motor connector.
3. Measure the resistance between the (G404) Driver Seat Front Vertical Position Sense circuit and the (P121) Driver Seat Front Vertical Down Driver circuit at the Front Driver Vertical Seat Adjuster Motor connector.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (G404) Driver Seat Front Vertical Position Sense circuit.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT AND THE (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT FUNCTION**

Fig. 45: Checking Driver Seat Front Vertical Position Sense Function
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the MSM C3 connector.
2. Disconnect the scan tool.
3. Turn off all vehicle interior and exterior lighting.
4. Mark sure all doors are closed then wait 10 seconds.
5. Connect a 12-Volt test light between the (G404) Driver Seat Front Vertical Position Sense circuit and the (G494) Driver Seat Front Vertical Sensor Ground circuit at the Front Driver Vertical Seat Adjuster Motor connector.

6. Move the seat switch in the front vertical adjust position then release the switch.

   Does the test light illuminate for approximately five seconds then turn off?

   Yes

   - Replace the Front Driver Vertical Seat Adjuster Motor assembly in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D72-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT HIGH

Fig. 46: Driver Seat Front Vertical Motor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

When the seat motor is activated (sensor supply Voltage is switched on whenever motor is activated).

SET CONDITION:

If the sensor Voltage is not within a specified range and the seat switch is moved in the same direction three consecutive times.

POSSIBLE CAUSES

Possible Causes
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT SHORTED TO VOLTAGE
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT OPEN
(G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT OPEN
FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Move the seat switch in the front vertical adjust position three times.
    4. Using a scan tool, read DTC's.

    Does the scan tool display DTC B1D72-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.
2. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 47: Checking Driver Seat Front Vertical Position Sense Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Front Driver Vertical Seat Adjuster Motor connector.
3. Disconnect the MSM C3 connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Turn the ignition on.
5. Measure the Voltage of the (G404) Driver Seat Front Vertical Position Sense circuit between the Driver Horizontal Seat Adjuster Motor connector and ground.

Is there any Voltage present?

Yes

- Repair the (G404) Driver Seat Front Vertical Position Sense circuit for a short to Voltage.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT AND THE (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT FUNCTION**

Fig. 48: Checking Driver Seat Front Vertical Position Sense Function
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the MSM C3 connector.
3. Disconnect the scan tool.
4. Turn off all vehicle interior and exterior lighting.
5. Mark sure all doors are closed then wait 10 seconds.
6. Connect a 12-Volt test light between the (G404) Driver Seat Front Vertical Position Sense circuit and the (G494) Driver Seat Front Vertical Sensor Ground circuit at the Driver Front Vertical Seat

Adjuster Motor connector.

7. Move the seat switch in the front vertical adjust position then release the switch.

   Does the test light illuminate for approximately five seconds then turn off?

   Yes

   - Replace the Front Driver Vertical Seat Adjuster Motor Assembly in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 49: Checking Driver Seat Front Vertical Position Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C3 connector.

   NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (G404) Driver Seat Front Vertical Position Sense circuit between the Front Driver Vertical Seat Adjuster Motor connector and the MSM C3 connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5.

No

- Repair the (G404) Driver Seat Front Vertical Position Sense circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

5. **CHECK THE (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 50: Checking Driver Seat Front Vertical Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G494) Driver Seat Front Vertical Sensor Ground circuit between the Driver Front Vertical Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Repair the (G494) Driver Seat Front Vertical Senor Ground circuit for an open.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D75-SEAT REAR VERTICAL POSITION SENSOR CIRCUIT LOW

Fig. 51: Driver Seat Rear Vertical Motor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

If Voltage on the (G402) Driver Seat Rear Vertical Position Sense circuit is not within a specified range.

POSSIBLE CAUSES

Possible Causes
(G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT SHORTED TO GROUND
(G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT SHORTED TO THE (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT
(G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT SHORTED TO THE (P111) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT
(G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT SHORTED TO THE (P113) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT
REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE FAULT WITH SEAT STATIONARY**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on and wait 30 seconds.
    5. Using a scan tool, read DTC's.

    Is DTC B1D75-SEAT REAR VERTICAL POSITION SENSOR CIRCUIT LOW active?

    Yes

    - Go To 3.

    No

    - Go To 2.
2. **CHECK FOR ACTIVE FAULT WHILE ADJUSTING THE SEAT**
    1. Move the seat switch in the rear vertical adjust position three times.
    2. Using a scan tool, read DTC's.

    Is DTC B1D75-SEAT REAR VERTICAL POSITION SENSOR CIRCUIT LOW active?

Yes

- Go To 3.

No

- The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

3. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 52: Checking Driver Seat Rear Vertical Position Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MSM C3 connector.
3. Disconnect the Rear Driver Vertical Seat Adjuster Motor connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Measure the resistance of the (G402) Driver Seat Rear Vertical Position Sense circuit between ground and the Rear Driver Vertical Seat Adjuster Motor connector.

   Is the resistance below 10K Ohms?

Yes

- Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for a short to ground.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT, (P111) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT, AND (P113) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT**

Fig. 53: Checking Driver Seat Rear Vertical Position Sense Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G402) Driver Seat Rear Vertical Position Sense circuit and the (G492) Driver Seat Rear Vertical Sensor Ground circuit at the Rear Driver Vertical Seat Adjuster Motor connector.
2. Measure the resistance between the (G402) Driver Seat Rear Vertical Position Sense circuit and the (P111) Driver Seat Rear Vertical Up Driver circuit at the Rear Driver Vertical Seat Adjuster Motor connector.
3. Measure the resistance between the (G402) Driver Seat Rear Vertical Position Sense circuit and the (P113) Driver Seat Rear Vertical Down Driver circuit at the Rear Driver Vertical Seat Adjuster Motor connector.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (G402) Driver Seat Rear Vertical Position Sense circuit.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Go To 5.

5. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT AND THE (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT FUNCTION**

Fig. 54: Checking Driver Seat Rear Vertical Position Sense Function
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the MSM C3 connector.
2. Disconnect the scan tool.
3. Turn off all vehicle interior and exterior lighting.
4. Mark sure all doors are closed then wait 10 seconds.
5. Connect a 12-Volt test light between the (G402) Driver Seat Rear Vertical Position Sense circuit and the (G492) Driver Seat Rear Vertical Sensor Ground circuit at the Rear Driver Vertical Seat Adjuster Motor connector.
6. Move the seat switch in the rear vertical adjust position then release the switch.

   Does the test light illuminate for approximately five seconds then turn off?

   Yes

- Replace the Rear Driver Vertical Seat Adjuster Motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D76-SEAT REAR VERTICAL POSITION SENSOR CIRCUIT HIGH

Fig. 55: Driver Seat Rear Vertical Motor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED:

When the seat motor is activated (sensor supply voltage is switched on whenever motor is activated).

SET CONDITION:

If the sensor Voltage is not within a specified range and the seat switch is moved in the same direction three consecutive times.

POSSIBLE CAUSES

Possible Causes
(G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT SHORTED TO VOLTAGE
(G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT OPEN
(G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT OPEN
REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Move the seat switch in the rear vertical adjust position three times.
    4. Using a scan tool, read DTC's.

    Does the scan tool display DTC B1D76-SEAT REAR VERTICAL POSITION SENSOR CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.
2. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 56: Checking Driver Seat Rear Vertical Position Sense Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Rear Driver Vertical Seat Adjuster Motor connector.
3. Disconnect the MSM C3 connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Turn the ignition on.

5. Measure the Voltage of the (G402) Driver Seat Rear Vertical Position Sense circuit between the Rear Driver Vertical Seat Adjuster Motor connector and ground.

   Is there any Voltage present?

   Yes

   - Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for a short to Voltage.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT AND THE (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT FUNCTION**

Fig. 57: Checking Driver Seat Rear Vertical Position Sense Function
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the MSM C3 connector.
3. Disconnect the scan tool.
4. Turn off all vehicle interior and exterior lighting.
5. Mark sure all doors are closed then wait 10 seconds.
6. Connect a 12-Volt test light between the (G402) Driver Seat Rear Vertical Position Sense circuit and the (G492) Driver Seat Rear Vertical Sensor Ground circuit at the Driver Rear Vertical Seat Adjuster Motor connector.
7. Move the seat switch in the rear vertical adjust position then release the switch.

   Does the test light illuminate for approximately five seconds then turn off?

   Yes

   - Replace the Rear Driver Vertical Seat Adjuster motor assembly in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 58: Checking Driver Seat Rear Vertical Position Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C3 connector.

   NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (G402) Driver Seat Rear Vertical Position Sense circuit between the Rear Driver Vertical Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 ohms?

Yes

- Go To 5.

No

- Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

5. **CHECK THE (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 59: Checking Driver Seat Rear Vertical Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G492) Driver Seat Rear Vertical Sensor Ground circuit between the Driver Rear Vertical Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.

- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Repair the (G492) Driver Seat Rear Vertical Sensor Ground circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D79-SEAT RECLINER POSITION SENSOR CIRCUIT LOW

Fig. 60: Seat Recliner Position Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

If Voltage on the (G403) Driver Seat Recliner Position Sense circuit is not within a specified range.

POSSIBLE CAUSES

Possible Causes
(G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT SHORTED TO GROUND
(G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT SHORTED TO THE (G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT
(G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT SHORTED TO THE (P141) DRIVER SEAT RECLINER UP DRIVER CIRCUIT
(G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT SHORTED TO THE (P143) DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT
DRIVER RECLINER SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE FAULT WITH SEAT STATIONARY**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on and wait 30 seconds.
    5. Using a scan tool, read DTC's.

    Is DTC B1D79-SEAT RECLINER POSITION SENSOR CIRCUIT LOW active?

    Yes

    - Go To 3.

    No

    - Go To 2.
2. **CHECK FOR ACTIVE FAULT WHILE ADJUSTING THE SEAT**
    1. Move the seat switch in the recliner adjust position three times.
    2. Using a scan tool, read DTC's.

    Is DTC B1D79-SEAT RECLINER POSITION SENSOR CIRCUIT LOW active?

Yes

- Go To 3.

No

- The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

3. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 61: Checking Driver Seat Recliner Position Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MSM C2 connector.
3. Disconnect the Driver Recliner Seat Adjuster Motor connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Measure the resistance of the (G403) Driver Seat Recliner Position Sense circuit between ground and the Driver Recliner Seat Adjuster Motor connector.

   Is the resistance below 10K Ohms?

Yes

- Repair the (G403) Driver Seat Recliner Position Sense circuit for a short to ground.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT FOR A SHORT TO THE (G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT, THE (P141) DRIVER SEAT RECLINER UP DRIVER CIRCUIT, AND THE (P143) DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT**

Fig. 62: Checking Driver Seat Recliner Position Sense Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G403) Driver Seat Recliner Position Sense circuit and the (G493) Driver Seat Recliner Position Sensor Ground circuit at the Driver Recliner Seat Adjuster Motor connector.
2. Measure the resistance between the (G403) Driver Seat Recliner Position Sense circuit and the (P141) Driver Seat Recliner Up Driver circuit at the Driver Recliner Seat Adjuster Motor connector.
3. Measure the resistance between the (G403) Driver Seat Recliner Position Sense circuit and the (P143) Driver Seat Recliner Down Driver circuit at the Driver Recliner Seat Adjuster Motor connector.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (G403) Driver Seat Recliner Position Sense circuit.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT AND THE (G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT FUNCTION**

Fig. 63: Checking Driver Seat Recliner Position Sense Circuit Function
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the MSM C2 connector.
2. Disconnect the scan tool.
3. Turn off all vehicle interior and exterior lighting.
4. Mark sure all doors are closed then wait 10 seconds.
5. Connect a 12-Volt test light between the (G403) Driver Seat Recliner Position Sense circuit and the (G493) Driver Seat Recliner Position Sensor Ground circuit at the Driver Recliner Seat Adjuster Motor connector.
6. Move the seat switch in the recliner adjust position then release the switch.

Does the test light illuminate for approximately five seconds then turn off?

Yes

- Replace the Driver Recliner Seat Adjuster Motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D7A-SEAT RECLINER POSITION SENSOR CIRCUIT HIGH

Fig. 64: Seat Recliner Position Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

When the seat motor is activated (sensor supply Voltage is switched on whenever motor is activated).

SET CONDITION:

If the sensor Voltage is not within a specified range and the seat switch is moved in the same direction three consecutive times.

POSSIBLE CAUSES

Possible Causes
(G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT SHORTED TO VOLTAGE
(G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT OPEN
(G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT OPEN
DRIVER RECLINER SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Move the seat switch in the recliner adjust position three times.
    4. Using a scan tool, read DTC's.

    Does the scan tool display DTC B1D7A-SEAT RECLINER POSITION SENSOR CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.
2. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 65: Checking Driver Seat Recliner Position Sense Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Recliner Seat Adjuster Motor connector.
3. Disconnect the MSM C2 connector.

NOTE: Check connectors. Clean and repair as necessary.

4. Turn the ignition on.
5. Measure the Voltage of the (G403) Driver Seat Recliner Position Sense circuit between the Driver Recliner Seat Adjuster Motor connector and ground.

Is there any Voltage present?

Yes

- Repair the (G403) Driver Seat Recliner Position Sense circuit for a short to Voltage.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT AND THE (G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT FUNCTION**

Fig. 66: Checking Driver Seat Recliner Position Sense Circuit Function
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the MSM C3 connector.
3. Disconnect the scan tool.
4. Turn off all vehicle interior and exterior lighting.
5. Mark sure all doors are closed then wait 10 seconds.
6. Connect a 12-Volt test light between the (G403) Driver Seat Recliner Position Sense circuit and the (G493) Driver Seat Recliner Position Sensor Ground circuit at the Driver Recliner Seat Adjuster Motor connector.
7. Move the seat switch in the recliner adjust position then release the switch.

Does the test light illuminate for approximately five seconds then turn off?

Yes

- Replace the Driver Recliner Seat Adjuster Motor Assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 67: Checking Driver Seat Recliner Position Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C2 connector.

NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (G403) Driver Seat Recliner Position Sense circuit between the

Driver Recliner Seat Adjuster Motor connector and the MSM C2 connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5.

No

- Repair the (G403) Driver Seat Recliner Position Sense circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

5. **CHECK THE (G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 68: Checking Driver Seat Recliner Position Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G493) Driver Seat Recliner Position Sensor Ground circuit between the Driver Recliner Seat Adjuster Motor connector and the MSM C2 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Repair the (G493) Driver Seat Recliner Position Senor Ground circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D7B-SEAT HORIZONTAL MOTOR CONTROL CIRCUIT PERFORMANCE

MOTOR-
SEAT
ADJUSTER-
DRIVER

Fig. 69: Seat Horizontal Position Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the seat motor is activated.

SET CONDITION:

The seat switch is pressed three times in opposite directions (e.g. either, horizontal forward, horizontal rearward, and horizontal forward, or horizontal rearward, horizontal forward, and horizontal rearward) and each switch activation is for at least one second and the Memory Seat Module (MSM) does not detect seat motor rotation in either direction.

POSSIBLE CAUSES

Possible Causes
SEAT POSITION SENSOR DIAGNOSTIC TROUBLE CODES (DTC's) PRESENT
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT OPEN
(G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT OPEN
(P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT OPEN
(P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT OPEN
DRIVER HORIZONTAL SEAT ADJUSTER MOTOR SENSOR
DRIVER HORIZONTAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **INSPECT SEAT TRACK, MOTOR, AND HARNESS**
    1. Verify seat harness is routed correctly.
    2. Inspect seat track and motor for damage.
    3. Inspect for anything that would prevent the seat from moving to each end-stop.

    Is anything present that would prevent the seat from moving to each end-stop?

    Yes

    - Repair as necessary.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

    No

- Go To 2.

2. **CHECK FOR SEAT POSITION SENSOR DIAGNOSTIC TROUBLE CODES (DTC's)**
    1. Turn the ignition on.
    2. Using a scan tool, read DTC's.

    Does the scan tool display any seat position sensor DTC's?

    Yes

    - Diagnose and repair all seat position sensor DTC's. Refer to **DIAGNOSIS AND TESTING**.

    No

    - Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**
    1. Using a scan tool, record and erase DTC's.
    2. Move the seat switch in one horizontal adjustment direction for at least one second then release the switch. Repeat three times consecutively, but move the switch in the opposite direction each time.
    3. Using a scan tool, read DTC's.

    Does the scan tool display DTC B1D7B-SEAT HORIZONTAL MOTOR CONTROL CIRCUIT PERFORMANCE?

    Yes

    - Go To 4.

    No

    - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

4. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT AND THE (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT FUNCTION**

Fig. 70: Checking Driver Seat Horizontal Position Sense Function
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Horizontal Seat Adjuster Motor connector.

NOTE: Check connectors - Clean and repair as necessary.

3. Disconnect the scan tool.
4. Turn off all vehicle interior and exterior lighting.
5. Mark sure all doors are closed then wait 10 seconds.
6. Connect a 12-Volt test light connect between the (G401) Driver Seat Horizontal Position Sense

circuit and the (G491) Driver Seat Horizontal Sensor Ground circuit at the Driver Horizontal Seat Adjuster Motor connector.

7. Move the seat switch in the horizontal adjust position then release the switch.

   Does the test light illuminate for approximately five seconds then turn off?

   Yes

   - Go To 5.

   No

   - Go To 9.

5. **CHECK THE (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT AND THE (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT FUNCTION**

Fig. 71: Checking Driver Seat Horizontal Position Sense Circuit Function
Courtesy of CHRYSLER GROUP, LLC

1. Connect a 12-Volt test light between the (P115) Driver Seat Horizontal Forward Driver circuit and the (P117) Driver Seat Horizontal Rearward Driver circuit at the Driver Horizontal Seat Adjuster Motor connector.
2. Move the seat switch in the horizontal adjust position.

   Does the test light illuminate with the seat switch engaged?

   Yes

   - Go To 6.

No

- Go To 11.

6. **CHECK THE DRIVER HORIZONTAL SEAT ADJUSTER MOTOR OPERATION**

Fig. 72: Checking Driver Horizontal Seat Adjuster Motor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the Driver Horizontal Seat Adjuster Motor connector.
2. Disconnect the MSM C3 connector.

NOTE: **Check connectors. Clean and repair as necessary.**

3. Check motor operation in both directions as follows:

NOTE: **Do not adjust the seat against an end-stop when performing the following.**

To drive seat forward:

- Connect one end of a fused jumper wire to battery Voltage and the other end to the (P115) Driver Seat Horizontal Forward Driver circuit at the MSM C3 connector.
- Connect an ammeter between ground and the (P117) Driver Seat Horizontal Rearward Driver circuit at the MSM C3 connector.
- Disconnect before reaching the end-stop.

To drive seat rearward:

- Connect one end of a fused jumper wire to battery Voltage and the other end to the (P117) Driver Seat Horizontal Rearward Driver circuit at the MSM C3 connector.
- Connect an ammeter between ground and the (P115) Driver Seat Horizontal Forward Driver circuit at the MSM C3 connector.
- Disconnect before reaching the end-stop.

NOTE: **The seat motor should be operational in both directions and the ammeter should read approximately 4.3 amps in the forward direction and 3.5 amps in the rearward direction.**

Does the motor operate as specified?

Yes

- Go To 7.

No

- Check (P115) Driver Seat Horizontal Forward Driver circuit and (P117) Driver Seat Horizontal Rearward Driver circuit for high resistance. If circuits are okay, replace the Seat Track Horizontal Motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

7. **CHECK THE DRIVER HORIZONTAL SEAT ADJUSTER MOTOR SENSOR OPERATION**

Fig. 73: Checking Driver Horizontal Seat Adjuster Motor Sensor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the MSM C3 connector.
2. Turn the ignition on.
3. Using a scan tool, erase DTC's.
4. Connect the positive lead of a lab scope to the (G401) Driver Seat Horizontal Position Sense circuit and the negative lead to the (G491) Driver Seat Horizontal Sensor Ground circuit at the MSM C3 connector. Set the lab scope range to 20 Volts and time to 20 ms divisions.

NOTE: **Do not adjust the seat against an end-stop when performing the following.**

5. Move the seat switch in one horizontal adjust position.

NOTE: **If the sensor is functioning normally the scope will display a continuously cycling square wave when operating the seat. If the module fails to detect sensor operation it will stop seat operation in approximately two seconds.**

Does the sensor operate as specified?

Yes

- Leave Scope Connected. Go To 8.

No

- Replace the Seat Track Horizontal Motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

8. **CHECK THE DRIVER HORIZONTAL SEAT ADJUSTER MOTOR SENSOR OPERATION IN OPPOSITE DIRECTION**

Fig. 74: Checking Driver Horizontal Seat Adjuster Motor Sensor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Using a scan tool, erase DTC's if present.

NOTE: **Do not adjust the seat against an end-stop when performing the following.**

2. Move the seat switch in the direction opposite of that previously selected.

NOTE: **If the sensor is functioning normally the scope will display a continuously cycling square wave when operating the seat. If the**

module fails to detect sensor operation it will stop seat operation in approximately two seconds.

Does the sensor operate as specified?

Yes

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Replace the Seat Track Horizontal Motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

9. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 75: Checking Driver Seat Horizontal Position Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C3 connector.

   NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (G401) Driver Seat Horizontal Position Sense circuit between the Driver Horizontal Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 10.

No

- Repair the (G401) Driver Seat Horizontal Position Sense circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

10. **CHECK THE (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 76: Checking Driver Seat Horizontal Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G491) Driver Seat Horizontal Sensor Ground circuit between the Driver Horizontal Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Repair the (G491) Driver Seat Horizontal Senor Ground circuit for an open.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

11. **CHECK THE (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT FOR AN OPEN**

Fig. 77: Checking Driver Seat Horizontal Forward Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C3 connector.

   NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (P115) Driver Seat Horizontal Forward Driver circuit between the Driver Horizontal Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

   Yes

- Go To 12.

No

- Repair the (P115) Driver Seat Horizontal Forward Driver circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

12. **CHECK THE (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT FOR AN OPEN**

Fig. 78: Checking Driver Seat Horizontal Rearward Driver Circuit For An Open

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (P117) Driver Seat Horizontal Rearward Driver circuit between the Driver Horizontal Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Repair the (P117) Driver Seat Horizontal Rearward Driver circuit for an open.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D7F-SEAT FRONT VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE

Fig. 79: Driver Seat Front Vertical Motor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the seat motor is activated.

SET CONDITION:

The seat switch is pressed three times in opposite directions (e.g. either, front vertical up, front vertical down, and front vertical up, or front vertical down, front vertical up, and front vertical down) and each switch activation is for at least one second and the Memory Seat Module (MSM) does not detect seat motor rotation in either direction.

POSSIBLE CAUSES

Possible Causes
SEAT POSITION SENSOR DIAGNOSTIC TROUBLE CODES (DTC's) PRESENT
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT OPEN
(G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT OPEN
(P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT OPEN
(P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT OPEN
FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR SENSOR
FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **INSPECT SEAT TRACK, MOTOR, AND HARNESS**
    1. Verify seat harness is routed correctly.
    2. Inspect seat track and motor for damage.
    3. Inspect for anything that would prevent the seat from moving to each end-stop.

    Is anything present that would prevent the seat from moving to each end-stop?

    Yes

    - Repair as necessary.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

    No

    - Go To 2.
2. **CHECK FOR SEAT POSITION SENSOR DIAGNOSTIC TROUBLE CODES (DTC's)**
    1. Turn the ignition on.
    2. Using a scan tool, read DTC's.

Does the scan tool display any seat position sensor DTC's?

Yes

- Diagnose and repair all seat position sensor DTC's. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**
   1. Using a scan tool, record and erase DTC's.
   2. Move the seat switch in one front vertical adjustment direction for at least one second then release the switch. Repeat three times consecutively, but move the switch in the opposite direction each time.
   3. Using a scan tool, read DTC's.

   Does the scan tool display DTC B1D7F-SEAT FRONT VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE?

   Yes

   - Go To 4.

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

4. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT AND THE (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT FUNCTION**

Fig. 80: Checking Driver Seat Front Vertical Position Sense Function
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Front Driver Vertical Seat Adjuster Motor connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Disconnect the scan tool.
4. Turn off all vehicle interior and exterior lighting.

5. Mark sure all doors are closed then wait 10 seconds.
6. Connect a 12-Volt test light between the (G404) Driver Seat Front Vertical Position Sense circuit and the (G494) Driver Seat Front Vertical Sensor Ground circuit at the Driver Front Vertical Seat Adjuster Motor connector.
7. Move the seat switch in the front vertical adjust position then release the switch.

   Does the test light illuminate for approximately five seconds then turn off?

   Yes

   - Go To 5.

   No

   - Go To 9.

5. **CHECK THE (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT THE (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT FUNCTION**

Fig. 81: Checking Driver Seat Front Vertical Up Driver Circuit Function
Courtesy of CHRYSLER GROUP, LLC

1. Connect a 12-Volt test light between the (P119) Driver Seat Front Vertical Up Driver circuit and the (P121) Driver Seat Front Vertical Down Driver circuit at the Front Driver Vertical Seat Adjuster Motor connector.
2. Move the seat switch in the front vertical adjust position.

   Does the test light illuminate with the seat switch engaged?

   Yes

- Go To 6.

No

- Go To 11.

6. **CHECK THE FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR OPERATION**

Fig. 82: Checking Front Driver Vertical Seat Adjuster Motor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the Front Driver Vertical Seat Adjuster Motor connector.

2. Disconnect the MSM C3 connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Check motor operation in both directions as follows:

NOTE: Do not adjust the seat against an end-stop when performing the following.

To drive seat upward:

- Connect one end of a fused jumper wire to battery Voltage and the other end to the (P119) Driver Seat Front Vertical Up Driver circuit at the MSM C3 connector.
- Connect an ammeter between ground and the (P121) Driver Seat Front Vertical Down Driver circuit at the MSM C3 connector.
- Disconnect before reaching the end-stop.

To drive seat downward:

- Connect one end of a fused jumper wire to battery Voltage and the other end to the (P121) Driver Seat Front Vertical Down Driver circuit at the MSM C3 connector.
- Connect an ammeter between ground and the (P119) Driver Seat Front Vertical Up Driver circuit at the MSM C3 connector.
- Disconnect before reaching the end-stop.

NOTE: The seat motor should be operational in both directions and the ammeter should read approximately 2.5 amps in the upward direction and 3.5 amps in the downward direction.

Does the motor operate as specified?

Yes

- Go To 7.

No

- Check (P119) Driver Seat Front Vertical Up Driver circuit and (P121) Driver Seat Front Vertical Down Driver circuit for high resistance. If circuits are okay, replace the Front Driver Vertical Seat Adjuster motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

7. **CHECK THE FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR SENSOR OPERATION**

Fig. 83: Checking Front Driver Vertical Seat Adjuster Motor Sensor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the MSM C3 connector.
2. Turn the ignition on.
3. Using a scan tool, erase DTC's.
4. Connect the positive lead of a lab scope to the (G404) Driver Seat Front Vertical Position Sense circuit and the negative lead to the (G494) Driver Seat Front Vertical Sensor Ground circuit at the MSM C3 connector. Set the lab scope range to 20 Volts and time to 20 ms divisions.

NOTE: **Do not adjust the seat against an end-stop when performing the following.**

5. Move the seat switch in one front vertical adjust position.

NOTE: **If the sensor is functioning normally the scope will display a continuously cycling square wave when operating the seat. If the module fails to detect sensor operation it will stop seat operation in approximately two seconds.**

Does the sensor operate as specified?

Yes

- Leave Scope Connected. Go To 8.

No

- Replace the Front Driver Vertical Seat Adjuster motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

8. **CHECK THE FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR SENSOR OPERATION IN OPPOSITE DIRECTION**

Fig. 84: Checking Front Driver Vertical Seat Adjuster Motor Sensor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Using a scan tool, erase DTC's if present.

NOTE: **Do not adjust the seat against an end-stop when performing the following.**

2. Move the seat switch in the direction opposite of that previously selected.

NOTE: **If the sensor is functioning normally the scope will display a**

continuously cycling square wave when operating the seat. If the module fails to detect sensor operation it will stop seat operation in approximately two seconds.

Does the sensor operate as specified?

Yes

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Replace the Front Driver Vertical Seat Adjuster motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

9. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 85: Checking Driver Seat Front Vertical Position Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C3 connector.

   NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (G404) Driver Seat Front Vertical Position Sense circuit between the Front Driver Vertical Seat Adjuster Motor connector and the MSM C3 connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 10.

No

- Repair the (G404) Driver Seat Front Vertical Position Sense circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

10. **CHECK THE (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 86: Checking Driver Seat Front Vertical Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G494) Driver Seat Front Vertical Sensor Ground circuit between the Driver Front Vertical Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Repair the (G494) Driver Seat Front Vertical Senor Ground circuit for an open.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

11. **CHECK THE (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT FOR AN OPEN**

Fig. 87: Checking Driver Seat Front Vertical Up Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C3 connector.

   NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (P119) Driver Seat Front Vertical Up Driver circuit between the Driver Front Vertical Seat Adjuster Motor connector and the MSM C3 connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 12.

No

- Repair the (P119) Driver Seat Front Vertical Up Driver circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

12. **CHECK THE (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT FOR AN OPEN**

Fig. 88: Checking Driver Seat Front Vertical Down Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (P121) Driver Seat Front Vertical Down Driver circuit between the Driver Front Vertical Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Repair the (P121) Driver Seat Front Vertical Down Driver circuit for an open.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D83-SEAT REAR VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE

Fig. 89: Driver Seat Rear Vertical Motor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the seat motor is activated.

SET CONDITION:

The seat switch is pressed three times in opposite directions (e.g. either, rear vertical up, rear vertical down, and rear vertical up, or rear vertical down, rear vertical up, and rear vertical down) and each switch activation is for at least one second and the Memory Seat Module (MSM) does not detect seat motor rotation in either direction.

POSSIBLE CAUSES

Possible Causes
SEAT POSITION SENSOR DIAGNOSTIC TROUBLE CODES (DTC's) PRESENT
(G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT OPEN
(G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT OPEN
(P111) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT OPEN
(P113) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT OPEN
REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR SENSOR
REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **INSPECT SEAT TRACK, MOTOR, AND HARNESS**
    1. Verify seat harness is routed correctly.
    2. Inspect seat track and motor for damage.
    3. Inspect for anything that would prevent the seat from moving to each end-stop.

    Is anything present that would prevent the seat from moving to each end-stop?

    Yes

    - Repair as necessary.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

    No

    - Go To 2.
2. **CHECK FOR SEAT POSITION SENSOR DIAGNOSTIC TROUBLE CODES (DTC's)**
    1. Turn the ignition on.
    2. Using a scan tool, read DTC's.

Does the scan tool display any seat position sensor DTC's?

Yes

- Diagnose and repair all seat position sensor DTC's. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**
   1. Using a scan tool, record and erase DTC's.
   2. Move the seat switch in one rear vertical adjustment direction for at least one second then release the switch. Repeat three times consecutively, but move the switch in the opposite direction each time.
   3. Using a scan tool, read DTC's.

   Does the scan tool display DTC B1D83-SEAT REAR VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE?

   Yes

   - Go To 4.

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

4. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT AND THE (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT FUNCTION**

Fig. 90: Checking Driver Seat Rear Vertical Position Sense Function
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Rear Driver Vertical Seat Adjuster Motor connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Disconnect the scan tool.
4. Turn off all vehicle interior and exterior lighting.
5. Mark sure all doors are closed then wait 10 seconds.
6. Connect a 12-Volt test light between the (G402) Driver Seat Rear Vertical Position Sense circuit and the (G492) Driver Seat Rear Vertical Sensor Ground circuit at the Driver Rear Vertical Seat Adjuster Motor connector.
7. Move the seat switch in the rear vertical adjust position then release the switch.

Does the test light illuminate for approximately five seconds then turn off?

Yes

- Go To 5.

No

- Go To 9.

5. **CHECK THE (P111) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT AND THE (P113) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT FUNCTION**

Fig. 91: Checking Driver Seat Rear Vertical Up Driver Circuit Function
Courtesy of CHRYSLER GROUP, LLC

1. Connect a 12-Volt test light between the (P111) Driver Seat Rear Vertical Up Driver circuit and the (P113) Driver Seat Rear Vertical Down Driver circuit at the Rear Driver Vertical Seat Adjuster Motor connector.
2. Move the seat switch in the rear vertical adjust position.

   Does the test light illuminate with the seat switch engaged?

   Yes

- Go To 6.

No

- Go To 11.

6. **CHECK THE REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR OPERATION**

Fig. 92: Checking Rear Driver Vertical Seat Adjuster Motor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the Rear Driver Vertical Seat Adjuster Motor connector.
2. Disconnect the MSM C3 connector.

NOTE: **Check connectors. Clean and repair as necessary.**

3. Check motor operation in both directions as follows:

NOTE: **Do not adjust the seat against an end-stop when performing the following.**

To drive seat upward:

- Connect one end of a fused jumper wire to battery Voltage and the other end to the (P111) Driver Seat Rear Vertical Up Driver circuit at the MSM C3 connector.
- Connect an ammeter between ground and the (P113) Driver Seat Rear Vertical Down Driver circuit at the MSM C3 connector.
- Disconnect before reaching the end-stop.

To drive seat downward:

- Connect one end of a fused jumper wire to battery Voltage and the other end to the (P113) Driver Seat Rear Vertical Down Driver circuit at the MSM C3 connector.
- Connect an ammeter between ground and the (P111) Driver Seat Rear Vertical Up Driver circuit at the MSM C3 connector.
- Disconnect before reaching the end-stop.

NOTE: **The seat motor should be operational in both directions and the ammeter should read approximately 2.6 amps in the upward direction and 1.4 amps in the downward direction.**

Does the motor operate as specified?

Yes

- Go To 7.

No

- Check (P111) Driver Seat Rear Vertical Up Driver circuit and (P113) Driver Seat Rear Vertical Down Driver circuit for high resistance. If circuits are okay, replace the Rear Driver Vertical Seat Adjuster motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

7. **CHECK THE REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR SENSOR OPERATION**

Fig. 93: Checking Driver Rear Vertical Seat Adjuster Motor Sensor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the MSM C3 connector.
2. Turn the ignition on.
3. Using a scan tool, erase DTC's.
4. Connect the positive lead of a lab scope to the (G402) Driver Seat Rear Vertical Position Sense circuit and the negative lead to the (G492) Driver Seat Rear Vertical Sensor Ground circuit at the MSM C3 connector. Set the lab scope range to 20 Volts and time to 20 ms divisions.

NOTE: **Do not adjust the seat against an end-stop when performing the following.**

5. Move the seat switch in one rear vertical adjust position.

NOTE: **If the sensor is functioning normally the scope will display a continuously cycling square wave when operating the seat. If the module fails to detect sensor operation it will stop seat operation in approximately two seconds.**

Does the sensor operate as specified?

Yes

- Leave Scope Connected. Go To 8.

No

- Replace the Rear Driver Vertical Seat Adjuster motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

8. **CHECK THE REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR SENSOR OPERATION IN OPPOSITE DIRECTION**

Fig. 94: Checking Driver Rear Vertical Seat Adjuster Motor Sensor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Using a scan tool, erase DTC's if present.

   NOTE: Do not adjust the seat against an end-stop when performing the following.

2. Move the seat switch in the direction opposite of that previously selected.

NOTE: **If the sensor is functioning normally the scope will display a continuously cycling square wave when operating the seat. If the module fails to detect sensor operation it will stop seat operation in approximately two seconds.**

Does the sensor operate as specified?

Yes

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Replace the Rear Driver Vertical Seat Adjuster motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

9. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 95: Checking Driver Seat Rear Vertical Position Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C3 connector.

   NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (G402) Driver Seat Rear Vertical Position Sense circuit between the Rear Driver Vertical Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 10.

No

- Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

10. **CHECK THE (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 96: Checking Driver Seat Rear Vertical Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G492) Driver Seat Rear Vertical Sensor Ground circuit between the Driver Rear Vertical Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.

- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Repair the (G492) Driver Seat Rear Vertical Sensor Ground circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

11. **CHECK THE (P111) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT FOR AN OPEN**

Fig. 97: Checking Driver Seat Rear Vertical Up Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C3 connector.

   NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (P111) Driver Seat Rear Vertical Up Driver circuit between the Driver Rear Vertical Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 12.

   No

   - Repair the (P111) Driver Seat Rear Vertical Up Driver circuit for an open.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

12. **CHECK THE (P113) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT FOR AN OPEN**

Fig. 98: Checking Driver Seat Rear Vertical Down Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (P113) Driver Seat Rear Vertical Down Driver circuit between the Driver Rear Vertical Seat Adjuster Motor connector and the MSM C3 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Repair the (P113) Driver Seat Rear Vertical Down Driver circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D87-SEAT BACKREST MOTOR CONTROL CIRCUIT PERFORMANCE

Fig. 99: Seat Recliner Position Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the seat motor is activated.

SET CONDITION:

The seat switch is pressed three times in opposite directions (e.g. either, recliner forward, recliner rearward, and recliner forward, or recliner rearward, recliner forward, and recliner rearward) and each switch activation is for at least one second and the Memory Seat Module (MSM) does not detect seat motor rotation in either direction.

POSSIBLE CAUSES

Possible Causes
SEAT POSITION SENSOR DIAGNOSTIC TROUBLE CODES (DTC's) PRESENT
(G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT OPEN
(G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT OPEN
(P141) DRIVER SEAT RECLINER UP DRIVER CIRCUIT OPEN
(P143) DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT OPEN
DRIVER RECLINER SEAT ADJUSTER MOTOR SENSOR
DRIVER RECLINER SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **INSPECT FOR OBSTRUCTION IN SEAT PATH**
    1. Verify seat harness is routed correctly.
    2. Inspect seat for damage.
    3. Inspect for anything that would prevent the seat from moving to each end-stop.

    Is anything present that would prevent the seat from moving to each end-stop?

    Yes

    - Repair as necessary.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

    No

    - Go To 2.
2. **CHECK FOR SEAT POSITION SENSOR DIAGNOSTIC TROUBLE CODES (DTC's)**
    1. Turn the ignition on.
    2. Using a scan tool, read DTC's.

Does the scan tool display any seat position sensor DTC's?

Yes

- Diagnose and repair all seat position sensor DTC's. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**
   1. Using a scan tool, record and erase DTC's.
   2. Move the seat switch in one recliner adjustment direction for at least one second then release the switch. Repeat three times consecutively, but move the switch in the opposite direction each time.
   3. Using a scan tool, read DTC's.

   Does the scan tool display DTC B1D87-SEAT BACKREST MOTOR CONTROL CIRCUIT PERFORMANCE?

   Yes

   - Go To 4.

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

4. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT AND THE (G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT FUNCTION**

Fig. 100: Checking Driver Seat Recliner Position Sense Circuit Function
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Recliner Seat Adjuster Motor connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Disconnect the scan tool.
4. Turn off all vehicle interior and exterior lighting.
5. Mark sure all doors are closed then wait 10 seconds.
6. Connect a 12-Volt test light between the (G403) Driver Seat Recliner Position Sense circuit and the

(G493) Driver Seat Recliner Position Sensor Ground circuit at the Driver Recliner Seat Adjuster Motor connector.

7. Move the seat switch in the recliner adjust position then release the switch.

   Does the test light illuminate for approximately five seconds then turn off?

   Yes

   - Go To 5.

   No

   - Go To 9.

5. **CHECK THE (P141) DRIVER SEAT RECLINER UP DRIVER CIRCUIT AND THE (P143) DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT FUNCTION**

Fig. 101: Checking Driver Seat Recliner Up Driver Circuit Function
Courtesy of CHRYSLER GROUP, LLC

1. Connect a 12-Volt test light between the (P141) Driver Seat Recliner Up Driver circuit and the (P143) Driver Seat Recliner Down Driver circuit at the Driver Recliner Seat Adjuster Motor connector.
2. Move the seat switch in the recliner adjust position.

   Does the test light illuminate with the seat switch engaged?

   Yes

   - Go To 6.

No

- Go To 11.

6. **CHECK THE DRIVER SEAT RECLINER ADJUSTER MOTOR OPERATION**

Fig. 102: Checking Driver Seat Recliner Adjuster Motor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the Driver Recliner Seat Adjuster Motor connector.
3. Disconnect the MSM C2 connector.

NOTE: **Check connectors. Clean and repair as necessary.**

4. Check motor operation in both directions as follows:

NOTE: **Do not adjust the seat against an end-stop when performing the following.**

To drive seat back forward:

- Connect one end of a fused jumper wire to battery Voltage and the other end to the (P141) Driver Seat Recliner Up Driver circuit at the MSM C2 connector.
- Connect an ammeter between ground and the (P143) Driver Seat Recliner Down Driver circuit at the MSM C2 connector.
- Disconnect before reaching the end-stop.

To drive seat back rearward:

- Connect one end of a fused jumper wire to battery Voltage and the other end to the (P143) Driver Seat Recliner Down Driver circuit at the MSM C2 connector.
- Connect an ammeter between ground and the (P141) Driver Seat Recliner Up Driver circuit at the MSM C2 connector.
- Disconnect before reaching the end-stop.

NOTE: **The seat motor should be operational in both directions and the ammeter should read approximately 2.0 amps reclining backward and 2.5 amps reclining forward.**

Does the motor operate as specified?

Yes

- Go To 7.

No

- Check (P141) Driver Seat Recliner Up Driver circuit and (P143) Driver Seat Recliner Down Driver circuit for high resistance. If circuits are okay, replace the Recliner motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

7. **CHECK THE DRIVER SEAT RECLINER ADJUSTER MOTOR SENSOR OPERATION**

Fig. 103: Checking Driver Seat Recliner Adjuster Motor Sensor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the MSM C2 connector.
2. Turn the ignition on.
3. Using a scan tool, erase DTC's.
4. Connect the positive lead of a lab scope to the (G403) Driver Seat Recliner Position Sense circuit and the negative lead to the (G493) Driver Seat Recliner Position Sensor Ground circuit at the MSM C2 connector. Set the lab scope range to 20 Volts and time to 20 ms divisions.

NOTE: **Do not adjust the seat against an end-stop when performing the following.**

5. Move the seat switch in one recliner adjust position.

NOTE: **If the sensor is functioning normally the scope will display a continuously cycling square wave when operating the seat. If the module fails to detect sensor operation it will stop seat operation in approximately two seconds.**

Does the sensor operate as specified?

Yes

- Leave Scope Connected. Go To 8.

No

- Replace the Recliner motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

8. **CHECK THE DRIVER SEAT RECLINER ADJUSTER MOTOR SENSOR OPERATION IN OPPOSITE DIRECTION**

Fig. 104: Checking Driver Seat Recliner Adjuster Motor Sensor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Using a scan tool, erase DTC's if present.

NOTE: **Do not adjust the seat against an end-stop when performing the following.**

2. Move the seat switch in the direction opposite of that previously selected.

NOTE: **If the sensor is functioning normally the scope will display a continuously cycling square wave when operating the seat. If the**

module fails to detect sensor operation it will stop seat operation in approximately two seconds.

Does the sensor operate as specified?

Yes

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Replace the Recliner motor assembly in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

9. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 105: Checking Driver Seat Recliner Position Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C2 connector.

NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (G403) Driver Seat Recliner Position Sense circuit between the

Driver Recliner Seat Adjuster Motor connector and the MSM C2 connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 10.

No

- Repair the (G403) Driver Seat Recliner Position Sense circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

10. **CHECK THE (G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 106: Checking Driver Seat Recliner Position Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G493) Driver Seat Recliner Position Sensor Ground circuit between the Driver Recliner Seat Adjuster Motor connector and the MSM C2 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Repair the (G493) Driver Seat Recliner Position Senor Ground circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

11. **CHECK THE (P141) DRIVER SEAT RECLINER UP DRIVER CIRCUIT FOR AN OPEN**

Fig. 107: Checking Driver Seat Recliner Up Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the MSM C2 connector.

NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (P141) Driver Seat Recliner Up Driver circuit between the Driver Recliner Seat Adjuster Motor connector and the MSM C2 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 12.

   No

   - Repair the (P141) Driver Seat Recliner Up Driver circuit for an open.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

12. **CHECK THE (P143) DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT FOR AN OPEN**

Fig. 108: Checking Driver Seat Recliner Down Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (P143) Driver Seat Recliner Down Driver circuit between the Driver Recliner Seat Adjuster Motor connector and the MSM C2 connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the Service Information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- Repair the (P143) Driver Seat Recliner Down Driver circuit for an open.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B1D9B-SEAT HORIZONTAL FRONT STOP NOT LEARNED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the seat motor is activated.

SET CONDITION:

If the seat is standardized and then it becomes de-standardized. The seat is standardized when the module learns the seat cushion horizontal front hard stop position. The seat is de-standardized if the seat cushion motor is 5% past the expected hard stop position or if a seat cushion hall sensor failure occurs. The seat must be standardized to perform an Easy Exit/Entry function.

POSSIBLE CAUSES

Possible Causes
SEAT POSITION SENSOR DIAGNOSTIC TROUBLE CODES (DTC's) PRESENT SEAT STANDARDIZATION ROUTINE NOT PERFORMED

DIAGNOSTIC TEST

1. **CHECK FOR SEAT POSITION SENSOR AND CIRCUIT PERFORMANCE DIAGNOSTIC TROUBLE CODES (DTC's)**
   1. Turn the ignition on.
   2. Using a scan tool, read DTC's.

      Does the scan tool display any seat position sensor or circuit performance DTC's?

      Yes

      - Diagnose and repair all seat position sensor and circuit performance DTC's. Refer to **DIAGNOSIS AND TESTING**.

      No

      - Go To 2.
2. **TEST FOR INTERMITTENT CONDITION**
   1. Using a scan tool, record and erase DTC's.

2. Move the seat switch in the full forward horizontal adjust position.
3. Using a scan tool, read DTC's.

   Does the scan tool display DTC B1D9B-SEAT HORIZONTAL FRONT STOP NOT LEARNED?

   Yes

   - Using a scan tool, perform the MSM Standard Routine.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B210D-BATTERY VOLTAGE LOW

Fig. 109: Memory Seat Module Power Supply Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the Bus is awake or during seat motor operation.

SET CONDITION:

This code sets if the Memory Seat Module (MSM) detects Voltage under 9.5-volts on the (A907) Fused B(+) circuit.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE LOW
(A907) FUSED B(+) CIRCUIT
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DIAGNOSTIC TROUBLE CODES (DTC's)**
    1. Turn the ignition on.
    2. Using a scan tool, read Powertrain Control Module (PCM) DTC's.

    Are there any Charging System DTC's set in the PCM?

    Yes

    - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic procedures.

    No

    - Go To 2.
2. **TEST FOR INTERMITTENT CONDITION**
    1. Using a scan tool, record and erase DTC's.
    2. Turn the ignition off.
    3. Start the engine and let run for one minute.
    4. Operate the driver power seat.
    5. Using a scan tool, read DTC's.

    Does DTC B210D-BATTERY VOLTAGE LOW reset?

    Yes

- Go To 3.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

3. **CHECK (A907) FUSED B(+) CIRCUIT VOLTAGE**

Fig. 110: Checking Fused B(+) Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Memory Seat Module C1 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

3. Start the engine and let idle.

4. Measure the Voltage of the (A907) Fused B(+) circuit between the Memory Seat Module C1 harness connector and ground and compare it to the Voltage at the vehicle battery.

   Is the Voltage measured at the Memory Seat Module C1 harness connector the same as the Voltage measured at the battery?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the service information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Repair the (A907) Fused B(+) circuit for the cause of the low Voltage condition at the Memory Seat Module (MSM).
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B210E-BATTERY VOLTAGE HIGH

Fig. 111: Memory Seat Module Power Supply Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the Bus is awake or during seat operation.

SET CONDITION:

This code will set if the Memory Seat Module (MSM) detects Voltage over 16.5-volts on the (A907) Fused B (+) circuit.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH
(A907) FUSED B(+) CIRCUIT
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DIAGNOSTIC TROUBLE CODES (DTC's)**
    1. Turn the ignition on.
    2. Using a scan tool, read Powertrain Control Module (PCM) DTC's.

    Are there any Charging System DTC's set in the PCM?

    Yes

    - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic procedure.

    No

    - Go To 2.
2. **TEST FOR INTERMITTENT CONDITION**
    1. Using a scan tool, record and erase DTC's.
    2. Turn the ignition off.
    3. Start the engine and let run for one minute.
    4. Operate the driver power seat.
    5. Using a scan tool, read DTC's.

    Does DTC B210E-BATTERY VOLTAGE HIGH reset?

    Yes

- Go To 3.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

3. **CHECK (A907) FUSED B(+) CIRCUIT VOLTAGE**

Fig. 112: Checking Fused B(+) Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Memory Seat Module C1 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Start the engine and let idle.

4. Measure the Voltage of the (A907) Fused B(+) circuit between the Memory Seat Module C1 harness connector and ground and compare it to the Voltage at the vehicle battery.

   Is the Voltage measured at the Memory Seat Module C1 connector the same as the Voltage measured at the battery?

   Yes

   - Replace the Memory Seat Module (MSM) in accordance with the service information.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

   No

   - Repair the (A907) Fused B(+) circuit for the cause of the high Voltage condition at the Memory Seat Module (MSM).
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

B221C-MEMORY SEAT MODULE INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on.

SET CONDITION:

If the Memory Seat Module (MSM) internal self-test fails.

POSSIBLE CAUSES

Possible Causes
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
   3. Cycle the ignition switch off and then on again.
   4. Using a scan tool, read DTC's.

      Does the scan tool display DTC B221C-MEMORY SEAT MODULE INTERNAL?

Yes

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **POWER SEAT SYSTEM VERIFICATION TEST**.

U0011-CAN INTERIOR BUS OFF PERFORMANCE

Fig. 113: CAN Ihs Bus & TIPM CAN C Bus Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

The Memory Seat Module (MSM) detects that the (D265) CAN Interior Bus (125K) (+) circuit or (D264) CAN Interior Bus (125K) (-) circuit is shorted.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS (125K) (+) CIRCUIT SHORTED TO GROUND
(D264) CAN INTERIOR BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE
(D265) CAN INTERIOR BUS (125K) (+) CIRCUIT SHORTED TO (D264) CAN INTERIOR BUS (125K) (-) CIRCUIT
ANY CAN INTERIOR BUS MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

This module will not be able to communicate when this fault is active and therefore will only display this DTC as stored. To diagnose this fault, use a scan tool and check for DTC's in the TIPM. If DTC's are active, Refer to **DIAGNOSIS AND TESTING** and diagnose and repair the faults. If no DTC's are active, but there are stored Lost Communication DTC's set, Refer to **DIAGNOSIS AND TESTING** and diagnose and repair these faults. If no DTC's are set, perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0014-CAN INTERIOR BUS (+) CIRCUIT HIGH

Fig. 114: CAN Ihs Bus & TIPM CAN C Bus Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

The Memory Seat Module (MSM) detects that the (D265) CAN Interior Bus (125K) (+) circuit is shorted.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS (125K) (+) CIRCUIT SHORTED TO VOLTAGE
ANY CAN INTERIOR BUS MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

This module will not be able to communicate when this fault is active and therefore will only display this DTC as stored. To diagnose this fault, use a scan tool and check for DTC's in the TIPM. If DTC's are active, Refer to **DIAGNOSIS AND TESTING** and diagnose and repair the faults. If no DTC's are active, but there are stored Lost Communication DTC's set, Refer to **DIAGNOSIS AND TESTING** and diagnose and repair these faults. If no DTC's are set, perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0016-CAN INTERIOR BUS (-) CIRCUIT LOW

Fig. 115: CAN Ihs Bus & TIPM CAN C Bus Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

The Memory Seat Module (MSM) detects that the (D264) CAN Interior Bus (125K) (-) circuit is shorted.

POSSIBLE CAUSES

Possible Causes
(D264) CAN INTERIOR BUS (125K) (-) CIRCUIT SHORTED TO GROUND
ANY CAN INTERIOR BUS MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

This module will not be able to communicate when this fault is active and therefore will only display this DTC as stored. To diagnose this fault, use a scan tool and check for DTC's in the TIPM. If DTC's are active, Refer to **DIAGNOSIS AND TESTING** and diagnose and repair the faults. If no DTC's are active, but there are stored Lost Communication DTC's set, Refer to **DIAGNOSIS AND TESTING** and diagnose and repair these faults. If no DTC's are set, perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

Fig. 116: CAN Ihs Bus & TIPM CAN C Bus Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Battery Voltage between 10 and 16 Volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
DIAGNOSTIC CAN C BUS CIRCUITS OPEN OR SHORTED
CAN INTERIOR BUS (125K) CIRCUITS OPEN OR SHORTED
DIAGNOSTIC TROUBLE CODES (DTC's) RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES PRESENT
TIPM NOT CONFIGURED CORRECTLY
TIPM POWER AND GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM)
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery Voltage is between 10 and 16 Volts before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, read DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

      - **Refer to <u>DIAGNOSIS AND TESTING</u>** and perform the Stored Lost Communication DTC's diagnostic procedure.
2. **VERIFY TIPM IS COMMUNICATING WITH OTHER MODULES**
   1. Using a scan tool, read DTC's in all modules.

Is any other module reporting a loss of communication with the TIPM?

Yes

- **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response from TIPM diagnostic procedure.

No

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

Fig. 117: CAN Ihs Bus & TIPM CAN C Bus Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Battery Voltage between 10 and 16 Volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Cluster (CCN) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS (125K) CIRCUITS OPEN OR SHORTED
DIAGNOSTIC TROUBLE CODES (DTC's) RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES PRESENT
TIPM NOT CONFIGURED CORRECTLY
CCN POWER AND GROUND
CCN
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery Voltage is between 10 and 16 Volts before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, read DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

      - **Refer to <u>DIAGNOSIS AND TESTING</u>** and perform the Stored Lost Communication DTC's diagnostic procedure.
2. **VERIFY CCN IS COMMUNICATING WITH OTHER MODULES**
   1. Using a scan tool, read DTC's in all modules.

      Are any other modules reporting a loss of communication with the CCN?

Yes

- **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response from CCN diagnostic procedure.

No

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0203-LOST COMMUNICATION WITH DOOR MODULE FRONT LEFT

Fig. 118: CAN Ihs Bus & TIPM CAN C Bus Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED:

With the ignition on.

Battery Voltage between 10 and 16 Volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Door Module Front Left (DMFL) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS (125K) CIRCUITS OPEN OR SHORTED
DIAGNOSTIC TROUBLE CODES (DTC's) RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES PRESENT
TIPM NOT CONFIGURED CORRECTLY
DMFL POWER AND GROUND
DMFL
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery Voltage is between 10 and 16 Volts before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, read DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

      - **Refer to <u>DIAGNOSIS AND TESTING</u>** and perform the Stored Lost Communication DTC's diagnostic procedure.
2. **VERIFY DMFL IS COMMUNICATING WITH OTHER MODULES**
   1. Using a scan tool, read DTC's in all modules.

      Is any other module reporting a loss of communication with the DMFL?

Yes

- **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response from DMFL diagnostic procedure.

No

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0204-LOST COMMUNICATION WITH DOOR MODULE FRONT RIGHT

Fig. 119: CAN Ihs Bus & TIPM CAN C Bus Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Battery Voltage between 10 and 16 Volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Door Module Front Right (DMFR) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS (125K) CIRCUITS OPEN OR SHORTED
DIAGNOSTIC TROUBLE CODES (DTC's) RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES PRESENT
TIPM NOT CONFIGURED CORRECTLY
DMFR POWER AND GROUND
DMFR
MEMORY SEAT MODULE (MSM)

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery Voltage is between 10 and 16 Volts before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, read DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

      - **Refer to <u>DIAGNOSIS AND TESTING</u>** and perform the Stored Lost Communication DTC's diagnostic procedure.
2. **VERIFY DMFR IS COMMUNICATING WITH OTHER MODULES**
   1. Using a scan tool, read DTC's in all modules.

      Is any other module reporting a loss of communication with the DMFR?

Yes

- **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response from DMFR diagnostic procedure.

No

- Replace the Memory Seat Module (MSM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

STANDARD PROCEDURE

APS INTERMITTENT CONDITION TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **PERFORM APS INTERMITTENT CONDITION TEST**

WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Refer to any Technical Service Bulletins (TSBs) that may apply.
2. Review the scan tool information. If possible, try to duplicate the conditions under which the DTC set.
3. Turn the ignition off.
4. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
5. Wiggle the wires while checking for shorts and open circuits.
6. Perform a voltage drop test on the related circuits between the suspected faulty component and the Memory Seat Module.
7. Inspect and clean all grounds that are related to the most current DTC.
8. If numerous trouble codes were set, use a wiring schematic and look for any common ground or supply circuits
9. Monitor with the scan tool and wiggle the related wire harness to try to interrupt the actuation.
10. Use the scan tool to perform a System Test if one applies to failing component.
11. A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes

- Repair as necessary.
- Perform APS VERIFICATION TEST. Refer to **APS VERIFICATION TEST**.

No

- Test Complete.

APS VERIFICATION TEST

DIAGNOSTIC TEST

1. **PERFORM ADJUSTABLE PEDALS SYSTEM VERIFICATION TEST**
    1. Make sure all accessories are turned off and the battery is fully charged.
    2. Connect all previously disconnected components and connectors.
    3. If not done previously, turn the ignition on.
    4. Using a scan tool, erase all Diagnostic Trouble Codes (DTC's) from all modules.
    5. Cycle the ignition from on to off.
    6. Turn the ignition on.
    7. Operate the Adjustable Pedals in both directions.
    8. Press the Adjustable Pedals switch in one direction for at least one second then release the switch. Repeat three times consecutively, but press the switch in the opposite direction each time.
    9. Using a scan tool, read DTC's from all modules.

    Are any DTC's present or is the original concern still present?

    Yes

    - Repair is not complete. Refer to appropriate system for the diagnostic procedure.

    No

    - Repair is complete.

POWER SEAT SYSTEM VERIFICATION TEST

DIAGNOSTIC TEST

1. **PERFORM POWER SEAT SYSTEM VERIFICATION TEST**
    1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
    2. Make sure that all accessories are turned off.
    3. Make sure that the battery is fully charged.
    4. Turn the ignition on.

5. If either the Memory Seat Module (MSM) or the Driver Horizontal Seat Adjuster Motor/Seat Track was replaced, then the MSM Standard Routine must be performed using a scan tool.
6. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's) from all modules.
7. Operate the driver seat in all positions.
8. Using the Memory Switch on the driver's door, program the driver's seat number 1 Button to a desired position and driver's seat number 2 Button to a different position.
9. Verify both Memory positions can be recalled with the Remote Keyless Entry (RKE) transmitter and the Memory Switch on the driver's door.
10. Turn the ignition off, wait 10 seconds, then turn the ignition on.
11. Using a scan tool, select ECU View.
12. Check for DTC's in the modules.

    Are DTC's present in any of the modules or is the original condition still present?

    Yes

    - The Repair Is Not Complete. Refer To The Appropriate Diagnostic Information For The DTC Or Symptom That Is Still Present.

    No

    - The repair is complete.

CENTER, ELECTRONIC VEHICLE INFORMATION

DESCRIPTION

DESCRIPTION

1154127

Fig. 1: Electronic Vehicle Information Center (EVIC)
Courtesy of CHRYSLER GROUP, LLC

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display. The display is located in the middle of the instrument cluster between the speedometer and tachometer. This system conveniently allows the driver to select a variety of useful information by pressing the push buttons of an EVIC switch mounted on the left spoke of the steering wheel. The EVIC displays information related to the following:

- **Audio Mode Display**
- **Compass Display**
- **Diesel Exhaust Fluid (DEF)** - on 6.7 liter diesel engine models only.
- **Navigation System Displays** - if the vehicle is so equipped.
- **Outside Temperature Display**
- **Park Assist System** - if the vehicle is so equipped.
- **Personal Settings** - also known as customer programmable features.
- **System Status**
- **Tire Pressure Monitor System** - if the vehicle is so equipped.
- **Trip Computer Functions**
- **U-Connect™ Hands-Free Communication System Displays** - if the vehicle is so equipped.

- **Warning Message Displays**

The EVIC system includes the following components:

- **Ambient Temperature Sensor**
- **Electronic Overhead Module**
- **EVIC Switch**
- **Instrument Cluster**
- **Remote Compass Module**

The EVIC display is part of the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and is not serviced as a separate component. If the EVIC display is damaged or ineffective, the entire EMIC unit must be replaced.

OPERATION

OPERATION

The Electronic Vehicle Information Center (EVIC) uses both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the ON position. When the ignition switch is turned to the ON position, the EVIC display will return to the last function being displayed before the ignition was turned to the OFF position.

The EVIC system consists of several different components that communicate over the Controller Area Network (CAN) and Local Interface Network (LIN) data buses. **If the system is inoperative, a scan tool and the appropriate diagnostic information must be used to diagnose the system.**

Fig. 2: EVIC Switch Pod
Courtesy of CHRYSLER GROUP, LLC

The EVIC switch pod push buttons on the left spoke of the steering wheel are used to operate the available functions of the EVIC system. Pressing and releasing the **MENU** push button (6) allows the operator to select the Compass/Temperature, Trip Computer, Navigation (if equipped), Personal Settings (also known as customer programmable features) or System Status functions. The **DOWN / SCROLL** push button (4) is used to scroll through options or features of the Trip Computer, Personal Settings or System Status functions. Pressing and releasing the **SELECT / RESET** push button (3) enables the selection or resetting of the feature or function presently displayed in the EVIC. Pressing and releasing the **COMPASS** push button (5) will provide instant access to the compass/temperature display mode from any other mode.

In addition, if the vehicle is so equipped, the EVIC switch pod will include a **VR** (Voice Response) push button (1) to activate the optional Uconnect™ Voice Command system and a **PHONE** push button (2) to activate the Uconnect™ Phone system.

EVIC DISPLAY MODES

SYSTEM STATUS MODE

The System Status mode displays warnings and user interaction messages. Initial warnings will be displayed full-screen in the EVIC for three seconds, then override the odometer and show text warnings on the bottom line of the display. Critical warnings will be displayed until the condition is corrected. Non-critical warnings will be displayed for 60 seconds. The operator can scroll to view multiple messages by using the **DOWN / SCROLL** push button.

When the appropriate conditions exist, the EVIC displays the following messages:

- **Adjustable Pedals Disabled - Cruise Engaged** - If the vehicle is equipped with the optional adjustable pedals system.
- **Adjustable Pedals Disabled - Vehicle In Reverse** - If the vehicle is equipped with the optional adjustable pedals system.
- **Channels Cleared** - If the vehicle is equipped with the optional Universal Garage Door Opener (HomeLink®) system.
- **Channels Defaulted** - If the vehicle is equipped with the optional Universal Garage Door Opener (HomeLink®) system.
- **Channel _ (1, 2, or 3) Transmit** - If the vehicle is equipped with the optional Universal Garage Door Opener (HomeLink®) system.
- **Channel _ (1, 2, or 3) Training** - If the vehicle is equipped with the optional Universal Garage Door Opener (HomeLink®) system.
- **Channel _ (1, 2, or 3) Trained** - If the vehicle is equipped with the optional Universal Garage Door Opener (HomeLink®) system.
- **Check Tire Pressure Monitoring System** - If the vehicle is equipped with the optional Tire Pressure Monitoring system.
- **Clearing Channels** - If the vehicle is equipped with the optional Universal Garage Door Opener (HomeLink®) system.
- **Did Not Train** - If the vehicle is equipped with the optional Universal Garage Door Opener (HomeLink®) system.

- **Door(s) Ajar** - Accompanied by a single audible chime if the vehicle is in motion.
- **Left Front Tire Low Pressure** - If the vehicle is equipped with the optional Tire Pressure Monitoring system.
- **Left Front Turn Signal Lamp Out**
- **Left Rear Tire Low Pressure** - If the vehicle is equipped with the optional Tire Pressure Monitoring system.
- **Left Rear Turn Signal Lamp Out**
- **Left/Right Front Door Ajar** - Either or both, accompanied by a single audible chime if vehicle speed is above 1 kilometer-per-hour (1 mile-per-hour).
- **Left/Right Rear Door Ajar** - If the vehicle is equipped with rear doors, either or both, accompanied by a single audible chime if vehicle speed is above 1 kilometer-per-hour (1 mile-per-hour).
- **Low Washer Fluid** - Accompanied by a single audible chime.
- **Memory System Disabled - Vehicle Not In Park** - If the vehicle is equipped with the optional Memory system. Accompanied by a single audible chime.
- **Memory System Disabled - Seat Belt Buckled** - If the vehicle is equipped with the optional Memory system. Accompanied by a single audible chime.
- **Memory _ (1 or 2) Profile Recall** - If the vehicle is equipped with the optional Memory system.
- **Memory _ (1 or 2) Profile Set** - If the vehicle is equipped with the optional Memory system.
- **Personal Settings Not Available - Vehicle Not in Park**
- **Right Front Tire Low Pressure** - If the vehicle is equipped with the optional Tire Pressure Monitoring system.
- **Right Front Turn Signal Lamp Out**
- **Right Rear Tire Low Pressure** - If the vehicle is equipped with the optional Tire Pressure Monitoring system.
- **Right Rear Turn Signal Lamp Out**
- **RKE Battery Low** - Accompanied by a single audible chime.
- **Service Park Assist System** - If the vehicle is equipped with the optional Park Assist system.
- **Turn Signal On** - Accompanied by a continuous audible warning chime.

TRIP MODE

The trip computer provides a customer programmable choice of displaying units in English or metric measure. The following information can be selected for display at the top of the EVIC screen:

- **Average (Kilometers/Miles) Per Gallon** - Average fuel economy achieved since last reset.
- **Distance To Empty** - Estimated distance (kilometers or miles) until the fuel tank is empty.
- **Trip A** - Distance (kilometers/miles) since last Trip A odometer reset.
- **Trip B** - Distance (kilometers/miles) since last Trip B odometer reset.
- **Elapsed Time** - Total time the ignition switch has been in the ON and ACCESSORY positions since the last elapsed time reset.

The EVIC trip computer features several functions that can be reset. Pressing and releasing the **SELECT / RESET** push button once will reset the function currently being displayed in the EVIC. To reset all functions (global reset), press and release the **SELECT / RESET** push button a second time within 3 seconds of resetting the currently displayed function. **>Reset ALL** will be displayed during this 3 second window.

The odometer is displayed at the bottom of the EVIC display. If warnings exist, they will replace the odometer in the display. The operator can scroll to view information in the EVIC by using the **DOWN / SCROLL** push button.

COMPASS, TEMPERATURE

Compass heading and outside temperature are displayed at the top of the screen. Eight-point compass headings are displayed: **N, S, E, W, NE, NW, SE, SW** . Up to 15 compass variance settings can be set and recalled. Outside temperature is displayed in **°C** (degrees Celsius) or **°F** (degrees Fahrenheit).

NAVIGATION MODE

When the optional Navigation System is active, the EVIC switch **SELECT / RESET** push button can be used to select the Map or Menu display on the Navigation unit. When the Navigation Menu display is active, the **DOWN / SCROLL** push button can be used to scroll through the list, the **SELECT / RESET** push button can be used to select an item. The **DOWN / SCROLL** push button can also be used to return to the previous menu. When the Map display is active, pressing the **SELECT / RESET** push button will change the Navigation unit display to the Menu.

If Turn-By-Turn Navigation is enabled through Personal Settings, the Navigation system will provide turn-by-turn directions to the programmed destination in the EVIC display. The name of the approaching road is displayed at the top of the screen, followed by an arrow to show the direction of the turn, with the remaining distance to the turn counted down.

PERSONAL SETTINGS MODE

The personal settings mode (also known as customer programmable features) allows the operator to set and recall features when the automatic transmission is in the PARK position or the manual transmission vehicle is completely stopped by pressing and releasing the **SELECT / RESET** push button and then the **DOWN / SCROLL** push button until **Personal Settings** is displayed in the EVIC. The following personal settings are available:

- **Automatically Move Seat Back On Exit: On or Off** - If the vehicle is equipped with the optional Memory system.
- **Confirmation Of Voice Commands: On or Off** - If the vehicle is equipped with the optional Uconnect™ Voice Command system.
- **Delay Power Off To Accessories Until Exit: Off, 45 Seconds, 5, 10 or 60 Minutes**
- **Delay Turning Headlamps Off: 0, 30, 60 or 90 seconds**
- **Display Units: English or Metric**
- **Fuel Saver indicator, Economizer (ECO): On or Off**
- **Headlamps On With Wipers: On or Off**

- **Language: English, Spanish or French**
- **Lock Doors Automatically At 24 Kmh (15 Mph): On or Off**
- **Park Assist System: On or Off -** If the vehicle is equipped with the optional Park Assist system.
- **Rain Sensing Intermittent Wipers: On or Off -** If the vehicle is equipped with the optional Automatic Wipers system.
- **Recall Memory With Remote Keyless Entry Unlock: On or Off -** If the vehicle is equipped with the optional Memory system.
- **Remote Keyless Entry: Unlock Driver Door On First Press or Unlock All Doors On First Press**
- **Sound Horn With Remote Keyless Entry Lock: On or Off**
- **Tilt Mirrors Down And In When Transmission Is Shifted To Reverse: On or Off -** If the vehicle is equipped with the optional Memory system.
- **Turn Headlamps On With Remote Keyless Entry Lock: On or Off**
- **Turn Headlamps On With Remote Keyless Entry Unlock: Off or 30 Seconds**
- **Turn-By-Turn Navigation: On or Off -** If the vehicle is equipped with the optional Navigation system.
- **Unlock Doors Automatically On Exit: On or Off**

SYSTEM SETUP MODE

In vehicles equipped with the Integrated Trailer Brake Module (ITBM), the EVIC allows the operator to set, reset and recall the optional settings for this feature. The following settings are available:

- **Trailer Brake Type: EOH (Electric Over Hydraulic) or Electric Brakes**
- **Trailer Weight: Light (10, 000 pounds and below) or Heavy (10, 001 pounds and above)**

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - EVIC

The Electronic Vehicle Information Center (EVIC) relies upon electronic message inputs received over the Controller Area Network (CAN) data bus from other electronic modules in the vehicle. The EVIC will not function properly if the bus messages from any of these modules are not received. If no EVIC data is displayed, check the CAN data bus communications as well as other instrument cluster (also known as the Cab Compartment Node/CCN) functions.

The use of a diagnostic scan tool and the proper diagnostic procedures is required for further testing of the EVIC and the CAN data bus. Refer to the appropriate wiring information for complete circuit schematics and connector pin-out information.

STANDARD PROCEDURE

RESET OIL CHANGE INDICATOR

After performing the needed maintenance, reset the **Oil Change Required** indicator using the following procedure:

1. Turn the ignition switch to the ON position, but do not start the engine.
2. Fully depress and release the accelerator pedal slowly three times within 10 seconds.
3. Turn the ignition switch to the OFF/LOCK position.

NOTE: **If the Oil Change Required indicator message illuminates when you start the engine, the indicator did not reset. If necessary, repeat this procedure.**

RESET PERFORM SERVICE INDICATOR

The **Perform Service** message will display on the Electronic Vehicle Information Center (EVIC) each time you turn the ignition switch to the ON/RUN position to indicate that emission system scheduled maintenance is required. After performing the scheduled maintenance, reset the **Perform Service** indicator using the following procedure:

1. Turn the ignition switch to the ON position, but do not start the engine.
2. Depress and release the brake pedal two times.
3. Fully depress and release the accelerator pedal slowly two times within 10 seconds.
4. Turn the ignition switch to the OFF/LOCK position.

NOTE: **If the indicator message illuminates when you start the engine, the Perform Service indicator did not reset. If necessary, repeat this procedure.**

MODULE, COMPASS

DESCRIPTION

DESCRIPTION

Fig. 3: Remote Compass Module
Courtesy of CHRYSLER GROUP, LLC

The Remote Compass Module (RCM) (2) is a separate stand alone module mounted in the overhead console (1). The RCM can be accessed by removing the overhead console from the vehicle. Some vehicles are equipped with a Universal Garage Door Opener (UGDO) also known as a HomeLink® transceiver. Both the RCM and the HomeLink® transceiver are one in the same and sometimes referred to as the Electronic Overhead Module (EOM).

Fig. 4: Overhead Console Assembly
Courtesy of CHRYSLER GROUP, LLC

The only visible component of the HomeLink® transceiver are the three push buttons (4). The buttons are marked with one, two or three dash marks, respectively, for identification of each channel. For more information on the HomeLink® transceiver, refer to **DESCRIPTION** .

The RCM or the HomeLink® transceiver cannot be repaired. If ether the compass position sensor or the transceiver is inoperative and requires replacement, the EOM must be replaced as a complete assembly, For the appropriate procedure, refer to **MODULE, COMPASS, REMOVAL**.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REMOTE COMPASS MODULE

The Remote Compass Module (RCM) data is transferred on the Controller Area Network (CAN) Data Bus circuit. The RCM and Electronic Vehicle Information Center (EVIC) will not function properly if the bus messages are not properly received. If no EVIC data is displayed, check the CAN Data Bus circuit communications, the RCM, the Instrument Cluster functions and the Totally Integrated Power Module (TIPM). **Any diagnosis of the RCM and EVIC display should begin with the use of a scan tool and the appropriate diagnostic service information.**

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

STANDARD PROCEDURE

COMPASS DEMAGNETIZING

Fig. 5: Degaussing Tool (Special Tool 6029)
Courtesy of CHRYSLER GROUP, LLC

A degaussing tool (Special Tool (special tool #6029, De Gauser)) is used to demagnetize, or degauss, the overhead console forward mounting screw and the roof panel above the overhead console. Equivalent units must be rated as continuous duty for 110/115 volts and 60 Hz. They must also have a field strength of over 350 gauss at 7 millimeters (0.25 inch) beyond the tip of the probe.

To demagnetize the roof panel and the overhead console forward mounting screw, proceed as follows:

1. Be certain that the ignition switch is in the Off position, before you begin the demagnetizing procedure.
2. Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.
3. Slowly approach the head of the overhead console forward mounting screw with the degaussing tool connected.
4. Contact the head of the screw with the plastic coated tip of the degaussing tool for about two seconds.
5. With the degaussing tool still energized, slowly back it away from the screw. When the tip of the tool is at least 61 centimeters (2 feet) from the screw head, disconnect the tool.

J908E-27

<u>Fig. 6: Demagnetizing Roof Panel Procedure</u>
Courtesy of CHRYSLER GROUP, LLC

To demagnetize the roof panel proceed as follows:

6. Place a piece of paper approximately 22 by 28 centimeters (8.5 by 11 inches), oriented on the vehicle lengthwise from front to rear, on the center line of the roof at the windshield header. The purpose of the paper is to protect the roof panel from scratches, and to define the area to be demagnetized.
7. Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.
8. Slowly approach the center line of the roof panel at the windshield header, with the degaussing tool connected.
9. Contact the roof panel with the plastic coated tip of the degaussing tool. Be sure that the template is in place to avoid scratching the roof panel. Using a slow, back-and-forth sweeping motion, and allowing 13 millimeters (0.50 inch) between passes, move the tool at least 11 centimeters (4 inches) to each side of the roof center line, and 28 centimeters (11 inches) back from the windshield header.
10. With the degaussing tool still energized, slowly back it away from the roof panel. When the tip of the tool is at least 61 centimeters (2 feet) from the roof panel, disconnect the tool.
11. Calibrate the compass and adjust the compass variance. Refer to **<u>COMPASS VARIANCE ADJUSTMENT</u>**.

COMPASS VARIANCE ADJUSTMENT

<u>Fig. 7: Magnetic & Geographic North Map</u>
Courtesy of CHRYSLER GROUP, LLC

Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and true geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give false readings. If this problem occurs, the compass variance must be set.

NOTE: **If the vehicle is taken on long trips into a new variance zone the compass function may be effected. Compass variance may need to be adjusted to the new zone number to function properly.**

NOTE: **The default for the compass variance from the factory is 8.**

To set the compass variance:

Fig. 8: Steering Wheel Switches (Scroll Buttons)
Courtesy of CHRYSLER GROUP, LLC

1. Using the Variance Settings Map, find your geographic location and note the zone number.
2. Turn the ignition switch to the On/Run position.
3. Press and release the **SCROLL** push buttons (3) until "System setup" displayed in the Electronic Vehicle Information Center (EVIC) display is selected.

Fig. 9: Steering Wheel Switches
Courtesy of CHRYSLER GROUP, LLC

4. Press and release the **SELECT** push button (1) to enter "System setup".
5. Press and release the **SCROLL** push buttons until "Compass Variance" displayed in the EVIC is selected.
6. Press and release the **SELECT** push button to enter the "Compass Variance" adjustment mode.
7. Press and release the **SELECT** push button repeatedly to toggle through the zone numbers (1-15), until

the zone number for your geographic location appears in the EVIC display.

8. Press and release the **BACK** push button (2) to enter the displayed zone number into the compass unit memory.
9. Confirm that the correct directions are now indicated by the compass.

MANUAL COMPASS CALIBRATION

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the overhead console. Do not use magnetic tools when servicing the overhead console.

NOTE: Whenever the compass is calibrated manually, the variance number must also be checked. For the appropriate procedure, refer to COMPASS VARIANCE ADJUSTMENT.

The electronic compass unit features a self-calibrating design, which simplifies the calibration procedure. This feature automatically updates the compass calibration while the vehicle is being driven. This allows the compass unit to compensate for small changes in the residual magnetism that the vehicle may acquire during normal use. If the compass readings appear to be erratic or the Electronic Vehicle Information Center (EVIC) displays "CAL", perform the following manual calibration procedure. Also, any time EVIC service replacement components are installed, they must be calibrated using this procedure. Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

Fig. 10: Steering Wheel Switches (Scroll Buttons)
Courtesy of CHRYSLER GROUP, LLC

Calibrate the compass manually as follows:

1. With the vehicle in park, start the engine and press the **SCROLL** push buttons (3) until "Calibrate Compass" is displayed in the EVIC.

Fig. 11: Steering Wheel Switches
Courtesy of CHRYSLER GROUP, LLC

2. Press the **SELECT** push button (1) to enter the calibration mode.
3. Slowly drive the vehicle on a level surface, away from large metal objects and power lines, through three **complete** circles not exceeding 8 km/h (5 mph). The "CAL" message will disappear from the display to indicate that the compass is now calibrated.

NOTE: **A blank compass display indicates that vehicle degaussing (demagnetizing) may be necessary.**

NOTE: **If the "CAL" message remains in the display, either there is excessive magnetism near the compass, or the EVIC is inoperative. Attempt the calibration procedure at least one more time before performing EVIC diagnosis.**

NOTE: **If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the manual calibration procedure in another location.**

REMOVAL

REMOVAL

Fig. 12: Remote Compass Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the overhead console assembly (1). Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .
3. Remove the four fasteners (5) that secure the Remote Compass Module (RCM) (2) to the overhead console.
4. Remove the module from the console.

INSTALLATION

INSTALLATION

Fig. 13: Remote Compass Module
Courtesy of CHRYSLER GROUP, LLC

1. Position the Remote Compass Module (RCM) (2) in the console.
2. Install the four fasteners (5) that secure the RCM to the overhead console (1).
3. Install the overhead console assembly. Refer to **CONSOLE, OVERHEAD, FRONT, INSTALLATION** .
4. Connect the negative battery cable.
5. Perform the Compass Variance Adjustment. Refer to **COMPASS VARIANCE ADJUSTMENT**.
6. Perform the Manual Compass Calibration. Refer to **MANUAL COMPASS CALIBRATION**.
7. Verify proper compass operation.

SENSOR, AMBIENT TEMPERATURE

DESCRIPTION

DESCRIPTION

Fig. 14: Ambient Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

The ambient temperature sensor is a variable resistor mounted to the lower left side of the Front End Module (FEM), behind the radiator grille and in front of the engine compartment.

The ambient temperature sensor cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced.

OPERATION

OPERATION

The ambient temperature sensor is a variable resistor that operates on a five-volt reference signal sent by the Totally Integrated Power Module (TIPM). The resistance in the sensor changes as temperature changes, changing the temperature sensor signal circuit voltage to the TIPM. Based upon the resistance in the sensor, the TIPM senses a specific voltage on the temperature sensor signal circuit. The TIPM then translates the voltage into a temperature reading that it sent over the Controller Area Network (CAN) data bus circuit to other modules utilizing temperature information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AMBIENT TEMPERATURE SENSOR

The temperature function is supported by the ambient temperature sensor, a wiring circuit, and the Totally Integrated Power Module (TIPM). When the sensor is exposed to temperatures above 60° C (140° F), or if the sensor circuit is shorted, 60° C (130/140° F) will appear in the display in place of the temperature. When the sensor is exposed to temperatures below - 40° C (- 40° F) or if the sensor circuit is open, - - ° C (- - ° F) will be displayed on Electronic Vehicle Information Center (EVIC) equipped vehicles.

NOTE: **The system displays the last known temperature when starting the vehicle and may take some time/mileage to update to an accurate current reading, up to 5 minutes at a maintained speed above 40 mph (64.3 kph). Customers with very short commutes may not get an updated reading before the vehicle is turned off, or if the ignition does not remain in the OFF position for more than 255 minutes (4hrs. 15min.). This strategy was intended to eliminate wildly fluctuating readings and may cause some customer confusion leading to unnecessary diagnostics/parts replacements.**

SENSOR TEST

The most reliable, efficient and accurate means to diagnose the ambient temperature circuit requires the use of a scan tool.

1. Turn the ignition switch to the Off position. Disconnect the ambient temperature sensor harness connector.
2. Measure the resistance of the ambient temperature sensor. At - 40° C (- 40° F), the sensor resistance is 336 kilohms. At 55° C (130° F), the sensor resistance is 2.488 kilohms. The sensor resistance should read between these two values. If not OK, replace the inoperative ambient temperature sensor. If OK, perform further diagnosis of the Ambient Temperature System as applicable. Refer to **DIAGNOSIS AND TESTING** .

The ambient temperature sensor circuit can be diagnosed using the following Temperature Sensor Test. If the temperature sensor and circuit are confirmed to be OK, but the temperature display is inoperative or incorrect as applicable. Refer to **DIAGNOSIS AND TESTING** .

SENSOR CIRCUIT TEST

NOTE: **Refer to appropriate Wiring Information for complete circuit schematic and connector pin-out information.**

1. Turn the ignition switch to the Off position. Disconnect and isolate the negative battery cable. Disconnect the wire harness connectors from the ambient temperature sensor and the TIPM.
2. Connect a jumper wire between the two terminals in the body half of the ambient temperature sensor harness connector.
3. Check for continuity between the sensor return circuit and the ambient temperature sensor signal circuit cavities of the TIPM harness connector. There should be continuity. If OK, refer to 4. If not OK, repair the open sensor return circuit or ambient temperature sensor signal circuit to the ambient temperature sensor as required.

4. Check for continuity between the ambient temperature sensor signal circuit cavity of the TIPM harness connector and a good ground. There should be no continuity. If OK, test the EVIC operation. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DIAGNOSIS AND TESTING**. If not OK, repair the shorted ambient temperature sensor signal circuit as required.

REMOVAL

REMOVAL

Fig. 15: Ambient Temperature Sensor & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

1. Open the hood.
2. Disconnect and isolate the negative battery cable.
3. Remove the grille. Refer to **GRILLE, REMOVAL** .
4. Disconnect the sensor electrical connector (1) and remove sensor (2) from vehicle.

INSTALLATION

INSTALLATION

Fig. 16: Ambient Temperature Sensor & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

1. Install the ambient temperature sensor (2) and connect the sensor electrical connector (1).
2. Install the grille. Refer to **GRILLE, INSTALLATION** .
3. Connect the negative battery cable.
4. Close the hood.

SWITCH, EVIC CONTROL

DESCRIPTION

DESCRIPTION

Fig. 17: EVIC Switches

Courtesy of CHRYSLER GROUP, LLC

Fig. 18: Control Switch Pod Without EVIC
Courtesy of CHRYSLER GROUP, LLC

The Electronic Vehicle Information Center (EVIC) control switch pod is located in the left spoke of the steering wheel spoke bezel. This switch has up to six push buttons. Four of the push buttons (3 through 6) are used on all vehicles equipped with the EVIC and two of the push buttons (7 and 8) are used on vehicles not equipped with the EVIC. Two additional push buttons (1 and 2) are found on vehicles equipped with the optional Uconnect™ Hands-Free Communication System. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle integral to the inboard end of the switch pod housing connects the EVIC control switch pod to the vehicle electrical system through a dedicated take out and connector of the steering wheel wire harness.

The EVIC control switch pod cannot be adjusted or repaired. If any function of the switch is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

OPERATION

The Electronic Vehicle Information Center (EVIC) control switch pod is a resistor multiplexed unit that receives source current from and provides hard wired inputs to the Local Interface Network (LIN) slave node integral to the speed control switch pod in the right spoke of the steering wheel spoke bezel. The LIN slave node communicates the switch states of the EVIC control switch pod, the remote radio switches and the horn

switch over the LIN data bus to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), which is the LIN master node.

The EVIC control switch pod (also known as the odometer switch) for vehicles not equipped with the EVIC system contains two switch push buttons whose functions are:

- **Reset** - This switch button allows the operator to reset the trip odometer (A or B) currently displayed in the odometer display unit of the instrument cluster.
- **Step** - This switch button allows the operator to step through the total odometer, trip odometer A and trip odometer B display options of the odometer display of the instrument cluster.

The EVIC control switch pod for vehicles equipped with the EVIC system contains four switch push buttons whose functions are:

- **Back** - Pressing and releasing the Back push button returns you to the previous sub menu or main menu.
- **Down Arrow** - Pressing and releasing the Down Arrow push button allows the operator to scroll downward through the various EVIC main menus and sub menus.
- **Right Arrow** - Pressing and releasing the Right Arrow (Select) push button allows the operator to navigate, select and reset items or settings in the currently displayed EVIC main menu or sub menu. Pressing and holding the Right Arrow (Select) push button for two seconds provides a global reset of all of those EVIC features that can be reset, whether currently displayed or not.
- **Up Arrow** - Pressing and releasing the Up Arrow push button allows the operator to scroll upward through the various EVIC main menus and sub menus.

For vehicles equipped with the Uconnect™ Hands-Free Communication System, the EVIC control switch pod contains two additional switch push buttons whose functions are:

- **VR (Voice Recognition)** - This switch button activates the Uconnect™ Voice Command system.
- **Phone** - This switch push button activates the Uconnect™ Hands-Free Phone system.

The EMIC LIN master node provides a clean ground and fused B(+) current for all of the switches and sensors on the rotating steering wheel through the LIN slave node circuitry of the speed control switch pod as well as for the Light Emitting Diode (LED) back lighting of both the speed control and the EVIC switch pods. The EMIC continually monitors the LIN bus data and will store a Signal Not Available (SNA) code for any LIN bus input errors. The EMIC also communicates with other electronic modules over the Controller Area Network (CAN) data bus. Therefore, any EMIC DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

The analog resistor multiplexed circuits of the EVIC control switch pod as well as the hard wired circuits between the switch pod and the LIN slave node within the speed control switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LIN slave or

master nodes, the EMIC or the electronic controls and communication between modules and other devices that provide some features of the EVIC system. The most reliable, efficient, and accurate means to diagnose the EVIC control switch pod, the LIN slave or master nodes, the EMIC or the electronic controls and communication related to EVIC system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 19: Rear Cover, Two Screws, Steering Wheel Spoke Front Bezel & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the driver airbag from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL** .
3. From the back of the steering wheel (4), remove the two screws (2) that secure the center spoke of the rear cover (1) to the center spoke of the steering wheel spoke front bezel (3).

Fig. 20: EVIC Switch Pod, Speed Control Switch Pod, Four Screws & Front Spoke Bezel
Courtesy of CHRYSLER GROUP, LLC

4. From the face of the steering wheel, remove the four screws (2) that secure the front spoke bezel (4) to the steering wheel armature within the steering wheel hub cavity.
5. Using a trim stick or another suitable wide flat-bladed tool, carefully pry at the parting line between the front spoke bezel and the steering wheel rear cover enough to unsnap the two horizontal members of the bezel from those of the rear cover.
6. Pull the front spoke bezel away from the steering wheel far enough to access and disconnect the steering wheel wire harness connections from the Electronic Vehicle Information Center (EVIC) control switch pod (1) and the speed control switch pod (3).

Fig. 21: EVIC Control Switch Pod, Steering Wheel Spoke Front Bezel & Screws

Courtesy of CHRYSLER GROUP, LLC

7. From the back of the steering wheel spoke front bezel (3), remove the three screws (1) that secure the EVIC control switch pod (2) mounting tabs to the bezel.
8. Remove the switch from the bezel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 22: EVIC Control Switch Pod, Steering Wheel Spoke Front Bezel & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the Electronic Vehicle Information Center (EVIC) control switch pod (2) to the back of the steering wheel spoke front bezel (3).
2. Install and tighten the three screws (1) that secure the switch mounting tabs to the bezel. Tighten the screws securely.
3. Position the front spoke bezel close enough to the steering wheel to reconnect the steering wheel wire

harness connections to the EVIC control switch pod and the speed control switch pod connector receptacles.

Fig. 23: EVIC Switch Pod, Speed Control Switch Pod, Four Screws & Front Spoke Bezel
Courtesy of CHRYSLER GROUP, LLC

4. Position the front spoke bezel (4), EVIC control switch pod (1) and speed control switch pod (3) as a unit to the steering wheel. Be certain that the steering wheel wire harness is routed between the lower or upper bezel stanchions and the inside circumference of the steering wheel hub cavity so that the wiring will not be pinched when the driver airbag is reinstalled.
5. Use hand pressure to squeeze the horizontal spokes of both the front spoke bezel and the steering wheel rear cover together until all of the snap features are fully engaged.
6. Install and tighten the four screws that secure the stanchions of the front spoke bezel to the steering wheel armature within the steering wheel hub cavity. Tighten the screws securely.

Fig. 24: Rear Cover, Two Screws, Steering Wheel Spoke Front Bezel & Steering Wheel

Courtesy of CHRYSLER GROUP, LLC

7. From the back of the steering wheel (4), install and tighten the two screws (2) that secure the center spoke of the rear cover (1) to the center spoke of the steering wheel spoke front bezel (3). Tighten the screws securely.
8. Reinstall the driver airbag onto the steering wheel. Refer to **AIR BAG, DRIVER, INSTALLATION** .
9. Reconnect the negative battery cable.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUTOMATIC DAY / NIGHT MIRROR

Fig. 1: Identifying Rearview Connector Terminals
Courtesy of CHRYSLER GROUP, LLC

For complete circuit diagrams, refer to the appropriate wiring information.

1. Check the fuse in the Totally Integrated Power Module (TIPM). If OK, go to 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Turn the ignition switch to the On position. Check for battery voltage at the fuse in the TIPM. If OK, go to 3. If not OK, repair the open circuit to the ignition switch as required.
3. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Unplug the wire harness connector from the automatic day/night mirror. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to 4. If not OK, repair the open circuit to the TIPM as required.
4. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the automatic day/night mirror wire harness connector and a good ground. There should be continuity. If OK, go to 5. If not OK, repair the circuit to ground as required.
5. Connect the battery negative cable. Turn the ignition switch to the On position. Set the parking brake. Place the transmission gear selector lever in the Reverse position. Check for battery voltage at the backup lamp switch output circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to 6. If not OK, repair the open circuit as required.
6. Turn the ignition switch to the Off position. Disconnect the battery negative cable. Plug in the automatic

day/night mirror wire harness connector. Connect the battery negative cable. Turn the ignition switch to the On position. Place the transmission gear selector lever in the Neutral position. Place the mirror switch in the On (the LED in the mirror switch is lighted) position. Cover the forward facing ambient photocell sensor to keep out any ambient light.

NOTE: **The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.**

7. Shine a light into the rearward facing headlamp photocell sensor. The mirror glass should darken. If OK, go to 8. If not OK, replace the faulty automatic day/night mirror unit.
8. With the mirror glass darkened, place the transmission gear selector lever in the Reverse position. The mirror should return to its normal reflectance. If not OK, replace the faulty automatic day/night mirror unit.

DESCRIPTION

DESCRIPTION

NAVIGATION

A optional navigation radio (RB4) is available on this vehicle. The navigation system allows the user to input addresses, points of interest or way points to plan a route to the desired location. The system will provide audible and visual prompts that will direct the user along the desired route. Any variances in the route will cause the navigation system to automatically recalculate the route. The Electronic Vehicle Information Center (EVIC) displays turn-by-turn directions to a programmed destination when Turn by Turn Navigation is enabled through Personal Settings. When enabled, the EVIC displays the name of the approaching road at the top of the screen, followed by an arrow to indicate the direction to turn the vehicle, and a count down to indicate the distance to the turn.

TELECOMMUNICATIONS

The hands-free cellular system on this vehicle uses Bluetooth™ technology to provide wireless communication between the operator's compatible cellular telephone and the vehicle's on-board receiver.

The system uses voice recognition technology to control operation. The incoming voice is broadcast through the vehicle's radio speakers, automatically overriding any other audio signals on the front speakers when the hands-free system is in use. A microphone in the rearview mirror picks up vehicle occupant's voices. If a call is in progress when the ignition is switched off, the hands-free system will continue to operate for up to 45 seconds as part of the Accessory Relay Delay function. Thereafter, the call can continue on the hand-held telephone.

The system will communicate with a telephone that is anywhere within the vehicle. However, covering the hand held phone or the hands-free phone module with a metal object may block the signal. The system will recognize up to seven telephones, each of which is given a spoken identification by the user during the setup process. The system includes Spanish and French voice recognition in addition to English.

Two buttons on the rearview mirror, identified with ISO icons, control the system: A "phone" button turns the system on and off; a "voice recognition" (or voice command) button prompts the hands-free system to listen for a voice command.

OPERATION

OPERATION

NAVIGATION

The optional navigation radio system receives GPS signals from up to eight satellites to display the position and direction of the vehicle. Map information is supplied through a DVD-ROM. An electronic gyro-sensor and the

vehicle's speed sensor enable the system to display the present vehicle position even in locations where GPS signals may be blocked.

When a destination is selected, the navigation system uses information from the map to quickly calculate a route. As the vehicle is driven along the chosen route, the operator is guided with pictorial displays and voice prompts.

TELECOMMUNICATION

Two buttons on the rearview mirror, identified with ISO icons, control the system: A "phone" button turns the system on and off; a "voice recognition" (or voice command) button prompts the hands-free system to listen for a voice command. The system includes the following features:

- Phone book - Stores telephone numbers for later recall by name or other verbal identification, called a voice tag, and memory location.
- Four memory locations - Home, Work, Cellular and Pager. A maximum of 32 unique names or voice tags may be stored at the same time, with a different number in each of the four memory locations.
- Voice tag dialing - Dials the number associated with a voice tag and memory location.
- Digit dialing - Dials the telephone number by recognizing the names of the digits as they are spoken.
- Receiving calls - A voice prompt notifies the user of an incoming call. A voice response accepts or rejects the call without manual intervention.
- Privacy Mode - Switches the call to the handheld telephone and the hands-free system and back again using the "voice recognition" (or "voice command") button and a voice command, if desired.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TELECOMMUNICATION

Any diagnosis of the Telecommunication system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: **On vehicles equipped with airbags, refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

TELECOMMUNICATION SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
PHONE NOT AVAILABLE	1. Bluetooth phone not paired to the system.	1. Ensure that phone(s) are paired to the system.

	2. Bluetooth phone not present or turned OFF.	2. Make sure paired phone is present, turned ON and that the Bluetooth option is enabled on the phone.
	3. Bluetooth phone has low battery.	3. At low battery levels, some phones will turn off Bluetooth functionality. Ensure cellular phone is charged to an adequate level.
PHONE PAIRING FAILED	1. Phone does not support Hands Free Profile	1. The Telecommunication system requires the cellular phone to be Bluetooth™ enabled, as well as supporting the Hands Free Profile. The customer will have to upgrade their phone to one supporting Hands Free Profile. A list of suggested phones is available at: http://www.chrysler.com/uconnect.
	2. Phone not Bluetooth enabled.	2. The Telecommunication system requires the cellular phone to be Bluetooth™ enabled. A list of suggested phones is available at: http://www.chrysler.com/uconnect.
	3. PIN entered on the phone is not the same as PIN spoken to the system.	3. The PIN spoken to the system must be the same PIN entered into the phone.
	4. Phone has reached maximum number of allowed devices paired.	4. Remove one of the previously paired devices from it's list.
POOR VOICE RECOGNITION	1. Microphone failure	1. Using a scan tool, check for microphone fault codes.
	2. Customer not waiting for the beep before speaking.	2. Ensure customer is waiting for the system "beep" prior to beginning the speech to be recognized.
	3. Customer not speaking in a smooth normal manner.	3. Verify that the customer is attempting to use the system with a smooth consistent voice. The system is designed to accept normal speech spoken at a normal tone, some people tend to speak to a computer loud and slow, which results in reduced performance.
	4. Rear view mirror not properly attached to mounting.	4. Mirror must be firmly mounted to the mounting location. Ensure that mirror is tightened to the specified torque.
	5. High levels of noise in vehicle compartment	5. System performance is increased when noise conditions in the vehicle are lowered. Ideal conditions include windows closed.
	6. Object interfering with microphone input	6. Verify that there is no object, hanging from the mirror, that could be obstructing the microphone.
	7. User not saying "send" after a pager	7. User must say "send" at the end of a Pager Dialing request.

	dialing request	
	8. Other passengers talking while customer is attempting to use the system	8. Although designed for primary use by the driver, the microphone will pick up passengers in any seat of the vehicle. System performance is increased in low noise environments.
PHONEBOOK NAMES NOT RECOGNIZED CONSISTENTLY	1. Phonebook names recorded in high noise conditions	1. For increased system performance, it is recommended that the phone book entries are recorded in a low noise environment. That is, vehicle in park, with windows up.
	2. Phonebook name (s) short	2. For increased performance it is recommended that the user use both first and last name as a phonebook entry. Example: "Daniel Johnson" as opposed to "Dan".
	3. Phonebook names recorded by another user	3. It is recommended that each user of the system record their own phonebook entries. This will increase the recognition performance.
	4. Similar names in phonebook	4. For increased system performance it is recommended that the user do not enter similar sounding names in the phonebook.
	5. Object interfering with microphone input	5. Object interfering with microphone input.
POOR PHONE AUDIO QUALITY.	1. Microphone failure	1. Use a scan tool, and check for Microphone faults.
	2. Rear view mirror not properly fixed to mounting button	2. Mirror must be firmly mounted to the mounting location. Tighten mirror to the specified torque.
	3. System being used in high noise conditions	3. System performance is increased when noise conditions in the vehicle are lowered. Ideal conditions include windows closed.
NO PHONE AUDIO	1. Phone setting cause phone audio to be routed to handset.	1. Route audio to "Hands free" device.

ANTENNA, NAVIGATION

REMOVAL

REMOVAL

Fig. 1: Identifying Navigation Antenna

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

NOTE: **A disconnected sensor will set this DTC. Verify the Park Assist Sensor is**

connected before proceeding with this diagnostic procedure.

1. Turn the ignition on.
2. With the scan tool, read DTC's.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**

Fig. 2: Measuring Voltage Of Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (X700) Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

- Go To 4.

No

- Go To 3.

3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 3: Measuring Resistance Of Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.

3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X700) Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

Fig. 4: Measuring Resistance Between Ground & Park Assist Sensor Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this step with the Park Assist Module connected.

1. Measure the resistance between ground and the (D701) Park Assist Sensor 8 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Go To 5.

No

- Go To 7.

5. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**

MODULE-
PARK
ASSIST C2

SENSOR-
PARK

Fig. 5: Measuring Resistance Between Ground & Park Assist Sensor Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C2 harness connector.
2. Measure the resistance between ground and the (D701) Park Assist Sensor 8 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D701) Park Assist Sensor 8 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6.

6. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Fig. 6: Measuring Resistance Between Park Assist Sensor Signal Circuit & Park Assist Sensor Ground Circuit

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT

B1295-25-PTS SENSOR 8 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler LLC vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING

FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Park Assist Sensor in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

(D701) PTS SENSOR 8 SIGNAL CIRCUIT SHORTED TO BATTERY
(D701) PTS SENSOR 8 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 8
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, read the active DTC's.

       Does the scan tool display this DTC as active?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK PARK ASSIST SENSOR 8 FOR INTERNAL SHORT**
   1. Disconnect the Park Assist Sensor 8 harness connector.
   2. With the scan tool, read the active DTC's.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3.

   No

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 15: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.
3. Using a 12-volt test light connected to 12-volts, check the (D701) Park Assist Sensor 8 Signal circuit at the Park Assist Module C2 harness connector.

   Does the test light illuminate brightly?

   Yes

   - Repair the short to ground in the (D701) Park Assist Sensor 8 Signal circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

Fig. 16: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.

2. Using a 12-volt test light connected to ground, check the (D701) Park Assist Sensor 8 Signal circuit at the Park Assist Module C2 harness connector.

   Does the test light illuminate brightly?

   Yes

   - Repair the short to voltage (D701) Park Assist Sensor 8 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5.

5. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 17: Checking Park Assist Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D701) Park Assist Sensor 8 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 8 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D701) Park Assist Sensor 8 Signal circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1296-11-PTS SENSOR 9 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler LLC vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING

FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Park Assist Sensor in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1296-92-PTS SENSOR 9 - PERFORMANCE OR INCORRECT OPERATION

Fig. 31: Park Assist Sensor 9 Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

During Reverse and during self test in Forward between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

If the system detects data corruption in the transmission in the internal communication line between the module and sensors.

POSSIBLE CAUSES

Possible Causes
(D703) PTS SENSOR 9 SIGNAL CIRCUIT SHORTED TO GROUND
(D703) PTS SENSOR 9 SIGNAL CIRCUIT SHORTED TO BATTERY
(D703) PTS SENSOR 9 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 9
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, read the active DTC's.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK PARK ASSIST SENSOR 9 FOR INTERNAL SHORT**
   1. Disconnect the Park Assist Sensor 9 harness connector.
   2. With the scan tool, read the active DTC's.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3.

   No

   - Replace the Park Assist Sensor 9 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 32: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.
3. Using a 12-volt test light connected to 12-volts, check the (D703) Park Assist Sensor 9 Signal circuit at the Park Assist Module C2 harness connector.

   Does the test light illuminate brightly?

   Yes

- Repair the short to ground in the (D703) Park Assist Sensor 9 Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

Fig. 33: Checking Park Assist Sensor Signal Circuit For A Short To Battery

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Using a 12-volt test light connected to ground, check the (D703) Park Assist Sensor 9 Signal circuit at the Park Assist Module C2 harness connector.

   Does the test light illuminate brightly?

   Yes

   - Repair the short to voltage in the (D703) Park Assist Sensor 9 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5.

5. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 34: Checking Park Assist Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D703) Park Assist Sensor 9 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 9 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D703) Park Assist Sensor 9 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   Is the voltage above 8.0 volts?

   Yes

- Go To 4.

No

- Go To 3.

3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 37: Measuring Resistance Of Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.

3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X700) Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

Fig. 38: Measuring Resistance Between Ground & Park Assist Sensor Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this step with the Park Assist Module connected.

1. Measure the resistance between ground and the (D704) Park Assist Sensor 10 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Go To 5.

No

- Go To 7.

5. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.

3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X700) Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

Fig. 55: Measuring Resistance Between Ground & Park Assist Sensor Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this step with the Park Assist Module connected.

1. Measure the resistance between ground and the (D710) Park Assist Sensor 11 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Go To 5.

No

- Go To 7.

5. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**

SENSOR-
PARK
ASSIST

MODULE-
PARK
ASSIST C2

Fig. 56: Measuring Resistance Between Ground & Park Assist Sensor 9 Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C2 harness connector.
2. Measure the resistance between ground and the (D710) Park Assist Sensor 11 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D710) Park Assist Sensor 11 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6.

6. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Fig. 57: Measuring Resistance Between Park Assist Sensor Signal Circuit & Park Assist Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D710) Park Assist Sensor 11 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D710) Park Assist Sensor 11 Signal circuit and the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR AN OPEN**

3553662

Fig. 58: Checking Park Assist Sensor 11 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C2 harness connector.
2. Measure the resistance of the (D710) Park Assist Sensor 11 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D710) Park Assist Sensor 11 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8.

8. **PARK ASSIST SENSOR**

Fig. 59: Park Assist Sensor Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Reconnect the Park Assist Module C2 harness connector.
3. Connect a jumper wire across the (X700) Park Assist Sensor Supply and (D710) Park Assist Sensor 11 Signal circuits.
4. Turn the ignition on.

5. With the scan tool, read DTC's.

   Does the scan tool display DTC: B1298-12-PTS SENSOR 11 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1298-12-PTS SENSOR 11 - CIRCUIT SHORT TO BATTERY

Fig. 60: Park Assist Sensor 11 Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT
(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTC's.

    Does the scan tool display this DTC as active?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO BATTERY**

Fig. 61: Measuring Voltage Of Park Assist Sensor 8 Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the Park Assist Module C2 harness connector.
3. Disconnect the Park Assist Sensor 11 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D710) Park Assist Sensor 11 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D710) Park Assist Sensor 11 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1298-25-PTS SENSOR 11 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler LLC vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING

FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Park Assist Sensor in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1298-92-PTS SENSOR 11 - PERFORMANCE OR INCORRECT OPERATION

Fig. 65: Park Assist Sensor 11 Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

During Reverse and during self test in Forward between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

If the system detects data corruption in the transmission in the internal communication line between the module and sensors.

POSSIBLE CAUSES

Possible Causes
(D710) PTS SENSOR 11 SIGNAL CIRCUIT SHORTED TO GROUND
(D710) PTS SENSOR 11 SIGNAL CIRCUIT SHORTED TO BATTERY
(D710) PTS SENSOR 11 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 11
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, read the active DTC's.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK PARK ASSIST SENSOR 11 FOR INTERNAL SHORT**
   1. Disconnect the Park Assist Sensor 11 harness connector.
   2. With the scan tool, read the active DTC's.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3.

   No

   - Replace the Park Assist Sensor 11 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 66: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module harness connectors C1 and C2.
3. Using a 12-volt test light connected to 12-volts, check the (D710) Park Assist Sensor 11 Signal circuit at the Park Assist Module C2 harness connector.

   Does the test light illuminate brightly?

   Yes

- Repair the short to ground in the (D710) Park Assist Sensor 11 Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

Fig. 67: Checking Park Assist Sensor 11 Signal Circuit For A Short To Battery

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Using a 12-volt test light connected to ground, check the (D710) Park Assist Sensor 11 Signal circuit at the Park Assist module C2 harness connector.

   Does the test light illuminate brightly?

   Yes

   - Repair the short to voltage in the (D710) Park Assist Sensor 11 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5.

5. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 68: Checking Park Assist Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D710) Park Assist Sensor 11 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 11 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D710) Park Assist Sensor 11 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210C-16-BATTERY VOLTAGE INPUT-CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

While the vehicle is in reverse for speeds less than 10 mph (16km/h).

SET CONDITION:

Park Assist Module supply voltage less than 6.5 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. Apply the vehicle park brake.
    3. Shift the transmission into reverse.
    4. With the scan tool, record and erase Park Assist Module DTC's.
    5. Wait 30 seconds.
    6. With the scan tool, read Park Assist Module DTC's.

    Is this DTC active?

    Yes

    - Go To 2.

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

NOTE: **Troubleshoot any Powertrain Control Module (PCM) charging/cranking DTC's before proceeding.**

NOTE: **Make sure the battery is fully charged.**

Are any charging system DTC's present?

Yes

- Refer to **CHARGING SYSTEM - DIAGNOSIS AND TESTING** and perform the active charging system or battery diagnostic procedure.

No

- Replace the Park Assist Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210C-17-BATTERY VOLTAGE INPUT-CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

While the vehicle is in reverse for speeds less than 16km/h (10 mph).

SET CONDITION:

Park Assist Module supply voltage greater than 16.0 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. Apply the vehicle park brake.
    3. Shift the transmission into reverse.
    4. With the scan tool, record and erase Park Assist Module DTC's.
    5. Wait 30 seconds.
    6. With the scan tool, read Park Assist Module DTC's.

Is this DTC active?

Yes

- Go To 2.

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

NOTE: Troubleshoot any Powertrain Control Module (PCM) charging/cranking DTC's before proceeding.

NOTE: Make sure the battery is fully charged.

Are any charging system DTC's present?

Yes

- Refer to **CHARGING SYSTEM - DIAGNOSIS AND TESTING** and perform the active charging system or battery diagnostic procedures.

No

- Replace the Park Assist Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2128-16-SENSOR SUPPLY VOLTAGE-CIRCUIT VOLTAGE BELOW THRESHOLD

Fig. 69: Parking Assist Sensor Power Supply Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a**

clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler LLC vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

While the vehicle is in reverse for speeds less than 10 mph (16km/h).

SET CONDITION:

Park Assist Sensor supply voltage less than 7.2 volts.

POSSIBLE CAUSES

Possible Causes
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO (X772) PARK ASSIST DISPLAY GROUND CIRCUIT
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO (Z906) PARK ASSIST MODULE GROUND CIRCUIT
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Apply the park brake.
    3. Shift the transmission into Reverse.
    4. With the scan tool, record and erase DTC's.
    5. Wait 30 seconds.
    6. With the scan tool, read DTC's.

    Is this DTC active?

    Yes

    - Go To 2.

    No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK EACH PARK ASSIST SENSOR FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect one Park Assist Sensor.
   3. Turn the ignition on.
   4. With the scan tool, read Park Assist Module DTC's. If this DTC is still active, repeat this procedure by disconnecting another park assist sensor. However, if this DTC changes from active to stored, or if all four sensors have been disconnected, proceed as follows:

      Is this DTC still active?

      Yes

      - Go To 3.

      No

      - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Fig. 70: Checking Park Assist Sensor Supply Circuit For A Short To Park Assist Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this test with all Park Assist Sensors disconnected.

1. Turn the ignition off.
2. Disconnect the Park Assist Module harness connector.
3. Measure the resistance between the (X700) Park Assist Sensor Supply circuit and the (X750) Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

- Repair the (X700) Park Assist Sensor Supply circuit for a short to the (X750) Park Assist Sensor Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO THE (X772) PARK ASSIST DISPLAY GROUND CIRCUIT**

Fig. 71: Checking Park Assist Sensor Supply Circuit For A Short To The Park Assist Display Ground Circuit

Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this test with all Park Assist Sensors disconnected.

1. Measure the resistance between the (X700) Park Assist Sensor Supply circuit and the (X772) Park Assist Display Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (X700) Park Assist Sensor Supply circuit for a short to the (X772) Park Assist Display Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5.

5. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO THE (Z906) PARK ASSIST MODULE GROUND CIRCUIT**

Fig. 72: Checking Park Assist Sensor Supply Circuit For A Short To The Park Assist Module Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this test with all Park Assist Sensors disconnected.

1. Measure the resistance between the (X700) Park Assist Sensor Supply circuit and the (Z906) Park Assist Module Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (X700) Park Assist Sensor Supply circuit for a short to the (Z906) Park Assist

Module Ground circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6.

6. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 73: Checking Park Assist Sensor Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this test with all Park Assist Sensors disconnected.

1. Measure the resistance between ground and the (X700) Park Assist Sensor Supply circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the (X700) Park Assist Sensor Supply circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Park Assist Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2128-17-SENSOR SUPPLY VOLTAGE-CIRCUIT VOLTAGE ABOVE THRESHOLD

Fig. 74: Parking Assist Sensor Power Supply Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a**

clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler LLC vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

While the vehicle is in reverse for speeds less than 10 mph (16km/h).

SET CONDITION:

Park Assist Sensor supply voltage greater than 9.2 volts.

POSSIBLE CAUSES

Possible Causes
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. Apply the vehicle park brake.
    3. Shift the transmission into Reverse.
    4. With the scan tool, record and erase Park Assist Module DTC's.
    5. Wait 30 seconds.
    6. With the scan tool, read Park Assist Module DTC's.

    Is this DTC active?

    Yes

    - Go To 2.

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 75: Checking Park Assist Sensor Supply Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (X700) Park Assist Sensor Supply circuit.

   Is the voltage above 9.2 volts?

   Yes

   - Repair the (X700) Park Assist Sensor Supply circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Park Assist Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B222A-00-VEHICLE LINE MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

If the Vehicle Line data transmitted on the bus doesn't correspond with the data stored in the Park Assist Module.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK VEHICLE LINE IN THE PCM**
    1. With the scan tool, compare the vehicle line that is programmed in to the Powertrain Control Module (PCM) to the vehicle line of the vehicle.

       Does the vehicle line programmed into the PCM match the vehicle?

       Yes

       - Replace the Park Assist Module in accordance with the Service Information.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2232-00-(PTS) PARKTRONICS INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

The Park Assist Module detects an internal failure.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **REPLACE THE PARK ASSIST MODULE**

   View Repair

   Repair

   - Replace the Park Assist Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0010-00-CAN INTERIOR BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

SET CONDITION:

The controller detects a short to ground on the CAN Interior Bus (125K) (+) circuit or a short to voltage on the CAN Interior Bus (125K) (-) circuit.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE

(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO THE (D265) CAN INTERIOR BUS (+) (125k) CIRCUIT
TOTALLY INTEGRATED POWER MODULE (TIPM)
ANY CAN INTERIOR BUS MODULE

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. Using the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to TIPM - DIAGNOSIS AND TESTING** and perform the U0010-CAN Interior Bus diagnostic procedure.

      No

      - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC's diagnostic procedure.

U0423-00-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Park Assist Module supply voltage between 9-16 volts. Ignition in Run/Start.

SET CONDITION:

Ignition status = 7h

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH INSTRUMENT CLUSTER
DTC's STORED OR ACTIVE IN THE INSTRUMENT CLUSTER
ACTIVE DTC's IN THE TIPM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Park Assist Module DTC's.
    3. Wait 30 seconds.
    4. With the scan tool, read Park Assist Module DTC's.

    Is this DTC active?

    Yes

    - Go To 2.

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **INSTRUMENT CLUSTER IS ACTIVE ON THE CAN C INTERIOR BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the Instrument Cluster is active on the bus.

    Is the Instrument Cluster active on the bus?

    Yes

    - Go To 3.

    No

    - Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response from Cluster/CCN diagnostic procedure.
3. **DTC's STORED OR ACTIVE IN THE INSTRUMENT CLUSTER**
    1. Check for Ignition Switch DTC's in the Instrument Cluster.

    Are any DTC's active or stored in the Instrument Cluster?

    Yes

    - Refer to **CCN - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 4.

4. **ACTIVE DTC's IN THE TIPM**
   1. With the scan tool, select ECU View and select TIPM.
   2. With the scan tool, read active DTC's.

   Are any Communication DTC's active in the TIPM Park Assist System?

   Yes

   - Refer to **TIPM - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Replace and program the Park Assist Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0141-00-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM) POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)

MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is the DTC active at this time?

      Yes

      - Perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure. **Refer to TIPM - DIAGNOSIS AND TESTING** .

      No

      - Perform the Stored Lost Communication DTC's diagnostic procedure. **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** .

U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Instrument Cluster (CCN) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE

(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND
INSTRUMENT CLUSTER POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
INSTRUMENT CLUSTER (CCN)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to TIPM - DIAGNOSIS AND TESTING** and perform the U0155-Lost Communication with Cluster/CCN diagnostic procedure.

      No

      - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC's diagnostic procedure.

DIAGNOSIS AND TESTING

B164E-11-PASSENGER MIRROR SIGNAL LAMP CONTROL - CIRCUIT FOR A SHORT TO GROUND

Fig. 1: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses a short low on the (P502) Passenger Mirror Turn Signal Driver circuit for more than two seconds with the turn signal switched on.

POSSIBLE CAUSES

Possible Causes
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO GROUND
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 2: Checking Passenger Mirror Turn Signal Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
3. Measure the resistance of the (P502) Passenger Mirror Turn Signal Driver circuit between ground and the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P502) Passenger Mirror Turn Signal Driver circuit for a short to ground. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in

accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3.

3. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT, OR TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 3: Checking Passenger Mirror Turn Signal Driver Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the

(P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

2. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.
3. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P502) Passenger Mirror Turn Signal Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Heated Mirror

- Go To 4.

No, without Heated Mirror

- Go To 5.

4. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT**

Fig. 4: Checking Passenger Mirror Turn Signal Driver Circuit For A Short To The Passenger Mirror Heater Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P502) Passenger Mirror Turn Signal Driver circuit for a short to the (C170) Passenger Mirror Heater Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

5. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 5: Checking Passenger Mirror Turn Signal Driver Circuit For A Short To The Passenger Mirror Turn Signal Return Circuit
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Ohmmeter positive lead must be connected to the (P595) Passenger Mirror Turn Signal Return circuit and the negative lead to the (P502) Passenger Mirror Turn Signal Driver circuit for the test results to be valid.**

1. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (P595) Passenger Mirror Turn Signal Return circuit at the Passenger Outside Rearview Mirror C2

(Component Side) connector.

Is there any resistance present?

Yes

- Repair the (P502) Passenger Mirror Turn Signal Driver circuit for a short to the (P595) Passenger Mirror Turn Signal Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6.

6. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT**

Fig. 6: Checking Passenger Mirror Turn Signal Driver Circuit For A Short To The Passenger Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
2. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (P66) Passenger Mirror Sensor Ground circuit at the Passenger Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

   Yes

- Repair the (P502) Passenger Mirror Turn Signal Driver circuit for a short to the (P66) Passenger Mirror Sensor Ground circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Puddle Lamp Mirror

- Go To 7.

No, without Puddle Lamp Mirror

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT**

Fig. 7: Checking Passenger Mirror Turn Signal Driver Circuit For A Short To The Passenger Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (P592) Passenger Puddle Lamp Return circuit at the Passenger Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

   Yes

- Repair the (P502) Passenger Mirror Turn Signal Driver circuit for a short to the (P592) Passenger Puddle Lamp Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B164E-15-PASSENGER MIRROR SIGNAL LAMP CONTROL - CIRCUIT FOR A SHORT TO BATTERY OR OPEN

Fig. 8: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses current greater than 100 mA or an open on the (P502) Passenger Mirror Turn Signal Driver circuit for more than two seconds with the turn signal switched on.

POSSIBLE CAUSES

Possible Causes
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO VOLTAGE
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR AN OPEN
(P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT FOR AN OPEN
(P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

    NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

    Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 9: Checking Passenger Mirror Turn Signal Driver Circuit For A Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
3. Turn the ignition on.
4. Measure the voltage of the (P502) Passenger Mirror Turn Signal Driver circuit between the Passenger Outside Rearview Mirror C2 (Component Side) connector and ground.

   Is there any voltage present?

   Yes

   - Repair the (P502) Passenger Mirror Turn Signal Driver circuit for a short to voltage. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3.

3. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT, OR TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 10: Checking Passenger Mirror Turn Signal Driver Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.
3. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.
4. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P502) Passenger Mirror Turn Signal Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Heated Mirror

- Go To 4.

No, without Heated Mirror

- Go To 5.

4. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT**

Fig. 11: Checking Passenger Mirror Turn Signal Driver Circuit For A Short To The Passenger Mirror Heater Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (C17) Passenger Mirror Heater Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P502) Passenger Mirror Turn Signal Driver circuit for a short to the (C17) Passenger Mirror Heater Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

5. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT AND (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT FOR AN OPEN**

Fig. 12: Checking Passenger Mirror Turn Signal Driver Circuit And Passenger Mirror Turn Signal Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Ohmmeter positive lead must be connected to the (P502) Passenger Mirror Turn Signal Driver circuit and the negative lead to the (P595)**

Passenger Mirror Turn Signal Return circuit for the test results to be valid.

1. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (P595) Passenger Mirror Turn Signal Return circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance above 1K Ohm?

   Yes

   - Repair the (P502) Passenger Mirror Turn Signal Driver circuit or the (P595) Passenger Mirror Turn Signal Return circuit for an open. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No, with Puddle Lamp Mirror

   - Go To 6.

   No, without Puddle Lamp Mirror

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO THE (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT**

Fig. 13: Checking Passenger Mirror Turn Signal Driver Circuit For A Short To The Passenger Puddle Lamp Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
2. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (M42) Passenger Puddle Lamp Driver circuit at the Passenger Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P502) Passenger Mirror Turn Signal Driver circuit for a short to the (M42)

Passenger Puddle Lamp Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16A3-11-PASSENGER WINDOW SWITCH BACKLIGHTING - CIRCUIT FOR A SHORT TO GROUND

Fig. 14: Passenger Window Switch Backlighting Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the module is awake, the park lamps are on and the window lock out switch is on.

SET CONDITION:

When the Passenger Window Switch Illumination Driver circuit falls below 3.0 Volts for over 25 ms. and the above conditions are met.

POSSIBLE CAUSES

Possible Causes
(E34) PASSENGER WINDOW SWITCH ILLUMINATION DRIVER CIRCUIT FOR A SHORT TO GROUND
(E34) PASSENGER WINDOW SWITCH ILLUMINATION DRIVER CIRCUIT FOR A SHORT TO THE (Q936) PASSENGER WINDOW SWITCH RETURN
WINDOW/DOOR LOCK SWITCH SHORTED
PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTC's.
    3. Make sure the passenger window lock out switch is on.
    4. Turn the park lights on.
    5. Wait 30 seconds.
    6. With the scan tool, read the active DTC's.

    Does the scan tool display B16A3-11-PASSENGER WINDOW SWITCH BACKLIGHTING - CIRCUIT FOR A SHORT TO GROUND?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW/DOOR LOCK SWITCH SHORTED**

Fig. 15: Checking Window/Door Lock Switch For A Short
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool, erase DTC's.
2. Turn the ignition off.
3. Disconnect the Passenger Window/Door Lock Switch harness connector.
4. Make sure the passenger window lock out switch is on and the park lamps are still on.
5. Turn the ignition on.
6. With the scan tool, read the active DTC's.

   Does the scan tool display B16A3-11-PASSENGER WINDOW SWITCH BACKLIGHTING - CIRCUIT FOR A SHORT TO GROUND?

   Yes

- Go To 3.

No

- Replace the Window/Door Lock Switch in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(E34) PASSENGER WINDOW SWITCH ILLUMINATION DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 16: Checking Passenger Window Switch Illumination Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Turn the park lamps off.

3. Disconnect the Passenger Door Module C5 harness connector.
4. Measure the resistance between ground and the (E34) Passenger Window Switch Illumination Driver circuit.

   Is the resistance below 10, 000 Ohms?

   Yes

   - Repair the short to ground in the (E34) Passenger Window Switch Illumination Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4.

4. **(E34) PASSENGER WINDOW SWITCH ILLUMINATION DRIVER CIRCUIT FOR A SHORT TO (Q936) PASSENGER WINDOW SWITCH RETURN CIRCUIT**

Fig. 17: Checking Passenger Window Switch Illumination Driver Circuit For A Short To Passenger Window Switch Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (E34) Passenger Window Switch Illumination Driver circuit and the (Q936) Passenger Window Switch Return circuit.

   Is the resistance below 10, 000 Ohms?

   Yes

   - Repair the (E34) Passenger Window Switch Illumination Driver circuit for a short to the (Q936) Passenger Window Switch Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16A3-15-PASSENGER WINDOW SWITCH BACKLIGHTING - CIRCUIT FOR A SHORT TO BATTERY OR OPEN

Fig. 18: Passenger Window Switch Backlighting Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the module is awake.

SET CONDITION:

When the Passenger Window Switch Illumination Driver circuit current draw is greater than 120mA for over 2000 ms. and the switch illumination output is turned off or there is no current draw when the switch illumination is turn on.

POSSIBLE CAUSES

Possible Causes
(E34) PASSENGER WINDOW SWITCH ILLUMINATION DRIVER CIRCUIT FOR A SHORT TO VOLTAGE
(E34) PASSENGER WINDOW SWITCH ILLUMINATION DRIVER CIRCUIT FOR AN OPEN
(Q936) PASSENGER WINDOW SWITCH RETURN CIRCUIT FOR AN OPEN
WINDOW/DOOR LOCK SWITCH
PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **CHECK FOR OPEN CIRCUIT**
    1. With the scan tool, record and erase DTC's.
    2. Make sure the passenger window lock out switch is on.
    3. Make sure the ignition is on.
    4. Turn the park lamps are on.
    5. Wait 30 seconds.
    6. With the scan tool, read the active DTC's.

    Does the scan tool display B16A3-15-PASSENGER WINDOW SWITCH BACKLIGHTING - CIRCUIT FOR A SHORT TO BATTERY OR OPEN?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and harness connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(E34) PASSENGER WINDOW SWITCH ILLUMINATION DRIVER CIRCUIT FOR AN OPEN**

Fig. 19: Checking Window/Door Lock Switch For A Short
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Window/Door Lock Switch harness connector.
3. Turn the ignition on.
4. Make sure the park lamps and the lock out switch are still on.
5. Turn the panel lamps fully on.
6. Measure the voltage between the (E34) Passenger Window Switch Illumination Driver circuit and ground.

   Is the voltage above 10.0 Volts?

   Yes

- Go To 4.

No

- Go To 3.

3. **(E34) PASSENGER WINDOW SWITCH ILLUMINATION DRIVER WIRE OPEN**

Fig. 20: Checking Passenger Window Switch Illumination Driver Wire For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Door Module C5 harness connector.
3. Measure the resistance of the (E34) Passenger Window Switch Illumination Driver circuit between the Passenger Door Module C5 harness connector and the Passenger Window/Door Lock Switch harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (E34) Passenger Window Switch Illumination Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Passenger Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **(Q936) PASSENGER WINDOW SWITCH RETURN CIRCUIT FOR AN OPEN**

Fig. 21: Checking Passenger Window Switch Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (Q936) Passenger Window Switch Return circuit between the Passenger Door Module C5 harness connector and the Passenger Window/Door Lock Switch harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q936) Passenger Window Switch Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 5.

5. **(E34) PASSENGER WINDOW SWITCH ILLUMINATION DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 22: Checking Passenger Window Switch Illumination Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage between the (E34) Passenger Window Switch Illumination Driver circuit and ground.

   Is there any voltage present?

   Yes

- Repair the short to voltage in the (E34) Passenger Window Switch Illumination Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1805-2A-PASSENGER DOOR LOCK/UNLOCK SWITCH - SIGNAL STUCK IN RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously

SET CONDITION:

When the Door Lock/Unlock Switch is stuck for over 30 seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
OBSTRUCTION IN SWITCH
DOOR LOCK SWITCH

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTC's.
    2. Operate the Passenger Door Lock Switch in all positions several times.
    3. Cycle the ignition from on to off.
    4. Turn the ignition on.
    5. With the scan tool, read the DTC's.

    Does the scan tool display B1805-2A-PASSENGER DOOR LOCK/UNLOCK SWITCH - SIGNAL STUCK IN RANGE?

    Yes

    - Go To 2.

    No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **DOOR LOCK SWITCH**
    1. Check the switch for any objects that could cause a sticking condition.

       Was anything found that could cause a sticking condition?

       Yes

       - Clean or remove the object as necessary.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Replace the Door Lock Switch.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B185E-11-PASSENGER WINDOW CONTROL - CIRCUIT FOR A SHORT TO GROUND

MODULE-
DOOR-
PASSENGER C4

MOTOR-
WINDOW-
PASSENGER

Fig. 23: Passenger Window Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the module is awake.

SET CONDITION:

When both Passenger Window Driver circuits (Up and Down) are grounded during a window movement command.

POSSIBLE CAUSES

Possible Causes
(Q22) PASSENGER WINDOW DRIVER (DOWN) CIRCUIT FOR A SHORT TO GROUND
(Q12) PASSENGER WINDOW DRIVER (UP) CIRCUIT FOR A SHORT TO GROUND
(Q22) PASSENGER WINDOW DRIVER (DOWN) CIRCUIT FOR A SHORT TO THE (Q12) PASSENGER WINDOW DRIVER (UP) CIRCUIT
WINDOW MOTOR SHORTED
PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTC's.
    3. Operate the Passenger Window switch up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTC's.

    Does the scan tool display B185E-11-PASSENGER WINDOW CONTROL - CIRCUIT FOR A SHORT TO GROUND?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **WINDOW MOTOR SHORTED**

Fig. 24: Checking Window Motor For A Short
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool, erase DTC's.
2. Turn the ignition off.
3. Disconnect the Passenger Window Motor harness connector.
4. Turn the ignition on.

5. Operate the Passenger Window switch up and down several times.
6. With the scan tool, read the active DTC's.

   Does the scan tool display B185E-11-PASSENGER WINDOW CONTROL - CIRCUIT FOR A SHORT TO GROUND?

   Yes

   - Go To 3.

   No

   - Replace the Passenger Window Motor in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q22) PASSENGER WINDOW DRIVER (DOWN) CIRCUIT FOR A SHORT TO GROUND**

Fig. 25: Checking Passenger Window Driver (Down) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Door Module C4 harness connector.
3. Measure the resistance between ground and the (Q22) Passenger Window Driver (Down) circuit.

   Is the resistance below 10, 000 Ohms?

   Yes

   - Repair the short to ground in the (Q22) Passenger Window Driver (Down) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 4.

4. **(Q12) PASSENGER WINDOW DRIVER (UP) CIRCUIT FOR A SHORT TO GROUND**

Fig. 26: Checking Passenger Window Driver (Up) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (Q12) Passenger Window Driver (Up) circuit.

   Is the resistance below 10, 000 Ohms?

   Yes

   - Repair the short to ground in the (Q12) Passenger Window Driver (Up) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 5.

5. **(Q22) DRIVER WINDOW DRIVER (DOWN) CIRCUIT FOR A SHORT TO THE (Q12) PASSENGER WINDOW DRIVER (UP) CIRCUIT**

Fig. 27: Checking Driver Window Driver (Down) Circuit For A Short To The Passenger Window Driver (Up) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q22) Passenger Window Driver (Down) circuit and the (Q12) Passenger Window Driver (Up) circuit.

   Is the resistance below 10, 000 Ohms?

   Yes

- Repair the (Q22) Passenger Window Driver (Down) circuit for a short to the (Q12) Passenger Window Driver (Up) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B185E-13-PASSENGER WINDOW CONTROL - CIRCUIT FOR AN OPEN

MODULE-
DOOR-
PASSENGER C4

MOTOR-
WINDOW-
PASSENGER

Fig. 28: Passenger Window Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the module is awake.

SET CONDITION:

When one or both Driver Window Driver circuits (Up and Down) are not supplied with voltage, when they should be, during a window movement command for more than 2000 ms.

POSSIBLE CAUSES

Possible Causes
(Q22) PASSENGER WINDOW DRIVER (DOWN) CIRCUIT FOR AN OPEN
(Q12) PASSENGER WINDOW DRIVER (UP) CIRCUIT FOR AN OPEN
WINDOW MOTOR (REGULATOR)
PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTC's.
    3. Operate the Passenger Window switch up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTC's.

    Does the scan tool display B185E-13-PASSENGER WINDOW CONTROL - CIRCUIT FOR AN OPEN?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW MOTOR OR CIRCUIT FOR AN OPEN**

Fig. 29: Checking Window Motor Or Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Window Motor harness connector.
3. Connect a test light between the (Q12) Passenger Window Driver (Up) circuit and the (Q22) Passenger Window Driver (Down) circuit.
4. Turn the ignition on.
5. Trip the driver door latch to the closed position.
6. Operate the Passenger Window switch up and down several times while observing the test light.

   Does the test light illuminate brightly when the switch is pressed in both directions? With the express up window, the test light will only flash momentarily each time the switch is activated.

   Yes

- Replace the Passenger Window Motor (regulator) in accordances with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3.

3. **(Q22) PASSENGER WINDOW DRIVER (DOWN) CIRCUIT FOR AN OPEN**

Fig. 30: Checking Passenger Window Driver (Down) Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Door Module C4 harness connector.
3. Measure the resistance of the (Q22) Passenger Window Driver (Down) circuit between the Passenger Door Module C4 module harness connector and the Passenger Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q22) Passenger Window Driver (Down) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4.

4. **(Q12) PASSENGER WINDOW DRIVER (UP) CIRCUIT FOR AN OPEN**

Fig. 31: Checking Passenger Window Driver (Up) Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (Q12) Passenger Window Driver (Up) circuit between the Passenger Door Module C4 module harness connector and the Passenger Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q12) Passenger Window Driver (Up) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

Yes

- Replace the Passenger Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1862-11-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY - CIRCUIT FOR A SHORT TO GROUND

MODULE-
DOOR-
PASSENGER C4

MOTOR-
WINDOW-
PASSENGER

Fig. 32: Passenger Window Hall Sensor Power Supply Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the module is awake.

SET CONDITION:

When the Passenger Window Hall Sensor Supply circuit falls below 0.8 of a Volt for over two seconds.

POSSIBLE CAUSES

Possible Causes
(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND
WINDOW MOTOR SHORTED
PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTC's.
    3. Operate the Passenger Window switch up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTC's.

    Does the scan tool display B1862-11-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY - CIRCUIT FOR A SHORT TO GROUND?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW MOTOR SHORTED**

Fig. 33: Checking Window Motor For A Short
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool, erase DTC's.
2. Turn the ignition off.
3. Disconnect the Passenger Window Motor harness connector.
4. Turn the ignition on.
5. Operate the Passenger Window switch up and down several times.
6. With the scan tool, read the active DTC's.

Does the scan tool display B1862-11-PASSENGER WINDOW POSITION SENSOR POWER

SUPPLY - CIRCUIT FOR A SHORT TO GROUND?

Yes

- Go To 3.

No

- Replace the Window Motor (regulator) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 34: Checking Passenger Window Hall Sensor Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Door Module C4 harness connector.
3. Measure the resistance between ground and the (Q306) Passenger Window Hall Sensor Supply circuit.

   Is the resistance below 10, 000 Ohms?

   Yes

   - Repair the short to ground in the (Q306) Passenger Window Hall Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Passenger Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1862-15-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY - CIRCUIT FOR A SHORT TO BATTERY OR OPEN - EXPRESS MOTOR ONLY

MODULE-
DOOR-
PASSENGER C4

MOTOR-
WINDOW-
PASSENGER

Fig. 35: Passenger Window Hall Sensor Power Supply Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the module is awake.

SET CONDITION:

When the Passenger Window Hall Sensor Supply circuit is above 1.5 Volts for over 2000 ms. and the power to the module has been turned off.

POSSIBLE CAUSES

Possible Causes
(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE
(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT FOR AN OPEN
(Q990) PASSENGER WINDOW HALL SENSOR RETURN CIRCUIT FOR AN OPEN
PASSENGER WINDOW MOTOR
PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTC's.
    3. Wait 30 seconds.
    4. Operate the Passenger Window switch in both directions several times.
    5. With the scan tool, read the active DTC's.

    Does the scan tool display B1862-15-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY - CIRCUIT FOR A SHORT TO BATTERY OR OPEN?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 36: Checking Passenger Window Hall Sensor Supply Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Door Module C4 harness connector.
3. Disconnect the Passenger Window Motor harness connector.
4. Turn the ignition on.
5. Measure the voltage between the (Q306) Passenger Window Hall Sensor Supply circuit and ground.

Is there any voltage present?

Yes

- Repair the short to the voltage in the (Q306) Passenger Window Hall Sensor Supply circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3.

3. **(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Fig. 37: Checking Passenger Window Hall Sensor Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance of the (Q306) Passenger Window Hall Sensor Supply circuit between the Passenger Door Module C4 harness connector and the Passenger Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q306) Passenger Window Hall Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4.

4. **(Q990) PASSENGER WINDOW HALL SENSOR RETURN CIRCUIT FOR AN OPEN**

Fig. 38: Checking Passenger Window Hall Sensor Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (Q990) Passenger Window Hall Sensor Return circuit between the Passenger Door Module C4 harness connector and the Passenger Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q990) Passenger Window Hall Sensor Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

5. **PASSENGER WINDOW MOTOR HALL SENSOR OPEN**

Fig. 39: Checking Passenger Window Motor Hall Sensor For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the Passenger Window Motor harness connector.
2. Measure the resistance between the (Q990) Passenger Window Hall Sensor Return circuit and the (Q306) Passenger Window Hall Sensor Supply circuit in the Passenger Door Module C4 harness connector.

NOTE: **If the Ohmmeter shows "OL", reconnect the Passenger Door Module C4 harness connector and move the motor to a different position.**

Disconnect the Passenger Door Module C4 harness connector and check the resistance again. If the Ohmmeter still shows "OL", re-try moving the motor again and re-check.

Is the resistance between 500, 000 and 650, 000 (500k and 650k) Ohms?

Yes

- Replace the Passenger Door Module in accordance with the Service Information
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Window Motor in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1865-31-PASSENGER WINDOW POSITION SENSOR - NO SIGNAL

MODULE-
DOOR-
PASSENGER C4

MOTOR-
WINDOW-
PASSENGER

Fig. 40: Passenger Window Hall Sensor Power Supply Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Whenever the module is awake.

SET CONDITION:

When the Passenger Window Motor Hall Sensor does not generate a signal during a window movement.

POSSIBLE CAUSES

Possible Causes
(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT FOR A SHORT TO GROUND
(Q990) PASSENGER WINDOW HALL SENSOR RETURN CIRCUIT FOR AN OPEN
(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT FOR A SHORT TO THE (Q990) PASSENGER WINDOW HALL SENSOR RETURN CIRCUIT
(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT FOR AN OPEN
WINDOW MOTOR

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTC's.
    3. Operate the Passenger Window switch up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTC's.

    Does the scan tool display B1865-31-PASSENGER WINDOW POSITION SENSOR - NO SIGNAL?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL SHORTED TO GROUND**

Fig. 41: Checking Passenger Window Hall Sensor A Signal Shorted To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Window Motor harness connector.
3. Disconnect the Passenger Door Module C4 harness connector.

4. Measure the resistance between ground and the (Q302) Passenger Window Hall Sensor A Signal circuit.

   Is the resistance below 10, 000 Ohms?

   Yes

   - Repair the short to ground in the Passenger Window Hall Sensor A signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3.

3. **(Q990) PASSENGER WINDOW HALL SENSOR RETURN CIRCUIT FOR AN OPEN**

Fig. 42: Checking Passenger Window Hall Sensor Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (Q990) Passenger Window Hall Sensor Return circuit between the Passenger Door Module C4 harness connector and the Passenger Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q990) Passenger Window Hall Sensor Return circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT FOR AN OPEN**

Fig. 43: Checking Passenger Window Hall Sensor A Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (Q302) Passenger Window Hall Sensor A Signal circuit between the Passenger Door Module C4 harness connector and the Passenger Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

Yes

- Repair the open in the (Q302) Passenger Window Hall Sensor A Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

5. **(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT FOR A SHORT TO THE (Q990) PASSENGER WINDOW HALL SENSOR RETURN CIRCUIT**

Fig. 44: Checking Passenger Window Hall Sensor A Signal Circuit For A Short To The Passenger Window Hall Sensor Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q302) Passenger Window Hall Sensor A Signal circuit and the (Q990) Passenger Window Hall Sensor Return circuit.

   Is the resistance below 10, 000 Ohms?

   Yes

   - Repair the (Q302) Passenger Window Hall Sensor A Signal circuit for a short to the (Q990) Passenger Window Hall Sensor Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Window Motor in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1910-2A-PASSENGER WINDOW SWITCH - SIGNAL STUCK IN RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously

SET CONDITION:

When the Passenger Window Switch is stuck for over 30 seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
OBSTRUCTION IN SWITCH
PASSENGER WINDOW SWITCH

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. With the scan tool, record and erase the DTC's.
   2. Operate the Passenger Window Switch in all positions several times.
   3. Cycle the ignition from on to off.
   4. Turn the ignition on.
   5. With the scan tool, read the DTC's.

      Does the scan tool display B1910-2A-PASSENGER WINDOW SWITCH - SIGNAL STUCK IN RANGE?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **WINDOW SWITCH**
   1. Check the switch for any objects that could cause a sticking condition.

      Was anything found that could cause a sticking condition?

      Yes

      - Clean or remove the object as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Passenger Window Switch.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D11-11-PASSENGER MIRROR POSITION SENSOR POWER SUPPLY - CIRCUIT FOR A SHORT TO GROUND

Fig. 45: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses a short low on the (A857) 5-volt Supply circuit for more than two seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on, if equipped puddle lamp mirror.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 46: Checking 5-Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
3. Measure the resistance of the (A857) 5-volt Supply circuit between ground and the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (A857) 5-volt Supply circuit for a short to ground. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3.

3. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT**

Fig. 47: Checking 5-Volt Supply Circuit For A Short To Passenger Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the residence between the (A857) 5-volt Supply circuit and the (P66) Passenger Mirror Sensor Ground circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 1.0 Ohm?

   Yes

   - Repair the (A857) 5-volt Supply circuit for a short to the (P66) Passenger Mirror Sensor Ground circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Puddle Lamp Mirror

- Go To 4.

No, without Puddle Lamp Mirror

- Go To 5.

4. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT**

Fig. 48: Checking 5-Volt Supply Circuit For A Short To Passenger Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the residence between the (A857) 5-volt Supply circuit and the (P592) Passenger Puddle Lamp Return circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms?

Yes

- Repair the (A857) 5-volt Supply circuit for a short to the (P592) Passenger Puddle Lamp Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

5. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT, OR TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 49: Checking 5-Volt Supply Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
2. Measure the resistance between the (A857) 5-volt Supply circuit and the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (A857) 5-volt Supply circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

4. Measure the resistance between the (A857) 5-volt Supply circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (A857) 5-volt Supply circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No, with Heated/Turn Signal Mirror

   - Go To 6.

   No, without Heated/Turn Signal Mirror

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT OR TO (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 50: Checking 5-Volt Supply Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (A857) 5-volt Supply circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (A857) 5-volt Supply circuit and the (P595) Passenger Mirror Turn Signal Return circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for either measurement?

   Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (A857) 5-volt Supply circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D14-11-PASSENGER MIRROR VERTICAL POSITION SENSOR INPUT - CIRCUIT FOR A SHORT TO GROUND

Fig. 51: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses a short low on the (P64) Passenger Mirror Vertical Position Signal circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

    NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 52: Checking Passenger Mirror Vertical Position Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
3. Measure the resistance of the (P64) Passenger Mirror Vertical Position Signal circuit between ground and the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P64) Passenger Mirror Vertical Position Signal circuit for a short to ground. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in

accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3.

3. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT**

Fig. 53: Checking Passenger Mirror Vertical Position Signal Circuit For A Short To Passenger Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the residence between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P66) Passenger Mirror Sensor Ground circuit at the Passenger Outside Rearview Mirror C1

(Component Side) connector.

Is the resistance below 1.0 Ohm?

Yes

- Repair the (P64) Passenger Mirror Vertical Position Signal circuit for a short to the (P66) Passenger Mirror Sensor Ground circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Puddle Lamp Mirror

- Go To 4.

No, without Puddle Lamp Mirror

- Go To 5.

4. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT**

Fig. 54: Checking Passenger Mirror Vertical Position Signal Circuit For A Short To Passenger Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the residence between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P592) Passenger Puddle Lamp Return circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P64) Passenger Mirror Vertical Position Signal circuit for a short to the (P592) Passenger Puddle Lamp Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

5. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT, OR TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 55: Checking Passenger Mirror Vertical Position Signal Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
2. Measure the resistance between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
4. Measure the resistance between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (P64) Passenger Mirror Vertical Position Signal circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No, with Heated/Turn Signal Mirror

   - Go To 6.

   No, without Heated/Turn Signal Mirror

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT OR TO (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 56: Checking Passenger Mirror Vertical Position Signal Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (P64) Passenger Mirror Vertical Position Signal circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P595) Passenger Mirror Turn Signal Return circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P64) Passenger Mirror Vertical Position Signal circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D14-12-PASSENGER MIRROR VERTICAL POSITION SENSOR INPUT - CIRCUIT FOR A SHORT TO BATTERY

Fig. 57: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses more than 400 mA current on the (A857) 5-volt Supply circuit or an open or a short high on the (P64) Passenger Mirror Vertical Position Signal circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR AN OPEN
(P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT FOR AN OPEN
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT
(P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
3. Turn the turn signal on, if equipped with turn signal mirror.
4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
5. Turn the rear defogger on, if equipped with heated mirror.
6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT AND (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 58: Checking Passenger Mirror Vertical Position Signal Circuit And 5-Volt Supply Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
3. Turn the ignition on.
4. Measure the voltage of the (P64) Passenger Mirror Vertical Position Signal circuit between the Passenger Outside Rearview Mirror C1 (Component Side) connector and ground.
5. Measure the voltage of the (A857) 5-volt Supply circuit between the Passenger Outside Rearview Mirror C1 (Component Side) connector and ground.

   Is there any Voltage present on either circuit?

Yes

- Repair all circuits with Voltage present for a short to Voltage. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Puddle Lamp Mirror

- Go To 3.

No, without Puddle Lamp Mirror

- Go To 4.

3. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT AND (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT**

Fig. 59: Checking Passenger Mirror Vertical Position Signal Circuit And 5-Volt Supply Circuit For A Short To Passenger Puddle Lamp Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P64) Passenger Mirror Vertical Position Signal circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.
3. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (A857) 5-volt Supply circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms for either measurement?

   Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (M42) Passenger Puddle Lamp Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT AND (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 60: Checking Passenger Mirror Vertical Position Signal Circuit For A Short To Passenger Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. If not done previously, turn the ignition off.
2. Measure the resistance between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P66) Passenger Mirror Sensor Ground circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 3.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair (P64) Passenger Mirror Vertical Position Signal circuit or the (P66) Passenger Mirror Sensor Ground circuit for an open. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT, OR TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 61: Checking Passenger Mirror Vertical Position Signal Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
2. Measure the resistance between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

4. Measure the resistance between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (P64) Passenger Mirror Vertical Position Signal circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No, with Heated/Turn Signal Mirror

   - Go To 6.

   No, without Heated/Turn Signal Mirror

   - Go To 7.

6. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT OR TO (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT**

Fig. 62: Checking Passenger Mirror Vertical Position Signal Circuit For A Short To Passenger Mirror Heater Driver Circuit Or To Passenger Mirror Turn Signal Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (P64) Passenger Mirror Vertical Position Signal circuit and the (C17) Passenger Mirror Heater Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P502) Passenger Mirror Turn Signal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P64) Passenger Mirror Vertical Position Signal circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 7.

7. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT, OR TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 63: Checking 5-Volt Supply Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (A857) 5-volt Supply circuit and the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. Measure the resistance between the (A857) 5-volt Supply circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (A857) 5-volt Supply circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side)

connectors.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (A857) 5-volt Supply circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Heated/Turn Signal Mirror

- Go To 8.

No, without Heated/Turn Signal Mirror

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT OR TO (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT**

Fig. 64: Checking 5-Volt Supply Circuit For A Short To Passenger Mirror Heater Driver Circuit Or To Passenger Mirror Turn Signal Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (A857) 5-volt Supply circuit and the (C17) Passenger Mirror Heater Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (A857) 5-volt Supply circuit and the (P502) Passenger Mirror Turn Signal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (A857) 5-volt Supply circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D17-11-PASSENGER MIRROR HORIZONTAL POSITION SENSOR INPUT - CIRCUIT FOR A SHORT TO GROUND

Fig. 65: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses a short low on the (P68) Passenger Mirror Horizontal Position Signal circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the can tool, record and erase DTC's.
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

    NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Does the scan tool display B1D17-11-PASSENGER MIRROR HORIZONTAL POSITION SENSOR INPUT - CIRCUIT FOR A SHORT TO GROUND?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 66: Checking Passenger Mirror Horizontal Position Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) harness connector from the Door Module.
3. Measure the resistance between ground and the (P68) Passenger Mirror Horizontal Position Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (P68) Passenger Mirror Horizontal Position Signal circuit. If the wiring harness and harness connector are okay, replace the Passenger Outside Rearview

Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3.

3. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT**

Fig. 67: Checking Passenger Mirror Horizontal Position Signal Circuit For A Short To Passenger Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the residence between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (P66) Passenger Mirror Sensor Ground circuit.

Is the resistance below 1.0 Ohm?

Yes

- Repair the (P68) Passenger Mirror Horizontal Position Signal circuit for a short to the (P66) Passenger Mirror Sensor Ground circuit. If the wiring harness and harness connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Puddle Lamp Mirror

- Go To 4.

No, without Puddle Lamp Mirror

- Go To 5.

4. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT**

Fig. 68: Checking Passenger Mirror Horizontal Position Signal Circuit For A Short To Passenger Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the residence between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (P592) Passenger Puddle Lamp Return circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P68) Passenger Mirror Horizontal Position Signal circuit for a short to the (P592) Passenger Puddle Lamp Return circuit. If the wiring harness and harness connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

5. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT, OR TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 69: Checking Passenger Mirror Horizontal Position Signal Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) harness connector from the Door Module.
2. Measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit and

the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

3. Measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.
4. Measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P68) Passenger Mirror Horizontal Position Signal circuit. If the wiring harness and harness connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Heated/Turn Signal Mirror

- Go To 6.

No, without Heated/Turn Signal Mirror

- Inspect the wiring and harness connectors for damage and repair as necessary. If the wiring and harness connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT OR TO (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 70: Checking Passenger Mirror Horizontal Position Signal Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.
2. For Turn Signal Mirror, measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (P595) Passenger Mirror Turn Signal Return circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P68) Passenger Mirror Horizontal Position Signal circuit. If the wiring harness and harness connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and harness connectors for damage and repair as necessary. If the wiring and harness connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D17-12-PASSENGER MIRROR HORIZONTAL POSITION SENSOR INPUT - CIRCUIT FOR A SHORT TO BATTERY

Fig. 71: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses more than 400 mA current on the (A857) 5-volt Supply circuit or an open or a short high on the (P68) Passenger Mirror Horizontal Position Signal circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR AN OPEN
(P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT FOR AN OPEN
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT
(P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT
(A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO THE (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
3. Turn the turn signal on, if equipped with turn signal mirror.
4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
5. Turn the rear defogger on, if equipped with heated mirror.
6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT AND (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 72: Checking Passenger Mirror Horizontal Position Signal Circuit And 5-Volt Supply Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
3. Turn the ignition on.
4. Measure the Voltage of the (P68) Passenger Mirror Horizontal Position Signal circuit between the Passenger Outside Rearview Mirror C1 (Component Side) connector and ground.
5. Measure the voltage of the (A857) 5-volt Supply circuit between the Passenger Outside Rearview Mirror C1 (Component Side) connector and ground.

   Is there any Voltage present on either circuit?

Yes

- Repair all circuits with Voltage present for a short to Voltage. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Puddle Lamp Mirror

- Go To 3.

No, without Puddle Lamp Mirror

- Go To 4.

3. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT AND (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT**

Fig. 73: Checking Passenger Mirror Horizontal Position Signal Circuit And 5-Volt Supply Circuit For A Short To Passenger Puddle Lamp Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P68) Passenger Mirror Horizontal Position Signal circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.
3. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (A857) 5-volt Supply circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms for either measurement?

   Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (M42) Passenger Puddle Lamp Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT AND (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 74: Checking Passenger Mirror Horizontal Position Signal Circuit For A Short To Passenger Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. If not done previously, turn the ignition off.
2. Measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (P66) Passenger Mirror Sensor Ground circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 3.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the (P68) Passenger Mirror Horizontal Position Signal circuit or the (P66) Passenger Mirror Sensor Ground circuit for an open. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT, OR TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 75: Checking Passenger Mirror Horizontal Position Signal Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
2. Measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
4. Measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P68) Passenger Mirror Horizontal Position Signal circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Heated/Turn Signal Mirror

- Go To 6.

No, without Heated/Turn Signal Mirror

- Go To 7.

6. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT OR TO (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT**

Fig. 76: Checking Passenger Mirror Horizontal Position Signal Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (C17) Passenger Mirror Heater Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (P502) Passenger Mirror Turn Signal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P68) Passenger Mirror Horizontal Position Signal circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 7.

7. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT, OR TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 77: Checking 5-Volt Supply Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (A857) 5-volt Supply circuit and the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. Measure the resistance between the (A857) 5-volt Supply circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (A857) 5-volt Supply circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side)

connectors.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (A857) 5-volt Supply circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Heated/Turn Signal Mirror

- Go To 8.

No, without Heated/Turn Signal Mirror

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT OR TO (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT**

Fig. 78: Checking 5-Volt Supply Circuit For A Short To Passenger Mirror Heater Driver Circuit Or To Passenger Mirror Turn Signal Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (A857) 5-volt Supply circuit and the (C17) Passenger Mirror Heater Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (A857) 5-volt Supply circuit and the (P502) Passenger Mirror Turn Signal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (A857) 5-volt Supply circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D2A-11-PASSENGER MIRROR VERTICAL MOTOR CONTROL - CIRCUIT FOR A SHORT TO GROUND

Fig. 79: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses a short low on the (P72) Passenger Mirror Vertical Driver circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
(P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT FOR A SHORT TO GROUND
(P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT FOR A SHORT TO THE (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT
(P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT FOR A SHORT TO THE (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT
(P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT FOR A SHORT TO THE (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT
(P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT FOR A SHORT TO THE (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

    NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction as this will allow time for an active fault to set if present.**

    Is the DTC active?

    Yes

    - Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 80: Checking Passenger Mirror Vertical Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.

3. Measure the resistance of the (P72) Passenger Mirror Vertical Driver circuit between ground and the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P72) Passenger Mirror Vertical Driver circuit for a short to ground. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No, with Heated/Turn Signal Mirror

   - Go To 3.

   No, without Heated/Turn Signal Mirror

   - Go To 4.

3. **CHECK (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT FOR A SHORT TO (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT OR TO (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 81: Checking Passenger Mirror Vertical Driver Circuit For A Short To Passenger Mirror Heater Return Circuit Or To Passenger Mirror Turn Signal Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. For heated mirror, measure the resistance between the (P72) Passenger Mirror Vertical Driver circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.
2. For turn signal mirror, measure the resistance between the (P72) Passenger Mirror Vertical Driver circuit and the (P595) Passenger Mirror Turn Signal Return circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms for either measurement?

   Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (P72) Passenger Mirror Vertical Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **CHECK (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT FOR A SHORT TO (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT**

Fig. 82: Checking Passenger Mirror Vertical Driver Circuit For A Short To Passenger Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
2. Measure the resistance between the (P72) Passenger Mirror Vertical Driver circuit and the (P66) Passenger Mirror Sensor Ground circuit at the Passenger Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P72) Passenger Mirror Vertical Driver circuit for a short to the (P66) Passenger Mirror Sensor Ground circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No, with Puddle Lamp Mirror

   - Go To 5.

   No, without Puddle Lamp Mirror

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT FOR A SHORT TO (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT**

Fig. 83: Checking Passenger Mirror Vertical Driver Circuit For A Short To Passenger Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P72) Passenger Mirror Vertical Driver circuit and the (P592) Passenger Puddle Lamp Return circuit at the Passenger Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P72) Passenger Mirror Vertical Driver circuit for a short to the (P592) Passenger Puddle Lamp Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D2E-11-PASSENGER MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT FOR A SHORT TO GROUND

Fig. 84: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses a short low on the (P74) Passenger Mirror Horizontal Driver circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
(P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO GROUND
(P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO THE (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT
(P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO THE (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT
(P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO THE (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT
(P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO THE (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

    NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

    Is the DTC active?

    Yes

    - Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 85: Checking Passenger Mirror Horizontal Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.

3. Measure the resistance of the (P74) Passenger Mirror Horizontal Driver circuit between ground and the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P74) Passenger Mirror Horizontal Driver circuit for a short to ground. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No, with Heated/Turn Signal Mirror

   - Go To 3.

   No, without Heated/Turn Signal Mirror

   - Go To 4.

3. **CHECK (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT OR TO (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 86: Checking Passenger Mirror Horizontal Driver Circuit For A Short To Passenger Mirror Heater Return Circuit Or To Passenger Mirror Turn Signal Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. For heated mirror, measure the resistance between the (P74) Passenger Mirror Horizontal Driver circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.
2. For turn signal mirror, measure the resistance between the (P74) Passenger Mirror Horizontal Driver circuit and the (P595) Passenger Mirror Turn Signal Return circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms for either measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (P74) Passenger

Mirror Horizontal Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **CHECK (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT**

Fig. 87: Checking Passenger Mirror Horizontal Driver Circuit For A Short To Passenger Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
2. Measure the resistance between the (P74) Passenger Mirror Horizontal Driver circuit and the (P66) Passenger Mirror Sensor Ground circuit at the Passenger Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P74) Passenger Mirror Horizontal Driver circuit for a short to the (P66) Passenger Mirror Sensor Ground circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No, with Puddle Lamp Mirror

   - Go To 5.

   No, without Puddle Lamp Mirror

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT**

Fig. 88: Checking Passenger Mirror Horizontal Driver Circuit For A Short To Passenger Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P74) Passenger Mirror Horizontal Driver circuit and the (P592) Passenger Puddle Lamp Return circuit at the Passenger Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P74) Passenger Mirror Horizontal Driver circuit for a short to the (P592)

Passenger Puddle Lamp Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D36-11-PASSENGER MIRROR HEATER CONTROL - CIRCUIT FOR A SHORT TO GROUND

Fig. 89: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses a short low on the (C17) Passenger Mirror Heater Driver circuit for more than two seconds with the heater switched on.

POSSIBLE CAUSES

Possible Causes
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO GROUND
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P592) PASSENGER PUDDLE LAMP DRIVER CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Turn the rear defogger on.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 90: Checking Passenger Mirror Heater Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
3. Measure the resistance of the (C17) Passenger Mirror Heater Driver circuit between ground and the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (C17) Passenger Mirror Heater Driver circuit for a short to ground. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in

accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3.

3. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT, (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, OR TO (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT**

Fig. 91: Checking Passenger Mirror Heater Driver Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (P74)

Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

2. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.
3. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (C17) Passenger Mirror Heater Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Turn Signal Mirror

- Go To 4.

No, without Turn Signal Mirror

- Go To 5.

4. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 92: Checking Passenger Mirror Heater Driver Circuit For A Short To Passenger Mirror Turn Signal Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (P595) Passenger Mirror Turn Signal Return circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (C17) Passenger Mirror Heater Driver circuit for a short to the (P595) Passenger Mirror Turn Signal Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

5. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT**

Fig. 93: Checking Passenger Mirror Heater Driver Circuit For A Short To Passenger Mirror Heater Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 1.0 Ohm?

Yes

- Repair the (C17) Passenger Mirror Heater Driver circuit for a short to the (C170) Passenger Mirror Heater Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6.

6. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (66) PASSENGER MIRROR SENSOR GROUND CIRCUIT**

Fig. 94: Checking Passenger Mirror Heater Driver Circuit For A Short To Passenger Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
2. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (P66) Passenger Mirror Sensor Ground circuit at the Passenger Outside Rearview Mirror C2 and C1 (Component Side) connectors.

Is the resistance below 10K Ohms?

Yes

- Repair the (C17) Passenger Mirror Heater Driver circuit for a short to the (P66) Passenger Mirror Sensor Ground circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Puddle Lamp Mirror

- Go To 7.

No, without Puddle Lamp Mirror

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT**

Fig. 95: Checking Passenger Mirror Heater Driver Circuit For A Short To Passenger Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (P592) Passenger Puddle Lamp Return circuit at the Passenger Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (C17) Passenger Mirror Heater Driver circuit for a short to the (P592) Passenger

Puddle Lamp Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D36-15-PASSENGER MIRROR HEATER CONTROL - CIRCUIT FOR A SHORT TO BATTERY OR OPEN

Fig. 96: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses an open or a short high on the (C17) Passenger Mirror Heater Driver circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO VOLTAGE
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR AN OPEN
(C170) PASSENGER MIRROR HEATER RETURN CIRCUIT FOR AN OPEN
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT
(C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION - HEATER OFF**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on, if equipped with puddle lamp mirror.
    5. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    6. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

    NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

    Is the DTC active?

    Yes

- Go To 3.

No

- Go To 2.

2. **TEST FOR INTERMITTENT CONDITION - HEATER ON**
   1. Turn the rear defogger on.
   2. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 3.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 3. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 97: Checking Passenger Mirror Heater Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
3. Turn the ignition on.
4. Measure the voltage of the (C17) Passenger Mirror Heater Driver circuit between the Passenger Outside Rearview Mirror C2 (Component Side) connector and ground.

   Is there any voltage present?

   Yes

   - Repair the (C17) Passenger Mirror Heater Driver circuit for a short to voltage. If the wiring

harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT AND (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT FOR AN OPEN**

Fig. 98: Checking Passenger Mirror Heater Driver Circuit For A Short To Passenger Mirror Heater Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 9.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the (C17) Passenger Mirror Heater Driver circuit or the (C170) Passenger Mirror Heater Return circuit for an open. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT, (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, OR TO (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT**

Fig. 99: Checking Passenger Mirror Heater Driver Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.
2. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.
3. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (C17) Passenger Mirror Heater Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Turn Signal Mirror

- Go To 6.

No, without Turn Signal Mirror

- Go To 7.

6. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT**

Fig. 100: Checking Passenger Mirror Heater Driver Circuit For A Short To Passenger Mirror Turn Signal Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (P502) Passenger Mirror Turn Signal Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (C17) Passenger Mirror Heater Driver circuit for a short to the (P502) Passenger Mirror Turn Signal Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Puddle Lamp Mirror

- Go To 7.

No, without Puddle Lamp Mirror

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT**

Fig. 101: Checking Passenger Mirror Heater Driver Circuit For A Short To Passenger Puddle Lamp Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
2. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (M42) Passenger Puddle Lamp Driver circuit at the Passenger Outside Rearview Mirror C2 and C1 (Component Side) connectors.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (C17) Passenger Mirror Heater Driver circuit for a short to the (M42) Passenger Puddle Lamp Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1E6A-11-PASSENGER MIRROR FOLD CONTROL CIRCUIT FOR A SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

When one of the Mirror Fold or Unfold driver circuits are shorted to ground for approximately 30 seconds.

POSSIBLE CAUSES

Possible Causes
PASSENGER MIRROR ASSEMBLY
PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

1. Turn the ignition on.
2. With the scan tool, erase the DTC's.
3. Cycle the ignition from on to off three times.
4. Turn the ignition on.
5. Operate the Mirror Fold switch in both directions three times.
6. Wait 30 seconds.
7. With the scan tool, read active DTC's.

   Does the scan tool display: B1E6A-11-PASSENGER MIRROR FOLD CONTROL CIRCUIT FOR A SHORT TO GROUND as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit. Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**

Fig. 102: Passenger Outside Rearview Mirror Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror connector at the Passenger Door Module C2 harness connector.
3. Inspect the wiring and connectors between the mirror and the Passenger Door Module.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3.

3. **MIRROR ASSEMBLY**
    1. Turn the ignition on
    2. With the scan tool, erase the DTC's.
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on.
    5. Operate the Mirror Fold switch in both directions three times.
    6. Wait 30 seconds.
    7. With the scan tool, read the active DTC's.

    Does the scan tool display: B1E6A-11-PASSENGER MIRROR FOLD CONTROL CIRCUIT FOR A SHORT TO GROUND as active?

    Yes

    - Replace the Drivers Door Module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the Passenger Folding Mirror assembly in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1E6A-15-PASSENGER MIRROR FOLD CONTROL CIRCUIT FOR A SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

When one of the Mirror Fold or Unfold Driver circuits are shorted to battery voltage or the circuit is open for approximately 30 seconds.

POSSIBLE CAUSES

Possible Causes
PASSENGER MIRROR ASSEMBLY
PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, erase the DTC's.
    3. Cycle the ignition from on to off 3 times.
    4. Turn the ignition on.
    5. Operate the Mirror Fold switch in both directions three times.
    6. Wait 30 seconds.
    7. With the scan tool, read the active DTC's.

    Does the scan tool display: B1E6A-15-PASSENGER MIRROR FOLD CONTROL CIRCUIT FOR A SHORT TO BATTERY OR OPEN as active?

    Yes

    - Go To 2.

    No

    - The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded or contaminated terminals. Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **INSPECT MIRROR CONNECTIONS**

Fig. 103: Passenger Outside Rearview Mirror Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror connector at the Passenger Door Module C2 harness connector.
3. Inspect the wiring and connectors between the mirror and the Passenger Door Module.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3.

3. **MIRROR ASSEMBLY**
    1. Turn the ignition off.
    2. Replace the Passenger Power Folding Mirror Assembly.
    3. Turn the ignition on
    4. With the scan tool, erase the DTC's.
    5. Cycle the ignition from on to off three times.
    6. Turn the ignition on.
    7. Operate the Mirror Fold switch in both directions three times.
    8. Wait 30 seconds.
    9. With the scan tool, read the active DTC's.

    Does the scan tool display: B1E6A-15-PASSENGER MIRROR FOLD CONTROL CIRCUIT FOR A SHORT TO BATTERY OR OPEN as active?

    Yes

    - Replace the Passenger Door Module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test Complete.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

At all times.

SET CONDITION:

Anytime the module senses voltage input below 8.0 Volts for more than four seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW VOLTAGE ENGINE DTC
(A214) FUSED B(+) CIRCUIT HAS HIGH RESISTANCE
(Z909) GROUND CIRCUIT HAS HIGH RESISTANCE
PASSENGER DOOR MODULE

DIAGNOSTIC TEST

1. **CHECK ENGINE DTC's**
    1. Using the scan tool, read the active ENGINE DTC's.

       Are there any ENGINE Charging or Battery DTC's present?

       No

       - Go To 2.

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic test procedure.
2. **TEST FOR INTERMITTENT CONDITION**
    1. Using the scan tool, record and erase the DTC's.
    2. Start the engine and run for two minutes.
    3. Using the scan tool, read the active DTC's in the Door Module.

       Does the scan tool display B210C-16-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD?

Yes

- Go To 3.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(A214) FUSED B(+) OR (Z909) GROUND CIRCUITS RESISTED**

Fig. 105: Checking Fused B(+) Or Ground Circuits For Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the Passenger Door Module C3 connector.
3. Turn the ignition on.
4. Test the (A214) Fused B(+) circuits by connecting a 12-volt test light between the Fused B(+) circuit and the (Z909) Ground circuits in the door module C3 connector. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly?

   Yes

   - Replace the Passenger Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test the (A214) Fused B(+) and the (Z909) Ground circuits to determine which one has the high resistance. Repair the necessary circuit for high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN CONTROL MODULE DTC's**
    1. Using the scan tool, read the active PCM DTC's.

       Are there any PCM Charging or Battery DTC's present?

       No

       - Go To 2.

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic test procedure.
2. **TEST FOR INTERMITTENT CONDITION**
    1. Using the scan tool, record and erase the DTC's.
    2. Start the engine and run for two minutes.
    3. Using the scan tool, read the active DTC's in the Door Module.

       Does the scan tool display B210C-16-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD?

Yes

- Go To 3.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(A214) FUSED B(+) OR (Z909) GROUND CIRCUITS RESISTED**

Fig. 107: Checking Fused B(+) Or Ground Circuits For Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the Passenger Door Module C3 connector.
3. Turn the ignition on.
4. Test the (A214) Fused B(+) circuits by connecting a 12-volt test light between the Fused B(+) circuit and the (Z909) Ground circuits in the door module C3 connector. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly?

   Yes

   - Replace the Passenger Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test the (A214) Fused B(+) and the (Z909) Ground circuits to determine which one has the high resistance. Repair the necessary circuit for high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

WHEN MONITORED:

At all times.

SET CONDITION:

Anytime the module senses voltage input above 16.0 volts for more than four seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
HIGH VOLTAGE ENGINE DTC PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **CHECK ENGINE DTC's**
    1. With the scan tool, read the active Powertrain Control Module DTC's.

       Are there any active Charging or Battery DTC's present?

       No

       - Go To 2.

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic test procedure.
2. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTC's.
    2. Start the engine and run for two minutes.
    3. With the scan tool, read the active door module DTC's.

       Does the scan tool display B210C-17-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE ABOVE THRESHOLD?

       Yes

- Replace the Passenger Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

WHEN MONITORED:

At all times.

SET CONDITION:

Anytime the module senses voltage input above 16.0 volts for more than four seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
HIGH VOLTAGE ENGINE DTC PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN CONTROL MODULE DTC's**
    1. With the scan tool, read the active PCM DTC's.

       Are there any active PCM Charging or Battery DTC's present?

       No

       - Go To 2.

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic test procedure.
2. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTC's.
    2. Start the engine and run for two minutes.
    3. With the scan tool, read the active door module DTC's.

       Does the scan tool display; B210C-17-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE ABOVE THRESHOLD?

       Yes

- Replace the Passenger Door Module (PDM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21A1-00-ECU RESET/RECOVERY OCCURRED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

At all times.

SET CONDITION:

Whenever the module detects a power on reset or a reflash, this code will set. This code is for information only. No repair is necessary.

POSSIBLE CAUSES

POSSIBLE CAUSES
MODULE WAS RE-FLASHED MODULE WAS RESET

DIAGNOSTIC TEST

This DTC is for information only. At some time the module was re-flashed or was reset during a power on operation. No repair is necessary.

B21DD-84-SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

At all times.

SET CONDITION:

This is a CAN message that the battery voltage was below 10.0 volts for over four seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW SYSTEM VOLTAGE BATTERY OR CHARGING SYSTEM

DIAGNOSTIC TEST

1. **CHECK ENGINE DTC's**
    1. With the scan tool, read Powertrain Control Module DTC's

       Are there any Charging or Battery DTC's present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic test procedure.

       No

       - This code is for information only. At some time there was a low battery system voltage. Check the battery and charging system in accordance with the Service Information.

B21DD-85-SYSTEM VOLTAGE - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

At all times.

SET CONDITION:

This is a CAN message that the system voltage was above 16.0 volts for over four seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
HIGH BATTERY SYSTEM VOLTAGE CHARGING SYSTEM

DIAGNOSTIC TEST

1. **CHECK ENGINE DTC's**
    1. With the scan tool, read Powertrain Control Module DTC's

Are there any Charging or Battery DTC's present?

Yes

- Refer to **CHARGING SYSTEM - DIAGNOSIS AND TESTING** and perform the active charging system or battery DTC diagnostic procedure.

No

- This code is a CAN system message for information only. Check the charging system in accordance with the Service Information.

B2599-54-DOOR MODULE FRONT RIGHT - MISSING CALIBRATION - QUAD/CREW CAB ONLY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This code can set anytime the battery or the door module connector is disconnected.

WHEN MONITORED:

Whenever the window motor is operating.

SET CONDITION:

When the Door Module has lost the parameters for window travel.

POSSIBLE CAUSES

Possible Causes
MODULE NOT CALIBRATED
EXPRESS WINDOW SWITCH
PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: If there are any other Power Window DTC's, repair them before continuing.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTC's.
   3. Operate the Passenger Window switch up and down several times.
   4. Wait 30 seconds.
   5. With the scan tool, read the active DTC's.

Does the scan tool display B2599-54-DOOR MODULE FRONT RIGHT - MISSING CALIBRATION?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **WINDOW MODULE NOT CALIBRATED**
    1. Operate the window to the full up position and continue to hold the switch for an additional two seconds.
    2. Operate the window to the full down position and continue to hold the switch for an additional two seconds.
    3. Again operate the window to the full up position and continue to hold the switch for an additional two seconds.
    4. Lower the window all the way down then press and release the switch to the express up position.

    Did the window move to the full up position?

    Yes

    - Test complete.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 3.
3. **EXPRESS WINDOW SWITCH**
    1. Turn the ignition off.
    2. Move the Passenger Express Window Switch from the idle position to the up position and then to the express up position.

    Is there two definite detent positions felt?

    Yes

    - Replace the Passenger Door Module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Express Window Switch in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2599-96-DOOR MODULE FRONT RIGHT - COMPONENT INTERNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

At all times.

SET CONDITION:

When the door module senses an internal fault, this code will set.

POSSIBLE CAUSES

Possible Causes
PASSENGER DOOR MODULE (PDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the DTC's.
    3. Operate the Passenger Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTC's.

    Does the scan tool display B2599-96-DOOR MODULE FRONT RIGHT - COMPONENT INTERNAL FAILURE ?

    Yes

    - Replace the Door Module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - The conditions that caused this code to set are not present at this time. If this code ever repeats, replace the door module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B282F-11-PASSENGER PUDDLE LAMP CONTROL - CIRCUIT FOR A SHORT TO GROUND

Fig. 110: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses a short low on the (M42) Passenger Puddle Lamp Driver circuit for more than two seconds with the lamp switched on.

POSSIBLE CAUSES

Possible Causes
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on.

    NOTE: Verify the panel lamps dimmer switch is not in the defeat (off) position.

    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for

DTC's.

NOTE: **After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.**

Is the DTC active?

Yes

- Go To 2.

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 111: Checking Passenger Puddle Lamp Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) connector from the Door Module C1 connector.
3. Measure the resistance of the (M42) Passenger Puddle Lamp Driver circuit between ground and the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (M42) Passenger Puddle Lamp Driver circuit for a short to ground. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in

accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3.

3. **CHECK (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO (P66) PASSENGER MIRROR SENSOR GROUND CIRCUIT**

Fig. 112: Checking Passenger Puddle Lamp Driver Circuit For A Short To Passenger Mirror Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P66) Passenger Mirror Sensor Ground circuit at the Passenger Outside Rearview Mirror C1 (Component

Side) connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (M42) Passenger Puddle Lamp Driver circuit for a short to the (P66) Passenger Mirror Sensor Ground circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **CHECK (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT**

Fig. 113: Checking Passenger Puddle Lamp Driver Circuit For A Short To Passenger Puddle Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Ohmmeter positive lead must be connected to the (P592) Passenger Puddle Lamp Return circuit and the negative lead to the (M42) Passenger Puddle Lamp Driver circuit for the test results to be valid.**

1. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P592) Passenger Puddle Lamp Return circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is there any resistance present?

   Yes

- Repair the (M42) Passenger Puddle Lamp Driver circuit for a short to the (P592) Passenger Puddle Lamp Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

5. **CHECK (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT, OR TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 114: Checking Passenger Puddle Lamp Driver Circuit For A Short To Other Circuits

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 connector.
2. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
3. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
4. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (M42) Passenger Puddle Lamp Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No, with Heated/Turn Signal Mirror

   - Go To 6.

   No, without Heated/Turn Signal Mirror

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT OR TO (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 115: Checking Passenger Puddle Lamp Driver Circuit For A Short To Passenger Mirror Heater Return Circuit Or To Passenger Mirror Turn Signal Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.
2. For Turn Signal Mirror, measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P595) Passenger Mirror Turn Signal Return circuit at the Passenger Outside

Rearview Mirror C1 and C2 (Component Side) connectors.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (M42) Passenger Puddle Lamp Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B282F-15-PASSENGER PUDDLE LAMP CONTROL - CIRCUIT FOR A SHORT TO BATTERY OR OPEN

Fig. 116: Passenger Mirror Signal Lamp Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Door Module senses a short high or an open on the (M42) Passenger Puddle Lamp Driver circuit for more than two seconds with the lamp switched on.

POSSIBLE CAUSES

Possible Causes
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR AN OPEN
(P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT FOR AN OPEN
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT
(M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT
PASSENGER OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With a scan tool, record and erase DTC's.
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the puddle lamps on.

    NOTE: Verify the panel lamps dimmer switch is not in the defeat (off) position.

    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTC's.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow

time for an active fault to set if present.

Does the scan tool display B282F-15-PASSENGER PUDDLE LAMP CONTROL - CIRCUIT FOR A SHORT TO BATTERY OR OPEN?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 117: Checking Passenger Puddle Lamp Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect Passenger Outside Rearview Mirror C1 (Component Side) harness connector from the Door Module.
3. Turn the ignition on.
4. Measure the voltage between the (M42) Passenger Puddle Lamp Driver circuit and ground.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (M42) Passenger Puddle Lamp Driver circuit. If the wiring harness and harness connector are okay, replace the Passenger Outside Rearview Mirror in

accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3.

3. **CHECK (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT AND (P592) PASSENGER PUDDLE LAMP RETURN CIRCUIT FOR AN OPEN**

Fig. 118: Checking Passenger Puddle Lamp Driver Circuit And Passenger Puddle Lamp Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

NOTE: **The Ohmmeter positive lead must be connected to the (M42) Passenger Puddle Lamp Driver circuit and the negative lead to the (P592) Passenger Puddle Lamp Return circuit for the test results to be valid.**

2. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P592) Passenger Puddle Lamp Return circuit.

   Is the resistance above 1000 Ohms?

   Yes

   - Repair the open in the (M42) Passenger Puddle Lamp Driver circuit or the (P592) Passenger Puddle Lamp Return circuit. If the wiring harness and harness connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4.

4. **CHECK (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT, (P70) PASSENGER MIRROR COMMON DRIVER CIRCUIT, OR TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 119: Checking Passenger Puddle Lamp Driver Circuit For A Short To Other Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Outside Rearview Mirror C2 (Component Side) harness connector from the Door Module.
2. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P72) Passenger Mirror Vertical Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.
3. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P70) Passenger Mirror Common Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.
4. Measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P74) Passenger Mirror Horizontal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

Is the resistance below 10K Ohms for any measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (M42) Passenger Puddle Lamp Driver circuit. If the wiring harness and harness connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No, with Heated/Turn Signal Mirror

- Go To 5.

No, without Heated/Turn Signal Mirror

- Inspect the wiring and harness connectors for damage and repair as necessary. If the wiring and harness connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (M42) PASSENGER PUDDLE LAMP DRIVER CIRCUIT FOR A SHORT TO (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT OR TO (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT**

Fig. 120: Checking Passenger Puddle Lamp Driver Circuit For A Short To Passenger Mirror Heater Driver Circuit Or To Passenger Mirror Turn Signal Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. For Heated Mirror, measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (C17) Passenger Mirror Heater Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.
2. For Turn Signal Mirror, measure the resistance between the (M42) Passenger Puddle Lamp Driver circuit and the (P502) Passenger Mirror Turn Signal Driver circuit at the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10K Ohms for a short to the (M42) Passenger Puddle Lamp Driver circuit. If the wiring harness and harness connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Inspect the wiring and harness connectors for damage and repair as necessary. If the wiring and harness connectors are okay, replace the Door Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0010-00-CAN INTERIOR BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects a short to ground on the CAN Interior Bus (125K) (+) circuit or a short to voltage on the CAN Interior Bus (125K) (-) circuit.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT FOR A SHORT TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT FOR A SHORT TO GROUND
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT FOR A SHORT TO THE (D265) CAN INTERIOR BUS(+) (125k) CIRCUIT
TOTALLY INTEGRATED POWER MODULE (TIPM)
ANY CAN INTERIOR BUS MODULE

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: **Make sure the IOD fuse is installed and the battery is fully charged before proceeding.**

1. Turn the ignition on.
2. With the scan tool, read active Door Module DTC's.

   Is this DTC active?

   Yes

   - **Refer to DIAGNOSIS AND TESTING** and perform the U0010-CAN Interior Bus diagnostic procedure.

   No

   - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC's diagnostic procedure.

U0141-00-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D65) CAN C BUS(+) CIRCUIT FOR A SHORT TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT FOR A SHORT TO GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM) POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is the DTC active at this time?

      Yes

      - Perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure. **Refer to DIAGNOSIS AND TESTING** .

      No

      - Perform the Stored Lost Communication DTC's diagnostic procedure. **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** .

U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Instrument Cluster (CCN) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT FOR A SHORT TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT FOR A SHORT TO GROUND
INSTRUMENT CLUSTER POWER AND GROUND

TIPM NOT CONFIGURED CORRECTLY
INSTRUMENT CLUSTER (CCN)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to DIAGNOSIS AND TESTING** and perform the U0155-Lost Communication with Cluster/CCN diagnostic procedure.

      No

      - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC's diagnostic procedure.

U0164-00-LOST COMMUNICATION WITH HVAC CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

SET CONDITION:

Bus messages not received from the HVAC Control Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT FOR A SHORT TO VOLTAGE

(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT FOR A SHORT TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
HVAC POWER AND GROUND
HVAC CONTROL MODULE
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to DIAGNOSIS AND TESTING** and perform the U0164-Lost Communication with HVAC Control Module.

      No

      - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC's diagnostic procedure.

U0203-00-LOST COMMUNICATION WITH DOOR MODULE FRONT LEFT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

SET CONDITION:

Bus messages not received from the Left Front Door Module (DMFL) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT FOR A SHORT TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT FOR A SHORT TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
DOOR MODULE POWER AND GROUND
LEFT FRONT DOOR MODULE
CONTROL MODULE MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to DIAGNOSIS AND TESTING** and perform the U0203-Lost Communication with Door Module Front Left diagnostic procedure.

      No

      - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC's diagnostic procedure.

U0204-00-LOST COMMUNICATION WITH DOOR MODULE FRONT RIGHT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

SET CONDITION:

Bus messages not received from the Right Front Door Module (DMFR) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT FOR A SHORT TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT FOR A SHORT TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
DOOR MODULE POWER AND GROUND
RIGHT FRONT DOOR MODULE
CONTROL MODULE MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to <u>DIAGNOSIS AND TESTING</u>** and perform the U0204-Lost Communication with Door Module Front Right diagnostic procedure.

      No

      - **Refer to <u>COMMUNICATION - DIAGNOSIS AND TESTING</u>** and perform the Stored Lost Communication DTC's diagnostic procedure.

U0209-00-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Memory Seat Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT FOR A SHORT TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT FOR A SHORT TO GROUND
MEMORY SEAT MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
MEMORY SEAT MODULE
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to DIAGNOSIS AND TESTING** and perform the U0209-Lost Communication with Memory Seat Control Module diagnostic procedure.

      No

      - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC's diagnostic procedure.

DIAGNOSIS AND TESTING

DRIVER DOOR LOCK INOPERATIVE - DS/DJ/D2

Fig. 1: Driver Door Latch Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

POSSIBLE CAUSES

Possible Causes
(P930) DRIVER DOOR LOCK DRIVER CIRCUIT OPEN
(P930) DRIVER DOOR LOCK DRIVER CIRCUIT SHORTED TO GROUND
(P910) DRIVER DOOR UNLOCK DRIVER CIRCUIT OPEN
(P910) DRIVER DOOR UNLOCK DRIVER CIRCUIT SHORTED TO GROUND
DRIVER DOOR LATCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **DRIVER DOOR LATCH INOPERATIVE**

Fig. 2: Checking Driver Door Latch Operation
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Driver Door Latch connector.
2. Connect a test light between the (P930) Driver Door Lock Driver circuit and the (P910) Driver Door Unlock Driver circuit.
3. Close the front doors or trip the door latches to the closed position.
4. Operate the door locks in both positions and observe the test light.

   Does the test light illuminate brightly for approximately 300 ms. when the door locks are actuated?

   Yes

   - Replace the Driver Door Latch.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 2.

2. **(P910) DRIVER DOOR UNLOCK DRIVER CIRCUIT OPEN**

Fig. 3: Checking Driver Door Unlock Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Driver Unlock circuit is shown in the TIPM graphic above.**

1. Turn the ignition off.
2. Disconnect the TIPM C6 harness connector.
3. Measure the resistance of the (P910) Driver Door Unlock Driver circuit between the Latch connector and the TIPM C6 connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 3.

   No

   - Repair the (P910) Driver Door Unlock Driver circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(P910) DRIVER DOOR UNLOCK DRIVER CIRCUIT SHORTED TO GROUND**

Fig. 4: Checking Driver Door Unlock Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between Ground and the (P910) Driver Door Unlock Driver circuit.

   Is the resistance below 1, 000 Ohms?

   Yes

   - Repair the (P910) Driver Door Unlock Driver circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4.

4. **(P930) DRIVER DOOR LOCK DRIVER CIRCUIT OPEN**

NOTE: The Driver Lock circuit is shown in the TIPM graphic above.

1. Measure the resistance of the (P930) Driver Door Lock Driver circuit between the TIPM C6 connector and the Driver Door Latch connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the (P930) Driver Door Lock Driver circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(P930) DRIVER DOOR LOCK DRIVER CIRCUIT SHORTED TO GROUND**

Fig. 6: Checking Driver Door Lock Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between Ground and the (P930) Driver Door Lock Driver circuit.

   Is the resistance below 1, 000 Ohms?

   Yes

   - Repair the (P930) Driver Door Lock Driver circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

DRIVER DOOR LOCK INOPERATIVE - DD/DP

LATCH-
DOOR-
DRIVER

MODULE-

(P3) DRIVER DOOR LOCK DRIVER CIRCUIT SHORTED TO GROUND
(P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT OPEN
(P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT SHORTED TO GROUND
DRIVER DOOR LATCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **DRIVER DOOR LATCH INOPERATIVE**

Fig. 8: Checking Driver Door Latch Operation
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Driver Door Latch connector.
2. Connect a test light between the (P3) Driver Door Lock Driver circuit and the (P1) Driver Door Unlock Driver circuit.
3. Close the front doors or trip the door latches to the closed position.
4. Operate the door locks in both positions and observe the test light.

   Does the test light illuminate brightly for approximately 300 ms. when the door locks are actuated?

   Yes

   - Replace the Driver Door Latch.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 2.

2. **CHECK (P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT OPEN**

Fig. 9: Checking Driver Door Unlock Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C5 harness connector.
3. Measure the resistance of the (P1) Driver Door Unlock Driver circuit between the Latch connector and the TIPM C5 connector.

Is the resistance below 2.0 Ohms?

Yes

- Go To 3.

No

- Repair the (P1) Driver Door Unlock Driver circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT SHORT TO GROUND**

Fig. 10: Checking Driver Door Unlock Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between Ground and the (P910) Driver Door Unlock Driver circuit.

   Is the resistance below 1, 000 Ohms?

   Yes

   - Repair the (P1) Driver Door Unlock Driver circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4.

4. **CHECK (P3) DRIVER DOOR LOCK DRIVER CIRCUIT OPEN**

Fig. 11: Checking Driver Door Lock Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (P3) Driver Door Lock Driver circuit between the TIPM C5 connector and the Driver Door Latch connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 5.

No

- Repair the (P3) Driver Door Lock Driver circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (P3) DRIVER DOOR LOCK DRIVER CIRCUIT SHORT TO GROUND**

Fig. 12: Checking Driver Door Lock Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between Ground and the (P3) Driver Door Lock Driver circuit.

   Is the resistance below 1, 000 Ohms?

   Yes

- Repair the (P3) Driver Door Lock Driver circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Totally Integrated Power Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

ONE PASSENGER DOOR LOCK INOPERATIVE - DS/DJ/D2

1. Measure the resistance of the appropriate Door Lock Driver circuit between the TIPM C5 connector and the appropriate Door Latch connector.

   Is the resistance below 2.0 Ohms?

Yes

- Go To 5.

No

- Using the wiring diagram/schematic as a guide, measure the circuit from the in-line door harness connector to the latch connector to determine if the wire is open in the door harness or the instrument panel harness. Repair the appropriate Door Lock Driver circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **PASSENGER DOOR LOCK DRIVER CIRCUIT SHORTED TO GROUND**

Fig. 24: Checking Passenger Door Lock Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between Ground and the appropriate Door Lock Driver circuit.

Is the resistance below 1, 000 Ohms?

Yes

- Using the wiring diagram/schematic as a guide, measure the circuit from the in-line door harness connector to ground to determine if the wire is shorted in the door harness or the instrument panel harness. Repair the appropriate Door Lock Driver circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Totally Integrated Power Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

DESCRIPTION

DESCRIPTION

POWER LOCKS

The power lock system allows all of the doors to be locked or unlocked electrically by operating a switch on either front door trim panel. When an actuation input signal from the door lock switch, WIN or FOBIK signal is received, the door modules turns on the output drivers a provides a voltage level to the door lock motor for a specified time to lock/unlock the door. Their are two door modules, the Driver Door Module (DDM) and Passenger Door Module (PDM). The door modules have an unswitched battery feed from the TIPM, so the locks can be actuated in any ignition switch position.

The door modules locks the doors automatically when the vehicle is driven beyond the speed of 25.7 km/h (15 mph), all doors are closed and the accelerator pedal is depressed. The rolling door lock feature can be disabled if desired.

This vehicle also offers several customer programmable features, which allows the selection of several optional electronic features to suit individual preferences.

The power lock system for this vehicle can also be operated remotely using the FOBIK.

Certain functions and features of the power lock system rely upon resources shared with other electronic modules in the vehicle over the CAN data bus network. For proper diagnosis of these electronic modules or of the CAN data bus network, the use of a scan tool and the appropriate diagnostic information are required.

AUTOMATIC DOOR LOCKS

When enabled, this feature will lock all of the door locks if all of the doors are closed and the vehicle speed goes above 25.7 km/h (15 mph). If a door unlock has occurred, then the door modules will perform another auto lock, if the doors did not electrically unlock, another auto lock will not occur.

DOOR LOCK INHIBIT

When the FOBIK is in the ignition (in any switch position) and either front door is opened, the door lock switches LOCK functions are disabled. The UN-LOCK functions are still functional. This protects against locking the vehicle with the FOBIK still in the ignition. The FOBIK will still lock the doors. After the FOBIK is removed from the ignition or the doors are closed, the power door locks will operate normally.

REMOTE KEYLESS ENTRY

A Radio Frequency (RF) type Remote Keyless Entry (RKE) system is an available factory-installed option on this model. The RKE system allows the use of a remote battery-powered radio transmitter to signal the Wireless Ignition Node (WIN) to actuate the power lock system. The WIN operates on non-switched battery current

through a fuse in the Totally Integrated Power Module (TIPM), so that the system remains operational, regardless of the ignition switch position.

The FOBIK transmitters are also equipped with a Panic button. If the Panic button on the FOBIK transmitter is depressed, the horn will sound and the exterior lights will flash on the vehicle for about three minutes, or until the Panic button is depressed a second time. A vehicle speed of about 25.7 km/h (15 mph) will also cancel the panic event.

The RKE system can also perform other functions on this vehicle. If the vehicle is equipped with the optional Vehicle Theft Security System (VTSS), the FOBIK transmitter will arm the VTSS when the Lock button is depressed, and disarm the VTSS when the Unlock button is depressed.

The RKE system includes two transmitters when the vehicle is shipped from the factory, but the system can retain the vehicle access codes of up to a total of eight transmitters. The transmitter codes are retained in the WIN memory, even if the battery is disconnected. If an FOBIK transmitter is faulty or lost, new transmitter vehicle access codes can be programmed into the system using a scan tool. Refer to **STANDARD PROCEDURE** .

This vehicle also offers several customer programmable features, which allows the selection of several optional electronic features to suit individual preferences. Customer programmable feature options affecting the RKE system include:

- **Automatic Door Lock** - Customer programmable feature that allows the TIPM to perform an automatic door lock if the vehicle speed is above 25.7 km/h (15 miles-per-hour).
- **Automatic Door Unlock On Exit** - Customer programmable feature that allows the TIPM to perform an automatic door unlock if the vehicle speed is 0, vehicle in park and driver door is opened.
- **Flash Lights with Lock and Unlock** - Allows the option of having the park lamps flash as an optical verification that the RKE system received a valid Lock request or Unlock request from the FOBIK transmitter, or having no optical verification.
- **Programming Additional Transmitters** - Allows up to a total of eight transmitter vehicle access codes to be stored.
- **Remote Unlock Sequence** - Allows the option of having only the driver side front door unlock when the FOBIK transmitter Unlock button is depressed the first time. The remaining doors unlock when the button is depressed a second time within 5 seconds of the first unlock press. Another option is having all doors unlock upon the first depression of the FOBIK transmitter Unlock button.
- **Sound Horn on Lock** - Allows the option of having the horn sound a short chirp as an audible verification that the RKE system received a valid Lock request from the FOBIK transmitter, or having no audible verification.

Certain functions and features of the RKE system rely upon resources shared with other electronic modules in the vehicle over CAN data bus network. For diagnosis of these electronic modules or of the CAN data bus network, the use of a scan tool and the appropriate diagnostic information are required.

OPERATION

OPERATION

POWER LOCKS

The power lock system allows all of the doors to be locked or unlocked electrically by operating a switch on either front door trim panel. When an actuation input signal from the door lock switch, WIN or FOBIK signal is received, the door modules turns on the output drivers a provides a voltage level to the door lock motor for a specified time to lock/unlock the door. Their are two door modules, the Driver Door Module (DDM) and Passenger Door Module (PDM). The door modules have an unswitched battery feed from the TIPM, so the locks can be actuated in any ignition switch position.

REMOTE KEYLESS ENTRY

The FOBIK transmitter uses radio frequency signals to communicate with the WIN. The WIN is on the CAN bus. When the operator presses a button on the transmitter, it sends a specific request to the WIN. In turn, the WIN sends the appropriate request over the CAN bus to the following:

- **Totally Integrated Power Module (TIPM) -** to activate the park lamps, the headlamps and the horn for the horn chirp.
- **Door Control Modules -** to activate the door locks and windows.

After pressing the lock button on the FOBIK transmitter, all of the door locks will lock, the illuminated entry will turn off (if all doors are closed) and the vehicle theft security system (if equipped) will arm.

Pressing the unlock button one time will unlock the driver door, or all doors based on the customer programmable feature enabled, the illuminated entry will turn on the courtesy lamps and the vehicle theft security system (if equipped) will disarm. Pressing the unlock button a second time, the remaining door locks will unlock.

If the vehicle is equipped with the memory system, the memory message will identify which transmitter sent the signal.

ROLLING CODE

The rolling code feature changes part of the transmitter message each time that it is used. The transmitter message and the receiver message increment together. Under certain conditions with a rolling code system, such as pressing a button on the FOBIK transmitter over 255 times outside of receiver range or replacing the battery, the receiver and transmitter can fall out of synchronization. To re-synchronize, press and release the UNLOCK button on the FOBIK transmitter repeatedly (it may take up to eight cycles) while listening carefully for the power door locks in the vehicle to cycle, indicating that resynchronization has occurred.

The lock function works from the FOBIK transmitter even in an out of synchronization condition, therefore it could be verified by pressing the LOCK button on the FOBIK.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LOCKS

The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a

scan tool and the proper Diagnostic Procedures information.

Refer to the appropriate wiring information.

Following are tests that will help to diagnose the hard wired components and circuits of the power lock system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the power lock system, the CAN data bus network and all of the electronic modules that provide inputs to, or receive outputs from the power lock system components must be checked.

PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the power lock system, note the system operation while you actuate both the Lock and Unlock functions with the power lock switches and with the Remote Keyless Entry FOBIK transmitter. Then, proceed as follows:

- If the entire power lock system fails to function with either the power lock switches or the FOBIK, check the fused B(+) fuse in the Totally Integrated Power Module (TIPM).
- If the power lock system functions with both power lock switches, but not with the FOBIK, refer to **TRANSMITTER, INTEGRATED KEY FOB, DIAGNOSIS AND TESTING** or **DIAGNOSIS AND TESTING** .
- If the power lock system functions with the FOBIK, but not with one or both power lock switches, refer to **DIAGNOSIS AND TESTING** .
- If the driver side power lock switch operates only the driver side front door power lock motor, but all other power lock motors operate with the passenger side power lock switch or the FOBIK, use a scan tool and the appropriate diagnostic information to diagnose the CAN data bus.

MOTOR, DOOR LOCK

DESCRIPTION

DESCRIPTION

The lock mechanisms are actuated by a reversible electric motor mounted within each door. The power lock motors are integral to the door latch units. The power lock motors cannot be adjusted or repaired and, if faulty or damaged, the door latch unit must be replaced.

For replacement of the front door latch, refer to **LATCH, DOOR, REMOVAL** .

For replacement of the rear door latch, refer to **LATCH, DOOR, REMOVAL** .

OPERATION

OPERATION

The door lock motors are controlled by the Totally Integrated Power Module (TIPM). A positive and negative battery connection to the two motor terminals will cause the motor to move in one direction. Reversing the current will cause the motor to move in the opposite direction.

SWITCH, LOCK, WITH WINDOW SWITCHES

DESCRIPTION

DESCRIPTION

A window/lock switch is used on all models equipped with power locks, power windows, and power mirrors. The window/lock switch houses the following switches:

- **Power Lock Switch -** A two-way, momentary, resistor multiplexed switch to control the power lock system.
- **Power Mirror Selector Switch -** Two separate push button switches selects the right or left power mirror for adjustment, or turns the power mirror system Off.
- **Power Mirror Adjustment Switches -** Four momentary, arrowhead shaped, directional switches allow the driver to adjust the selected power mirror in the Up, Down, Right, or Left directions.
- **Power Window Lockout Switch -** A two-way, latching, push-button switch allows the vehicle operator to lock out the power window switches on each passenger door so that the passenger door power windows may be operated only from the master switches.
- **Power Window Switches -** A two-way, momentary power window switch for the driver side front door. This switch also has a second detent in the Down and up (when equipped) direction and internal circuitry to provide an Auto-Up/Down feature for the driver side front door power window. The four door gets auto-up/down, while the two door just gets the auto-down feature. In addition to the power window switch for its own door, there are individual master switches for each passenger door power window.

The window/lock switch also incorporates several green Light-Emitting Diodes (LEDs) that illuminate the power lock and power window switch paddles, and the power mirror switch directional buttons to improve switch visibility.

OPERATION

OPERATION

The window/lock switch combines a power lock switch, a driver power window switch with an Auto-down/up feature, master switches for each passenger door power window, a power window lockout switch, a power mirror selector switch, and four power mirror adjustment switches in a single unit.

POWER LOCK SWITCH

The power lock switch circuitry is connected in series between ground and the driver door switch mux input of the instrument cluster. Each power lock switch position (Lock, Unlock, and Neutral) provides a different resistance value to the instrument cluster input, which allows the instrument cluster to sense the switch position. Based upon the power lock switch input, the instrument cluster controls the battery and ground feed outputs to the individual power lock motors to lock or unlock the door latches. The Light-Emitting Diode (LED) in the power lock switch is connected to battery current through the power window circuit breaker in the Totally Integrated Power Module (TIPM) on a fused ignition switch output (run-acc) circuit. The switch will be illuminated whenever the ignition switch is in the On or Accessory positions.

POWER WINDOW SWITCHES

The power window switch circuitry is connected to battery current through a circuit breaker in the Totally Integrated Power Module (TIPM) on a fused ignition switch output (run-acc) circuit so that the power windows will operate whenever the ignition switch is in the On or Accessory positions. Each two-way, momentary master passenger power window switch provides battery current and ground to the individual power window switches on each passenger door so that the power window switch controls the battery current and ground feeds to its respective power window motor. The switch for the driver side front door power window is labeled "Auto" and includes an auto-up/down feature. The four door gets both auto-up/down, the two door gets auto-down only feature. When this switch is pressed/depressed to a second momentary detent position and released, the driver door power window is automatically operated through an internal circuit and relay to its fully lowered or closed positions. The Auto-up/down event is cancelled if the switch paddle is depressed a second time in either the Up or Down direction. When the two position window lockout switch is depressed and latched in the lockout position, the battery current feed to each of the individual passenger power window switches is interrupted so that the passenger door power windows can only be operated from the master switches. The window lockout switch also controls the battery current feed for the LED in each passenger power window switch so that the switch will not be illuminated when it is locked out.

POWER MIRROR SWITCHES

The power mirror switch circuitry is connected to battery current through a fuse in the TIPM on a fused B(+) circuit so that the power mirrors remain operational regardless of the ignition switch position. A monetary two push button selector switch one to select the right mirror, and one to select the left mirror. After the right or left mirror is selected, one of four directional buttons is depressed to move the selected mirror Up, Down, Right or Left. The power mirror switch circuitry controls the battery current and ground feeds to each of the four (two in each mirror head) power mirror motors. The Light-Emitting Diode (LED) in the power mirror switch is connected to battery current through the power window circuit breaker in the TIPM on a fused ignition switch output (run-acc) circuit so that the switch directional buttons will be illuminated whenever the ignition switch is in the On or Accessory positions.

REMOVAL

REMOVAL

Fig. 1: Location Of Window/Lock Switch (Driver Side)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick, gently pry the switch from the door trim panel.
3. Disconnect electrical connectors.
4. Remove switch from trim panel.

TRANSMITTER, INTEGRATED KEY FOB

DIAGNOSIS AND TESTING

FOBIK TRAPPED IN WIN

The Fob with Integrated Key (FOBIK) cannot be rotated to the LOCK position, allowing it to be removed from the ignition switch also referred to as the Wireless Ignition Node/WIN. The automatic transmission or transaxle is shifted mechanically through a cable from the gearshift lever mechanism to the transmission or transaxle valve body. A gated park switch is physically located on and integral to the gearshift lever mechanism and is hard wired directly to the WIN. The gated park switch is a simple plunger-like actuated open or closed contact switch that could be considered redundant to the Transmission Range Sensor (TRS) except that it monitors the position selected with the gearshift lever, while the TRS monitors the position or gear of the transmission or transaxle that is actually engaged. A damaged or improperly adjusted gearshift cable could result in a different gear being engaged than that which is selected. The WIN uses the gated park switch input to control an internal key lock solenoid, which controls whether the FOBIK can be rotated to the LOCK position. When the gearshift lever is not in the PARK position, the gated park switch is a closed circuit, the key lock solenoid is energized and the FOBIK cannot be rotated to the LOCK position for removal.

CONDITION	POSSIBLE CAUSES	CORRECTION
CANNOT TURN FOBIK TO LOCK POSITION	1. Damaged, binding or improperly adjusted gearshift cable.	1. Inspect and replace or adjust gearshift cable, if required.
	2. Damaged or binding gearshift lever mechanism.	2. Inspect and replace or adjust gearshift lever mechanism.
	3. No gated park switch input to WIN.	3. Use a diagnostic scan tool with software release version 8.05 or greater to read and confirm no gated park switch input to the WIN. Refer to the appropriate CONDITION that follows.
	4. Key lock solenoid (WIN) unresponsive to gated park switch input.	4. Use a diagnostic scan tool with software release version 8.05 or greater to read and confirm gated park switch input to the WIN. Refer to the appropriate CONDITION that follows.
NO GATED PARK SWITCH INPUT	1. Open TRS park signal circuit.	1. Repair the open TRS park signal circuit between the gated park switch (gearshift lever mechanism) and the WIN, if required
	2. Damaged or ineffective gated park switch.	2. Replace the damaged or ineffective gated park switch (gearshift lever mechanism), if required.
KEY LOCK SOLENOID	1. Damaged or	

UNRESPONSIVE TO GATED PARK SWITCH INPUT	ineffective key lock solenoid.	1. Replace the damaged or ineffective key lock solenoid (WIN), if required.

REMOTE KEYLESS ENTRY TRANSMITTER

Fig. 5: Radio Frequency Detector #9001
Courtesy of CHRYSLER GROUP, LLC

Using special tool (special tool #9001, Rf Detector), first test to ensure that the transmitter is functioning. Typical testing distance is 2.5 centimeters (1 inch) for Asian transmitters and 30.5 centimeters (12 inches) for all others. To test, position the transmitter as shown in illustration. Press any transmitter button, then test each button individually. The tool will beep if a radio signal strength that lights five or more LED's is detected. Repeat this test three times. If transmitter fails any of the tests, refer to **DIAGNOSIS AND TESTING**.

STANDARD PROCEDURE

FOBIK TRANSMITTER BATTERY REPLACEMENT

FOBIK WITH BATTERY COVER

1953754

Fig. 6: Fobik With Battery Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not disturb the metal terminal near the battery. Avoid touching the new battery. Skin oils may cause battery deterioration. If battery is touched, clean with rubbing alcohol.**

To replace the FOBIK transmitter battery:

1. Using a small flat bladed tool, carefully remove the battery cover on the back of the FOBIK.

1953797

Fig. 7: Fobik With Battery Cover Removed
Courtesy of CHRYSLER GROUP, LLC

2. Remove the battery by slightly lifting up and sliding out from the FOBIK.
3. Replace the battery with the same type of battery cell.
4. Install the battery with the positive terminal up.
5. Install battery cover and snap into place.
6. Test FOBIK operation.

FOBIK WITHOUT BATTERY COVER

Fig. 8: Fobik Without Battery Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not disturb the metal terminal near the battery. Avoid touching the new battery. Skin oils may cause battery deterioration. If battery is touched, clean with rubbing alcohol.**

This design is a clam shell design whereby both halves are split apart.

1. Remove the valet/spare key from the FOBIK if present.
2. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, carefully separate the top half from the bottom half.

Fig. 9: Fobik Without Battery Cover Separated
Courtesy of CHRYSLER GROUP, LLC

3. Lift up on the battery to remove.
4. Replace battery with the same type of cell.
5. Install new battery negative side up.
6. Snap the top and bottom halves together.
7. Test FOBIK operation.

FOBIK PROGRAMING

Make sure instructions are followed in order. Refer to **STANDARD PROCEDURE** .

SPECIFICATIONS

SPECIFICATIONS

BATTERY

The transmitter has two 3 volt batteries, which can be removed and replaced without special tools. Insert a dime in the side slot of the transmitter case and twist. The halves should separate and the batteries are stacked on top of each other. The batteries are available at local retail stores. Recommended batteries are Duracell DL 2016 or equivalent. Typical battery life is about two years.

CAUTION: Do not handle the batteries any more than necessary. Hands must be clean and dry.

RANGE

Normal Remote Keyless Entry (RKE) transmitter operation range for vehicles manufactured for domestic markets is up to 20 meters (66 feet) away from the vehicle. On vehicles manufactured for export markets, normal RKE transmitter range is up to 10 meters (33 feet) away from the vehicle. If a domestic market vehicle is equipped with the optional factory-installed Remote Start System, the normal transmitter range is increased to up to 91 meters (300 feet). Please note that the actual RKE transmitter range values may be better or worse than specified above, depending upon many possible variables in the environment at the specific time and location that any RKE transmission is attempted.

Power Mirrors - Service Information - Ram Pickup

DESCRIPTION

DESCRIPTION

AUTOMATIC DAY/NIGHT MIRROR

The automatic day/night mirror system is able to automatically change the reflectance of the inside rear view mirror in order to reduce the glare of headlamps approaching the vehicle from the rear. The automatic day/night rear view mirror receives battery current through a fuse in the Totally Integrated Power Module (TIPM) only when the ignition switch is in the On position.

OUTSIDE REAR VIEW MIRROR

The power operated outside rear view mirrors allow the driver to adjust both outside mirrors electrically from the driver side front seat position by operating a switch on the driver side front door trim panel. The power mirrors receive a non-switched battery feed through a fuse in the Totally Integrated Power Module (TIPM) so that the system will remain operational, regardless of the ignition switch position.

OPERATION

OPERATION

AUTOMATIC DAY/NIGHT MIRROR

A switch located on the bottom of the automatic day/night mirror housing allows the vehicle operator to select whether the automatic dimming feature is operational. When the automatic day/night mirror is turned on, the mirror switch is lighted by an integral Light-Emitting Diode (LED). The mirror will automatically disable its self-dimming feature whenever the vehicle is being driven in reverse.

OUTSIDE REAR VIEW MIRROR

The mirror switch has a push button selector switch for the driver and passenger side mirror operation, with a four directional arrow push button switch. When the mirror switch is press, it sends a signal to the driver door module (DMM), which controls the motors for the mirror.

The heated mirrors include an electric heating grid behind the mirror glass in each outside mirror, which can clear the mirror glass of ice, snow, or fog. For more information, Refer to **DESCRIPTION** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER MIRRORS

Any diagnosis of the Power Mirror system should begin with the use of scan tool. Refer to DIAGNOSIS

AND TESTING .

For complete circuit diagrams, refer to the appropriate wiring information.

MIRROR, AUTOMATIC DAY AND NIGHT

DESCRIPTION

DESCRIPTION

The automatic day/night mirror uses a thin layer of electrochromic material between two pieces of conductive glass to make up the face of the mirror. When the mirror switch is in the On position, two photocell sensors are used by the mirror circuitry to monitor external light levels and adjust the reflectance of the mirror.

OPERATION

OPERATION

The ambient photocell sensor is located on the forward-facing (windshield side) of the rear view mirror housing, and detects the ambient light levels outside of the vehicle. The headlamp photocell sensor is located inside the rear view mirror housing behind the mirror glass and faces rearward, to detect the level of the light being received at the rear window side of the mirror. When the circuitry of the automatic day/night mirror detects that the difference between the two light levels is too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror), it begins to darken the mirror.

The automatic day/night mirror circuitry also monitors the transmission using an input from the backup lamp circuit. The mirror circuitry is programmed to automatically disable its self-dimming feature whenever it senses that the transmission backup lamp circuit is energized.

The automatic day/night mirror is a completely self-contained unit and cannot be repaired. If faulty or damaged, the entire mirror assembly must be replaced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUTOMATIC DAY / NIGHT MIRROR

Fig. 1: Identifying Rearview Connector Terminals
Courtesy of CHRYSLER GROUP, LLC

For complete circuit diagrams, refer to the appropriate wiring information.

1. Check the fuse in the Totally Integrated Power Module (TIPM). If OK, refer to 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Turn the ignition switch to the On position. Check for battery voltage at the fuse in the TIPM. If OK, refer to 3. If not OK, repair the open circuit to the ignition switch as required.
3. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Unplug the wire harness connector from the automatic day/night mirror. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the automatic day/night mirror wire harness connector. If OK, refer to 4. If not OK, repair the open circuit to the TIPM as required.
4. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the automatic day/night mirror wire harness connector and a good ground. There should be continuity. If OK, refer to 5. If not OK, repair the circuit to ground as required.
5. Connect the battery negative cable. Turn the ignition switch to the On position. Set the parking brake. Place the transmission gear selector lever in the Reverse position. Check for battery voltage at the backup lamp switch output circuit cavity of the automatic day/night mirror wire harness connector. If OK, refer to 6. If not OK, repair the open circuit as required.
6. Turn the ignition switch to the Off position. Disconnect the battery negative cable. Plug in the automatic day/night mirror wire harness connector. Connect the battery negative cable. Turn the ignition switch to the On position. Place the transmission gear selector lever in the Neutral position. Place the mirror switch in the On (the LED in the mirror switch is lighted) position. Cover the forward facing ambient photocell sensor to keep out any ambient light.

NOTE: **The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.**

7. Shine a light into the rearward facing headlamp photocell sensor. The mirror glass should darken. If OK, refer to 8. If not OK, replace the faulty automatic day/night mirror unit.
8. With the mirror glass darkened, place the transmission gear selector lever in the Reverse position. The mirror should return to its normal reflectance. If not OK, replace the faulty automatic day/night mirror unit.

SWITCH, MIRROR

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER MIRROR SWITCH

The power mirror switch is included with the window/lock switch. Refer to **DIAGNOSIS AND TESTING**.

REMOVAL

REMOVAL

The power mirror switch is included with the window/lock switch. Refer to **SWITCH, LOCK, WITH WINDOW SWITCHES, REMOVAL** .

INSTALLATION

INSTALLATION

The power mirror switch is included with the window/lock switch. Refer to **SWITCH, LOCK, WITH WINDOW SWITCHES, INSTALLATION** .

DESCRIPTION

DESCRIPTION

POWER SEAT SYSTEM

The power seat system allows the driver and front seat passenger to electrically adjust their seating positions using the power seat switches located on the outboard seat cushion side shield of each front seat.

A driver side ten-way power seat includes a six-way adjustable seat cushion track, a two-way power seat back and two-way power lumbar. The driver power seat can be adjusted up, down, front up, front down, forward, rearward, recliner forward, and recliner rearward. A passenger side four-way power seat includes a two-way adjustable seat cushion track and a two-way power seat back. The passenger power front seat can be adjusted forward, rearward, recliner forward and recliner rearward. The power seat system is also available with the heated seat option and memory seat option that automatically positions the power seat for two different drivers and Memory Seat System. Refer to **DESCRIPTION** .

Fig. 1: Front Tilt Motor, Power Seat Adjuster Motor & Rear Tilt Motor
Courtesy of CHRYSLER GROUP, LLC

The driver power seat adjuster fore/aft contains a reversible motor (2) that are connected to worm-drive gearbox that move the seat adjuster through a combination of screw-type drive units. On vehicles equipped with non-memory power seats, each motor contains a self-resetting circuit breaker to protect it from overload. On vehicles equipped with memory power seats the motor overload protection is a function of the Memory Seat Module (MSM). Consecutive or frequent resetting of the circuit breakers may damaged the motors. There are

no motors on the passenger upper power seat adjuster.

The power seat system for this vehicle includes the following major components:

The **Front Tilt Motor** (1). Located on the left front of the seat bottom.

The **Rear Tilt Motor** (3). Located on the right front of the seat bottom.

The **Power Seat Adjuster Motor** (2) (driver and passenger seat). Located on the left rear of the seat bottom. The reversible motor is connected to a worm-drive gearbox that moves the seat adjuster through a screw-type drive unit. On vehicles equipped with non-memory power seats, the motor will contain a self-resetting circuit breaker to protect it from overload. On vehicles equipped with memory power seats, the motor overload protection is a function of the Memory Seat Module (MSM). Consecutive or frequent resetting of the circuit breakers may damaged the motors. The motor is part of the lower power seat track unit and must be replaced as an assembly.

Fig. 2: Power Lumbar Motor & Power Seat Recliner Motor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The power seat recliner motor cannot be repaired. If the unit is inoperative or damaged, the seat back frame must be replaced. Refer to RECLINER, REMOVAL.

Power Lumbar Motor (1). Located on the inboard side of the seat back with a black wire cable.

Power Seat Recliner Motor (2). Located on the inboard side of the seat back. The power seat recliner replaces the manual seat recliner. The power seat option includes an electrically operated power seat back recliner mechanism. The power seat recliner switch is integral to the power seat switch assembly, but is actuated with a separate switch knob.

Fig. 3: Power Seat Switch, Memory Seat Switch & Power Lumbar Switch
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left front power seat switch shown in illustration. Right front power seat switch doesn't include lumbar and memory.

Power Seat Switch (1). Located on the outboard side of the seat cushion. Vehicles may be equipped with driver only, or driver and passenger power seat switches. One seat switch is used for each front seat. The power seat switches are paddle-type levers. Movement of the seat cushions and backs mimics the action of the switch paddles. The driver power seat switch type (memory or non-memory) can be identified by the color of the switch electrical connector receptacle. Memory switches have a light gray connector receptacle and non-memory have a black receptacle. for additional information.

Power Lumbar Switch (3). When equipped, this switch is located at the bottom rear of the seat switch panel.

Memory Seat Switch (2) (driver seat only). When equipped, this switch is located at the upper rear of the seat switch panel. For more information, refer to **MEMORY SEAT SYSTEM**.

MEMORY SEAT SYSTEM

An electronic memory seat system is available on certain models. The memory system is able to store and recall all driver side power seat positions, and the drivers side view mirror positions. The system can be set for two different drivers. On vehicles with a factory installed radio connected to the Controller Area Network (CAN) data bus network, the memory system is also able to store and recall up to twenty radio station presets (ten AM and ten FM), also for two drivers. The memory system also will store and recall the last station listened to for each driver, even if it is not one of the twenty preset stations.

The memory system will automatically recall all of these settings when a button of the memory switch is depressed, or when the doors are unlocked using the FOBIK transmitter (if enabled). If the vehicle has more

than two drivers the FOBIK transmitter recall of memory features can be disabled. This is a customer programmable feature of the EVIC.

The memory system also has a easy exit feature that will move the driver seat rearward 55 millimeters or to the end of its travel, whichever occurs first, when the key is removed from the ignition switch lock cylinder. This is a customer programmable feature of the overhead console.

The memory system includes the following components:

- **Memory Selector Switch** - located in the driver seat trim panel.
- **Driver Door Module (DMM)** - located in the driver door, behind the trim panel.
- **Passenger Door Module (PDM)** - located in the passenger door, behind the trim panel.
- **Hall Effect Sensors - Drivers Mirror** - The hall effect sensor is permanently installed on the drivers side view mirror motor. This hall effect sensor is used to provide a reference signal to the memory heated seat mirror module, letting the module know the exact position of the mirror.
- **Wireless Integration Node (WIN)** - located at ignition key cylinder.
- **FOBIK Transmitter** - located with ignition key.
- **Memory Seat Module (MSM)** - located underneath the driver seat, also controls the Adjustable Pedals and Mirrors.
- **Hall Effect Sensors - Seat Track** - These hall effect sensors are permanently installed in each of the power seat track motors. They are used to provide a reference signal to the memory heated seat mirror module, letting the module know the exact position of the seat cushion and recliner.
- **Radio** - located in the instrument panel center stack.
- **Automatic Temperature Control (ATC)** - located in the instrument panel center stack.

Certain functions and features of the memory system rely upon resources shared with other electronic modules in the vehicle over the Controller Area Network (CAN) bus. The CAN bus allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware, and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities. For diagnosis of these electronic modules or of the CAN bus, the use of a scan tool and the proper diagnostic information are needed.

OPERATION

OPERATION

POWER SEAT SYSTEM

The power seat system receives battery current through a 50 amp fuse in the Totally Integrated Power Module (TIPM) so that the power seats remain operational, regardless of the ignition switch position.

When a power seat switch is actuated, a battery feed and a ground path are applied through the power seat switch contacts to the appropriate motor or motors. The motor and drive unit operate to move the seat in the selected direction until the switch is released, or until the travel limit of the power seat track is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor is reversed through

the switch contacts. This causes the motor to run in the opposite direction.

MEMORY SEAT SYSTEM

The Memory Seat Module (MSM) receives battery current through a 50 amp fuse in the Totally Integrated Power Module (TIPM) so that the power seats remain operational, regardless of the ignition switch position. When the driver memory seat switch control knob is actuated, a resistance signal is sent to the MSM via the Controller Area Network (CAN) bus circuit. The MSM is responsible for the 12v battery feed and ground path to the power seat adjuster motor. The adjuster motor operates to move the power seat adjuster mechanism through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached.

The MSM receives memory set/position switch input through the CAN bus circuit. The MSM also receives hard wired input from the hall effect sensors, mounted on each of the driver power seat adjuster motors and the driver side view mirror motor. The programmed software in the module allows it to know where the seat/mirror is located in its designed travel by a pulse count generated from the hall effect sensors. This way, when the memory switch is depressed the module will power the seat adjuster/mirror motors until the correct preset location is achieved. The module will prevent the seat memory recall function from being initiated, if the transmission gear selector lever is not in the Park position, or if the vehicle is moving. These inputs are monitored over the Controller Area Network (CAN) bus circuit by the MSM.

A memory setting is saved by pressing the "set" button, then pressing either the memory "1" or "2" button within 5 seconds of pressing the "set" button.

A memory setting is recalled by pressing either the memory "1" or "2" button, or by pressing the unlock button on a "linked" FOBIK.

For driver safety, memorized settings can not be recalled if the transmission is in a position other than Park or the seat belt is latched.

DIAGNOSIS AND TESTING

MEMORY SEAT SYSTEM

In order to obtain conclusive testing of the power seats with and without the memory system option, the Controller Area Network (CAN) bus, and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked. Use a scan tool and the proper diagnostic information to accurately diagnose the power seat/memory seat systems.

NOTE: Vehicles equipped with the memory/heated seat option utilize a low voltage cut-off feature. This feature turns off the 12v power to the power seat system anytime vehicle voltage is below 11.0v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the power seat system is attempted, the battery should be fully-charged.

POWER SEAT ADJUSTER

Operate the power seat switch and move the seat in all directions. The seat should move in each of the selected directions.

If the power seat adjuster fails to operate in more than one direction, proceed as follows:

1. Inspect the power seat adjuster motors to ensure the electrical connectors are fully seated to the motors. If OK, refer to 2. If not OK, connect the electrical connector to the fully seated position.
2. Check the power seat fuse in the power distribution center. If OK, refer to 3. If not OK, replace the inoperative fuse.
3. Remove the power seat switch from the seat cushion side panel. Check for battery voltage at the fused B (+) circuit cavity of the power seat switch wire harness connector. If OK, refer to 4. If not OK, repair the open circuit to the power distribution center as required.
4. Check for continuity between the ground circuit cavity of the power seat switch wire harness connector and a good ground. There should be continuity. If OK, refer to 5. If not OK, repair the open circuit to ground as required.
5. Refer to **SWITCH, SEAT, POWER, DIAGNOSIS AND TESTING**. If the switch tests OK, check the wire harness between the power seat switch and the motor. If the circuits check OK, replace the faulty power seat adjuster assembly. If the circuits are not OK, repair the wire harness as required.

STANDARD PROCEDURE

STANDARD PROCEDURE - MEMORY SYSTEM PROGRAMMING

NOTE: The module will abort a recall if the transmission is moved out of park or if any seat movement is activated whether manually or by memory recall. The module will also abort a recall if any movement of the adjustable pedals is detected.

MEMORY SYSTEM PROGRAMMING

The Memory Seat Module (MSM) interfaces with the Remote Keyless Entry (RKE) system/ WIN via the Controller Area Network (CAN) bus. The proper procedure of setting and recalling a memory position using the RKE is as follows:

1. Press and release memory switch 1 or 2 to recall memory position 1 or 2.
2. Adjust the seat, recliner, adjustable pedal position, set radio station presets, set HVAC temperature preset, and the side view mirrors to the desired position.
3. Press momentarily and release memory switch S.
4. Within five seconds, press momentarily and release memory switch 1 or 2.
5. To link the FOBIK transmitter, the FOBIK must be removed from the ignition switch: within ten seconds, press and release the "LOCK" button on one of the RKE transmitters

To program the second driver's position, repeat the above procedure using memory switch 2. The second RKE transmitter can be programmed in the same fashion as indicated in step 5. Refer to 5.

To recall either of the programmed positions momentarily press and release either memory selector switch 1 or

2. If using FOBIK, just press and release the "UNLOCK" button on the proper transmitter for either position 1 or 2.

A recall is possible any time the vehicle transmission is in PARK and the seatbelt is unbuckled. This condition is monitored by the MSM.

TO DISABLE A RKE TRANSMITTER LINKED TO MEMORY

1. Turn the ignition switch to the OFF position and remove the key.
2. Press and release the memory SET button located on the driver's seat.
3. Within 10 seconds, press and release the UNLOCK button on the RKE transmitter.

To disable another RKE transmitter linked to either memory position, repeat Steps 1-3 for each RKE transmitter.

NOTE: The capability to link RKE transmitters to memory is enabled when delivered from the factory. The capability to link RKE transmitters to memory can be disabled (or later re-enabled) by an authorized dealer. For vehicles equipped with the electronics vehicle information center (EVIC) under setup features.

MOTOR, LUMBAR

REMOVAL

REMOVAL

Fig. 4: Power Lumbar Motor & Power Seat Recliner Motor
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The lumbar motor (1) is serviced as part of the seat back frame. Do not attempt to transfer the motor as the service part will come equipped with a new motor installed.**

1. Remove the seat back frame assembly. Refer to **SEAT BACK, FRONT, REMOVAL** .
2. Remove any parts that will need to be installed on new seat back frame assembly. (1)

INSTALLATION

INSTALLATION

Fig. 5: Power Lumbar Motor & Power Seat Recliner Motor
Courtesy of CHRYSLER GROUP, LLC

1. Install parts from old seat back assembly as necessary. (1)
2. Install the seat back. Refer to **SEAT BACK, FRONT, INSTALLATION** .

MOTOR, SEAT ADJUSTER

REMOVAL

REMOVAL

Fig. 6: View Of Locking Pawl
Courtesy of CHRYSLER GROUP, LLC

WARNING: A seat structure that has seen significant load may have the locking mechanism activated and may exhibit the following symptoms:

- **Locking pawl (2) loose**
- **Locking pawl (2) engaged into the seat frame sidemember (1)**
- **Height adjuster only works on outboard side**
- **Broken or missing shear pin (3)**

If any of above symptoms exist, replace the height adjuster assembly. Do not attempt any repairs. Failure to follow these instructions may result in possible serious or fatal injury.

FRONT TILT MOTOR

Fig. 7: Front Tilt Motor, Power Seat Adjuster Motor & Rear Tilt Motor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the affected seat. Refer to **SEAT, FRONT, REMOVAL** or **SEAT, FRONT CENTER, REMOVAL** .
3. Remove the affected seat cushion cover, cushion and pan.
4. Disconnect the electrical connector from the front tilt motor (1).
5. Remove the screws retaining the front tilt motor to the seat adjuster.
6. Remove the front tilt motor from the seat adjuster.

REAR TILT MOTOR

Fig. 8: Front Tilt Motor, Power Seat Adjuster Motor & Rear Tilt Motor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the affected seat. Refer to **SEAT, FRONT, REMOVAL** or **SEAT, FRONT CENTER, REMOVAL** .
3. Remove the affected seat cushion cover, cushion and pan.
4. Disconnect the electrical connector from the rear tilt motor (3).
5. Remove the screws retaining the rear tilt motor to the seat adjuster.
6. Remove the screw and washer from the motor shaft.
7. Remove the rear tilt motor from the seat adjuster.

INSTALLATION

INSTALLATION

FRONT TILT MOTOR

Fig. 9: Front Tilt Motor, Power Seat Adjuster Motor & Rear Tilt Motor
Courtesy of CHRYSLER GROUP, LLC

1. Position the front tilt motor (1) to the seat adjuster and install the screws. Tighten the screws to 5 N.m (44 in. lbs.).
2. Connect the electrical connector.
3. Install the seat cushion cover, cushion and pan.
4. Clip the wire harness to the pan.
5. Install the seat assembly. Refer to **SEAT, FRONT, INSTALLATION** or **SEAT, FRONT CENTER, INSTALLATION** .
6. Reconnect the negative battery cable.

REAR TILT MOTOR

Fig. 10: Front Tilt Motor, Power Seat Adjuster Motor & Rear Tilt Motor
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear tilt motor (3) to the seat adjuster and install the screws. Tighten the screws to 5 N.m (44 in. lbs.).
2. Connect the electrical connector.
3. Install the seat cushion cover, cushion and pan.
4. Clip the wire harness to the pan.
5. Install the seat assembly. Refer to **SEAT, FRONT, INSTALLATION** or **SEAT, FRONT CENTER, INSTALLATION** .
6. Reconnect the negative battery cable.

RECLINER

REMOVAL

REMOVAL

Fig. 11: Power Lumbar Motor & Power Seat Recliner Motor
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The recliner motor is serviced as part of the seat back frame. Do not attempt to transfer the motor as the service part will come equipped with a new motor installed.**

1. Remove the seat back frame assembly. Refer to **SEAT BACK, FRONT, REMOVAL** .
2. Remove any parts that will need to be installed on new seat back frame assembly. (2)

INSTALLATION

INSTALLATION

Fig. 12: Power Lumbar Motor & Power Seat Recliner Motor

1. Install parts from old seat back assembly as necessary. (2)
2. Install the seat back. Refer to **SEAT BACK, FRONT, INSTALLATION** .

SWITCH, LUMBAR CONTROL

DESCRIPTION

DESCRIPTION

Fig. 13: Lumbar Control Switch & Electrical Connector

Courtesy of CHRYSLER GROUP, LLC

The power lumbar support can be adjusted inward and outward for added driver comfort using the lumbar control switch (1), located on the outboard seat cushion side trim panel.

CAUTION: The electrical connector for the lumbar control switch must be disconnected prior to removing the power seat switch bezel from the seat cushion side trim panel. Failure to follow these instructions can result in damage to the lumbar control switch.

The lumbar control switch has a wire lead and electrical connector (2) attached to it. The electrical connector must be disconnected, prior to removing the seat switch bezel from the seat cushion side trim panel.

OPERATION

OPERATION

When the lumbar control switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power lumbar support adjuster motor. The lumbar support adjuster motor operates the lumbar support adjuster mechanism through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the power lumbar support adjuster motor to run in the opposite direction.

On vehicles equipped with the memory seat system, the driver memory seat switch provides a resistive signal/input to the Memory Seat Module (MSM). The MSM is responsible for the 12 volt battery feed and ground path to the power lumbar support adjuster motor.

The lumbar control switch should NOT be held applied in any direction after the adjuster has reached its travel limit. The power lumbar support adjuster motor contains a self-resetting circuit breaker to protect it from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The lumbar control switch cannot be adjusted or repaired and must be replaced if damaged or inoperative.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LUMBAR CONTROL SWITCH

NOTE: For complete circuit diagrams, refer to appropriate Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

Fig. 14: Lumbar Control Switch
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the lumbar control switch from the seat. Refer to **SWITCH, LUMBAR CONTROL, REMOVAL**.
3. Use an ohmmeter to test the continuity of the lumbar control switch using the following table. If not OK, replace the inoperative lumbar control switch. If switch tests OK, check for an open or short in the power lumbar support circuit wiring. If no open or short is found, replace the seat back. Refer to **SEAT BACK, FRONT, REMOVAL** .

LUMBAR CONTROL SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	2-3, 2-4, 3-4
IN	1-2, 3-4
OUT	1-4, 2-3

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

NOTE: **Take the proper precautions to protect the face of the seat switch bezel from cosmetic damage while performing this procedure.**

NOTE: **Driver side shown in illustration. Passenger side similar.**

Fig. 15: Lumbar Control Switch Electrical Connector & Seat Wire Harness
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.

CAUTION: **Disconnect the lumbar control switch electrical connector beneath the seat, prior to removing the power seat switch bezel from the seat. Failure to follow these instructions can result in damage to the lumbar control switch.**

2. From the back of the seat, reach under the seat being serviced and disconnect the lumbar control switch electrical connector (1) from the seat wire harness (2).

Fig. 16: Seat Switch Bezel & Seat Cushion Side Trim Panel
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The seat switch bezel is attached to the seat cushion side trim panel by a total of eight retaining tabs. Always disengage the retaining tabs starting at the rear of the bezel. Always disengage the front retaining tab last. Failure to follow these instructions can result in damage to the seat switch bezel or the seat cushion side trim panel.

3. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent (1), carefully disengage seven of the eight retaining tabs (2) that secure the seat switch bezel (3) to the seat cushion side trim panel (4). Start at the rear of the switch bezel and work forward. There is one tab at the rear of the bezel, four on top and two on the bottom.
4. Slide the power seat switch bezel rearward to disengage the eighth retaining tab (5), located at the front of the switch bezel.

Fig. 17: Seat Switch Bezel & Electrical Connectors

6. Connect the lumbar control switch electrical connector (1) to the seat wire harness (2).
7. Reconnect the negative battery cable.
8. Verify proper power seat operation.

SWITCH, MEMORY

DESCRIPTION

DESCRIPTION

Fig. 23: Memory Seat Switch
Courtesy of CHRYSLER GROUP, LLC

The driver seating position can be automatically adjusted for two different driver preference settings using the memory seat switch (1), located on the outboard seat cushion side trim panel, when equipped with memory seat system. The memory seat system is able to store and recall all driver power seat positions (fore/aft, up/down, tilt and recline), driver side power rear view mirror position and up to twelve radio station presets (six AM and six FM), along with the last radio station listened to for each driver, even if it is not one of the twelve preset stations, on vehicles with a factory installed radio connected to the Controller Area Network (CAN) data bus network.

OPERATION

OPERATION

When one of the two buttons of the memory seat switch is pressed, the Memory Seat Module (MSM) receives the memory set/position switch input over the Controller Area Network (CAN) bus. The MSM also receives hard wired input from the hall effect sensors, mounted on each of the driver power seat adjuster motors and driver side power rear view mirror motors. The programmed software in the MSM allows it to know where the seat and mirror are located in there designed travel by a pulse count generated from the hall effect sensors. This way, when a memory seat switch button is pressed, the MSM will power the seat adjuster motors and mirror adjuster motors until the correct preset locations are achieved. The MSM will prevent the seat memory recall function from being initiated whenever the transmission gear selector lever is not in the Park position, or if the vehicle is moving. These inputs are monitored over the CAN bus by the MSM.

The memory seat switch is diagnosed using a scan tool. Refer to appropriate Electrical Diagnostic article.

The memory seat switch cannot be adjusted or repaired and must be replaced if damaged or inoperative.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Take the proper precautions to protect the face of the seat switch bezel from cosmetic damage while performing this procedure.

NOTE: Driver side shown in illustration. Passenger side similar.

6. Connect the lumbar control switch electrical connector (1) to the seat wire harness (2).
7. Reconnect the negative battery cable.
8. Verify proper power seat operation.

SWITCH, SEAT, POWER

DESCRIPTION

DESCRIPTION

Fig. 32: Power Seat Switch
Courtesy of CHRYSLER GROUP, LLC

NOTE: Driver power seat switch shown in illustration.

The standard power driver seat and available power front passenger seat can be adjusted using the power seat switches located on the outboard seat cushion side shield. The driver power seat can be adjusted in ten different ways and the passenger power seat can be adjusted in four different ways.

OPERATION

OPERATION

When a power seat switch is actuated, a battery feed and a ground path are applied through the switch contacts to the selected power seat adjuster or recliner adjuster motor. The selected seat adjuster motor operates to move the seat or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the seat adjuster motor to run in the opposite direction.

On vehicles equipped with the memory seat system, the driver memory seat switch provides a resistive signal/input to the Memory Seat Module (MSM). The MSM is responsible for the 12 volt battery feed and ground path to the power seat adjuster motors.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The individual switches in the power seat switch cannot be adjusted or repaired. If a switch is damaged or inoperative, the entire power seat switch must be replaced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SEAT SWITCH

DRIVER SEAT WITHOUT MEMORY SEAT SYSTEM

Fig. 33: Power Seat Switch Connector End View (Without Memory)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the seat. Refer to **SWITCH, SEAT, POWER, REMOVAL**.
3. Use an ohmmeter to test the continuity of the power seat switch using the following table. If not OK, replace the inoperative power seat switch. If switch tests OK, check for an open or short in the power seat circuit wiring. If no open or short is found, replace the power adjuster motor(s) as required.

DRIVER SEAT SWITCH CONTINUITY - WITHOUT MEMORY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER UP	6-3, 7-1, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER DOWN	6-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11
FRONT TILT DOWN	6-5, 7-1, 7-3, 7-4, 7-8, 7-9, 7-10, 7-11
FRONT TILT UP	6-9, 7-1, 7-3, 7-4, 7-5, 7-8, 7-10, 7-11
REAR TILT DOWN	6-10, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-11
REAR TILT UP	6-11, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10

DRIVER SEAT WITH MEMORY SEAT SYSTEM

8132c26a

4. Engage the retaining tab (4) at the front of the seat switch bezel (2) to the seat cushion side trim panel (3).
5. Carefully engage the remaining seven retaining tabs (1) that secure the seat switch bezel to the seat cushion side trim panel. Start at the front of the switch bezel and work rearward. Make sure all eight retaining tabs are fully engaged.

Fig. 42: Lumbar Control Switch Electrical Connector & Seat Wire Harness
Courtesy of CHRYSLER GROUP, LLC

6. Connect the lumbar control switch electrical connector (1) to the seat wire harness (2).
7. Reconnect the negative battery cable.
8. Verify proper power seat operation.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MOTOR/MODULE - SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor is being sent the proper hard wired output by the sunroof switch.

Refer to the appropriate diagnostic information.

NOTE: If there is no sunroof movement when the "OPEN" or "CLOSED" button are pushed but the sunroof operates when the "VENT" button is pushed and held the sunroof motor/module is out of calibration. Complete the sunroof position calibration procedure prior to performing any sunroof diagnostics. Refer to MOTOR, SUNROOF, STANDARD PROCEDURE .

The wire harness connectors for the sunroof motor/module are located above the vehicle headliner. Removal of the headliner may be necessary for access to the connector and proper diagnosis of the motor/module. Refer to **HEADLINER, REMOVAL** . **For complete circuit diagrams, refer to the appropriate wiring information.** The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Verify that all other power accessories are in proper operating condition. If not, a common electrical problem may exist.
2. Disconnect the sunroof motor/module connector directly at the motor/module (not at the headliner in-line connector). Connect a test light between the harness connector pin 6 and a known good B+ circuit. The test light should illuminate brightly. If OK, go to 3. If not OK repair the ground circuit as necessary.
3. Connect a test light between the harness connector pin 8 and a known good ground. The test light should illuminate brightly. If OK, go to 4. If not OK repair the B+ circuit as necessary.
4. Using an ohmmeter check the sunroof switch feed circuit for continuity between the sunroof motor/module and sunroof switch. Continuity should be present. If OK replace the inoperative motor/module. Refer to **MOTOR, SUNROOF, REMOVAL** . If not OK repair the sunroof switch feed circuit as necessary.

DIAGNOSIS AND TESTING - POWER WINDOWS

POWER WINDOW MOTOR TEST

If the power window motor is receiving proper current and ground and does not operate, proceed with motor test.

1. Remove front door trim panel as necessary to gain access to power window motor wire connector. Refer to **PANEL, DOOR TRIM, REMOVAL** .
2. Disconnect power window motor wire connector from door harness.
3. Using two jumper wires, connect one to a battery (+) source and the other to a good ground (-).
4. Connect the Negative (-) jumper probe to one of the motor connector terminals.
5. Momentarily touch the Positive (+) jumper probe to the other motor connector terminal.

   When positive probe is connected the motor should rotate in one direction to either move window up or down. If window is all the way up or down the motor will grunt and the inner door panel will flex when actuated in that one direction.

6. Reverse jumper probes at the motor connector terminals and window should now move in opposite direction. If window does not move or grunt, replace the motor.

If window moved completely up or down, reverse the jumper probes and cycle window to the opposite position to verify full operation.

If motor grunts and does not move, verify that regulator is not binding.

DIAGNOSIS AND TESTING - SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor is being sent the proper hard wired output by the sunroof switch.

Check the condition of the circuit protection and inspect all wiring connector pins for proper engagement and continuity. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

Refer to the appropriate diagnostic information.

NOTE: If there is no sunroof movement when the "OPEN" or "CLOSED" button are pushed but the sunroof operates when the "VENT" button is pushed and held the sunroof motor/module is out of calibration. Complete the sunroof position calibration procedure prior to performing any sunroof diagnostics. Refer to MOTOR, SUNROOF, STANDARD PROCEDURE .

for possible causes. Refer to **SUNROOF DIAGNOSIS CHART**. Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. If not, a common electrical problem may exist.

SUNROOF DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE	CORRECTION

Sunroof completely inoperative.	Inoperative control switch.	Perform sunroof switch diagnostics. Refer to **SWITCH, SUNROOF, DIAGNOSIS AND TESTING** .
	Inoperative circuit ground between sunroof motor/module and body harness.	Inspect ground connections and wiring. Repair as necessary.
	Inoperative power circuit between sunroof motor/module, control switch, and body harness.	Check the condition of the circuit protection and inspect all wiring. Repair as necessary.
	Inoperative sunroof motor/module.	Replace the sunroof motor/module. Refer to **MOTOR, SUNROOF, REMOVAL** .
Audible whine when switch is depressed, sunroof does not operate.	Inoperative sunroof motor/module.	Replace the sunroof motor/module. Refer to **MOTOR, SUNROOF, REMOVAL** .
	Binding cable.	Repair or replace binding cable as necessary.
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable.	Repair or replace binding cable as necessary.
	Worn drive motor gear.	Replace the sunroof motor/module. Refer to **MOTOR, SUNROOF, REMOVAL** .
	Sunroof glass panel out of adjustment.	Perform sunroof glass panel adjustment procedure. Refer to **GLASS, SUNROOF, ADJUSTMENTS** .
Sunroof vents and opens, but does not close.	Broken or disengaged trough guide.	Repair trough guide as necessary.
	Binding cable.	Repair or replace binding cable as necessary.
	Inoperative sunroof "CLOSE" circuit.	Check the condition of the circuit, connections and wiring. Repair as necessary.
	Inoperative control switch.	Perform sunroof switch diagnostics. Refer to **SWITCH, SUNROOF, DIAGNOSIS AND TESTING** .
	Inoperative sunroof motor/module.	Replace the sunroof motor/module. Refer to **MOTOR, SUNROOF, REMOVAL** .
Sunroof vents and closes, but does not open.	Binding cable or mechanism.	Repair or replace binding cable as necessary.
	Inoperative sunroof "OPEN" circuit.	Check the condition of the circuit, connections and wiring. Repair as necessary.
	Inoperative control switch.	Perform sunroof switch diagnostics. Refer to **SWITCH, SUNROOF, DIAGNOSIS AND TESTING** .
	Inoperative sunroof motor/module.	Replace the sunroof motor/module. Refer to **MOTOR, SUNROOF, REMOVAL** .

Sunroof does not vent	Binding cable or mechanism.	Repair or replace binding cable as necessary.
	Inoperative sunroof "VENT" circuit.	Check the condition of the circuit, connections and wiring. Repair as necessary.
	Inoperative control switch.	Perform sunroof switch diagnostics. Refer to **MOTOR, SUNROOF, REMOVAL** .
	Inoperative sunroof motor/module.	Replace the sunroof motor/module. Refer to **SWITCH, SUNROOF, DIAGNOSIS AND TESTING** .
Glass movement not consistent or glass does not operate smoothly	Sunroof glass panel out of adjustment.	Perform sunroof glass panel adjustment procedure. Refer to **GLASS, SUNROOF, ADJUSTMENTS** .

DIAGNOSIS AND TESTING - SWITCH - POWER SUNROOF

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. If completing the appropriate diagnostic information results in the sunroof switch being inoperative, perform the following test prior to switch replacement.

Fig. 1: Power Sunroof Switch Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .
3. Disconnect the power sunroof switch wire harness connector.
4. Using an ohmmeter, test the continuity of the power sunroof switch in each switch position. Refer to the

POWER SUNROOF SWITCH CONTINUITY TABLE. If OK, inspect the wiring harness and connectors for damage. Use a scan tool and the proper Diagnostic Procedures Information to complete diagnosis of the power sunroof system. If not OK, replace the overhead console.

POWER SUNROOF SWITCH CONTINUITY TABLE

SWITCH POSITION	CONTINUITY BETWEEN PINS
OFF	NO CONTINUITY
SUNROOF OPEN	B AND D
SUNROOF CLOSED	B AND C
SUNROOF VENT	B AND A

DIAGNOSIS AND TESTING - WINDOW SWITCH

The Light-Emitting Diode (LED) illumination lamps for all of the power window and lock switch and bezel unit switch paddles receive battery current through the power window circuit breaker in the junction block. If all of the LEDs are inoperative in both the power window and lock switch units and the power windows are inoperative. Refer to **DIAGNOSIS AND TESTING** . If the power windows operate, but any or all of the LEDs are inoperative, the power window and lock switch units with the inoperative LED(s) is faulty and must be replaced. For complete circuit diagrams, refer to the appropriate wiring information.

Fig. 2: Passenger Door Switch
Courtesy of CHRYSLER GROUP, LLC

1. Check the fuse in the Totally Integrated Power Module (TIPM) and the circuit breaker located near the park brake pedal. If OK, go to 2. If not OK, replace the faulty fuse or circuit breaker.
2. Turn the ignition switch to the On position. Check for battery voltage at the fuse in the Totally Integrated Power Module (TIPM). If OK, turn the ignition switch to the Off position and go to 3. If not OK, check circuit breaker and repair the circuit to the ignition switch as required.
3. Disconnect and isolate the battery negative cable. Remove the power window switch unit from the door trim panel (passenger doors). The drivers door switch is included with the window/lock switch for service procedures. Refer to **SWITCH, POWER WINDOW, REMOVAL** . Unplug the wire harness connector from the switch unit.

4. Test the power window switch continuity. See the Power Window Switch Continuity charts to determine if the continuity is correct in the Off, Up and Down switch positions. Refer to **Fig. 2**. If OK. Refer to **DIAGNOSIS AND TESTING** . If not OK, replace the faulty switch.

POWER WINDOW SWITCH CONTINUITY CHART

SWITCH POSITION	CONTINUITY BETWEEN
NEUTRAL	PIN 2 AND 5, PIN 4 AND 1
UP (FRONT PASSENGER)	PIN 6 AND 5
UP (REAR PASSENGER)	PIN 6 AND 1
DOWN (FRONT PASSENGER)	PIN 6 AND 1
DOWN (REAR PASSENGER)	PIN 6 AND 5

DESCRIPTION

DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on each door panel. A master switch on the drivers door allows the driver to raise or lower each of the passenger door windows and to lock out the individual switches on the passenger doors from operation. The power window system receives battery feed through a fuse in the Totally Integrated Power Module (TIPM) to the door modules. Their are two door modules, the Driver Door Module (DDM) and the Passenger Door Module (PDM). This is only powered when the ignition switch is in the RUN or ACCESSORY position.

If equipped, the windows have the option of auto up/down. If equipped, the four door gets auto-up/down feature, while the two door just gets the auto-down feature.

The window motors are replaced with the window regulator assembly. If the window motors require replacement, the window regulator must be replaced. For the front door, refer to **MOTOR, WINDOW REGULATOR, REMOVAL**. For the rear window, refer to **MOTOR, WINDOW REGULATOR, REAR SLIDING WINDOW, REMOVAL**.

OPERATION

OPERATION

POWER WINDOWS

The door control modules, (Driver Door Module (DDM) and Passenger Door Module (PDM)) opens or closes the windows when a actuation input signal from the window switch is received from the door trim panel. When the power window lockout switch is in the Lock position, the passenger doors windows switches are disabled. This is only powered when the ignition switch is in the RUN or ACCESSORY position.

If equipped, the windows have the option of auto up/down. If equipped, the four door gets auto-up/down feature, while the two door just gets the auto-down feature.

WINDOW MOTOR

Window motors use permanent type magnets. The B+ and ground applied at the motor terminal pins will cause the motor to rotate in one direction. Reversing current through the motor terminals will cause the motor to rotate in the opposite direction.

EXPRESS DOWN WINDOW FEATURE

This feature allows you to remotely lower both front door windows at the same time. To use this feature, press and release the UNLOCK button on the RKE transmitter and then immediately press and hold the UNLOCK

button until the windows lower to the desired level or until they lower completely.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER WINDOWS

POWER WINDOW MOTOR TEST

If the power window motor is receiving proper current and ground and does not operate, proceed with motor test.

1. Remove front door trim panel as necessary to gain access to power window motor wire connector. Refer to **PANEL, DOOR TRIM, REMOVAL** .
2. Disconnect power window motor wire connector from door harness.
3. Using two jumper wires, connect one to a battery (+) source and the other to a good ground (-).
4. Connect the Negative (-) jumper probe to one of the motor connector terminals.
5. Momentarily touch the Positive (+) jumper probe to the other motor connector terminal.

   When positive probe is connected the motor should rotate in one direction to either move window up or down. If window is all the way up or down the motor will grunt and the inner door panel will flex when actuated in that one direction.

6. Reverse jumper probes at the motor connector terminals and window should now move in opposite direction. If window does not move or grunt, replace the motor.

If window moved completely up or down, reverse the jumper probes and cycle window to the opposite position to verify full operation.

If motor grunts and does not move, verify that regulator is not binding.

STANDARD PROCEDURE

STANDARD PROCEDURE

CLEAR/RELEARN

NOTE: The battery must be fully charged or the vehicle running for proper calibration of the front door module.

NOTE: The following procedure must be performed anytime the power window system has been serviced in either front door or, there is a possible concern with a door module calibration.

Express-up / Express-down possible concerns.

- Glass will not lower all the way down flush to the belt-line.
- Glass will not raise fully; wind noise / water leak.
- Glass will not raise automatically (Expess-up) after lifting the switch to the second detent and releasing.

To clear/denormalize the door module memory, perform the following procedure:

CLEAR/DENORMALIZE

1. Check and repair any door module Diagnostic Trouble Code (DTC) (s) before proceeding.
2. Using a scan tool, under the miscellaneous functions menu select (Denormalize Window/Reset ECU), and follow the directions to clear/denormalize the door module memory.

To relearn/normalize the door module memory, perform the following procedure:

RELEARN/NORMALIZE

NOTE: The battery must be fully charged or the vehicle running before proceeding.

1. If needed, place the vehicle battery on charge or have the engine running.
2. To relearn/normalize the door module, start by raising the door glass to the full-up position by pulling up on the window switch to its second detent and hold the switch until the door glass is fully closed. Continue to hold the window switch up for two seconds after the door glass is full closed.
3. Lower the door glass to the full-down position by pushing down (depress) the window switch to its second detent and hold the switch until the door glass is fully open. Continue to hold the window switch down for two seconds after the door glass is fully open.
4. Check the operation of the express-up and express-down features.
5. If the express up does not work, repeat the procedure starting at step #2, waiting for three seconds after the window stops.
6. Check that the door glass reverses when in the express-up mode by holding a pen in the path of the glass.
7. Recheck and repair any door module DTC's as needed

MOTOR, WINDOW REGULATOR

REMOVAL

REMOVAL

Fig. 1: Window Regulator Motor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Remove fasteners from motor/regulator.
4. Disconnect electrical connector.
5. Remove motor/regulator from carrier plate.

INSTALLATION

INSTALLATION

Fig. 2: Window Regulator Motor
Courtesy of CHRYSLER GROUP, LLC

1. Connect electrical connector.
2. Place motor/regulator into place and install fasteners.
3. Install door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
4. Connect the negative battery cable.

MOTOR, WINDOW REGULATOR, REAR SLIDING WINDOW

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the rear seats. Refer to **SEAT, REAR, REMOVAL** or **SEAT, MEGA CAB REAR, REMOVAL** .
3. Remove the rear cab back panel. Refer to **PANEL, CAB BACK TRIM, REMOVAL** .

Fig. 3: Backlite Glass Regulator Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the 2 mounting bolts (1).
5. Disconnect the electrical connector to the power motor.

Fig. 4: Motor Screws
Courtesy of CHRYSLER GROUP, LLC

6. Rotate the assembly and remove the 3 screws (1) that attach the motor to the regulator.

INSTALLATION

INSTALLATION

Fig. 5: Motor Screws
Courtesy of CHRYSLER GROUP, LLC

1. Install the power motor to the regulator with the 3 screws (1).
2. Connect the electrical connector to the power motor.

Fig. 6: Backlite Glass Regulator Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the 2 mounting bolts (1).
4. Install the rear cab back panel. Refer to **PANEL, CAB BACK TRIM, INSTALLATION** .
5. Install the rear seats. Refer to **SEAT, REAR, INSTALLATION** or **SEAT, MEGA CAB REAR, INSTALLATION** .

6. Connect the battery negative cable.

SWITCH, POWER WINDOW

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WINDOW SWITCH

The Light-Emitting Diode (LED) illumination lamps for all of the power window and lock switch and bezel unit switch paddles receive battery current through the power window circuit breaker in the junction block. If all of the LEDs are inoperative in both the power window and lock switch units and the power windows are inoperative. Refer to **DIAGNOSIS AND TESTING**. If the power windows operate, but any or all of the LEDs are inoperative, the power window and lock switch units with the inoperative LED(s) is faulty and must be replaced. For complete circuit diagrams, refer to the appropriate wiring information.

Fig. 7: Power Window Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Check the fuse in the Totally Integrated Power Module (TIPM) and the circuit breaker located near the park brake pedal. If OK, refer to 2. If not OK, replace the faulty fuse or circuit breaker.
2. Turn the ignition switch to the On position. Check for battery voltage at the fuse in the Totally Integrated Power Module (TIPM). If OK, turn the ignition switch to the Off position. Refer to 3. If not OK, check circuit breaker and repair the circuit to the ignition switch as required.
3. Disconnect and isolate the battery negative cable. Remove the power window switch unit from the door trim panel (passenger doors). The drivers door switch is included with the window/lock switch. For service procedures, refer to **SWITCH, POWER WINDOW, REMOVAL**. Unplug the wire harness connector from the switch unit.
4. Test the power window switch continuity. Refer to **POWER WINDOW SWITCH CONTINUITY CHART**. To determine if the continuity is correct in the Off, Up and Down switch positions, refer to **Fig. 7**. If OK, refer to **DIAGNOSIS AND TESTING**. If not OK, replace the faulty switch.

POWER WINDOW SWITCH CONTINUITY CHART

SWITCH POSITION	CONTINUITY BETWEEN
NEUTRAL	PIN 2 AND 5, PIN 4 AND 1
UP (FRONT PASSENGER)	PIN 6 AND 5
UP (REAR PASSENGER)	PIN 6 AND 1
DOWN (FRONT PASSENGER)	PIN 6 AND 1
DOWN (REAR PASSENGER)	PIN 6 AND 5

REMOVAL

REMOVAL

The power window switch is included with the power mirror/lock switch. Refer to **SWITCH, LOCK, WITH WINDOW SWITCHES, REMOVAL** .

INSTALLATION

INSTALLATION

The power window switch is included with the power mirror/lock switch. Refer to **SWITCH, LOCK, WITH WINDOW SWITCHES, INSTALLATION** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LUMBAR CONTROL SWITCH

NOTE: **For complete circuit diagrams, see appropriate Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

Fig. 1: Lumbar Control Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the lumbar control switch from the seat. Refer to **SWITCH, LUMBAR CONTROL, REMOVAL** .
3. Use an ohmmeter to test the continuity of the lumbar control switch using the following table. If not OK, replace the inoperative lumbar control switch. If switch tests OK, check for an open or short in the power lumbar support circuit wiring. If no open or short is found, replace the seat back. Refer to **SEAT BACK, FRONT, REMOVAL** and/or **SEAT BACK, REAR, REMOVAL** .

LUMBAR CONTROL SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	2-3, 2-4, 3-4
IN	1-2, 3-4
OUT	1-4, 2-3

MEMORY SEAT SYSTEM

In order to obtain conclusive testing of the power seats with and without the memory system option, the Controller Area Network (CAN) bus, and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked. Use a scan tool and the proper diagnostic information to accurately diagnose the power seat/memory seat systems.

NOTE: **Vehicles equipped with the memory/heated seat option utilize a low voltage cut-off feature. This feature turns off the 12v power to the power seat system anytime vehicle voltage is below 11.0v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.**

Before any testing of the power seat system is attempted, the battery should be fully-charged.

POWER SEAT ADJUSTER

Operate the power seat switch and move the seat in all directions. The seat should move in each of the selected directions.

If the power seat adjuster fails to operate in more than one direction, proceed as follows:

1. Inspect the power seat adjuster motors to ensure the electrical connectors are fully seated to the motors. If OK, go to 2. If not OK, connect the electrical connector to the fully seated position.
2. Check the power seat fuse in the power distribution center. If OK, go to 3. If not OK, replace the inoperative fuse.
3. Remove the power seat switch from the seat cushion side panel. Check for battery voltage at the fused B (+) circuit cavity of the power seat switch wire harness connector. If OK, go to 4. If not OK, repair the open circuit to the power distribution center as required.
4. Check for continuity between the ground circuit cavity of the power seat switch wire harness connector and a good ground. There should be continuity. If OK, go to 5. If not OK, repair the open circuit to ground as required.
5. Refer to **SWITCH, SEAT, POWER, DIAGNOSIS AND TESTING** . If the switch tests OK, check the wire harness between the power seat switch and the motor. If the circuits check OK, replace the faulty power seat adjuster assembly. If the circuits are not OK, repair the wire harness as required.

DIAGNOSIS AND TESTING - POWER SEAT SWITCH

DRIVER SEAT WITHOUT MEMORY SEAT SYSTEM

8132c253

Fig. 2: Power Seat Switch Connector End View (Without Memory)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the seat. Refer to **SWITCH, SEAT, POWER, REMOVAL** .
3. Use an ohmmeter to test the continuity of the power seat switch using the following table. If not OK, replace the inoperative power seat switch. If switch tests OK, check for an open or short in the power seat circuit wiring. If no open or short is found, replace the power adjuster motor(s) as required.

DRIVER SEAT SWITCH CONTINUITY - WITHOUT MEMORY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER UP	6-3, 7-1, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER DOWN	6-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11
FRONT TILT DOWN	6-5, 7-1, 7-3, 7-4, 7-8, 7-9, 7-10, 7-11
FRONT TILT UP	6-9, 7-1, 7-3, 7-4, 7-5, 7-8, 7-10, 7-11
REAR TILT DOWN	6-10, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-11
REAR TILT UP	6-11, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10

DRIVER SEAT WITH MEMORY SEAT SYSTEM

Fig. 3: Power Seat Switch Connector End View (With Memory)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the seat. Refer to **SWITCH, SEAT, POWER, REMOVAL** .
3. Use an ohmmeter to test the continuity of the power seat switch using the following table. If not OK, replace the inoperative power seat switch. If switch tests OK, check for an open or short in the power seat circuit wiring. If no open or short is found, replace the power adjuster motor(s) as required.

DRIVER SEAT SWITCH CONTINUITY - WITH MEMORY

SWITCH POSITION	CONTINUITY BETWEEN	RESISTANCE VALUE
OFF	10-4	OPEN
OFF	10-11	OPEN
OFF	1-4	47 OHMS
OFF	1-11	47 OHMS
REAR TILT UP	10-11	169 OHMS
REAR TILT DOWN	10-11	76 OHMS
HORIZONTAL FORWARD	10-11	43 OHMS
HORIZONTAL REARWARD	10-11	10 OHMS
RECLINER UP	10-4	43 OHMS
RECLINER DOWN	10-4	10 OHMS
FRONT TILT UP	10-4	169 OHMS
FRONT TILT DOWN	10-4	76 OHMS
ALL RESISTANCE VALUES ARE ± FIVE PERCENT		

PASSENGER SEAT

8132c253

Fig. 4: Power Seat Switch Connector End View (Without Memory)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the power seat switch from the seat. Refer to **SWITCH, SEAT, POWER, REMOVAL** .
3. Use an ohmmeter to test the continuity of the power seat switch using the following tables. If not OK, replace the inoperative power seat switch. If switch tests OK, check for an open or short in the power seat circuit wiring. If no open or short is found, replace the power adjuster motor(s) as required.

PASSENGER SEAT SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-8
RECLINER UP	6-3, 7-1, 7-4, 7-8
RECLINER DOWN	6-1, 7-3, 7-4, 7-8
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-8

VENTED SEATS

Diagnosis of the vented seat system requires the use of a scan tool. If a fault is present in the vented seat system a DTC will be set and the vented seat switch will illuminate for 2 seconds and then go out. For further diagnosis see the appropriate diagnostic information.

DESCRIPTION

DESCRIPTION

An electronic speed control (also known as cruise control) system is available factory-installed equipment on this vehicle. The electronic speed control system includes the following major components, which are described in further detail elsewhere in this service information:

- **Antilock Brake Module** - An Antilock Brake Module (ABM) (also known as Controller Antilock Brake/CAB or the Electronic Stability Control/ESC module) is located on the antilock brake Hydraulic Control Unit (HCU) in the engine compartment. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- **Brake Lamp Switch** - The brake (also known as stop) lamp switch is located on the brake pedal support bracket under the driver side of the instrument panel. Refer to **SWITCH, STOP LAMP, DESCRIPTION** .
- **ElectroMechanical Instrument Cluster** - A CRUISE indicator is located in the fixed segment display of the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) that provides an indication to the vehicle operator when the speed control system is turned ON. Refer to **DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) located in the left front corner of the engine compartment contains the software and hardware that monitors all of the speed control system inputs and controls all of the speed control system outputs. Refer to appropriate Electrical Diagnostic article. .
- **Speed Control Switches** - A speed control switch pod containing four momentary switch push buttons is located in the right horizontal spoke of the steering wheel.
- **Wheel Speed Sensors** - A wheel speed sensor is located on the knuckle of each front and rear wheel. Refer to **SENSOR, WHEEL SPEED, FRONT, DESCRIPTION** .

The ABM, the EMIC and the PCM each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the PCM for control of the CRUISE indicator in the EMIC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the conventional electronic speed control system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the speed control system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

The vehicle operator controls all speed control system features through the speed control switch pod on the face of the right horizontal spoke of the steering wheel. When a push button of the switch pod is depressed, it provides a hard wired resistor multiplexed analog input to the Powertrain Control Module (PCM).

The PCM reads the speed control switch input, along with other hard wired and electronic message inputs received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. The PCM software continually monitors these inputs as well as electronic **vehicle distance** message inputs from the Antilock Brake Module (ABM) (also known as the Controller Antilock Brake/CAB or the Electronic Stability Control/ESC module) and numerous hard wired inputs including the brake (or stop) lamp switch, then provides the appropriate electronic message and hard wired outputs to invoke the requested and programmed electronic speed control features.

The PCM microprocessor continuously monitors all of the speed control system electrical circuits to determine the system readiness. If the PCM detects a monitored system fault, it sets and stores a Diagnostic Trouble Code (DTC). The PCM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the Cruise indicator and the Malfunction Indicator Lamp (MIL) (also known as the Check Engine lamp) in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and for system diagnosis and testing through the 16-way Data Link Connector (DLC) located on the driver side lower edge of the instrument panel.

The hard wired inputs and outputs for the PCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PCM or the electronic controls or communication between other modules and devices that provide features of the speed control system. The most reliable, efficient, and accurate means to diagnose the PCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, SPEED CONTROL

DESCRIPTION

DESCRIPTION

Fig. 1: Speed Control Switch Pod, Mounting Tabs & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The speed control switch pod (1) is located in the right spoke of the steering wheel spoke bezel. This switch has four push buttons and is used on all vehicles equipped with the optional speed control (also known as cruise control) system. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs (2) to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle (3) integral to the inboard end of the switch pod housing connects the speed control switch and the Local Interface Network (LIN) slave node circuitry integral to the switch pod to the vehicle electrical system through a dedicated take out and connector of the steering wheel wire harness.

The speed control switch pod cannot be adjusted or repaired. If any function of the switch or the LIN slave node is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

OPERATION

The speed control switch pod is a resistor multiplexed unit that provides hard wired inputs to the Powertrain Control Module (PCM) microprocessor. The speed control switch pod also contains the circuitry of a Local Interface Network (LIN) slave node, which provides source current for and communicates the switch or sensor states of the Electronic Vehicle Information Center (EVIC) switches, the remote radio switches and the horn switch over the LIN data bus to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab

Compartment Node/CCN), which is the LIN master node.

The speed control switch pod for vehicles equipped with the electronic speed control system contains four switch push buttons whose functions are:

- **On/Off -** This switch button enables or disables the speed control system and clears any previous speed control set speed from system memory.
- **Resume / + -** This switch button restores the vehicle to a previously stored set speed or accelerates the vehicle from an already attained set speed.
- **Cancel -** This switch button cancels the current speed control event, but does not turn the system OFF or clear the currently stored set speed.
- **Set / - -** This switch button sets the current vehicle speed as the stored set speed or decelerates (coasts) the vehicle to a speed that is slower than the already attained set speed.

The EMIC LIN master node provides a clean ground and fused B(+) current for all of the switches and sensors on the rotating steering wheel through the LIN slave node circuitry of the speed control switch pod as well as for the Light Emitting Diode (LED) back lighting of both the speed control and the EVIC switch pods. The PCM continually monitors all of the hard wired speed control switch circuits, while the EMIC continually monitors the LIN bus data. The PCM will set a Diagnostic Trouble Code (DTC) for any problem it detects in the speed control switch circuits, and the EMIC will store a Signal Not Available (SNA) code for any LIN bus input errors. The PCM and EMIC also communicate with other electronic modules over the Controller Area Network (CAN) data bus. Therefore, any PCM or EMIC DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

The analog resistor multiplexed circuits of the speed control switch pod as well as the hard wired circuits between the switch pod and the PCM or EMIC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LIN slave or master nodes, the PCM, the EMIC or the electronic controls and communication between modules and other devices that provide some features of the speed control system. The most reliable, efficient, and accurate means to diagnose the speed control switch pod, the LIN slave or master nodes, the PCM, the EMIC or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SPEED CONTROL SWITCH

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further**

diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 2: Speed Control Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following test confirms only correct speed control switch functions. It does not test or confirm any of the Local Interface Network (LIN) slave node inputs, outputs or functions. LIN slave node testing requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.**

1. Remove the speed control switch pod from the steering wheel. Refer to **SWITCH, SPEED CONTROL, REMOVAL**.
2. Disconnect the steering wheel wire harness connector from the back of the speed control switch pod.
3. Using an ohmmeter, test the resistance between the terminals of the switch as shown in the Speed Control Switch Tests table.

SPEED CONTROL SWITCH TESTS	
SWITCH POSITION (PINS)	**PINS (*RESISTANCE - OHMS)**
NO PUSH BUTTONS DEPRESSED	13 and 14 (20708) 14 and 15 (20591)
ON / OFF	13 and 14 (464) 14 and 15 (133)
CANCEL	13 and 14 (896) 14 and 15 (457)
SET / - (DECEL)	13 and 14 (4088) 14 and 15 (2471)
	13 and 14 (7408)

RESUME / + (ACCEL)	14 and 15 (4091)
*All resistance values are plus or minus 5%.	

4. If the switch fails any of the tests, replace the ineffective speed control switch pod as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 3: Rear Cover, Two Screws, Steering Wheel Spoke Front Bezel & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the driver airbag from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL** .
3. From the back of the steering wheel (4), remove the two screws (2) that secure the center spoke of the rear cover (1) to the center spoke of the steering wheel spoke front bezel (3).

Fig. 4: EVIC Switch Pod, Speed Control Switch Pod, Four Screws & Front Spoke Bezel
Courtesy of CHRYSLER GROUP, LLC

4. From the face of the steering wheel, remove the four screws (2) that secure the front spoke bezel (4) to the steering wheel armature within the steering wheel hub cavity.
5. Using a trim stick or another suitable wide flat-bladed tool, carefully pry at the parting line between the front spoke bezel and the steering wheel rear cover enough to unsnap the two horizontal members of the bezel from those of the rear cover.
6. Pull the front spoke bezel away from the steering wheel far enough to access and disconnect the steering wheel wire harness connections from the Electronic Vehicle Information Center (EVIC) switch pod (1) and the speed control switch pod (3).

Fig. 5: Steering Wheel Spoke Front Bezel, Screws, Speed Control Switch Pod & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. From the back of the steering wheel spoke front bezel (4), remove the three screws (2) that secure the

speed control switch pod (1) mounting tabs to the bezel.

8. Remove the switch from the bezel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 6: Steering Wheel Spoke Front Bezel, Screws, Speed Control Switch Pod & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the speed control switch pod (1) to the back of the steering wheel spoke front bezel (4).
2. Install and tighten the three screws (2) that secure the switch mounting tabs to the bezel. Tighten the screws securely.
3. Position the front spoke bezel close enough to the steering wheel to reconnect the steering wheel wire harness connections to the Electronic Vehicle Information Center (EVIC) switch pod and the speed control switch pod connector receptacles (3).

Fig. 7: EVIC Switch Pod, Speed Control Switch Pod, Four Screws & Front Spoke Bezel
Courtesy of CHRYSLER GROUP, LLC

4. Position the front spoke bezel (4), EVIC switch pod (1) and speed control switch pod (3) as a unit to the steering wheel. Be certain that the steering wheel wire harness is routed between the lower or upper bezel stanchions and the inside circumference of the steering wheel hub cavity so that the wiring will not be pinched when the driver airbag is reinstalled.
5. Use hand pressure to squeeze the horizontal spokes of both the front spoke bezel and the steering wheel rear cover together until all of the snap features are fully engaged.
6. Install and tighten the four screws that secure the stanchions of the front spoke bezel to the steering wheel armature within the steering wheel hub cavity. Tighten the screws securely.

Fig. 8: Rear Cover, Two Screws, Steering Wheel Spoke Front Bezel & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

7. From the back of the steering wheel (4), install and tighten the two screws (2) that secure the center spoke

of the rear cover (1) to the center spoke of the steering wheel spoke front bezel (3). Tighten the screws securely.

8. Reinstall the driver airbag onto the steering wheel. Refer to **AIR BAG, DRIVER, INSTALLATION** .
9. Reconnect the battery negative cable.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - UCI SERVICE DIAGNOSTICS

CONDITION	POSSIBLE CAUSES	CORRECTION
RADIO DOES NOT ENTER UCI / iPOD MODE	1. iPOD not connected	1. Check and connect device.
	2. iPOD faulty	2. Check device, use known good device to check connection.
	3. iPOD battery completely discharged.	3. When unplugged, Check if the iPOD works, if not iPOD may be in deep battery discharge. Charge it on UCI or separately. If the iPOD does not work at all (or does not charge at all), see iPOD dealer/service.
	4. Vehicle not equipped with UConnect	4. Notify customer vehicle not equipped. Check if Mopar kit available for this vehicle.
	5. iPOD works, but when connected to UCI, it does not.	5. Ask customer to update the iPOD firmware to the latest from the iPOD manufactures website (www.apple.com).
	6. iPOD harness wiring faulty	6a. Use scan tool to determine "UCI Connection State", if shows no harness connected with iPOD plugged in, then wiring is suspect / faulty. 6b. Check wiring and repair if needed.
	7. Radio Faulty	7. Refer to Radio Diagnostic Service Information.
	8. UConnect module Faulty	8. Replace the Hands Free Module in accordance with the Service Information.
iPOD DOES NOT SHOW "OK TO DISCONNECT" SCREEN	1. iPOD faulty	1. Check device, use known good device to check connection
	2. iPOD harness wiring faulty	2. Check wiring and repair if needed.
	3. UConnect module Faulty	4. Replace the Hands Free Module in accordance with the Service Information.
iPOD DOES NOT CHARGE	1. iPOD not connected	1. Check and connect device

	2. iPOD faulty / iPOD battery faulty	2. Check device, use known good device to check connection
	3. iPOD harness wiring faulty	3. Check wiring and repair if needed.
	4. UConnect module Faulty	4. Replace the Hands Free Module in accordance with the Service Information.
iPOD DOES NOT PLAY AUDIO	1. iPOD not connected	1. Check and connect device
	2. iPOD faulty	2. Check device, use known good device to check connection
	3. iPOD harness wiring faulty	3. Check wiring and repair if needed.
	4. Radio Faulty	4. Check that radio audio is audible in other modes
	5. UConnect module Faulty	5. Replace the Hands Free Module in accordance with the Service Information.
CANNOT GET RADIO TO ENTER UCI MODE	1. iPOD not plugged into UCI port	1. Make sure cable is available to customer (usually in glovebox of new vehicles) and show customer how to plug in device.
	2. iPOD plugged into audio jack on radio	2. iPOD must be plugged into UCI port using provided cable in glovebox. Connecting via audio jack or USB port to radio will not provide UCI mode access.
	3. iPOD plugged into USB jack on radio	3. iPOD must be plugged into UCI port using provided cable in glovebox. Connecting via audio jack or USB port to radio will not provide UCI mode access.
	4. No cable provided to customer	4. Cable not provided from factory. Mopar cable P/N is 82210787
ALPHA SORT BUTTON ON REN / REZ RADIO DOES NOT STAY ON DURING BROWSE MODE	1. Customer iPOD is using version of iTunes software with known software bug (Version 7.0)	1. Ask customer to update the iPOD firmware to the latest from the iPOD manufactures website (www.apple.com)
	2. Customer has entries stored on their device which begin with non-standard English lanaguage characters	2. The system may not recognize entries which begin with characters from certain non-English languages such as Russian, Japanese, Chinese, Hebrew, etc. This could cause the alpha-sort function to fail and the button to turn off.
ALPHA SORT BUTTON ON REN / REZ RADIO IS	1. This is Normal Behavior, the	

GRAYED OUT FOR A WHILE BEFORE IT CAN BE SELECTED	button is grayed out while the song / artist / album / etc. data is being alphabetized by the UCI system.	1. Not an issue, The time the button is grayed out is directly proportional to the number of entries to be alphabetized.
ERROR MESSAGE DISPLAYED ON RADIO WHEN ATTEMPTING TO ENTER UCI MODE.	1. Error message: Comm Error	1a. Use the scan tool to determine UCI Connection state, if shows no harness connected wiring is suspect / faulty. 1b. Check wiring and repair if needed. 1c. Unplug and reconnect iPOD.
	2. Error Message:Not Supported	2. Ask customer to update the iPOD firmware to the latest from the iPOD manufactures website (www.apple.com)
	3. Error Message: No Files Found on iPOD	3. iPOD has no audio files on it, have the customer put some audio files on the iPOD and try to reconnect the device.
	4. Error Message: Unknown Error. iPOD unavailable	4a. Unplug and reconnect iPOD. 4b. Check wiring and repair if needed.
CUSTOMER IS UNABLE TO COPY FILES FROM iPOD TO RADIO HARD DRIVE	1. This feature is only available by connecting the iPOD to the USB port on the radio AND using the iPOD as a storage device. It is not possible to download audio tracks you play on the iPOD to the radio Hard Drive	1a. Ensure customer is connecting iPOD to USB port on radio. 1b. Feature not available by plugging iPOD into the UCI port.
iPOD DOES NOT TURN OFF WHEN THE VEHICLE IS TURNED OFF AND THE iPOD IS LEFT PLUGGED IN	1. This is normal iPOD behavior. The iPOD has a default setting where it will stay on for X minutes after the vehicle is turned off.	1. Not an issue.

DIAGNOSIS AND TESTING - TELECOMMUNICATION

Any diagnosis of the Telecommunication system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: **On vehicles equipped with airbags, refer to electrical, restraints before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

TELECOMMUNICATION SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
PHONE NOT AVAILABLE	1. Bluetooth™™ phone not paired to the system.	1. Ensure that phone(s) are paired to the system.

	2. Bluetooth™™ phone not present or turned OFF.	2. Make sure paired phone is present, turned ON and that the Bluetooth™™ option is enabled on the phone.
	3. Bluetooth™™ phone has low battery.	3. At low battery levels, some phones will turn off Bluetooth™™ functionality. Ensure cellular phone is charged to an adequate level.
PHONE PAIRING FAILED	1. Phone does not support Hands Free Profile	1. The Telecommunication system requires the cellular phone to be Bluetooth™™ enabled, as well as supporting the Hands Free Profile. The customer will have to upgrade their phone to one supporting Hands Free Profile. A list of suggested phones is available at: http://www.chrysler.com/uconnect.
	2. Phone not Bluetooth™™ enabled.	2. The Telecommunication system requires the cellular phone to be Bluetooth™™™ enabled. A list of suggested phones is available at: http://www.chrysler.com/uconnect.
	3. PIN entered on the phone is not the same as PIN spoken to the system.	3. The PIN spoken to the system must be the same PIN entered into the phone.
	4. Phone has reached maximum number of allowed devices paired.	4. Remove one of the previously paired devices from it's list.
POOR VOICE RECOGNITION	1. Microphone failure	1. Using a scan tool, check for microphone fault codes.
	2. Customer not waiting for the beep before speaking.	2. Ensure customer is waiting for the system "beep" prior to beginning the speech to be recognized.
	3. Customer not speaking in a smooth normal manner.	3. Verify that the customer is attempting to use the system with a smooth consistent voice. The system is designed to accept normal speech spoken at a normal tone, some people tend to speak to a computer loud and slow, which results in reduced performance.
	4. Rear view mirror not properly attached to mounting.	4. Mirror must be firmly mounted to the mounting location. Ensure that mirror is tightened to the specified torque.
	5. High levels of noise in vehicle compartment	5. System performance is increased when noise conditions in the vehicle are lowered. Ideal conditions include windows closed.
	6. Object interfering with microphone input	6. Verify that there is no object, hanging from the mirror, that could be obstructing the microphone.
	7. User not saying "send" after a pager dialing request	7. User must say "send" at the end of a Pager Dialing request.

	8. Other passengers talking while customer is attempting to use the system	8. Although designed for primary use by the driver, the microphone will pick up passengers in any seat of the vehicle. System performance is increased in low noise environments.
PHONEBOOK NAMES NOT RECOGNIZED CONSISTENTLY	1. Phonebook names recorded in high noise conditions	1. For increased system performance, it is recommended that the phone book entries are recorded in a low noise environment. That is, vehicle in park, with windows up.
	2. Phonebook name(s) short	2. For increased performance it is recommended that the user use both first and last name as a phonebook entry. Example: "Daniel Johnson" as opposed to "Dan".
	3. Phonebook names recorded by another user	3. It is recommended that each user of the system record their own phonebook entries. This will increase the recognition performance.
	4. Similar names in phonebook	4. For increased system performance it is recommended that the user do not enter similar sounding names in the phonebook.
	5. Object interfering with microphone input	5. Object interfering with microphone input.
POOR PHONE AUDIO QUALITY.	1. Microphone failure	1. Use a scan tool, and check for Microphone faults.
	2. Rear view mirror not properly fixed to mounting button	2. Mirror must be firmly mounted to the mounting location. Tighten mirror to the specified torque.
	3. System being used in high noise conditions	3. System performance is increased when noise conditions in the vehicle are lowered. Ideal conditions include windows closed.
NO PHONE AUDIO	1. Phone setting cause phone audio to be routed to handset.	1. Route audio to "Hands free" device.

DIAGNOSIS AND TESTING

B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW

Fig. 1: Headlamp & Front Parking Lamp Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting low beam lamp illumination.

When this bus message is received, the TIPM provides a voltage output through the low beam driver circuit. The low beam driver circuit connects to the Low Beam Lamp. A headlamp return signal circuit is used instead of a ground circuit. For additional information on the Headlamp operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the low beam headlamps active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low condition on the (L43) Left Low Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L43) LEFT LOW BEAM DRIVER CIRCUIT SHORTED TO GROUND
(L43) LEFT LOW BEAM DRIVER CIRCUIT SHORTED TO THE (L911) LEFT HEADLAMP RETURN SIGNAL CIRCUIT
LEFT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Headlamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the ignition off.

2. Disconnect the Left Headlamp Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read DTC's.

   Does the scan tool display DTC: B162C-LEFT LOW BEAM CONTROL CIRCUIT HIGH?

   Yes

   - Replace the Left Low Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (L43) LEFT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 2: Checking Left Low Beam Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C3 harness connector.
3. Measure the resistance between ground and the (L43) Left Low Beam Driver circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4.

   No

   - Repair the short to ground in the (L43) Left Low Beam Driver circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. **CHECK THE (L43) LEFT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO THE (L911) LEFT HEADLAMP RETURN SIGNAL CIRCUIT**

Fig. 3: Checking Left Low Beam Driver Circuit For A Short To Left Headlamp Return Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (L43) Left Low Beam Driver circuit and the (L911) Left Headlamp Return Signal circuit.

   Is the resistance above 10k Ohms?

   Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short between the (L43) Left Low Beam Driver circuit and the (L911) Left Headlamp Return Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B162C-LEFT LOW BEAM CONTROL CIRCUIT HIGH

Fig. 4: Headlamp & Front Parking Lamp Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting low beam lamp illumination.

When this bus message is received, the TIPM provides a voltage output through the low beam driver circuit. The low beam driver circuit connects to the Low Beam Lamp. A headlamp return signal circuit is used instead of a ground circuit. For additional information on the Headlamp operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the low beam headlamps active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a high condition on the (L43) Left Low Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L43) LEFT LOW BEAM DRIVER CIRCUIT OPEN
(L43) LEFT LOW BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
(L911) LEFT HEADLAMP RETURN SIGNAL CIRCUIT OPEN
LEFT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Headlamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B162C-LEFT LOW BEAM CONTROL CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **CHECK THE (L43) LEFT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**

Fig. 5: Checking Left Low Beam Driver Circuit For A Short To Voltage In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the Headlamps off.
2. Turn the ignition off.
3. Disconnect the Left Headlamp Lamp harness connector.
4. Disconnect the TIPM C3 harness connector.
5. Turn the ignition on.
6. Measure the voltage between ground and the (L43) Left Low Beam Driver circuit.

   Is there any voltage present?

   Yes

- Repair the short to voltage in the (L43) Left Low Beam Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE TIPM FOR CORRECT OPERATION**

Fig. 6: Checking TIPM For Correct Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the TIPM C3 harness connector.
3. Connect a 12-volt test light between the (L43) Left Low Beam Driver circuit and (L911) Left

Headlamp Return Signal circuit in the Left Headlamp Lamp harness connector.

4. Turn the ignition on.
5. Turn the Headlamps on.

Does the test light illuminate brightly?

Yes

- Replace the Left Low Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (L43) LEFT LOW BEAM DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 7: Checking Left Low Beam Driver Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the TIPM C3 harness connector.
3. Measure the resistance of the (L43) Left Low Beam Driver circuit between the Left Headlamp Lamp harness connector and the TIPM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (L43) Left Low Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (L911) LEFT HEADLAMP RETURN SIGNAL CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 8: Checking Left Headlamp Return Signal Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (L911) Left Headlamp Return Signal circuit between the Left

Headlamp Lamp harness connector and the TIPM C3 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the open in the (L911) Left Headlamp Return Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B162F-RIGHT LOW BEAM CONTROL CIRCUIT LOW

Fig. 9: Headlamp & Front Parking Lamp Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting low beam lamp illumination.

When this bus message is received, the TIPM provides a voltage output through the low beam driver circuit. The low beam driver circuit connects to the Low Beam Lamp. A headlamp return signal circuit is used instead of a ground circuit. For additional information on the Headlamp operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the low beam headlamps active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low condition on the (L44) Right Low Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L44) RIGHT LOW BEAM DRIVER CIRCUIT SHORTED TO GROUND
(L44) RIGHT LOW BEAM DRIVER CIRCUIT SHORTED TO THE (L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT
RIGHT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Headlamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B162F-RIGHT LOW BEAM CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the ignition off.

2. Disconnect the Right Headlamp Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read DTC's.

   Does the scan tool display DTC: B1630-RIGHT LOW BEAM CONTROL CIRCUIT HIGH?

   Yes

   - Replace the Right Low Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (L44) RIGHT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 10: Checking Right Low Beam Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C3 harness connector.
3. Measure the resistance between ground and the (L44) Right Low Beam Driver circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4.

   No

- Repair the short to ground in the (L44) Right Low Beam Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. **CHECK THE (L44) RIGHT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO THE (L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT**

Fig. 11: Checking Right Low Beam Driver Circuit For A Short To Right Headlamp Return Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (L44) Right Low Beam Driver circuit and the (L910) Right Headlamp Return Signal circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service

Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short between the (L44) Right Low Beam Driver circuit and the (L910) Right Headlamp Return Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1630-RIGHT LOW BEAM CONTROL CIRCUIT HIGH

Fig. 12: Headlamp & Front Parking Lamp Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting low beam lamp illumination.

When this bus message is received, the TIPM provides a voltage output through the low beam driver circuit. The low beam driver circuit connects to the Low Beam Lamp. A headlamp return signal circuit is used instead of a ground circuit. For additional information on the Headlamp operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the low beam headlamps active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a high condition on the (L44) Right Low Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L44) RIGHT LOW BEAM DRIVER CIRCUIT OPEN
(L44) RIGHT LOW BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
(L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT OPEN
RIGHT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Headlamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B1630-RIGHT LOW BEAM CONTROL CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **CHECK THE (L44) RIGHT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**

Fig. 13: Checking Right Low Beam Driver Circuit For A Short To Voltage In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the Headlamps off.
2. Turn the ignition off.
3. Disconnect the Right Headlamp Lamp harness connector.
4. Disconnect the TIPM C3 harness connector.
5. Turn the ignition on.
6. Measure the voltage between ground and the (L44) Right Low Beam Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L44) Right Low Beam Driver circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE TIPM FOR CORRECT OPERATION**

Fig. 14: Checking TIPM For Correct Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the TIPM C3 harness connector.
3. Connect a 12-volt test light between the (L44) Right Low Beam Driver circuit and (L910) Right Headlamp Return Signal circuit in the Right Headlamp Lamp harness connector.

4. Turn the ignition on.
5. Turn the Headlamps on.

   Does the test light illuminate brightly?

   Yes

   - Replace the Right Low Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (L44) RIGHT LOW BEAM DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 15: Checking Right Low Beam Driver Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C3 harness connector.

3. Measure the resistance of the (L44) Right Low Beam Driver circuit between the Right Headlamp Lamp harness connector and the TIPM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (L44) Right Low Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 16: Checking Right Headlamp Return Signal Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (L910) Right Headlamp Return Signal circuit between the Right Headlamp Lamp harness connector and the TIPM C3 harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the open in the (L910) Right Headlamp Return Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1633-LEFT HI BEAM CONTROL CIRCUIT LOW

Fig. 17: Headlamp & Front Parking Lamp Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting high beam lamp illumination.

When this bus message is received, the TIPM provides a voltage output through the high beam driver circuit. The high beam driver circuit connects to the High Beam Lamp. A headlamp return signal circuit is used instead of a ground circuit. For additional information on the Headlamp operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the high beam headlamps active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low condition on the (L33) Left High Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L33) LEFT HIGH BEAM DRIVER CIRCUIT SHORTED TO GROUND
(L33) LEFT HIGH BEAM DRIVER CIRCUIT SHORTED TO THE (L911) LEFT HEADLAMP RETURN SIGNAL CIRCUIT
LEFT HIGH BEAM BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the High Beam Headlamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B1633-LEFT HI BEAM CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the ignition off.

2. Disconnect the Left Headlamp Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read DTC's.

   Does the scan tool display DTC: B1634-LEFT HI BEAM CONTROL CIRCUIT HIGH?

   Yes

   - Replace the Left High Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 18: Checking Left High Beam Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C3 harness connector.
3. Measure the resistance between ground and the (L33) Left High Beam Driver circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4.

   No

- Repair the short to ground in the (L33) Left High Beam Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. **CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO THE (L911) LEFT HEADLAMP RETURN SIGNAL CIRCUIT**

Fig. 19: Checking Left High Beam Driver Circuit For A Short To Left Headlamp Return Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (L33) Left High Beam Driver circuit and the (L911) Left Headlamp Return Signal circuit.

   Is the resistance above 10k Ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short between the (L33) Left High Beam Driver circuit and the (L911) Left Headlamp Return Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1634-LEFT HI BEAM CONTROL CIRCUIT HIGH

Fig. 20: Headlamp & Front Parking Lamp Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting high beam lamp illumination.

When this bus message is received, the TIPM provides a voltage output through the high beam driver circuit. The high beam driver circuit connects to the High Beam Lamp. A headlamp return signal circuit is used instead of a ground circuit. For additional information on the Headlamp operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the high beam headlamps active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a high condition on the (L33) Left High Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L33) LEFT HIGH BEAM DRIVER CIRCUIT OPEN
(L33) LEFT HIGH BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
(L911) LEFT HEADLAMP RETURN SIGNAL CIRCUIT OPEN
LEFT HIGH BEAM BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the High Beam Headlamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B1634-LEFT HI BEAM CONTROL CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**

Fig. 21: Checking Left High Beam Driver Circuit For A Short To Voltage In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the Headlamps off.
2. Turn the ignition off.
3. Disconnect the Left Headlamp Lamp harness connector.
4. Disconnect the TIPM C3 harness connector.
5. Turn the ignition on.
6. Measure the voltage between ground and the (L33) Left High Beam Driver circuit.

   Is there any voltage present?

   Yes

- Repair the short to voltage in the (L33) Left High Beam Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE TIPM FOR CORRECT OPERATION**

Fig. 22: Checking TIPM For Correct Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the TIPM C3 harness connector.

3. Connect a 12-volt test light between the (L33) Left High Beam Driver circuit and (L911) Left Headlamp Return Signal circuit in the Left Headlamp Lamp harness connector.
4. Turn the ignition on.
5. Turn the High Beam Headlamps on.

   Does the test light illuminate brightly?

   Yes

   - Replace the Left High Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 23: Checking Left High Beam Driver Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C3 harness connector.

3. Measure the resistance of the (L33) Left High Beam Driver circuit between the Left Headlamp Lamp harness connector and the TIPM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (L33) Left High Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (L911) LEFT HEADLAMP RETURN SIGNAL CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 24: Checking Left Headlamp Return Signal Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (L911) Left Headlamp Return Signal circuit between the Left

Headlamp Lamp harness connector and the TIPM C3 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the open in the (L911) Left Headlamp Return Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1637-RIGHT HI BEAM CONTROL CIRCUIT LOW

Fig. 25: Headlamp & Front Parking Lamp Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting high beam lamp illumination.

When this bus message is received, the TIPM provides a voltage output through the high beam driver circuit. The high beam driver circuit connects to the High Beam Lamp. A headlamp return signal circuit is used instead of a ground circuit. For additional information on the Headlamp operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the high beam headlamps active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low condition on the (L34) Right High Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L34) RIGHT HIGH BEAM DRIVER CIRCUIT SHORTED TO GROUND
(L34) RIGHT HIGH BEAM DRIVER CIRCUIT SHORTED TO THE (L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT
RIGHT HIGH BEAM BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the High Beam Headlamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B1637-RIGHT HI BEAM CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the ignition off.

2. Disconnect the Right Headlamp Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read DTC's.

   Does the scan tool display DTC: B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH?

   Yes

   - Replace the Right High Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 26: Checking Right High Beam Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C3 harness connector.
3. Measure the resistance between ground and the (L34) Right High Beam Driver circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4.

   No

   - Repair the short to ground in the (L34) Right High Beam Driver circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. **CHECK THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO THE (L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT**

Fig. 27: Checking Right High Beam Driver Circuit For A Short To Right Headlamp Return Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (L34) Right High Beam Driver circuit and the (L910) Right Headlamp Return Signal circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service

Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short between the (L34) Right High Beam Driver circuit and the (L910) Right Headlamp Return Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH

Fig. 28: Headlamp & Front Parking Lamp Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting high beam lamp illumination.

When this bus message is received, the TIPM provides a voltage output through the high beam driver circuit. The high beam driver circuit connects to the High Beam Lamp. A headlamp return signal circuit is used instead of a ground circuit. For additional information on the Headlamp operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the high beam headlamps active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a high condition on the (L34) Right High Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L34) RIGHT HIGH BEAM DRIVER CIRCUIT OPEN
(L34) RIGHT HIGH BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
(L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT OPEN
RIGHT HIGH BEAM BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the High Beam Headlamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **CHECK THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**

Fig. 29: Checking Right High Beam Driver Circuit For A Short To Voltage In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the Headlamps off.
2. Turn the ignition off.
3. Disconnect the Right Headlamp Lamp harness connector.
4. Disconnect the TIPM C3 harness connector.
5. Turn the ignition on.
6. Measure the voltage between ground and the (L34) Right High Beam Driver circuit.

   Is there any voltage present?

   Yes

- Repair the short to voltage in the (L34) Right High Beam Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE TIPM FOR CORRECT OPERATION**

Fig. 30: Checking TIPM For Correct Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the TIPM C3 harness connector.
3. Connect a 12-volt test light between the (L34) Right High Beam Driver circuit and (L910) Right Headlamp Return Signal circuit in the Right Headlamp Lamp harness connector.

4. Turn the ignition on.
5. Turn the High Beam Headlamps on.

   Does the test light illuminate brightly?

   Yes

   - Replace the Right High Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 31: Checking Right High Beam Driver Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C3 harness connector.

3. Measure the resistance of the (L34) Right High Beam Driver circuit between the Right Headlamp Lamp harness connector and the TIPM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (L34) Right High Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 32: Checking Right Headlamp Return Signal Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (L910) Right Headlamp Return Signal circuit between the Right Headlamp Lamp harness connector and the TIPM C3 harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the open in the (L910) Right Headlamp Return Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B163B-FRONT LEFT TURN LAMP CONTROL CIRCUIT LOW

Fig. 33: Headlamp & Front Parking Lamp Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting turn signal lamp illumination.

When this bus message is received, the TIPM provides a pulsed voltage output through the front turn signal control circuit. The front turn signal control circuit connects to the dual filament Park and Turn Signal Lamp. The same ground circuit is used for both the Park and Turn Signal filaments in a dual filament lamp. For additional information on the Turn Signal Lamps operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the turn signal active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low condition on the (L161) Left Front Turn Signal Control circuit.

POSSIBLE CAUSES

Possible Causes
(L161) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT SHORTED TO GROUND PARK AND TURN SIGNAL BULB TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Left Turn Signal on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B163B-FRONT LEFT TURN LAMP CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the Left Turn Signal off.

2. Turn the ignition off.
3. Disconnect the Left Front Park/Turn Lamp harness connector.
4. Turn the ignition on.
5. Turn the Left Turn Signal on.
6. With the scan tool, read DTC's.

   Does the scan tool display DTC: B163C-FRONT LEFT TURN LAMP CONTROL CIRCUIT HIGH?

   Yes

   - Replace the Left Park and Turn Signal Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (L161) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 34: Checking Left Front Turn Signal Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C4 harness connector.
3. Measure the resistance between ground and the (L161) Left Front Turn Signal Control circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short to ground in the (L161) Left Front Turn Signal Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B163C-FRONT LEFT TURN LAMP CONTROL CIRCUIT HIGH

Fig. 35: Headlamp & Front Parking Lamp Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting turn signal lamp illumination. When this bus message is received, the TIPM provides a pulsed voltage output through the front turn signal control circuit. The front turn signal control circuit connects to the dual filament Park and Turn Signal Lamp. The same ground circuit is used for both the Park and Turn Signal filaments in a dual filament lamp. For additional information on the Turn Signal Lamps operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the turn signal active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a high condition on the (L161) Left Front Turn Signal Control circuit.

POSSIBLE CAUSES

Possible Causes
(L161) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT OPEN
(L161) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE
(Z906) GROUND CIRCUIT OPEN
PARK AND TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Left Turn Signal on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B163C-FRONT LEFT TURN LAMP CONTROL CIRCUIT HIGH?

    Yes

    - Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE (L161) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**

Fig. 36: Checking Left Front Turn Signal Control Circuit For A Short To Voltage In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the Left Turn Signal off.
2. Turn the ignition off.
3. Disconnect the Left Front Park/Turn Lamp harness connector.

4. Disconnect the TIPM C4 harness connector.
5. Turn the ignition on.
6. Measure the voltage between ground and the (L161) Left Front Turn Signal Control circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L161) Left Front Turn Signal Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE TIPM FOR CORRECT OPERATION**

Fig. 37: Checking TIPM For Correct Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the TIPM C4 harness connector.
3. Connect a 12-volt test light between the (L161) Left Front Turn Signal Control circuit and the (Z906) Ground circuit at the Left Front Park/Turn Lamp harness connector.
4. Turn the ignition on.
5. Turn the Left Turn Signal on.

   Does the test light blink on and off?

   Yes

   - Replace the Park and Turn Signal Bulb in accordance with the Service Information. Refer to

UNIT, FRONT LAMP, REMOVAL .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (L161) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 38: Checking Left Front Turn Signal Control Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C4 harness connector.

3. Measure the resistance of the (L161) Left Front Turn Signal Control circuit between the Left Front Park/Turn Lamp harness connector and the TIPM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (L161) Left Front Turn Signal Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 39: Checking Ground Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Repair the open in the (Z906) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B163F-FRONT RIGHT TURN LAMP CONTROL CIRCUIT LOW

Fig. 40: Headlamp & Front Parking Lamp Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting turn signal lamp illumination.

When this bus message is received, the TIPM provides a pulsed voltage output through the front turn signal control circuit. The front turn signal control circuit connects to the dual filament Park and Turn Signal Lamp. The same ground circuit is used for both the Park and Turn Signal filaments in a dual filament lamp. For additional information on the Turn Signal Lamps operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the turn signal active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low condition on the (L160) Right Front Turn Signal Control circuit.

POSSIBLE CAUSES

Possible Causes
(L160) RIGHT FRONT TURN SIGNAL CONTROL CIRCUIT SHORTED TO GROUND PARK AND TURN SIGNAL BULB TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Right Turn Signal on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B163F-FRONT RIGHT TURN LAMP CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the ignition off.

2. Disconnect the Right Front Park/Turn Lamp harness connector.
3. Turn the ignition on.
4. Turn the Right Turn Signal on.
5. With the scan tool, read DTC's.

   Does the scan tool display DTC: B1640-FRONT RIGHT TURN LAMP CONTROL CIRCUIT HIGH?

   Yes

   - Replace the Right Park and Turn Signal Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (L160) RIGHT FRONT TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 41: Checking Right Front Turn Signal Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (L160) Right Front Turn Signal Control circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short to ground in the (L160) Right Front Turn Signal Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1640-FRONT RIGHT TURN LAMP CONTROL CIRCUIT HIGH

Fig. 42: Headlamp & Front Parking Lamp Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting turn signal lamp illumination. When this bus message is received, the TIPM provides a pulsed voltage output through the front turn signal control circuit. The front turn signal control circuit connects to the dual filament Park and Turn Signal Lamp. The same ground circuit is used for both the Park and Turn Signal filaments in a dual filament lamp. For additional information on the Turn Signal Lamps operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the turn signal active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a high condition on the (L160) Right Front Turn Signal Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L160) RIGHT FRONT TURN SIGNAL DRIVER CIRCUIT OPEN
(L160) RIGHT FRONT TURN SIGNAL DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z904) GROUND CIRCUIT OPEN
PARK AND TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Right Turn Signal on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B1640-FRONT RIGHT TURN LAMP CONTROL CIRCUIT HIGH?

    Yes

    - Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE (L160) RIGHT FRONT TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**

Fig. 43: Checking Right Front Turn Signal Driver Circuit For A Short To Voltage In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the Right Turn Signal off.
2. Turn the ignition off.
3. Disconnect the Right Front Park/Turn Lamp harness connector.

4. Disconnect the TIPM C4 harness connector.
5. Turn the ignition on.
6. Measure the voltage between ground and the (L160) Right Front Turn Signal Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L160) Right Front Turn Signal Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE TIPM FOR CORRECT OPERATION**

Fig. 44: Checking TIPM For Correct Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the TIPM C4 harness connector.
3. Connect a 12-volt test light between the (L160) Right Front Turn Signal Driver circuit and the (Z904) Ground circuit at the Right Front Park/Turn Lamp harness connector.
4. Turn the ignition on.
5. Turn the Right Turn Signal on.

   Does the test light blink on and off?

   Yes

- Replace the Park and Turn Signal Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (L160) RIGHT FRONT TURN SIGNAL DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 45: Checking Right Front Turn Signal Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the TIPM C4 harness connector.
3. Measure the resistance of the (L160) Right Front Turn Signal Driver circuit between the Right Front Park/Turn Lamp harness connector and the TIPM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (L160) Right Front Turn Signal Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (Z904) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 46: Checking Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12-volts, check the (Z904) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Repair the open in the (Z904) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1643-REAR LEFT TURN LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting turn signal lamp illumination. When this bus message is received, the TIPM provides a pulsed voltage output through the rear turn signal control circuit. The rear turn signal control circuit connects to the dual filament Park and Turn Signal Bulb in the Lamp, Tail Stop Turn. The same ground circuit is used for both the Park and Turn Signal filaments in a dual filament lamp. For additional information on the Turn Signal Lamps operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the turn signal active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low condition on the (L63) Left Rear Turn Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L63) LEFT REAR TURN LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT REAR TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Left Turn Signal on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B1643-REAR LEFT TURN LAMP CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the Left Turn Signal off.
    2. Turn the ignition off.
    3. Disconnect the Left Tail Lamp Assembly C1 harness connector.
    4. Turn the ignition on.
    5. Turn the Left Turn Signal on.
    6. With the scan tool, read DTC's.

    Does the scan tool display DTC: B1644-REAR LEFT TURN LAMP CONTROL CIRCUIT HIGH?

    Yes

    - Replace the Left Rear Turn Signal Bulb in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (L63) LEFT REAR TURN LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the TIPM C7 harness connector.

3. Measure the resistance between ground and the (L63) Left Rear Turn Lamp Driver circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Repair the short to ground in the (L63) Left Rear Turn Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1644-REAR LEFT TURN LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting turn signal lamp illumination. When this bus message is received, the TIPM provides a pulsed voltage output through the rear turn signal control circuit. The rear turn signal control circuit connects to the dual filament Park and Turn Signal Bulb in the Lamp, Tail Stop Turn. The same ground circuit is used for both the Park and Turn Signal filaments in a dual filament lamp. For additional information on the Turn Signal Lamps operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the turn signal active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a high condition on the (L63) Left Rear Turn Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L63) LEFT REAR TURN LAMP DRIVER CIRCUIT OPEN
(L63) LEFT REAR TURN LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z906) GROUND CIRCUIT OPEN
LEFT REAR TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Left Turn Signal on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B1644-REAR LEFT TURN LAMP CONTROL CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **CHECK THE (L63) LEFT REAR TURN LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the Left Turn Signal off.
    2. Turn the ignition off.
    3. Disconnect the Left Tail Lamp Assembly C1 harness connector.
    4. Disconnect the TIPM C7 harness connector.
    5. Turn the ignition on.
    6. Measure the voltage between ground and the (L63) Left Rear Turn Lamp Driver circuit.

    Is there any voltage present?

    Yes

    - Repair the short to voltage in the (L63) Left Rear Turn Lamp Driver circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE TIPM FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Reconnect the TIPM C7 harness connector.
    3. Connect a 12-volt test light between the (L63) Left Rear Turn Lamp Driver circuit and the (Z906)

Ground circuit at the Left Tail Lamp Assembly C1 harness connector.

4. Turn the ignition on.
5. Turn the Left Turn Signal on.

Does the test light blink on and off?

Yes

- Replace the Left Rear Turn Signal Bulb in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (L63) LEFT REAR TURN LAMP DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Disconnect the TIPM C7 harness connector.
   3. Measure the resistance of the (L63) Left Rear Turn Lamp Driver circuit between the Left Tail Lamp Assembly C1 harness connector and the TIPM C7 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (L63) Left Rear Turn Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
5. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the open in the (Z906) Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1647-REAR RIGHT TURN LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting turn signal lamp illumination. When this bus message is received, the TIPM provides a pulsed voltage output through the rear turn signal control circuit. The rear turn signal control circuit connects to the dual filament Park and Turn Signal Bulb in the Lamp, Tail Stop Turn. The same ground circuit is used for both the Park and Turn Signal filaments in a dual filament lamp. For additional information on the Turn Signal Lamps operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the turn signal active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low condition on the (L62) Right Rear Turn Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L62) RIGHT REAR TURN LAMP DRIVER CIRCUIT SHORTED TO GROUND
RIGHT REAR TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Right Turn Signal on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B1647-REAR RIGHT TURN LAMP CONTROL CIRCUIT LOW?

    Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **ATTEMPT TO SET THE OPPOSITE DTC**
   1. Turn the Right Turn Signal off.
   2. Turn the ignition off.
   3. Disconnect the Right Tail Lamp Assembly C1 harness connector.
   4. Turn the ignition on.
   5. Turn the Right Turn Signal on.
   6. With the scan tool, read DTC's.

   Does the scan tool display DTC: B1648-REAR RIGHT TURN LAMP CONTROL CIRCUIT HIGH?

   Yes

   - Replace the Right Rear Turn Signal Bulb in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (L62) RIGHT REAR TURN LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the TIPM C7 harness connector.
   3. Measure the resistance between ground and the (L62) Right Rear Turn Lamp Driver circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short to ground in the (L62) Right Rear Turn Lamp Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1648-REAR RIGHT TURN LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting turn signal lamp illumination. When this bus message is received, the TIPM provides a pulsed voltage output through the rear turn signal control circuit. The rear turn signal control circuit connects to the dual filament Park and Turn Signal Bulb in the Lamp, Tail Stop Turn. The same ground circuit is used for both the Park and Turn Signal filaments in a dual filament lamp. For additional information on the Turn Signal Lamps operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the turn signal active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a high condition on the (L62) Right Rear Turn Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L62) RIGHT REAR TURN LAMP DRIVER CIRCUIT OPEN
(L62) RIGHT REAR TURN LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z914) GROUND CIRCUIT OPEN
RIGHT REAR TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Right Turn Signal on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B1648-REAR RIGHT TURN LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE (L62) RIGHT REAR TURN LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
   1. Turn the Right Turn Signal off.
   2. Turn the ignition off.
   3. Disconnect the Right Tail Lamp Assembly C1 harness connector.
   4. Disconnect the TIPM C7 harness connector.
   5. Turn the ignition on.
   6. Measure the voltage between ground and the (L62) Right Rear Turn Lamp Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L62) Right Rear Turn Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE TIPM FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Reconnect the TIPM C7 harness connector.
   3. Connect a 12-volt test light between the (L62) Right Rear Turn Lamp Driver circuit and the (Z914) Ground circuit at the Right Tail Lamp Assembly C1 harness connector.
   4. Turn the ignition on.
   5. Turn the Right Turn Signal on.

   Does the test light blink on and off?

   Yes

   - Replace the Right Rear Turn Signal Bulb in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (L62) RIGHT REAR TURN LAMP DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Disconnect the TIPM C7 harness connector.
   3. Measure the resistance of the (L62) Right Rear Turn Lamp Driver circuit between the Right Tail Lamp Assembly C1 harness connector and the TIPM C7 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5.

      No

      - Repair the open in the (L62) Right Rear Turn Lamp Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
5. **CHECK THE (Z914) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Using a 12-volt test light connected to 12-volts, check the (Z914) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

      - Repair the open in the (Z914) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B165C-PARK LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting park lamp illumination. When this bus message is received, the TIPM provides a voltage output through the park lamp circuits. Two of the park lamp circuits are controlled by the TIPM through a relay. The other circuit is controlled directly by the TIPM. For additional information on the operation of the Park Lamps. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the Park Lamps active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low voltage condition on one of the park lamp voltage supply circuits.

POSSIBLE CAUSES

Possible Causes
(L17) FUSED PARK LAMP RELAY OUTPUT CIRCUIT SHORTED TO GROUND
(L60) RIGHT PARK LAMP DRIVER CIRCUIT SHORTED TO GROUND
(L678) FUSED PARK LAMP RELAY OUTPUT CIRCUIT SHORTED TO GROUND
DAMAGED OR INOPERATIVE LAMP/BULB
AFTERMARKET OR ACCESSORIES
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all TIPM DTC's.
    3. Turn the Park Lamps off and on.
    4. With the scan tool, read the DTC's.

    Does the scan tool display B165C-PARK LAMP CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **ISOLATE THE (L17) FUSED PARK LAMP RELAY OUTPUT CIRCUIT**
    1. Remove Fuse M35 to isolate the (L17) Fused Park Lamp Relay Output circuit.
    2. Turn the Park Lamps off and on.
    3. With the scan tool, read the DTC's.

    Does the scan tool display DTC B165C-PARK LAMP CONTROL CIRCUIT LOW as stored?

    Yes

    - Go To 3.

    No

    - Go To 5.
3. **CHECK THE LAMPS ON THE (L17) FUSED PARK LAMP RELAY OUTPUT CIRCUIT FOR AN INTERNAL SHORT TO GROUND**
    1. Install Fuse M35.
    2. Turn the Park Lamps off and on.
    3. Using the wiring diagrams as a guide, disconnect the harness connector for each lamp on the (L17) Fused Park Lamp Relay Output circuit one at a time while checking for the DTC to become stored.

    Does the DTC change to stored?

    Yes

    - Repair or replace the lamp/bulb that caused the DTC to change to stored in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Go To 4.
4. **CHECK THE (L17) FUSED PARK LAMP RELAY OUTPUT CIRCUIT FOR A SHORT TO GROUND**

Fig. 47: Checking Fused Park Lamp Relay Output Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C5 harness connector.
3. Measure the resistance between ground and the (L17) Fused Park Lamp Relay Output circuit in the TIPM C5 harness connector.

   Is the resistance above 10k Ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short to ground in the (L17) Fused Park Lamp Relay Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **ISOLATE THE (L678) FUSED PARK LAMP RELAY OUTPUT CIRCUIT**
   1. Install Fuse M35.
   2. Remove Fuse J14 to isolate the (L678) Fused Park Lamp Relay Output circuit.
   3. Turn the Park Lamps off and on.
   4. With the scan tool, read the DTC's.

   Does the scan tool display DTC B165C-PARK LAMP CONTROL CIRCUIT LOW as stored?

   Yes

   - Go To 6.

   No

   - Go To 8.

6. **CHECK THE AFTERMARKET, TRAILER TOW, OR ACCESSORIES FOR A SHORT TO GROUND**

   NOTE: **Inspect the connections at any aftermarket, trailer tow, or accessories using the (L678) Fused Park Lamp Relay Output circuit for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. Repair as necessary.**

   1. Install Fuse J14.
   2. Disconnect any aftermarket, trailer tow, or accessories using the (L678) Fused Park Lamp Relay Output circuit.
   3. Turn the Park Lamps off and on.
   4. With the scan tool, read the DTC's.

   Does the scan tool display DTC B165C-PARK LAMP CONTROL CIRCUIT LOW as stored?

   Yes

- The concern is with the aftermarket, trailer tow, or accessories using the (L678) Fused Park Lamp Relay Output circuit. Repair as necessary. Refer to the aftermarket accessories or accessories information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 7.

7. **CHECK THE (L678) FUSED PARK LAMP RELAY OUTPUT CIRCUIT FOR A SHORT TO GROUND**

Fig. 48: Checking Fused Park Lamp Relay Output Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C5 harness connector.
3. Measure the resistance between ground and the (L678) Fused Park Lamp Relay Output circuit in the TIPM C5 harness connector.

   Is the resistance above 10k Ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short to ground in the (L678) Fused Park Lamp Relay Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **CHECK THE LAMPS ON THE (L60) RIGHT PARK LAMP DRIVER CIRCUIT FOR AN INTERNAL SHORT TO GROUND**
   1. Install Fuse J14.
   2. Using the wiring diagrams as a guide, disconnect the harness connector for each lamp or component on the (L60) Right Park Lamp Driver circuit one at a time while checking for the DTC to become stored.

      Does the DTC change to stored?

      Yes

      - Repair or replace the lamp/bulb that caused the DTC to change to stored in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

      - Go To 9.

9. **CHECK THE (L60) RIGHT PARK LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 49: Checking Right Park Lamp Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C7 harness connector.
3. Measure the resistance between ground and the (L60) Right Park Lamp Driver circuit in the TIPM C7 harness connector.

   Is the resistance above 10k Ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short to ground in the (L60) Right Park Lamp Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting fog lamp illumination. When this bus message is received, the TIPM provides a voltage output through the left and right fog lamp control output circuits. Separate ground circuits are used for the Left and Right Front Fog Lamps. For additional information on the Front Fog Lamps operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the fog lamps active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low condition on the (L89) Left Front Fog Lamp Control circuit.

POSSIBLE CAUSES

Possible Causes
(L89) LEFT FRONT FOG LAMP CONTROL CIRCUIT SHORTED TO GROUND
LEFT FRONT FOG LAMP BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Fog Lamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B16F8-FRONT LEFT FOG LAMP CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs

of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the Fog Lamps off.
    2. Turn the ignition off.
    3. Disconnect the Left Front Fog Lamp harness connector.
    4. Turn the ignition on.
    5. Turn the Fog Lamps on.
    6. With the scan tool, read DTC's.

    Does the scan tool display DTC: B16F9-FRONT LEFT FOG LAMP CONTROL CIRCUIT HIGH?

    Yes

    - Replace the Left Front Fog Lamp Bulb in accordance with the Service Information. Refer to **LAMP, FOG, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Go To 3.

3. **CHECK THE (L89) LEFT FRONT FOG LAMP CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 51: Checking Left Front Fog Lamp Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C4 harness connector.
3. Measure the resistance between ground and the (L89) Left Front Fog Lamp Control circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short to ground in the (L89) Left Front Fog Lamp Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting fog lamp illumination. When this bus message is received, the TIPM provides a voltage output through the left and right fog lamp control output circuits. Separate ground circuits are used for the Left and Right Front Fog Lamps. For additional information on the Front Fog Lamps operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the fog lamps active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a high condition on the (L89) Left Front Fog Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L89) LEFT FRONT FOG LAMP CONTROL CIRCUIT OPEN
(L89) LEFT FRONT FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
(Z904) GROUND CIRCUIT OPEN
LEFT FRONT FOG LAMP BULBS
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all TIPM DTC's.
    3. Turn the Front Fog Lamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B16F9-FRONT LEFT FOG LAMP CONTROL CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE (L89) LEFT FRONT FOG LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**

Fig. 53: Checking Left Front Fog Lamp Control Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the Fog Lamps off.
2. Turn the ignition off.
3. Disconnect the Left Front Fog Lamp harness connector.
4. Disconnect the TIPM C4 harness connector.

5. Turn the ignition on.
6. Measure the voltage between ground and the (L89) Left Front Fog Lamp Control circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage on the (L89) Left Front Fog Lamp Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE TIPM FOR CORRECT OPERATION**

Fig. 54: Checking TIPM For Correct Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the TIPM C4 harness connector.
3. Connect a 12-volt test light between the (L89) Left Front Fog Lamp Control circuit and the (Z904) Ground circuit at the Left Front Fog Lamp harness connector.
4. Turn the ignition on.
5. Turn the Fog Lamps on.

   Does the test light illuminate brightly?

   Yes

- Replace the Left Front Fog Lamp Bulb in accordance with the Service Information. Refer to **LAMP, FOG, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (L89) LEFT FRONT FOG LAMP CONTROL CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 55: Checking Left Front Fog Lamp Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C4 harness connector.
3. Measure the resistance of the (L89) Left Front Fog Lamp Control circuit between the Left Front Fog Lamp harness connector and the TIPM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (L89) Left Front Fog Lamp Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (Z904) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 56: Checking Ground Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12-volts, check the (Z904) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

- Repair the open in the (Z904) Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Turn the Fog Lamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B16FC-FRONT RIGHT FOG LAMP CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this

time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **ATTEMPT TO SET THE OPPOSITE DTC**
   1. Turn the Fog Lamps off.
   2. Turn the ignition off.
   3. Disconnect the Right Front Fog Lamp harness connector.
   4. Turn the ignition on.
   5. Turn the Fog Lamps on.
   6. With the scan tool, read DTC's.

   Does the scan tool display DTC: B16FD-FRONT RIGHT FOG LAMP CONTROL CIRCUIT HIGH?

   Yes

   - Replace the Right Front Fog Lamp Bulb in accordance with the Service Information. Refer to **LAMP, FOG, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (L90) RIGHT FRONT FOG LAMP CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 58: Checking Right Front Fog Lamp Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C4 harness connector.
3. Measure the resistance between ground and the (L90) Right Front Fog Lamp Control circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short to ground in the (L90) Right Front Fog Lamp Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

(L90) RIGHT FRONT FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
(Z906) GROUND CIRCUIT OPEN
RIGHT FRONT FOG LAMP BULB
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all TIPM DTC's.
    3. Turn the Front Fog Lamps on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B16FD-FRONT RIGHT FOG LAMP CONTROL CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE (L90) RIGHT FRONT FOG LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**

Fig. 60: Checking Right Front Fog Lamp Control Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the Fog Lamps off.
2. Turn the ignition off.
3. Disconnect the Right Front Fog Lamp harness connectors.
4. Disconnect the TIPM C4 harness connector.

5. Turn the ignition on.
6. Measure the voltage between ground and the (L90) Right Front Fog Lamp Control circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage on the (L90) Right Front Fog Lamp Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE TIPM FOR CORRECT OPERATION**

Fig. 61: Checking TIPM For Correct Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the TIPM C4 harness connector.
3. Connect a 12-volt test light between the (L90) Right Front Fog Lamp Control circuit and the (Z906) Ground circuit at the Right Front Fog Lamp harness connector.
4. Turn the ignition on.
5. Turn the Fog Lamps on.

   Does the test light illuminate brightly?

   Yes

   - Replace the Right Front Fog Lamp Bulb in accordance with the Service Information. Refer to **LAMP, FOG, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (L90) RIGHT FRONT FOG LAMP CONTROL CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 62: Checking Right Front Fog Lamp Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C4 harness connector.

3. Measure the resistance of the (L90) Right Front Fog Lamp Control circuit between the Right Front Fog Lamp harness connector and the TIPM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (L90) Right Front Fog Lamp Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 63: Checking Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Repair the open in the (Z906) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B17AE-REAR LEFT TRAILER TURN LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting turn signal lamp illumination. When this bus message is received, the TIPM provides a pulsed voltage output through the trailer tow turn signal control circuit. For additional information on the Trailer Tow Wiring operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the turn signal active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low condition on the (L655) Left Rear Turn Signal Control circuit.

POSSIBLE CAUSES

Possible Causes
(L655) LEFT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO GROUND TRAILER TOW CONNECTOR TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Make sure any aftermarket or trailer tow accessories are disconnected from the trailer tow connector.

1. Turn the ignition on.
2. With the scan tool, clear all DTC's.
3. Turn on the Left Turn Signal.
4. With the scan tool, read DTC's.

   Does the scan tool display DTC: B17AE-REAR LEFT TRAILER TURN LAMP CONTROL CIRCUIT LOW?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE (L655) LEFT REAR TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS**

Fig. 64: Checking Left Rear Turn Signal Control Circuit For A Short
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C7 harness connector.
3. Disconnect the Trailer Tow 7-Way Wiring harness connector.
4. Measure the resistance between ground and the (L655) Left Rear Turn Signal Control circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3.

   No

- Repair the short to ground in the (L655) Left Rear Turn Signal Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **CHECK THE TRAILER TOW CONNECTOR FOR AN INTERNAL SHORT TO GROUND**

NOTE: This measurement is taken at the Trailer Tow Connector used by the customer. Use the diagram on the Trailer Tow Connector cover to determine the correct terminal.

1. Reconnect the Trailer Tow 7-Way Wiring harness connector.
2. Measure the resistance between ground and the (L655) Left Rear Turn Signal Control circuit at the appropriate terminal in the Trailer Tow Connector.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace the Trailer Tow Connector in accordance with the Service Information. Refer to **CONNECTOR, TRAILER TOW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B17B2-REAR RIGHT TRAILER TURN LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a bus message requesting turn signal lamp illumination. When this bus message is received, the TIPM provides a pulsed voltage output through the trailer tow turn signal control circuit. For additional information on the Trailer Tow Wiring operation. Refer to **EXTERIOR LIGHTING - OPERATION** .

WHEN MONITORED:

With the turn signal active.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects a low condition on the (L656) Right Rear Turn Signal Control circuit.

POSSIBLE CAUSES

Possible Causes
(L656) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO GROUND TRAILER TOW CONNECTOR TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Make sure any aftermarket or trailer tow accessories are disconnected from the Trailer Tow Connector.

   1. Turn the ignition on.
   2. With the scan tool, clear all DTC's.
   3. Turn on the Right Turn Signal.
   4. With the scan tool, read DTC's.

   Does the scan tool display DTC: B17B2-REAR RIGHT TRAILER TURN LAMP CONTROL CIRCUIT LOW?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE (L656) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS**

Fig. 65: Checking Right Rear Turn Signal Control Circuit For A Short
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C7 harness connector.
3. Disconnect the Trailer Tow 7-Way Wiring harness connector.
4. Measure the resistance between ground and the (L656) Right Rear Turn Signal Control circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3.

   No

- Repair the short to ground in the (L656) Right Rear Turn Signal Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **CHECK THE TRAILER TOW CONNECTOR FOR AN INTERNAL SHORT TO GROUND**

NOTE: This measurement is taken at the Trailer Tow Connector used by the customer. Use the diagram on the Trailer Tow Connector cover to determine the correct terminal.

1. Reconnect the Trailer Tow 7-Way Wiring harness connector.
2. Measure the resistance between ground and the (L656) Right Rear Turn Signal Control circuit at the appropriate terminal in the Trailer Tow Connector.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace the Trailer Tow Connector in accordance with the Service Information. Refer to **CONNECTOR, TRAILER TOW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1801-DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW

Fig. 66: Door Lock/Unlock Switch Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects that the Driver Door Unlock Driver circuit voltage is lower than the threshold value for more than five seconds.

POSSIBLE CAUSES

Possible Causes
(P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT SHORTED TO GROUND
DRIVER DOOR LATCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase DTC's.
    2. Operate the Driver Door Lock Switch in all positions several times.
    3. Cycle the ignition from on to off.
    4. Turn the ignition on.
    5. With the scan tool, read DTC's.

    Does the scan tool display B1801-DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **CHECK THE DRIVER DOOR LATCH FOR AN INTERNAL SHORT**
    1. With the scan tool, erase DTC's.
    2. Turn the ignition off.
    3. Disconnect the Driver Door Latch harness connector.
    4. Turn the ignition on.
    5. With the scan tool, read DTC's.

Does the scan tool display B1801-DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW as active?

Yes

- Go To 3.

No

- Replace the Driver Door Latch in accordance with the Service Information. Refer to **LATCH, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **CHECK THE (P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 67: Checking Driver Door Unlock Driver Circuit For A Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C6 harness connector.
3. Measure the resistance between ground and the (P1) Driver Door Unlock Driver circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Repair the short to ground in the (P1) Driver Door Unlock Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1806-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW

Fig. 68: Door Lock/Unlock Switch Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects that the Passenger Door Unlock Driver circuit voltage is lower than the threshold value for more than five seconds.

POSSIBLE CAUSES

Possible Causes
(P4) PASSENGER DOOR UNLOCK DRIVER CIRCUIT SHORTED TO GROUND
PASSENGER DOOR LATCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase DTC's.
    2. Operate the Passenger Door Lock Switch in all positions several times.
    3. Cycle the ignition from on to off.
    4. Turn the ignition on.
    5. With the scan tool, read DTC's.

    Does the scan tool display B1806-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **CHECK THE PASSENGER DOOR LATCH FOR A SHORT**
    1. With the scan tool, erase DTC's.
    2. Turn the ignition off.
    3. Disconnect the Passenger Door Latch harness connector.
    4. Turn the ignition on.
    5. With the scan tool, read DTC's.

Does the scan tool display B1806-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW as active?

Yes

- Go To 3.

No

- Replace the Passenger Door Latch in accordance with the Service Information. Refer to **LATCH, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **CHECK THE (P4) PASSENGER DOOR UNLOCK DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 69: Checking Passenger Door Unlock Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C5 harness connector.
3. Measure the resistance between ground and the (P4) Passenger Door Unlock Driver circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short to ground in the (P4) Passenger Door Unlock Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1820-HOOD AJAR INPUT CIRCUIT HIGH

MODULE-
TOTALLY
INTEGRATED
POWER C4

SWITCH-
HOOD
AJAR

Fig. 70: Hood Ajar Switch Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects and open or short to voltage on the Hood Ajar Switch Sense circuit for over 10 seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
(G70) HOOD AJAR SWITCH SENSE CIRCUIT OPEN
(G931) SENSOR RETURN CIRCUIT OPEN
(G70) HOOD AJAR SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
HOOD AJAR SWITCH OPEN
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Open the hood and make sure the Hood Ajar Switch is connected before proceeding.

   1. With the scan tool, record and erase DTC's.
   2. Close the hood.
   3. Cycle the ignition from on to off.
   4. Turn the ignition on.
   5. Open then close the hood.
   6. With the scan tool, read DTC's.

   Does the scan tool display B1820-HOOD AJAR INPUT CIRCUIT HIGH?

   Yes

   - Go To 2.

   No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE HOOD AJAR SWITCH**
   1. Turn the ignition off.
   2. Open the hood.
   3. Disconnect the Hood Ajar Switch harness connector.
   4. For vehicles with a plunger type Hood Ajar Switch, depress the switch plunger. For vehicles with the Hood Ajar Switch integral to the Hood Latch, manually rotate the Hood Latch into the closed position.
   5. Measure the resistance between the (G70) Hood Ajar Switch Sense circuit and the (G931) Sensor Return circuit at the component.

      Is the resistance approximately 1k Ohms?

      Yes

      - Go To 3.

      No

      - For vehicles with a plunger-type Hood Ajar Switch, replace the Hood Ajar Switch in accordance with the Service Information. Refer to **SWITCH, HOOD AJAR, REMOVAL** . For vehicles with the Hood Ajar Switch integral to the Hood Latch, replace the Hood Latch in accordance with the Service Information. Refer to **LATCH, HOOD, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **CHECK THE (G70) HOOD AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**

Fig. 71: Checking Hood Ajar Switch Sense Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the TIPM C4 harness connector.
2. Turn the ignition on.
3. Measure the voltage between ground and the (G70) Hood Ajar Switch Sense circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (G70) Hood Ajar Switch Sense circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

- Go To 4.

4. **CHECK THE (G70) HOOD AJAR SWITCH SENSE CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 72: Checking Hood Ajar Switch Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance of the (G70) Hood Ajar Switch Sense circuit between the TIPM C4 harness connector and the Hood Ajar Switch harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (G70) Hood Ajar Switch Sense circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (G931) SENSOR RETURN CIRCUIT FOR AN OPEN**

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G931) Sensor Return circuit between the TIPM C4 harness connector and the Hood Ajar Switch harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Repair the open in the (G931) Sensor Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1934-DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK

Fig. 74: Door Lock/Unlock Switch Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects that the Driver Door Unlock Driver circuit voltage does not change for more than 10 seconds.

POSSIBLE CAUSES

Possible Causes
(P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT OPEN
(P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT SHORTED VOLTAGE
DRIVER DOOR LATCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Make sure the Driver Door Lock Switch is not stuck in one position. Clean or repair as necessary.

   1. With the scan tool, record and erase DTC's.
   2. Operate the Driver Door Lock Switch in all positions several times.
   3. Cycle the ignition from on to off.
   4. Turn the ignition on.
   5. With the scan tool, read DTC's.

      Does the scan tool display B1934-DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE DRIVER DOOR LATCH FOR AN INTERNAL SHORT**
   1. With the scan tool, erase DTC's.

2. Turn the ignition off.
3. Disconnect the Driver Door Latch harness connector.
4. Turn the ignition on.
5. Operate the Driver Door Lock Switch in all positions several times.
6. With the scan tool, read DTC's.

   Does the scan tool display B1934-DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK?

   Yes

   - Go To 3.

   No

   - Replace the Driver Door Latch in accordance with the Service Information. Refer to **LATCH, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **CHECK THE (P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 75: Checking Driver Door Unlock Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C6 harness connector.
3. Turn the ignition on.
4. Measure the voltage between ground and the (P1) Driver Door Unlock Driver circuit in the Driver Door Latch harness connector.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (P1) Driver Door Unlock Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT FOR AN OPEN**

LATCH-
DOOR-
DRIVER

MODULE-
TOTALLY

Fig. 76: Checking Driver Door Unlock Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance of the (P1) Driver Door Unlock Driver circuit between the Driver Door Latch harness connector and the TIPM C6 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Repair the open in the (P1) Driver Door Unlock Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1935-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK

Fig. 77: Door Lock/Unlock Switch Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects that the Passenger Door Unlock Driver circuit voltage does not change for more than 10 seconds.

POSSIBLE CAUSES

Possible Causes
(P4) PASSENGER DOOR UNLOCK DRIVER CIRCUIT OPEN
(P4) PASSENGER DOOR UNLOCK DRIVER CIRCUIT SHORTED VOLTAGE
PASSENGER DOOR LATCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Make sure the Passenger Door Lock Switch is not stuck in one position. Clean or repair as necessary.

   1. With the scan tool, record and erase DTC's.
   2. Operate the Passenger Door Lock Switch in all positions several times.
   3. Cycle the ignition from on to off.
   4. Turn the ignition on.
   5. With the scan tool, read DTC's.

      Does the scan tool display B1935-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE PASSENGER DOOR LATCH FOR AN INTERNAL SHORT**
   1. With the scan tool, erase DTC's.

2. Turn the ignition off.
3. Disconnect the Passenger Door Latch harness connector.
4. Turn the ignition on.
5. Operate the Passenger Door Lock Switch in all positions several times.
6. With the scan tool, read DTC's.

   Does the scan tool display B1935-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK?

   Yes

   - Go To 3.

   No

   - Replace the Passenger Door Latch in accordance with the Service Information. Refer to **LATCH, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **CHECK THE (P4) PASSENGER DOOR UNLOCK DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 78: Checking Passenger Door Unlock Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C5 harness connector.
3. Turn the ignition on.
4. Measure the voltage between ground and the (P4) Passenger Door Unlock Driver circuit in the Passenger Door Latch harness connector.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (P4) Passenger Door Unlock Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (P4) PASSENGER DOOR UNLOCK DRIVER CIRCUIT FOR AN OPEN**

Fig. 79: Checking Passenger Door Unlock Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance of the (P4) Passenger Door Unlock Driver circuit between the Passenger Door Latch harness connector and the TIPM C5 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Repair the open in the (P4) Passenger Door Unlock Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW

Fig. 80: Adjustable Pedal Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Vehicle is not in reverse.

Cruise control is not active.

SET CONDITION:

If the Totally Integrated Power Module (TIPM) detects a low voltage condition on the (A128) Adjustable Pedals Motor Driver circuit.

POSSIBLE CAUSES

Possible Causes
(A128) ADJUSTABLE PEDALS MOTOR DRIVER CIRCUIT SHORTED TO GROUND
(A128) ADJUSTABLE PEDALS MOTOR DRIVER CIRCUIT SHORTED TO THE (P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT
(A128) ADJUSTABLE PEDALS MOTOR DRIVER CIRCUIT SHORTED TO THE (Z910) GROUND CIRCUIT
(A128) ADJUSTABLE PEDALS MOTOR DRIVER CIRCUIT SHORTED TO THE (P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT
ADJUSTABLE PEDALS SWITCH
ADJUSTABLE PEDALS MOTOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Look closely at the temperatures at which this Diagnostic Trouble Code (DTC) set. Low battery Voltage can also cause excessive current draw in very hot and very cold ambient temperatures. Make sure the battery can pass a load test before continuing.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTC's).
   3. Cycle the ignition from on to off.
   4. Turn the ignition on.
   5. Operate the Adjustable Pedals switch in both positions.

6. With the scan tool, read the TIPM DTC's.

   Is the DTC Active at this time?

   Yes

   - Go To 2.

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors. Look for the data to change or for the code to reset during the wiggle test.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK FOR AN ACTIVE DTC WITH THE ADJUSTABLE PEDALS MOTOR DISCONNECTED**
   1. Turn the ignition off.
   2. Disconnect the Adjustable Pedals Motor harness connector.
   3. Turn the ignition on.
   4. Operate the Adjustable Pedals switch in both positions.
   5. With the scan tool, read the TIPM DTC's.

      Is the DTC Active at this time?

      Yes

      - Go To 3.

      No

      - Replace the Adjustable Pedals Motor in accordance with the Service Information. Refer to **MOTOR, ADJUSTABLE PEDALS, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **CHECK FOR A SHORTED ADJUSTABLE PEDALS SWITCH**

Fig. 81: Checking For A Shorted Adjustable Pedals Switch
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Adjustable Pedals Switch harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Remove the Adjustable Pedals Switch in accordance with the Service Information. Refer to **SWITCH, ADJUSTABLE PEDALS, REMOVAL** .

NOTE: Adjustable Pedals Switch harness connector shown in illustration.

Mirror image for Adjustable Pedals Switch component connector.

4. Measure the resistance between the (A128) Adjustable Pedals Motor Driver circuit and the (P205) Adjustable Pedals Motor Forward circuit at the Adjustable Pedals Switch component connector.
5. Measure the resistance between the (A128) Adjustable Pedals Motor Driver circuit and the (Z910) Ground circuit at the Adjustable Pedals Switch component connector.
6. Measure the resistance between the (A128) Adjustable Pedals Motor Driver circuit and the (P206) Adjustable Pedals Motor Rearward circuit at the Adjustable Pedals Switch component connector.

   Is the resistance below 10k Ohms for any measurement?

   Yes

   - Replace the Adjustable Pedals Switch in accordance with the Service Information. Refer to **SWITCH, ADJUSTABLE PEDALS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK (A128) ADJUSTABLE PEDALS MOTOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 82: Checking Adjustable Pedals Motor Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the TIPM C7 connector.

   NOTE: Check connectors. Clean and repair as necessary.

2. Measure the resistance of the (A128) Adjustable Pedals Motor Driver circuit between ground and the Adjustable Pedal Switch harness connector.

   Is the resistance below 10k Ohms?

   Yes

- Repair the short to ground in the (A128) Adjustable Pedals Motor Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK (A128) ADJUSTABLE PEDALS MOTOR DRIVER CIRCUIT FOR A SHORT TO (P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT, (Z910) GROUND CIRCUIT, OR TO (P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT**

Fig. 83: Checking For A Shorted Adjustable Pedals Switch
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (A128) Adjustable Pedals Motor Driver circuit and the (P205) Adjustable Pedals Motor Forward circuit at the Adjustable Pedals Switch harness connector.
2. Measure the resistance between the (A128) Adjustable Pedals Motor Driver circuit and the (Z910) Ground circuit at the Adjustable Pedals Switch harness connector.
3. Measure the resistance between the (A128) Adjustable Pedals Motor Driver circuit and the (P206) Adjustable Pedals Motor Rearward circuit at the Adjustable Pedals Switch harness connector.

   Is the resistance below 10k Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10k Ohms for a short to the (A128) Adjustable Pedals Motor Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) monitors the hardwired ignition switch output circuit from the ignition switch or Wireless Ignition Node (WIN) and compares it to the ignition switch status message received over the Controller Area Network (CAN) bus.

WHEN MONITORED:

With the ignition switch on.

SET CONDITION:

The TIPM has detected that the hardwired ignition switch input voltage from the Wireless Ignition Node (WIN) indicates that the ignition switch is in the off position, but the CAN bus message indicates that the ignition switch is the run position.

POSSIBLE CAUSES

Possible Causes
(F20) IGNITION RUN/START CONTROL OUTPUT CIRCUIT SHORTED TO GROUND WIRELESS IGNITION NODE (WIN) TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

NOTE: **Check to make sure the battery and charging system are operating properly. Battery and/or charging system problems may cause these DTC's to set.**

NOTE: **Diagnose any related Powertrain DTC(s) before continuing.**

1. Turn the ignition on.
2. With the scan tool, read TIPM DTC(s).

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE (F20) IGNITION RUN/START CONTROL OUTPUT CIRCUIT AT THE TIPM**

Fig. 85: Measure Voltage AT TIPM
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C7 harness connector.

3. Turn the ignition on.
4. Measure the voltage between ground and the (F20) Ignition Run/Start Control Output circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (F20) IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR A SHORT TO GROUND**

Fig. 86: Checking Ignition Run/Start Control Output Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the WIN harness connector.
3. Measure the resistance between ground and the (F20) Ignition Run/Start Control Output circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the WIN in accordance with the Service Information. Refer to **RECEIVER,**

WIRELESS IGNITION NODE, REMOVAL .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short to ground in the (F20) Ignition Run/Start Control Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) monitors the hardwired ignition switch output circuit from the ignition switch or Wireless Ignition Node (WIN) and compares it to the ignition switch status message received over the Controller Area Network (CAN) bus.

WHEN MONITORED:

With the ignition switch on.

SET CONDITION:

The TIPM has detected that the hardwired ignition switch input voltage from the Wireless Ignition Node (WIN) indicates that the ignition switch is in the run position, but the CAN bus message indicates that the ignition switch is the off position.

POSSIBLE CAUSES

Possible Causes
(F20) IGNITION RUN/START CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE
WIRELESS IGNITION NODE (WIN)
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

NOTE: **Check to make sure the battery and charging system are operating properly. Battery and/or charging system problems may cause these DTC's to set.**

NOTE: **Diagnose any related Powertrain DTC(s) before continuing.**

1. Turn the ignition on.
2. Using the scan tool, read TIPM DTC(s).

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE (F20) IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR A SHORT TO BATTERY VOLTAGE**

Fig. 88: Checking Ignition Run/Start Control Output Circuit For A Short To Battery Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C7 harness connector.
3. Disconnect the WIN harness connector.
4. Measure the voltage between ground and the (F20) Ignition Run/Start Control Output circuit in the WIN harness connector.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (F20) Ignition Run/Start Control Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE WIN FOR AN INTERNAL SHORT TO VOLTAGE**

Fig. 89: Checking WIN For An Internal Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the WIN harness connector.
2. Measure the voltage between ground and the (F20) Ignition Run/Start Control Output circuit in the TIPM C7 harness connector.

   Is there any voltage present?

   Yes

- Replace the WIN in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B210D-BATTERY VOLTAGE LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

Battery voltage less than 9 volts for approximately five to six seconds.

POSSIBLE CAUSES

Possible Causes
RESISTANCE IN THE BATTERY POSITIVE CIRCUIT
RESISTANCE IN THE GENERATOR CASE GROUND
GENERATOR OPERATION
GROUND CIRCUIT OPEN
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **CHECK FOR ANY POWERTRAIN CONTROL MODULES DTC's**

NOTE: **Make sure the Battery is in good condition. Refer to BATTERY SYSTEM - DIAGNOSIS AND TESTING and perform the Battery System diagnostic procedure.**

NOTE: **Inspect the vehicle for after market accessories that may exceed the Generator System output.**

NOTE: **Make sure the generator drive belt is in good operating condition.**

NOTE: **Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.**

1. Turn the ignition on.
2. With the scan tool, read active PCM DTC's.

   Does the scan tool display any active PCM DTC's?

   Yes

   - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic test procedure.

   No

   - Check the above conditions that can cause a low voltage condition. Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B210E-BATTERY VOLTAGE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

Battery voltage greater than 16 volts for approximately five to six seconds.

POSSIBLE CAUSES

Possible Causes
GENERATOR OPERATION
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **CHECK FOR ANY POWERTRAIN CONTROL MODULES DTC's**

   NOTE: **Make sure the Battery is in good condition. Refer to BATTERY SYSTEM - DIAGNOSIS AND TESTING and perform the Battery System diagnostic procedure.**

NOTE: **Inspect the vehicle for after market accessories that may exceed the Generator System output.**

NOTE: **Make sure the generator drive belt is in good operating condition.**

NOTE: **Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.**

1. Turn the ignition on.
2. With the scan tool, read active PCM DTC's.

   Does the scan tool display any active PCM DTC's?

   Yes

   - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic test procedure.

   No

   - Check the above conditions that can cause a high voltage condition. Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B212F-IGNITION RUN/ACC CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When the ignition is in the accessory or on position, the Totally Integrated Power Module (TIPM) energizes the Run/Accessory Relay. The TIPM internally grounds the coil for the Run/Accessory Relay.

WHEN MONITORED:

With the ignition on.

Battery voltage greater than 10 volts.

With the Run/Accessory Relay commanded on.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects a short to ground in the internal Run/Accessory Relay

Control circuit.

POSSIBLE CAUSES

Possible Causes
RUN/ACCESSORY RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: B212F-IGNITION RUN/ACC CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **RUN/ACCESSORY RELAY**
    1. Turn the ignition off.
    2. Remove the Run/Accessory Relay and substitute it with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, clear all DTC's.
    5. Turn the ignition off.
    6. Turn the ignition on.
    7. With the scan tool, read DTC's.

    Does the scan tool display DTC: B212F-IGNITION RUN/ACC CONTROL CIRCUIT LOW?

    Yes

    - Go To 3.

No

- Replace the Run/Accessory Relay.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **TOTALLY INTEGRATED POWER MODULE**

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

1. Using the schematics as a guide, inspect the wire harness and connectors.
2. Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B2142-IGNITION OFF DRAW (IOD) FUSE NOT PRESENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is disconnected within the Totally Integrated Power Module (TIPM) when the vehicle is shipped from the factory. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the off position.

WHEN MONITORED:

With the Ignition on.

Odometer reading is less than 80.5 km (50 mi).

SET CONDITION:

Ignition Off Draw (IOD) Fuse not installed or blown in the Totally Integrated Power Module (TIPM).

POSSIBLE CAUSES

Possible Causes
IOD FUSE NOT PRESENT
IOD FUSE OPEN

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

   NOTE: If the odometer reading is greater than 80.5 km (50 mi), DTC B219F sets instead of B2142 when the IOD fuse cannot be detected.

   1. With the scan tool, record and erase DTC's.
   2. Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.
   3. With the scan tool, read the active DTC's.

   Does the scan tool display DTC: B2142-IGNITION OFF DRAW (IOD) FUSE NOT PRESENT?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
2. **VERIFY THE IOD FUSE IS INSTALLED**
   1. Verify the IOD Fuse is installed in the TIPM.

   Is the IOD Fuse present?

   Yes

   - Go To 3.

   No

   - Install the IOD Fuse.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
3. **CHECK FOR A OPEN IOD FUSE**
   1. Check if the IOD Fuse is open.

   Is the IOD Fuse blown?

Yes

- Using the wiring diagrams, diagnose the cause of the short to ground condition. Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Test complete.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B219A-IGNITION UNLOCK RUN/START CONTROL CIRCUIT OVERCURRENT

Fig. 90: Ignition Unlock Run/Start Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

The Totally Integrated Power Module (TIPM) sets this code when a short to ground condition exists in the (F1) Ignition Off/Run/Start Control Output circuit.

POSSIBLE CAUSES

Possible Causes
(F1) IGNITION OFF/RUN/START CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
POWERTRAIN CONTROL MODULE (PCM)
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. With the scan tool, read the active DTC.
    2. Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.
    3. With the scan tool, read the active DTC.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Turn the ignition off.
    2. Disconnect the PCM C1 or C2 (6.7L) harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTC's.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3.

    No

- Replace the PCM in accordance with the Service Information. Refer to **3.7L, 4.7L & 5.7L - MODULE, POWERTRAIN CONTROL, REMOVAL** or **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
- Perform the appropriate POWERTRAIN VERIFICATION TEST. Refer to **1500 & 2500 - 3.7L, 4.7L & 5.7L - POWERTRAIN VERIFICATION TEST** or **2500 & 3500 - POWERTRAIN VERIFICATION TEST - 6.7L** or **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** .

3. **(F1) IGNITION OFF/RUN/START CONTROL OUTPUT CIRCUIT SHORTED TO GROUND**

Fig. 91: Checking Ignition Off/Run/Start Control Output Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the TIPM C1 harness connector.
3. Measure the resistance between ground and the (F1) Ignition Off/Run/Start Control Output circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (F1) Ignition Off/Run/Start Control Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B219F-IGNITION OFF DRAW (IOD) FUSE BLOWN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is disconnected within the Totally Integrated Power Module (TIPM) when the vehicle is shipped from the factory. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the off position.

WHEN MONITORED:

With the Ignition on.

Odometer reading is greater than 80.5 km (50 mi).

SET CONDITION:

Ignition Off Draw (IOD) Fuse not installed or open in the Totally Integrated Power Module (TIPM).

POSSIBLE CAUSES

Possible Causes
IOD FUSE NOT PRESENT
IOD FUSE OPEN

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. With the scan tool, record and erase DTC's.
    2. Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.
    3. With the scan tool, read the active DTC's.

    Does the scan tool display DTC: B219F-IGNITION OFF DRAW (IOD) FUSE BLOWN?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
2. **VERIFY THE IOD FUSE IS INSTALLED**
    1. Verify the IOD Fuse is installed in the TIPM.

    Is the IOD Fuse present?

    Yes

    - Go To 3.

    No

    - Install the IOD Fuse.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
3. **CHECK FOR A OPEN IOD FUSE**
    1. Check if the IOD Fuse is open.

    Is the IOD Fuse blown?

    Yes

    - Using the wiring diagrams, diagnose the cause of the short to ground condition. Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Test complete.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B2206-CURRENT VIN MISSING / MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) transmits the Vehicle Identification Number (VIN) as a network message on the CAN C bus. The Totally Integrated Power Module (TIPM) receives and stores the VIN.

WHEN MONITORED:

With the ignition on.

SET CONDITION:

The current VIN message from the PCM is different than the VIN stored in the TIPM.

POSSIBLE CAUSES

Possible Causes
PCM FROM ANOTHER VEHICLE INSTALLED

DIAGNOSTIC TEST

1. **PCM FROM ANOTHER VEHICLE INSTALLED**

   NOTE: This DTC is set when a PCM from another vehicle is installed into the current vehicle.

   Has another PCM been installed?

   Yes

   - Replace the PCM in accordance with the Service Information. Refer to **3.7L, 4.7L & 5.7L - MODULE, POWERTRAIN CONTROL, REMOVAL** or **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 2.
2. **OTHER CAN-C MODULES SET VIN MISMATCH**

   Is the VIN Mismatch DTC set in other CAN-C modules?

   Yes

- Replace the PCM in accordance with the Service Information. Refer to **3.7L, 4.7L & 5.7L - MODULE, POWERTRAIN CONTROL, REMOVAL** or **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B2215-FRONT CONTROL MODULE INTERNAL (TOTALLY INTEGRATED POWER MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) performs an internal self test. The repair of this fault condition does not involve any external circuitry and centers on verifying the integrity of the internal circuitry and software validity.

WHEN MONITORED:

Continuously.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects an internal fault.

POSSIBLE CAUSES

Possible Causes
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **REPLACE THE TIPM IF THE DTC IS ACTIVE**
    1. With the scan tool, read the active DTC's.

       Does the scan tool display this DTC as active?

       Yes

       - Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B222C-VEHICLE CONFIGURATION NOT PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The same Totally Integrated Power Module (TIPM) for a vehicle can be used with different market and vehicle content applications. In order for the TIPM to function properly, the vehicle configuration information must be correctly programmed into the module when the module is replaced.

WHEN MONITORED:

With the ignition on.

SET CONDITION:

The Totally Integrated Power Module (TIPM) is not configured correctly to the vehicle.

POSSIBLE CAUSES

Possible Causes
TIPM NOT CONFIGURED CORRECTLY TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. With the scan tool, read the active DTC's.
    2. Cycle the ignition switch from off to on at least five times, leaving the ignition on for a minimum of 90 seconds per cycle.
    3. With the scan tool, read the active DTC's.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2.

    No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CONFIGURE THE TIPM TO THE VEHICLE**
    1. With the scan tool, enter program network configuration and program the TIPM to the vehicle configuration.
    2. With the scan tool, erase TIPM DTC's.
    3. Cycle the ignition switch from off to on at least five times, leaving the ignition on for a minimum of 90 seconds per cycle.
    4. With the scan tool, read the active DTC's.

    Does the scan tool display this DTC as active?

    Yes

    - Inspect the wiring and connectors for damage or shorted circuits. If OK, replace and program the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Repair is complete.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Front Wiper operating in Low Speed or Intermittent mode.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects a short to ground on the Wiper Park Switch Sense circuit.

POSSIBLE CAUSES

Possible Causes
(W7) WIPER PARK SWITCH SENSE CIRCUIT SHORTED TO GROUND
WIPER MOTOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Cycle the Wiper Switch on and off three times.
    4. With the scan tool, read DTC's.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **FRONT WIPER MOTOR**
    1. Turn the ignition off.
    2. Disconnect the Front Wiper Motor harness connector.

3. Turn the ignition on.
4. Wait 30 seconds.
5. With the scan tool, read the Front Wiper Park Switch Sense.

   Does the Front Wiper Park Switch Sense display: Not Parked?

   Yes

   - Replace the Wiper Motor in accordance with the Service Information. Refer to **MOTOR, WIPER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK (W7) WIPER PARK SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 93: Checking Wiper Park Switch Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C7 harness connector.
3. Measure the resistance between ground and the (W7) Front Wiper Park Sense Circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repair the short to ground in the (W7) Wiper Park Switch Sense circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Front Wiper operating in Low Speed or Intermittent mode.

SET CONDITION:

The Totally Integrated Power Module (TIPM) does not detect a change from High to Low voltage on the Wiper Park Switch Sense Circuit.

POSSIBLE CAUSES

Possible Causes
(W7) WIPER PARK SWITCH SENSE CIRCUIT OPEN
(W7) WIPER PARK SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
FRONT WIPER MOTOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. Cycle the Wiper Switch on and off three times.
    4. With the scan tool, read DTC's.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **CHECK THE (W7) WIPER PARK SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 95: Checking Wiper Park Switch Sense Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Front Wiper Motor harness connector.
3. Disconnect the TIPM C7 harness connector.
4. Turn the ignition on.
5. Measure the voltage between ground and the (W7) Wiper Park Switch Sense circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (W7) Wiper Park Switch Sense circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE FRONT WIPER MOTOR**

Fig. 96: Checking Front Wiper Motor
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Reconnect the TIPM C7 harness connector.
3. Turn the ignition on.
4. Connect a jumper wire between the (W7) Wiper Park Switch Sense circuit and ground.
5. With the scan tool, read the Front Wiper Park Switch Sense.

   Does the Front Wiper Park Switch Sense display: Parked?

   Yes

   - Replace the Wiper Motor in accordance with the Service Information. Refer to **MOTOR, WIPER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK (W7) WIPER PARK SWITCH SENSE CIRCUIT FOR AN OPEN**

MOTOR-
WIPER-
FRONT

MODULE-
TOTALLY

Fig. 97: Checking Wiper Park Switch Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C7 harness connector.
3. Measure the resistance of the (W7) Wiper Park Switch Sense circuit between the Front Wiper Motor harness connector and the TIPM C7 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Repair the open in the (W7) Wiper Park Switch Sense circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

C1008-BRAKE FLUID LEVEL CIRCUIT HIGH

SENSOR-
BRAKE
FLUID
LEVEL

Fig. 98: Brake Fluid Level Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects the Brake Fluid Level Circuit voltage is greater than expected for more than five seconds.

POSSIBLE CAUSES

Possible Causes
(B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT OPEN
(B20) BRAKE FLUID LEVEL SIGNAL SHORTED TO BATTERY VOLTAGE
(Z907) GROUND CIRCUIT OPEN
BRAKE FLUID LEVEL SENSOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read the TIPM DTC's.

       Does the scan tool display this DTC as active?

       Yes

       - Go To 2.

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **CHECK THE (B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**

Fig. 99: Checking Brake Fluid Level Sensor For A Short To Voltage In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Brake Fluid Level Sensor harness connector.
3. Disconnect the TIPM C7 harness connector.
4. Turn the ignition on.
5. Measure the voltage between ground and the (B20) Brake Fluid Level Signal circuit.

   Is there any voltage present?

   Yes

- Repair the short to voltage in the (B20) Brake Fluid Level Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 100: Checking Brake Fluid Level Signal Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance of the (B20) Brake Fluid Level Signal circuit between the Brake Fluid Level Sensor harness connector and the TIPM C7 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4.

   No

   - Repair the open in the (B20) Brake Fluid Level Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. **CHECK THE (Z907) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**

Fig. 101: Checking Ground Circuit For An Open In The Harness
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12-volts, check the (Z907) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 5.

   No

   - Repair the open in the (Z907) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE TIPM FOR CORRECT OPERATION**

Fig. 102: Checking Brake Fluid Level Sensor Operation
Courtesy of CHRYSLER GROUP, LLC

1. Connect a jumper wire between the (B20) Brake Fluid Level Signal circuit and the (Z907) Ground circuit in the Brake Fluid Level Switch harness connector.
2. Turn the ignition on.
3. With the scan tool, read the Brake Fluid Level Voltage.

   Is the voltage below 1.0 volt?

Yes

- Replace the Brake Fluid Level Switch.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

C1404-TRANSFER CASE RANGE POSITION SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on.

Battery voltage between 9.0 and 16.0 volts.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects a short to ground on the Mode Sensor A circuit for more than five seconds.

POSSIBLE CAUSES

Possible Causes
(D201) MODE SENSOR A CIRCUIT SHORTED TO GROUND
(D201) MODE SENSOR A CIRCUIT SHORTED TO THE (K91) SENSOR GROUND CIRCUIT (POWER WAGON)
TRANSFER CASE SELECTOR SWITCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Start the engine and allow it to idle.
    2. Move the Transfer Case Lever to each position several times.
    3. With the scan tool, read the DTC's.

       Is the status Active for this DTC?

       Yes

       - Go To 3.

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **ATTEMPT TO SET THE OPPOSITE DTC**

1. Turn the ignition off.
2. Disconnect the Transfer Case Selector Switch harness connector.
3. Turn the ignition on.
4. With the scan tool, read the TIPM DTC's.

   Does the scan tool display DTC C1405-TRANSFER CASE RANGE POSITION SENSOR CIRCUIT HIGH?

   Yes

   - Replace the Transfer Case Selector Switch in accordance with the Service Information. Refer to **SENSOR, POSITION, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (D201) MODE SENSOR A CIRCUIT FOR A SHORT TO GROUND**

Fig. 104: Checking Mode Sensor A Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the TIPM C1 harness connector.
3. Measure the resistance between ground and the (D201) Mode Sensor A circuit.

   Is the resistance above 10k Ohms?

   Yes

   - For Power Wagon vehicles, Go To 4.
   - For all others, replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Repair the short to ground in the (D201) Mode Sensor A circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. **CHECK THE (D201) MODE SENSOR A CIRCUIT FOR A SHORT TO THE (K91) SENSOR GROUND CIRCUIT**

Fig. 105: Checking Mode Sensor A Circuit For A Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D201) Mode Sensor A circuit and the (K91) Sensor Ground circuit at the Transfer Case Selector Switch harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

- Repair the short between the (D201) Mode Sensor A circuit and the (K91) Sensor Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

1. Using a 12-volt test light connected to 12-volts, check the (Z908) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Repair the open in the (Z908) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

P0072-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT LOW

MODULE-
TOTALLY
INTEGRATED
POWER C4

SENSOR-
AMBIENT AIR
TEMPERATURE

Fig. 112: Ambient Air Temperature (AAT) Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Battery voltage greater than 10.4 volts.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects the Ambient Air Temperature Sensor input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

Possible Causes
(G31) AAT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(G31) AAT SENSOR SIGNAL CIRCUIT SHORTED TO THE (G931) SENSOR RETURN CIRCUIT
AMBIENT AIR TEMPERATURE (AAT) SENSOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Diagnose and repair any system voltage DTC's before continuing with this test.

   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

   2. With the scan tool, select View DTC's.

      Is the DTC Active at this time?

      Yes

      - Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE AMBIENT AIR TEMPERATURE SENSOR**
   1. Turn the ignition off.
   2. Disconnect the Ambient Air Temperature Sensor harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read the Ambient Air Temperature Sensor signal voltage.

   Is the voltage above 4.5 volts with the Ambient Air Temperature Sensor harness disconnected?

   Yes

   - Verify there is good pin to terminal contact in the AAT Sensor and TIPM harness connectors. Replace the Ambient Temperature Sensor if no problems were found with the connectors in accordance with the Service Information. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 113: Checking AAT Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C4 harness connector.
3. Measure the resistance between ground and the (G31) AAT Sensor Signal circuit in the Ambient Air Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4.

   No

   - Repair the short to ground in the (G31) AAT Sensor Signal circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. **CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (G931) SENSOR RETURN CIRCUIT**

Fig. 114: Checking AAT Sensor Signal Circuit For A Short To Sensor Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G31) AAT Sensor Signal circuit and the (G931) Sensor Return circuit in the Ambient Air Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5.

   No

- Repair the short between the (G31) AAT Sensor Signal circuit and the (G931) Sensor Return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **TOTALLY INTEGRATED POWER MODULE (TIPM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ambient Air Temperature Sensor and the Totally Integrated Power Module (TIPM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Verify that there is good pin to terminal contact in the AAT Sensor and TIPM connectors.
    5. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    6. Look for the data to change or for the DTC to reset during the wiggle test.
    7. Perform any Technical Service Bulletins (TSB)s that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

Battery voltage greater than 10.4 volts.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects that the Ambient Air Temperature Sensor input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

Possible Causes
(G31) AAT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G31) AAT SENSOR SIGNAL CIRCUIT OPEN
(G931) SENSOR RETURN CIRCUIT OPEN
AMBIENT AIR TEMPERATURE (AAT) SENSOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Diagnose and repair any system voltage DTC's before continuing with this test.

   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

   2. With the scan tool, select View DTC's.

      Is the DTC Active at this time?

      Yes

      - Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 116: Checking AAT Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Ambient Air Temperature Sensor harness connector.
3. Disconnect the TIPM C4 harness connector.

4. Turn the ignition on.
5. Measure the voltage of the (G31) AAT Sensor Signal circuit in the Ambient Air Temperature Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (G31) AAT Sensor Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE AMBIENT AIR TEMPERATURE SENSOR**

Fig. 117: Checking Ambient Air Temperature (AAT) Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the TIPM C4 harness connector.
3. Connect a jumper wire between the (G31) AAT Sensor Signal circuit and the (G931) Sensor Return in the Ambient Air Temperature Sensor harness connector.

4. Turn the ignition on.
5. With the scan tool, read the Ambient Air Temperature Sensor signal voltage.

   Is the voltage below 1.0 volt with the jumper wire in place?

   Yes

   - Verify there is good pin to terminal contact in the AAT Sensor and TIPM harness connectors. Replace the Ambient Temperature Sensor if no problems were found with the connectors in accordance with the Service Information. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 118: Checking AAT Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C4 harness connector.

3. Measure the resistance of the (G31) AAT Sensor Signal circuit between the Ambient Air Temperature Sensor harness connector and the TIPM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (G31) AAT Sensor Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (G931) SENSOR RETURN CIRCUIT FOR AN OPEN**

Fig. 119: Checking Sensor Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G931) Sensor Return circuit between the Ambient Air Temperature Sensor harness connector and the TIPM C4 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 6.

No

- Repair the open in the (G931) Sensor Return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

6. **TOTALLY INTEGRATED POWER MODULE (TIPM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ambient Air Temperature Sensor and the Totally Integrated Power Module (TIPM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Verify that there is good pin to terminal contact in the AAT Sensor and Totally Integrated Power Module connectors.
    5. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    6. Look for the data to change or for the DTC to reset during the wiggle test.
    7. Perform any Technical Service Bulletins (TSB)s that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

P0462-FUEL LEVEL SENSOR 1 CIRCUIT LOW

Fig. 120: Fuel Level Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Battery voltage greater than 10.4 volts.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects that the Fuel Level Sensor input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

Possible Causes
(N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO THE (G109) FUEL LEVEL SENSE RETURN CIRCUIT
FUEL LEVEL SENSOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. With the scan tool, read DTC's.

    Does the scan tool display DTC: P0462-FUEL LEVEL SENSOR 1 CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the ignition off.
    2. Disconnect the Fuel Pump Module harness connector.
    3. Turn the ignition on.

4. With the scan tool, read DTC's.

   Does the scan tool display DTC: P0463-FUEL LEVEL SENSOR 1 CIRCUIT HIGH?

   Yes

   - Replace the Fuel Pump Module in accordance with the Service Information. Refer to **DIESEL - MODULE, FUEL PUMP, REMOVAL** **GAS - MODULE, FUEL PUMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 121: Checking Fuel Level Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Fuel Pump Module harness connector.
3. Disconnect the TIPM C7 harness connector.
4. Measure the resistance between ground and the (N4) Fuel Level Sensor Signal circuit at the Fuel Pump Module harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4.

No

- Repair the short to ground in the (N4) Fuel Level Sensor Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. **CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (G109) FUEL LEVEL SENSE RETURN CIRCUIT**

Fig. 122: Checking Fuel Level Sensor Signal Circuit For A Short To Fuel Level Sense Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G109) Fuel Level Sense Return circuit and the (N4) Fuel Level Sensor Signal circuit at the Fuel Pump Module harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5.

No

- Repair the short between the (G109) Fuel Level Sense Return circuit and the (N4) Fuel Level Sensor Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **TOTALLY INTEGRATED POWER MODULE (TIPM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Pump Module and the TIPM.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Fuel Pump Module and the TIPM C7 harness connectors.
   4. Perform any Technical Service Bulletins (TSB)s that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

P0463-FUEL LEVEL SENSOR 1 CIRCUIT HIGH

Fig. 123: Fuel Level Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Battery voltage greater than 10.4 volts.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects that the Fuel Level Sensor input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

Possible Causes
(N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT OPEN
(N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G109) FUEL LEVEL SENSE RETURN CIRCUIT OPEN
FUEL LEVEL SENSOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. With the scan tool, read DTC's.

    Does the scan tool display DTC: P0463-FUEL LEVEL SENSOR 1 CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 124: Checking Fuel Level Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Fuel Pump Module harness connector.
3. Disconnect the TIPM C7 harness connector.
4. Turn the ignition on.
5. Measure the voltage between ground and the (N4) Fuel Level Sensor Signal circuit at the Fuel Pump Module harness connector.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (N4) Fuel Level Sensor Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

- Go To 3.

3. **CHECK THE FUEL LEVEL SENSOR FOR CORRECT OPERATION**

Fig. 125: Checking Fuel Level Sensor For Correct Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Connect the TIPM C7 harness connector.
3. Connect a jumper wire between the (N4) Fuel Level Sensor Signal circuit and the (G109) Fuel Level Sense Return circuit at the Fuel Pump Module harness connector.
4. Turn the ignition on.
5. With the scan tool, read DTC's.

Does the scan tool display DTC: P0463-FUEL LEVEL SENSOR 1 CIRCUIT LOW?

Yes

- Replace the Fuel Pump Module in accordance with the Service Information. Refer to **DIESEL - MODULE, FUEL PUMP, REMOVAL** **GAS - MODULE, FUEL PUMP, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 126: Checking Fuel Level Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the TIPM C7 harness connector.
3. Measure the resistance of the (N4) Fuel Level Sensor Signal circuit between the Fuel Pump Module harness connector and the TIPM C7 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (N4) Fuel Level Sensor Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (G109) FUEL LEVEL SENSE RETURN CIRCUIT FOR AN OPEN**

Fig. 127: Checking Fuel Level Sense Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (G109) Fuel Level Sense Return circuit between the Fuel Pump Module harness connector and the TIPM C7 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6.

   No

   - Repair the open in the (G109) Fuel Level Sense Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

6. **TOTALLY INTEGRATED POWER MODULE (TIPM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Pump Module and the TIPM.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Fuel Pump Module and the TIPM C7 harness connectors.
   4. Perform any Technical Service Bulletins (TSB)s that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

      - Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

P0691-COOLING FAN 1 CONTROL CIRCUIT LOW

Fig. 128: Cooling Fan Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) sends a CAN bus message to the Totally Integrated Power Module (TIPM) requesting low speed cooling fan operation. The TIPM internally grounds the coil for the Low Speed Cooling Fan Relay. The Low Speed Cooling Fan Relay then provides battery voltage to the low speed coil in the Cooling Fan Motor.

WHEN MONITORED:

With the ignition on.

Battery voltage greater than 10 volts.

With the Low Speed Cooling Fan off.

SET CONDITION:

The TIPM detects an open in the internal Low Speed Cooling Fan Control circuit.

POSSIBLE CAUSES

Possible Causes
LOW SPEED COOLING FAN RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. With the scan tool, read DTC's.

    Does the scan tool display DTC: P0691-COOLING FAN 1 CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **LOW SPEED COOLING FAN RELAY**
    1. Turn the ignition off.
    2. Remove the Low Speed Cooling Fan Relay and substitute it with a known good relay.

3. Turn the ignition on.
4. With the scan tool, clear all DTC's.
5. Turn the ignition off.
6. Turn the ignition on.
7. With the scan tool, read DTC's.

Does the scan tool display DTC: P0691-COOLING FAN 1 CONTROL CIRCUIT LOW?

Yes

- Go To 3.

No

- Replace the Low Speed Cooling Fan Relay.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **TOTALLY INTEGRATED POWER MODULE**

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

1. Using the schematics as a guide, inspect the wire harness and connectors.
2. Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

P0692-COOLING FAN 1 CONTROL CIRCUIT HIGH

Fig. 129: Cooling Fan Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) sends a CAN bus message to the Totally Integrated Power Module (TIPM) requesting low speed cooling fan operation. The TIPM internally grounds the coil for the Low Speed Cooling Fan Relay. The Low Speed Cooling Fan Relay then provides battery voltage to the low speed coil in the Cooling Fan Motor.

WHEN MONITORED:

With the ignition on.

Battery voltage greater than 10 volts.

With the Low Speed Cooling Fan on.

SET CONDITION:

The TIPM detects a shorted condition in the internal Low Speed Cooling Fan Control circuit.

POSSIBLE CAUSES

Possible Causes
LOW SPEED COOLING FAN RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. With the scan tool, actuate Radiator Fan 1.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: P0692-COOLING FAN 1 CONTROL CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **LOW SPEED COOLING FAN RELAY**
    1. Turn the ignition off.

2. Remove the Low Speed Cooling Fan Relay and substitute it with a known good relay.
3. Turn the ignition on.
4. With the scan tool, clear all DTC's.
5. Turn the ignition off.
6. Turn the ignition on.
7. With the scan tool, actuate Radiator Fan 1.
8. With the scan tool, read DTC's.

   Does the scan tool display DTC: P0692-COOLING FAN 1 CONTROL CIRCUIT HIGH?

   Yes

   - Go To 3.

   No

   - Replace the Low Speed Cooling Fan Relay.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **TOTALLY INTEGRATED POWER MODULE**

   NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

   1. Using the schematics as a guide, inspect the wire harness and connectors.
   2. Pay particular attention to all Power and Ground circuits.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

P0693-COOLING FAN 2 CONTROL CIRCUIT LOW

Fig. 130: Cooling Fan Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) sends a CAN bus message to the Totally Integrated Power Module (TIPM) requesting high speed cooling fan operation. The TIPM grounds the coil for the High Speed Cooling Fan Relay through the high speed radiator fan control circuit. The High Speed Cooling Fan Relay then provides battery voltage to the high speed coil in the Cooling Fan Motor.

WHEN MONITORED:

With the ignition on.

Battery voltage greater than 10 volts.

With the High Speed Cooling Fan off.

SET CONDITION:

The TIPM detects a low condition in the Rad Fan High Speed Control circuit.

POSSIBLE CAUSES

Possible Causes
(K175) RAD FAN HIGH SPEED CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K175) RAD FAN HIGH SPEED CONTROL CIRCUIT SHORTED TO GROUND
(W24) FUSED RUN RELAY OUTPUT CIRCUIT OPEN
RADIATOR FAN HIGH RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. With the scan tool, read DTC's.

    Does the scan tool display DTC: P0693-COOLING FAN 2 CONTROL CIRCUIT LOW?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **RADIATOR FAN HIGH RELAY**
    1. Turn the ignition off.
    2. Remove the Radiator Fan High Relay and substitute it with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, clear all DTC's.
    5. Turn the ignition off.
    6. Turn the ignition on.
    7. With the scan tool, read DTC's.

    Does the scan tool display DTC: P0693-COOLING FAN 2 CONTROL CIRCUIT LOW?

    Yes

    - Go To 3.

    No

    - Replace the Radiator Fan High Relay.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
3. **CHECK THE (W24) FUSED RUN RELAY OUTPUT CIRCUIT FOR AN OPEN**

Fig. 131: Checking Fused Run Relay Output Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Remove the Radiator Fan High Relay.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (W24) Fused Run Relay Output circuit.

NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Is the test light illuminated and bright?

Yes

- Go To 4.

No

- Repair the open or high resistance in the (W24) Fused Run Relay Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. **CHECK THE (K175) RAD FAN HIGH SPEED CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 132: Checking Rad Fan High Speed Control Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C3 harness connector.

3. Measure the resistance between ground and the (K175) Rad Fan High Speed Control circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5.

   No

   - Repair the short to ground in the (K175) Rad Fan High Speed Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (K175) RAD FAN HIGH SPEED CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 133: Checking Rad Fan High Speed Control Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (K175) Rad Fan High Speed Control circuit from the TIPM C3 harness connector to the Radiator Fan High Relay.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6.

No

- Repair the open or high resistance in the (K175) Rad Fan High Speed Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

6. **TOTALLY INTEGRATED POWER MODULE (TIPM)**

NOTE: **Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

1. Using the schematics as a guide, inspect the wire harness and connectors.

   Pay particular attention to all Power and Ground circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

P0694-COOLING FAN 2 CONTROL CIRCUIT HIGH

Fig. 134: Cooling Fan Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) sends a CAN bus message to the Totally Integrated Power Module (TIPM) requesting high speed cooling fan operation. The TIPM grounds the coil for the High Speed Cooling Fan Relay through the high speed radiator fan control circuit. The High Speed Cooling Fan Relay then provides battery voltage to the high speed coil in the Cooling Fan Motor.

WHEN MONITORED:

With the ignition on.

Battery voltage greater than 10 volts.

With the High Speed Cooling Fan on.

SET CONDITION:

The TIPM detects a short to voltage in the Rad Fan High Speed Control circuit.

POSSIBLE CAUSES

Possible Causes
(K175) RAD FAN HIGH SPEED CONTROL CIRCUIT SHORTED TO VOLTAGE
RADIATOR FAN HIGH RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTC's.
    3. With the scan tool, actuate Radiator Fan 2.
    4. With the scan tool, read DTC's.

    Does the scan tool display DTC: P0694-COOLING FAN 2 CONTROL CIRCUIT HIGH?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
2. **RADIATOR FAN HIGH RELAY**

1. Turn the ignition off.
2. Remove the Radiator Fan High Relay and substitute it with a known good relay.
3. Turn the ignition on.
4. With the scan tool, clear all DTC's.
5. Turn the ignition off.
6. Turn the ignition on.
7. With the scan tool, actuate Radiator Fan 2.
8. With the scan tool, read DTC's.

Does the scan tool display DTC: P0694-COOLING FAN 2 CONTROL CIRCUIT HIGH?

Yes

- Go To 3.

No

- Replace the Radiator Fan High Relay.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **CHECK THE (K175) RAD FAN HIGH SPEED CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 135: Checking Rad Fan High Speed Control Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C3 harness connector.
3. Remove the Radiator Fan High Relay.
4. Turn the ignition on.
5. Measure the voltage between ground and the (K175) Rad Fan High Speed Control circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (K175) Rad Fan High Speed Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 4.

4. **TOTALLY INTEGRATED POWER MODULE (TIPM)**

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

1. Using the schematics as a guide, inspect the wire harness and connectors.

   Pay particular attention to all Power and Ground circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

P1273-A/C CONTROL CIRCUIT 2 HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) is commanded by the Powertrain Control Module (PCM) through a hardwired signal to actuate the A/C Clutch. The TIPM actuates the A/C Clutch by providing voltage through a high-side driver circuit. The TIPM monitors this circuit for correct voltage and current flow.

WHEN MONITORED:

With the ignition on.

Battery voltage greater than 10.4 volts.

Air Conditioning (A/C) Switch on.

A/C Compressor Clutch command on.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects the voltage on the A/C Clutch Control Output circuit is higher than the calibrated level.

POSSIBLE CAUSES

Possible Causes
(C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT OPEN
(C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE
(Z908)/(Z916) GROUND CIRCUIT OPEN OR EXCESSIVE RESISTANCE
A/C COMPRESSOR CLUTCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **A/C COMPRESSOR CLUTCH OPERATION**

   NOTE: If Powertrain Control Module (PCM) DTC P0645-A/C CLUTCH CONTROL CIRCUIT is present, diagnose it first.

   1. Ignition on, engine not running.
   2. With the scan tool, actuate the A/C Clutch.

      Does the A/C Clutch actuate?

      Yes

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

      - Go To 2.

2. **CHECK THE (C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 136: Checking A/C Clutch Control Output Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the A/C Compressor Clutch harness connector.
3. Disconnect the TIPM C1 harness connector.
4. Ignition on, engine not running.
5. Measure the voltage between ground and the (C3) A/C Clutch Control Output circuit at the A/C Compressor Clutch harness connector.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (C3) A/C Clutch Control Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE TIPM FOR CORRECT OPERATION**

Fig. 137: Checking A/C Clutch Control Output For Correct Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the TIPM C1 harness connector.
3. Ignition on, engine not running.
4. Connect a 12-volt test light between the (C3) A/C Clutch Control Output circuit and (Z908)/(Z916) Ground circuit at the A/C Compressor Clutch harness connector.
5. With the scan tool, actuate the A/C Clutch.

   Does the test light illuminate when the A/C Clutch is commanded on?

Yes

- Verify that there is good pin to terminal contact in the A/C Compressor Clutch and TIPM connectors. If OK, replace the A/C Compressor Clutch in accordance with the Service Information. Refer to **COMPRESSOR, A/C, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT FOR AN OPEN**

CLUTCH-A/C
COMPRESSOR

MODULE-
TOTALLY
INTEGRATED
POWER C1

2911328

Fig. 138: Checking A/C Clutch Control Output Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C1 harness connector.
3. Measure the resistance of the (C3) A/C Clutch Control Output circuit between the A/C Compressor Clutch harness connector and the TIPM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (C3) A/C Clutch Control Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. **CHECK THE (Z908)/(Z916) GROUND CIRCUIT FOR AN OPEN**

Fig. 139: Checking A/C Clutch Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12-volts, check the (Z908)/(Z916) Ground circuit at the A/C Compressor Clutch harness connector.

   Does the test light illuminate brightly?

   Yes

   - Go To 6.

   No

   - Repair the open or excessive resistance in the (Z908)/(Z916) Ground circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

6. **TOTALLY INTEGRATED POWER MODULE (TIPM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Clutch and TIPM.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the A/C Compressor Clutch and TIPM connectors.
    4. Perform any Technical Service Bulletins (TSB)s that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

P1275-A/C CONTROL CIRCUIT 2 OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) is commanded by the Powertrain Control Module (PCM) through a hardwired signal to actuate the A/C Clutch. The TIPM actuates the A/C Clutch by providing voltage through a high-side driver circuit. The TIPM monitors this circuit for correct voltage and current flow.

WHEN MONITORED:

With the ignition on.

Battery voltage greater than 10.4 volts.

Air Conditioning (A/C) Switch on.

A/C Compressor Clutch command on.

SET CONDITION:

The TIPM detects the current draw on the A/C Clutch Control Output circuit is higher than the calibrated level.

POSSIBLE CAUSES

Possible Causes
(C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
A/C COMPRESSOR CLUTCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **A/C CLUTCH OPERATION**
    1. Ignition on, engine not running.
    2. With a scan tool, actuate the A/C Clutch.

    Does the A/C Clutch actuate?

    Yes

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Go To 2.
2. **CHECK THE (C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT FOR A SHORT TO GROUND**

Fig. 140: Checking A/C Clutch Control Output Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the A/C Compressor Clutch harness connector.
3. Disconnect the TIPM C1 harness connector.
4. Measure the resistance between ground and the (C3) A/C Clutch Control Output circuit at the A/C Compressor Clutch harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3.

No

- Repair the short to ground in the (C3) A/C Clutch Control Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **CHECK THE (C3) A/C CLUTCH CONTROL OUTPUT FROM TIPM**

Fig. 141: Measuring A/C Clutch Control Output From TIPM
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the TIPM C1 harness connector.
2. Ignition on, engine not running.
3. Using the 12-volt test light connected to ground, check the (C3) A/C Clutch Control Output circuit in the A/C Compressor Clutch harness connector.
4. With a scan tool, actuate the A/C Clutch.

Does the test light illuminate when the A/C Clutch is commanded on?

Yes

- Verify that there is good pin to terminal contact in the A/C Compressor Clutch and TIPM connectors. If OK, replace the A/C Clutch in accordance with the Service Information. Refer to **COMPRESSOR, A/C, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

P129E-INVERTER CONTROL CIRCUIT OVERCURRENT

Fig. 142: Inverter Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Once the 115 Volt AC Outlet switch is pressed, the Switch Bank Module sends a message over the Local Interface Network (LIN) to the Cluster (CCN) indicating the switch has been pressed. The Cluster (CCN) then sends a message over the Controller Area Network (CAN) bus to the Totally Integrated Power Module (TIPM) to enable the Power Inverter Module. The TIPM provides a voltage output to enable the Power Inverter Module. Once the Power Inverter Module is functional, it sends a signal to the Cluster (CCN) indicating that it is ready to function. The Cluster (CCN) then requests the Switch Bank Module to illuminate the status indicator on the 115 Volt AC Outlet switch.

WHEN MONITORED:

With the ignition on.

Battery voltage greater than 10 volts.

Inverter commanded on.

SET CONDITION:

If the Totally Integrated Power Module (TIPM) detects an overcurrent condition on the (P807) Inverter Switch Signal circuit.

POSSIBLE CAUSES

Possible Causes
(P807) INVERTER SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
POWER INVERTER MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTC's.
    3. Operate the 115 Volt AC Outlet switch several times.
    4. With the scan tool, read DTC's.

    Is the DTC active at this time?

    Yes

    - Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

2. **CHECK (P807) INVERTER SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 143: Checking Inverter Switch Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C7 harness connector.
3. Disconnect the Inverter Module harness connector.
4. Measure the resistance between ground and the (P807) Inverter Switch Signal circuit at the Inverter Module harness connector.

   Is the resistance above 10k Ohms?

Yes

- Go To 3.

No

- Repair the short to ground in the (P807) Inverter Switch Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **CHECK (P807) INVERTER SWITCH SIGNAL CIRCUIT FUNCTION**

Fig. 144: Checking Inverter Switch Signal Circuit Function
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the TIPM C7 harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (P807) Inverter Switch Signal circuit at the Inverter Module harness connector.

5. With the scan tool, actuate the Inverter Switch.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Power Inverter Module in accordance with the Service Information. Refer to **MODULE, POWER INVERTER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0001-CAN C BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects a corrupt CAN C Bus message.

POSSIBLE CAUSES

Possible Causes
(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D52) CAN C BUS (+) CIRCUIT SHORTED TO THE (D51) CAN C BUS (-) CIRCUIT
(D65) CAN C BUS (+) CIRCUIT SHORTED TO THE (D64) CAN C BUS (-) CIRCUIT
ANTILOCK BRAKE MODULE (ABS)
OCCUPANT RESTRAINT CONTROLLER MODULE (ORC)
POWERTRAIN CONTROL MODULE (PCM)
STEERING ANGLE SENSOR (SAS)
WIRELESS IGNITION NODE (WIN)
DRIVE TRAIN CONTROL MODULE (DTCM)
FINAL DRIVE CONTROL MODULE (FDCM)
INTEGRATED TRAILER BRAKE MODULE (ITBM)
TIRE PRESSURE MONITORING (TPM) MODULE
TRANSMISSION CONTROL MODULE (TCM)
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase TIPM DTC's.

3. Cycle the ignition from on to off three times.
4. Turn the ignition on.
5. With the scan tool, read active TIPM DTC's.

   Does the scan tool display U0001-CAN C BUS as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

2. **ANTILOCK BRAKE MODULE - INTERNAL SHORT**
   1. Turn the ignition off.
   2. Disconnect the Antilock Brake Module harness connector.
   3. Turn the ignition on.
   4. With the scan tool, record and erase TIPM DTC's.
   5. Cycle the ignition from on to off three times.
   6. Turn the ignition on.
   7. With the scan tool, read active TIPM DTC's.

   Does the scan tool display U0001-CAN C BUS as active?

   Yes

   - Go To 3.

   No

   - Inspect the wiring and connectors for damage or shorted circuits. If OK, replace and program the Antilock Brake Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **1500, 2500 & 3500 - ABS VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - ABS VERIFICATION TEST** .

3. **OCCUPANT RESTRAINT CONTROLLER MODULE - INTERNAL SHORT**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Occupant Restraint Controller Module harness connectors.
2. Reconnect the 12-volt battery.
3. Turn the ignition on.
4. With the scan tool, record and erase TIPM DTC's.
5. Cycle the ignition from on to off three times.
6. Turn the ignition on.
7. With the scan tool, read active TIPM DTC's.

   Does the scan tool display U0001-CAN C BUS as active?

   Yes

   - Go To 4.

   No

   - Inspect the wiring and connectors for damage or shorted circuits. If OK, replace the Occupant Restraint Controller Module in accordance with the Service Information. Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **RESTRAINTS SYSTEM VERIFICATION TEST** .

4. **POWERTRAIN CONTROL MODULE - INTERNAL SHORT**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 or PCM C2 (6.7L) harness connector.
   3. Turn the ignition on.
   4. With the scan tool, record and erase TIPM DTC's.
   5. Cycle the ignition from on to off three times.
   6. Turn the ignition on.
   7. With the scan tool, read active TIPM DTC's.

      Does the scan tool display U0001-CAN C BUS as active?

      Yes

      - Go To 5.

      No

      - Inspect the wiring and connectors for damage or shorted circuits. If OK, replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **3.7L, 4.7L & 5.7L - MODULE, POWERTRAIN CONTROL, REMOVAL** or **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **1500 & 2500 - 3.7L, 4.7L &**

5.7L - POWERTRAIN VERIFICATION TEST or **2500 & 3500 - POWERTRAIN VERIFICATION TEST - 6.7L** or **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** .

5. **STEERING ANGLE SENSOR - INTERNAL SHORT**
    1. Turn the ignition off.
    2. Disconnect the Clockspring C3 (SAS) harness connector.
    3. Turn the ignition on.
    4. With the scan tool, record and erase TIPM DTC's.
    5. Cycle the ignition from on to off three times.
    6. Turn the ignition on.
    7. With the scan tool, read active TIPM DTC's.

    Does the scan tool display U0001-CAN C BUS as active?

    Yes

    - Go To 6.

    No

    - Inspect the wiring and connectors for damage or shorted circuits. If OK, replace the Clockspring and program the SAS in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
6. **WIRELESS IGNITION NODE - INTERNAL SHORT**
    1. Turn the ignition off.
    2. Disconnect the Wireless Ignition Node harness connector.
    3. Turn the ignition on.
    4. With the scan tool, record and erase TIPM DTC's.
    5. Cycle the ignition from on to off three times.
    6. Turn the ignition on.
    7. With the scan tool, read active TIPM DTC's.

    Does the scan tool display U0001-CAN C BUS as active?

    Yes

    - Go To 7.

    No

    - Inspect the wiring and connectors for damage or shorted circuits. If OK, replace the Wireless

Ignition Node in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .

- Perform the WIRELESS IGNITION NODE (WIN) VERIFICATION TEST. Refer to **WIRELESS IGNITION NODE (WIN) VERIFICATION** .

7. **DRIVETRAIN CONTROL MODULE - INTERNAL SHORT**
   1. Turn the ignition off.

      NOTE: If vehicle is not equipped with this module, answer yes to the question.

   2. Disconnect the Drive Train Control Module C1 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, record and erase TIPM DTC's.
   5. Cycle the ignition from on to off three times.
   6. Turn the ignition on.
   7. With the scan tool, read active TIPM DTC's.

      Does the scan tool display U0001-CAN C BUS as active?

      Yes

      - Go To 8.

      No

      - Inspect the wiring and connectors for damage or shorted circuits. If OK, replace the Drivetrain Control Module in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **1500, 2500& 3500 - DTCM VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - DTCM VERIFICATION TEST** .

8. **FINAL DRIVE CONTROL MODULE (FDCM) - INTERNAL SHORT**
   1. Turn the ignition off.

      NOTE: If vehicle is not equipped with this module, answer yes to the question.

   2. Disconnect the FDCM harness connector.
   3. Turn the ignition on.
   4. With the scan tool, record and erase TIPM DTC's.
   5. Cycle the ignition from on to off three times.
   6. Turn the ignition on.
   7. With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001-CAN C BUS as active?

Yes

- Go To 9.

No

- Inspect the wiring and connectors for damage or shorted circuits. If OK, replace and program the FDCM in accordance with the Service Information. Refer to **ACTUATOR, STABILIZER BAR, REMOVAL** .
- Perform the FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST** .

9. **INTEGRATED TRAILER BRAKE MODULE (ITBM) - INTERNAL SHORT**
   1. Turn the ignition off.

      NOTE: If vehicle is not equipped with this module, answer yes to the question.

   2. Disconnect the ITBM harness connector.
   3. Turn the ignition on.
   4. With the scan tool, record and erase TIPM DTC's.
   5. Cycle the ignition from on to off three times.
   6. Turn the ignition on.
   7. With the scan tool, read active TIPM DTC's.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 10.

      No

      - Inspect the wiring and connectors for damage or shorted circuits. If OK, replace and program the ITBM in accordance with the Service Information. Refer to **MODULE, INTEGRATED TRAILER BRAKE (ITBM), REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

10. **TIRE PRESSURE MONITORING MODULE - INTERNAL SHORT**
    1. Turn the ignition off.

       NOTE: If vehicle is not equipped with this module, answer yes to the question.

    2. Disconnect the Tire Pressure Module harness connector.

3. Turn the ignition on.
4. With the scan tool, record and erase TIPM DTC's.
5. Cycle the ignition from on to off three times.
6. Turn the ignition on.
7. With the scan tool, read active TIPM DTC's.

   Does the scan tool display U0001-CAN C BUS as active?

   Yes

   - Go To 11.

   No

   - Inspect the wiring and connectors for damage or shorted circuits. If OK, replace the Tire Pressure Monitoring Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION. Refer to **TPM VERIFICATION TEST** .

11. **TRANSMISSION CONTROL MODULE (TCM) - INTERNAL SHORT**
    1. Turn the ignition off.

       NOTE: If vehicle is not equipped with this module, answer yes to the question.

    2. Disconnect the TCM C2 harness connector.
    3. Turn the ignition on.
    4. With the scan tool, record and erase TIPM DTC's.
    5. Cycle the ignition from on to off three times.
    6. Turn the ignition on.
    7. With the scan tool, read active TIPM DTC's.

       Does the scan tool display U0001-CAN C BUS as active?

       Yes

       - Go To 12.

       No

       - Inspect the wiring and connectors for damage or shorted circuits. If OK, replace the Transmission Control Module in accordance with the Service Information. Refer to **MODULE, TRANSMISSION CONTROL, DESCRIPTION** .
       - Perform the TCM VERIFICATION TEST. Refer to **AS68RC TRANSMISSION**

VERIFICATION TEST .

12. **(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE**

Fig. 145: Checking Can C Bus (-) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM C7 and C1 harness connectors.
3. Turn the ignition on.
4. Measure the voltage between the (D51) CAN C Bus (-) circuit and ground at the TIPM C7 harness connector.
5. Measure the voltage between the (D64) CAN C Bus (-) circuit and ground at the TIPM C1 harness

connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (D51) or the (D64) CAN C Bus (-) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 13.

13. **(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND**

Fig. 146: Checking Can C Bus (+) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D52) CAN C Bus (+) circuit.
3. Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

   Is any resistance present?

   Yes

- Repair the short to ground in the (D52) or (D65) CAN C Bus (+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 14.

14. **CAN C BUS (+) CIRCUIT SHORTED TO CAN C BUS (-) CIRCUIT**

Fig. 147: Checking Can C Bus (+) Circuit For A Short To Can C Bus (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D52) CAN C Bus (+) circuit and the (D51) CAN C Bus (-) circuit.
2. Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

   Is any resistance present?

   Yes

   - Repair the short between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Inspect the wiring and connectors for damage or shorted circuits. If OK, replace the Totally Integrated Power Module in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0010-CAN INTERIOR BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects a short to ground on the CAN Interior Bus (125K) (+) circuit or a short to voltage on the CAN Interior Bus (125K) (-) circuit.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS (125K) (+) CIRCUIT SHORTED TO GROUND
(D264) CAN INTERIOR BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE
ANY CAN INTERIOR BUS MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase TIPM DTC's.
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on.
    5. With the scan tool, read active TIPM DTC's.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2.

    No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

2. **ANY CAN INTERIOR BUS (125K) MODULE - INTERNAL SHORT**

NOTE: When performing this step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.

NOTE: This step is to determine if the fault is internal within a module.

1. While monitoring the scan tool, disconnect each CAN Interior Bus (125K) module (except for the TIPM), one at a time.
2. Check for this DTC to become active after disconnecting each CAN Interior Bus (125K) module the vehicle is equipped with.

NOTE: If the DTC becomes stored when a particular module is disconnected, that module is causing the DTC to set.

With all the CAN Interior Bus modules disconnected, does the scan tool display this DTC as active?

Yes

- Go To 3.

No

- Replace the module that when disconnected caused this DTC to become stored in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. **(D265) CAN INTERIOR BUS (125K) (+) CIRCUIT SHORTED TO GROUND**

Fig. 148: Checking Can Interior Bus (125K) (+) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D265) CAN Interior Bus (125K) (+) circuit at the TIPM C7 harness connector.

   Is any resistance present?

   Yes

   - Repair the short to ground in the (D265) CAN Interior Bus (125K) (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

- Go To 4.

4. **(D264) CAN INTERIOR BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE**

Fig. 149: Checking Can Interior Bus (125K) (-) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage at the (D264) CAN Interior Bus (125K) (-) circuit at the TIPM C7 harness connector.

   Is the voltage above 6 volts?

   Yes

   - Repair the short to voltage in the (D264) CAN Interior Bus (125K) (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Inspect the wiring and connectors for damage or short circuits. If OK, replace the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0100-LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Powertrain Control Module (PCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D51) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D52) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
PCM POWER AND GROUND
POWERTRAIN CONTROL MODULE (PCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

      - Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**

1. With the scan tool, read all active DTC's from all modules.

   NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

   Does the scan tool display any active DTC's to the conditions listed above?

   Yes

   - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

   No

   - Go To 3.

3. **VERIFY THE PCM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the PCM is active on the bus.

   Is the PCM active on the bus?

   Yes

   - Go To 4.

   No

   - Refer to **NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) - GAS** or **NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) - 6.7L** and perform the appropriate diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

   Is there more than one module with active DTC's "Logged Against" the PCM?

   Yes

   - Replace/update the PCM in accordance with the Service Information. Refer to **3.7L, 4.7L & 5.7L - MODULE, POWERTRAIN CONTROL, REMOVAL** **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **1500 & 2500 - 3.7L, 4.7L & 5.7L - POWERTRAIN VERIFICATION TEST** or **2500 & 3500 - POWERTRAIN VERIFICATION TEST - 6.7L** or **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** .

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the PCM.
   2. Clear active DTC's.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7.

   No

   - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched and partially broken wires and the wiring harness connectors for broken, bent, pushed out and corroded terminals.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

   Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

   Yes

   - Go To 8.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Fig. 150: Checking Can C Bus (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D52) CAN C Bus (+) circuit and ground.
2. Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D52) or (D65) CAN C Bus (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 9.

9. **(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Fig. 151: Checking Can C Bus (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D51) CAN C Bus (-) circuit.
3. Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (D51) or (D64) CAN C Bus (-) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0101-LOST COMMUNICATION WITH TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+)

wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Transmission Control Module (TCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D51) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D52) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TCM POWER AND GROUND
TRANSMISSION CONTROL MODULE (TCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE TCM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the TCM is active on the bus.

      Is the TCM active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM TCM (POWERTRAIN CONTROL MODULE) - GAS** or **NO RESPONSE FROM TCM (TRANSMISSION CONTROL MODULE) - 6.7L** or **NO RESPONSE FROM TCM (TRANSMISSION CONTROL MODULE) - AS68RC** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the TCM?

      Yes

      - Replace/update the TCM in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** for RLE and RFE transmissions, or **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** . Refer to **MODULE, TRANSMISSION CONTROL, DESCRIPTION** for AS68RC transmissions.

- Perform the appropriate TRANSMISSION VERIFICATION TEST. Refer to **AS68RC TRANSMISSION VERIFICATION TEST** .

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the TCM.
   2. Clear active DTC's.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7.

   No

   - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
   - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

   Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

   Yes

- Go To 8.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Fig. 152: Checking Can C Bus (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D52) CAN C Bus (+) circuit and ground.
2. Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D52) or (D65) CAN C Bus (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 9.

9. **(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Fig. 153: Checking Can C Bus (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D51) CAN C Bus (-) circuit.
3. Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (D51) or (D64) CAN C Bus (-) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0102-LOST COMMUNICATION WITH TRANSFER CASE CONTROL MODULE / AWD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+)

wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Drive Train Control Module (DTCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D51) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D52) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
DTCM POWER AND GROUND
DRIVE TRAIN CONTROL MODULE (DTCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE DTCM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the DTCM is active on the bus.

      Is the DTCM active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM DTCM (DRIVETRAIN CONTROL MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the DTCM?

      Yes

      - Replace/update the DTCM in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **1500, 2500& 3500 - DTCM VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - DTCM VERIFICATION TEST** .

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the DTCM.
   2. Clear active DTC's.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

      - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7.

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

      Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8.

      No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Fig. 154: Checking Can C Bus (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D52) CAN C Bus (+) circuit and ground.

2. Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D52) or (D65) CAN C Bus (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 9.

9. **(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Fig. 155: Checking Can C Bus (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D51) CAN C Bus (-) circuit.
3. Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (D51) or (D64) CAN C Bus (-) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0114-LOST COMMUNICATION WITH FINAL DRIVE CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+)

wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Final Drive Control Module (FDCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
FDCM POWER AND GROUND
FINAL DRIVE CONTROL MODULE (FDCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE FDCM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the FDCM is active on the bus.

      Is the FDCM active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM FDCM (FINAL DRIVE CONTROL MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the FDCM?

      Yes

      - Replace/update the FDCM in accordance with the Service Information. Refer to **ACTUATOR, STABILIZER BAR, REMOVAL** .
      - Perform the FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST** .

      No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
    1. With the scan tool, select the module setting the DTC against the FDCM.
    2. Clear active DTC's.

    Is this DTC still active?

    Yes

    - Replace/update the module that set this DTC in accordance with the Service Information.
    - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Go To 6.

6. **CYCLE IGNITION**
    1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

    Does this DTC become active?

    Yes

    - Go To 7.

    No

    - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
    1. With the scan tool, select Network Diagnostics.

    Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

    Yes

    - Go To 8.

    No

    - Replace/update the module that set this DTC in accordance with the Service Information.

- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Fig. 156: Checking Can C Bus (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D52) CAN C Bus (+) circuit and ground.
2. Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

- Repair the short to voltage in the (D52) or (D65) CAN C Bus (+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Fig. 157: Checking Can C Bus (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D51) CAN C Bus (-) circuit.
3. Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D51) or (D64) CAN C Bus (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0121-LOST COMMUNICATION WITH ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that

operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Anti-Lock Brake Module (ABS) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D51) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D52) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
ABS POWER AND GROUND
ANTI-LOCK BRAKE MODULE (ABS)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: **Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

1. With the scan tool, read active DTC's.

   Is this DTC active?

   Yes

   - Go To 2.

   No

   - Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE ABS IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the ABS is active on the bus.

      Is the ABS active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM ABS (ANTILOCK BRAKE MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

Is there more than one module with active DTC's "Logged Against" the ABS?

Yes

- Replace/update the ABS module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **1500, 2500 & 3500 - ABS VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - ABS VERIFICATION TEST** .

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the ABS.
   2. Clear active DTC's.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7.

   No

   - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
   - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**

1. With the scan tool, select Network Diagnostics.

   Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

   Yes

   - Go To 8.

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Fig. 158: Checking Can C Bus (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D52) CAN C Bus (+) circuit and ground.
2. Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D52) or (D65) CAN C Bus (+) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Fig. 159: Checking Can C Bus (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Measure the resistance between ground and the (D51) CAN C Bus (-) circuit.
3. Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (D51) or (D64) CAN C Bus (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0127-LOST COMMUNICATION WITH TIRE PRESSURE MONITOR MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or

determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Tire Pressure Monitoring (TPM) module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D51) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D52) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TPM POWER AND GROUND
TIRE PRESSURE MONITORING (TPM) MODULE
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: **Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

1. With the scan tool, read active DTC's.

Is this DTC active?

Yes

- Go To 2.

No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE TPM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the TPM is active on the bus.

      Is the TPM active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM TPM (TIRE PRESSURE MONITORING) MODULE** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the TPM?

Yes

- Replace/update the TPM module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **TPM VERIFICATION TEST** .

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the TPM.
   2. Clear active DTC's.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7.

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

   Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To 8.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Fig. 160: Checking Can C Bus (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D52) CAN C Bus (+) circuit and ground.
2. Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D52) or (D65) CAN C Bus (+) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Fig. 161: Checking Can C Bus (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Measure the resistance between ground and the (D51) CAN C Bus (-) circuit.
3. Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D51) or (D64) CAN C Bus (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0137-LOST COMMUNICATION WITH TRAILER BRAKE CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or

determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Integrated Trailer Brake Module (ITBM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
ITBM POWER AND GROUND
INTEGRATED TRAILER BRAKE MODULE (ITBM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

Is this DTC active?

Yes

- Go To 2.

No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE ITBM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the ITBM is active on the bus.

      Is the ITBM active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM ITBM (INTEGRATED TRAILER BRAKE MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the ITBM?

Yes

- Replace the ITBM in accordance with the Service Information. Refer to **MODULE, INTEGRATED TRAILER BRAKE (ITBM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the ITBM.
   2. Clear active DTC's.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7.

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

   Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To 8.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Fig. 162: Checking Can C Bus (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D52) CAN C Bus (+) circuit and ground.
2. Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D52) or (D65) CAN C Bus (+) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Fig. 163: Checking Can C Bus (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Measure the resistance between ground and the (D51) CAN C Bus (-) circuit.
3. Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D51) or (D64) CAN C Bus (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or

determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
DIAGNOSTIC CAN C BUS CIRCUITS OPEN OR SHORTED
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TIPM POWER AND GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

Yes

- Go To 2.

No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE TIPM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the TIPM is active on the bus.

      Is the TIPM active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM TIPM (TOTALLY INTEGRATED POWER MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the TIPM?

      Yes

- Replace/update the TIPM in accordance with the Service Information. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing

interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Occupant Restraint Controller (ORC) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D51) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D52) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
ORC POWER AND GROUND
OCCUPANT RESTRAINT CONTROLLER (ORC)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE ORC IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the ORC is active on the bus.

      Is the ORC active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM ORC (OCCUPANT RESTRAINT CONTROLLER)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the ORC?

      Yes

      - Replace/update the ORC in accordance with the Service Information. Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL** .
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the ORC.
   2. Clear active DTC's.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

      - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7.

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

      Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8.

      No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Fig. 164: Checking Can C Bus (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D52) CAN C Bus (+) circuit and ground.

2. Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D52) or (D65) CAN C Bus (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 9.

9. **(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Fig. 165: Checking Can C Bus (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D51) CAN C Bus (-) circuit.
3. Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (D51) or (D64) CAN C Bus (-) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+)

wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Cluster/Cabin Compartment Node (CCN) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
CLUSTER/CCN POWER AND GROUND
CLUSTER/CABIN COMPARTMENT NODE (CCN)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE CCN IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the CCN is active on the bus.

      Is the CCN active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM CCN (CLUSTER)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the CCN?

      Yes

      - Replace/update the Cluster/CCN in accordance with the Service Information. Refer to **REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
    1. With the scan tool, select the module setting the DTC against the Cluster/CCN.
    2. Clear active DTC's.

    Is this DTC still active?

    Yes

    - Replace/update the module that set this DTC in accordance with the Service Information.
    - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Go To 6.

6. **CYCLE IGNITION**
    1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

    Does this DTC become active?

    Yes

    - Go To 7.

    No

    - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
    1. With the scan tool, select Network Diagnostics.

    Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

    Yes

    - Go To 8.

    No

    - Replace/update the module that set this DTC in accordance with the Service Information.

- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE**

Fig. 166: Checking Can Interior Bus (+) (125K) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D265) CAN Interior Bus (+) (125K) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D265) CAN Interior Bus (+) (125K) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND**

Fig. 167: Checking Can Interior Bus (-) (125K) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D264) CAN Interior Bus (-) (125K) circuit.

   Is the resistance below 10k Ohms?

Yes

- Repair the short to ground in the (D264) CAN Interior Bus (-) (125K) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0159-LOST COMMUNICATION WITH PARK ASSIST MODULE (PTS)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are

wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fused installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Park Assist (PTS) Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
PARK ASSIST MODULE POWER AND GROUND
PARK ASSIST MODULE (PTS)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE PTS IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the PTS is active on the bus.

      Is the PTS active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM PTS (PARK ASSIST MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the PTS?

      Yes

      - Replace/update the Park Assist (PTS) Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the Park Assist (PTS) Module.
   2. Clear active DTC's.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7.

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

   Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

   Yes

   - Go To 8.

   No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE**

Fig. 168: Checking Can Interior Bus (+) (125K) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D265) CAN Interior Bus (+) (125K) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

- Repair the short to voltage in the (D265) CAN Interior Bus (+) (125K) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND**

Fig. 169: Checking Can Interior Bus (-) (125K) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D264) CAN Interior Bus (-) (125K) circuit.

Is the resistance below 10k Ohms?

Yes

- Repair the short to ground in the (D264) CAN Interior Bus (-) (125K) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the HVAC Control Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
HVAC POWER AND GROUND
HVAC CONTROL MODULE
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE HVAC IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the HVAC is active on the bus.

      Is the HVAC active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM HVAC (A/C HEATER CONTROL MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the HVAC?

      Yes

      - Replace/update the HVAC Control Module in accordance with the Service Information. Refer to **CONTROL, A/C AND HEATER, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **ATC- 1500, 2500 & 3500 - HVAC VERIFICATION TEST** or **ATC - 3500 CAB & CHASSIS, 4500 & 5500 - HVAC**

VERIFICATION TEST or **MTC - 1500, 2500 & 3500 - HVAC VERIFICATION TEST** or **MTC - 3500 CAB & CHASSIS, 4500 & 5500 - HVAC VERIFICATION TEST** .

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the HVAC.
   2. Clear active DTC's.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7.

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

   Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

   Yes

- Go To 8.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE**

Fig. 170: Checking Can Interior Bus (+) (125K) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D265) CAN Interior Bus (+) (125K) circuit and ground.

Is the voltage above 5.0 volts?

Yes

- Repair the short to voltage in the (D265) CAN Interior Bus (+) (125K) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND**

Fig. 171: Checking Can Interior Bus (-) (125K) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D264) CAN Interior Bus (-) (125K) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (D264) CAN Interior Bus (-) (125K) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (WIRELESS IGNITION NODE OR WIN)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder

of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Wireless Ignition Node (WIN) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D51) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D52) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
WIN POWER AND GROUND
WIRELESS IGNITION NODE (WIN)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: **Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

1. With the scan tool, read active DTC's.

Is this DTC active?

Yes

- Go To 2.

No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE WIN IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the WIN is active on the bus.

      Is the WIN active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM WIN (WIRELESS IGNITION NODE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the WIN?

Yes

- Replace/update the WIN in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Perform the WIRELESS IGNITION NODE (WIN) VERIFICATION TEST. Refer to **WIRELESS IGNITION NODE (WIN) VERIFICATION** .

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the WIN.
   2. Clear active DTC's.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7.

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

   Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining

CAN C BUS modules?

Yes

- Go To 8.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Fig. 172: Checking Can C Bus (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D52) CAN C Bus (+) circuit and ground.
2. Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D52) or (D65) CAN C Bus (+) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Fig. 173: Checking Can C Bus (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Measure the resistance between ground and the (D51) CAN C Bus (-) circuit.
3. Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (D51) or (D64) CAN C Bus (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0184-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or

determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Radio for approximately two to five seconds.

SET CONDITION:

Bus messages not received from the Amplifier (AMP) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
AMP POWER AND GROUND
AMPLIFIER (AMP)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: **Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

1. With the scan tool, read active DTC's.

   Is this DTC active?

Yes

- Go To 2.

No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE AMP IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the AMP is active on the bus.

      Is the AMP active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM AMP (AMPLIFIER)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the AMP?

      Yes

- Replace/update the AMP in accordance with the Service Information. Refer to **AMPLIFIER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the AMP.
   2. Clear active DTC's.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

      - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7.

      No

      - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

      Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

- Go To 8.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE**

Fig. 176: Checking Can Interior Bus (+) (125K) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D265) CAN Interior Bus (+) (125K) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D265) CAN Interior Bus (+) (125K) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 9.

9. **(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND**

Fig. 177: Checking Can Interior Bus (-) (125K) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D264) CAN Interior Bus (-) (125K) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (D264) CAN Interior Bus (-) (125K) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE (HFM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the HFM for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
HFM POWER AND GROUND
HANDS FREE PHONE MODULE (HFM)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

Is this DTC active?

Yes

- Go To 2.

No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE HFM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the HFM is active on the bus.

      Is the HFM active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM HFM (HANDS FREE MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the HFM?

Yes

- Replace/update the HFM in accordance with the Service Information. Refer to **MODULE, HANDS FREE (HFM), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the HFM.
   2. Clear active DTC's.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7.

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

   Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

- Go To 8.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE**

Fig. 178: Checking Can Interior Bus (+) (125K) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D265) CAN Interior Bus (+) (125K) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D265) CAN Interior Bus (+) (125K) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 9.

9. **(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND**

Fig. 179: Checking Can Interior Bus (-) (125K) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D264) CAN Interior Bus (-) (125K) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (D264) CAN Interior Bus (-) (125K) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0203-LOST COMMUNICATION WITH DOOR MODULE FRONT LEFT (DMFL) (DRIVER DOOR MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that

operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Door Module Front Left (DMFL) or Driver Door Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
DMFL POWER AND GROUND
DOOR MODULE FRONT LEFT (DMFL)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and

16 volts before proceeding.

1. With the scan tool, read active DTC's.

   Is this DTC active?

   Yes

   - Go To 2.

   No

   - Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE DMFL IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the DMFL is active on the bus.

      Is the DMFL active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM DDM (DMLF) (DRIVER DOOR MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**

1. With the scan tool, select Network Diagnostics.

   Is there more than one module with active DTC's "Logged Against" the DMFL?

   Yes

   - Replace/update the DMFL or Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the DMFL.
   2. Clear active DTC's.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

      - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7.

      No

      - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**

1. With the scan tool, select Network Diagnostics.

   Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

   Yes

   - Go To 8.

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE**

Fig. 180: Checking Can Interior Bus (+) (125K) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D265) CAN Interior Bus (+) (125K) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D265) CAN Interior Bus (+) (125K) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 9.

9. **(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND**

Fig. 181: Checking Can Interior Bus (-) (125K) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D264) CAN Interior Bus (-) (125K) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (D264) CAN Interior Bus (-) (125K) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0204-LOST COMMUNICATION WITH DOOR MODULE FRONT RIGHT (DMFR) (PASSENGER DOOR MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

      - Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**

1. With the scan tool, read active DTC's from all modules.

   NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

   Does the scan tool display any active DTC's to the conditions listed above?

   Yes

   - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

   No

   - Go To 3.

3. **VERIFY THE DMFR IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the DMFR is active on the bus.

   Is the DMFR active on the bus?

   Yes

   - Go To 4.

   No

   - Refer to **NO RESPONSE FROM PDM (DMRF) (PASSENGER DOOR MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

   Is there more than one module with active DTC's "Logged Against" the DMFR?

   Yes

   - Replace/update the DMFR or Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**

1. With the scan tool, select the module setting the DTC against the DMFR.
2. Clear active DTC's.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7.

      No

      - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

      Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

      Yes

      - Go To 8.

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST.

Refer to **BODY VERIFICATION TEST**.

8. **(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE**

Fig. 182: Checking Can Interior Bus (+) (125K) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D265) CAN Interior Bus (+) (125K) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D265) CAN Interior Bus (+) (125K) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND**

Fig. 183: Checking Can Interior Bus (-) (125K) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D264) CAN Interior Bus (-) (125K) circuit.

   Is the resistance below 10k Ohms?

   Yes

- Repair the short to ground in the (D264) CAN Interior Bus (-) (125K) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating

(active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Heated Seat Module (HSM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes

HEATED SEAT MODULE (HSM)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE HSM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the HSM is active on the bus.

      Is the HSM active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM HSM (HEATED SEAT MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the HSM?

      Yes

      - Replace/update the HSM in accordance with the Service Information. Refer to **MODULE, HEATED SEAT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
    1. With the scan tool, select the module setting the DTC against the HSM.
    2. Clear active DTC's.

    Is this DTC still active?

    Yes

    - Replace/update the module that set this DTC in accordance with the Service Information.
    - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Go To 6.

6. **CYCLE IGNITION**
    1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

    Does this DTC become active?

    Yes

    - Go To 7.

    No

    - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
    1. With the scan tool, select Network Diagnostics.

    Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

    Yes

    - Go To 8.

    No

    - Replace/update the module that set this DTC in accordance with the Service Information.

- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE**

Fig. 184: Checking Can Interior Bus (+) (125K) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D265) CAN Interior Bus (+) (125K) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D265) CAN Interior Bus (+) (125K) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND**

Fig. 185: Checking Can Interior Bus (-) (125K) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D264) CAN Interior Bus (-) (125K) circuit.

   Is the resistance below 10k Ohms?

Yes

- Repair the short to ground in the (D264) CAN Interior Bus (-) (125K) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE (MSMD)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are

wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the MSMD for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
MSMD POWER AND GROUND
MEMORY SEAT CONTROL MODULE (MSMD)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE MSMD IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the MSMD is active on the bus.

      Is the MSMD active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM MSMD (MEMORY SEAT MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the MSMD?

      Yes

      - Replace/update the MSMD in accordance with the Service Information. Refer to **MODULE, MEMORY, REMOVAL** .
      - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the MSMD.
   2. Clear active DTC's.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

      - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7.

      No

      - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

      Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

      Yes

      - Go To 8.

      No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE**

Fig. 186: Checking Can Interior Bus (+) (125K) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D265) CAN Interior Bus (+) (125K) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

- Repair the short to voltage in the (D265) CAN Interior Bus (+) (125K) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND**

Fig. 187: Checking Can Interior Bus (-) (125K) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D264) CAN Interior Bus (-) (125K) circuit.

Is the resistance below 10k Ohms?

Yes

- Repair the short to ground in the (D264) CAN Interior Bus (-) (125K) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0212-LOST COMMUNICATION WITH SCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Steering Control Module (SCM)/Steering Angle Sensor (SAS) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D51) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D52) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
SAS POWER AND GROUND
STEERING CONTROL MODULE (SCM)/STEERING ANGLE SENSOR (SAS)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

- Go To 2.

No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE SAS IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the SAS is active on the bus.

      Is the SAS active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM THE STEERING ANGLE SENSOR (SAS)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the SAS?

      Yes

      - Replace/update the SAS in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the SAS.
   2. Clear active DTC's.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

      - Go To 6.

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7.

      No

      - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

      Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D52) OR (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Fig. 188: Checking Can C Bus (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D52) CAN C Bus (+) circuit and ground.
2. Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D52) or (D65) CAN C Bus (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

   No

   - Go To 9.

9. **(D51) OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Fig. 189: Checking Can C Bus (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D51) CAN C Bus (-) circuit.
3. Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (D51) or (D64) CAN C Bus (-) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0249-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE - LAST ROW (VES3)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores Diagnostic Trouble Codes (DTC's) for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating

(active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Vehicle Entertainment Control Module (VES3) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
VES3 POWER AND GROUND
VEHICLE ENTERTAINMENT CONTROL MODULE (VES3)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

- Refer to **STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read active DTC's from all modules.

      NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

      Yes

      - Go to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **VERIFY THE VES3 IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify the VES3 is active on the bus.

      Is the VES3 active on the bus?

      Yes

      - Go To 4.

      No

      - Refer to **NO RESPONSE FROM VES3 (VIDEO SCREEN MODULE)** and perform the diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTC's "Logged Against" the VES3?

      Yes

      - Replace/update the VES3 in accordance with the Service Information. Refer to **MONITOR, MEDIA SYSTEM, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

      No

- Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**
    1. With the scan tool, select the module setting the DTC against the VES3.
    2. Clear active DTC's.

    Is this DTC still active?

    Yes

    - Replace/update the module that set this DTC in accordance with the Service Information.
    - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Go To 6.

6. **CYCLE IGNITION**
    1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

    Does this DTC become active?

    Yes

    - Go To 7.

    No

    - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
    - Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
    1. With the scan tool, select Network Diagnostics.

    Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

    Yes

    - Go To 8.

    No

    - Replace/update the module that set this DTC in accordance with the Service Information.

- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

8. **(D265) CAN INTERIOR BUS (+) (125K) CIRCUIT SHORTED TO VOLTAGE**

Fig. 190: Checking Can Interior Bus (+) (125K) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D265) CAN Interior Bus (+) (125K) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the (D265) CAN Interior Bus (+) (125K) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 9.

9. **(D264) CAN INTERIOR BUS (-) (125K) CIRCUIT SHORTED TO GROUND**

Fig. 191: Checking Can Interior Bus (-) (125K) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D264) CAN Interior Bus (-) (125K) circuit.

   Is the resistance below 10k Ohms?

Yes

- Repair the short to ground in the (D264) CAN Interior Bus (-) (125K) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U1147-ADDITIONAL CAN INTERIOR BUS ECU DETECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects an additional CAN Interior Bus module and requires reprogramming.

POSSIBLE CAUSES

Possible Causes
ADDITIONAL MODULE ADDED/REMOVED FROM THE CAN INTERIOR BUS NETWORK

DIAGNOSTIC TEST

1. **CHECK THE VEHICLE REPAIR HISTORY**
    1. Check the vehicle repair history for any recent module replacements or additions.

       Have any modules been recently replaced or added?

       Yes

       - Verify the appropriate installation and module initialization procedures were completed. Make sure any changes related to the sales codes associated with the vehicle or the vehicle configuration were correctly updated. Repair as necessary.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

       No

- Go To 2.

2. **RESTORE THE VEHICLE CONFIGURATION**
    1. Turn the ignition on.
    2. With the scan tool, view the modules on the communication network. Read and record the listed modules or run a Vehicle Scan Report.
    3. With the scan tool, select TIPM, miscellaneous functions then Restore Vehicle Configuration.
    4. With the scan tool, erase DTC's.
    5. Cycle the ignition from on to off three times and read the active TIPM DTC's.

    Does the scan tool display this DTC as active?

    Yes

    - Retest system and attempt to reprogram the TIPM.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Repair is complete.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U1148-ADDITIONAL CAN C BUS ECU DETECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

The Totally Integrated Power Module (TIPM) detects an additional CAN C Bus module and requires reprogramming.

POSSIBLE CAUSES

Possible Causes
ADDITIONAL MODULE ADDED/REMOVED FROM THE CAN C BUS NETWORK

DIAGNOSTIC TEST

1. **CHECK THE VEHICLE REPAIR HISTORY**
    1. Check the vehicle repair history for any recent module replacements or additions.

    Have any modules been recently replaced or added?

Yes

- Verify the appropriate installation and module initialization procedures were completed. Make sure any changes related to the sales codes associated with the vehicle or the vehicle configuration were correctly updated. Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To 2.

2. **RESTORE THE VEHICLE CONFIGURATION**
    1. Turn the ignition on.
    2. With the scan tool, view the modules on the communication network. Read and record the listed modules or run a Vehicle Scan Report.
    3. With the scan tool, select TIPM, miscellaneous functions then Restore Vehicle Configuration.
    4. With the scan tool, erase DTC's.
    5. Cycle the ignition from on to off three times and read the active TIPM DTC's.

    Does the scan tool display this DTC as active?

    Yes

    - Retest system and attempt to reprogram the TIPM.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

    No

    - Repair is complete.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

STANDARD PROCEDURE

BODY VERIFICATION TEST

DIAGNOSTIC TEST

1. **Perform Body Verification Test**
    1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
    2. Make sure all accessories are turned off.
    3. Make sure the battery is fully charged.
    4. Turn the ignition on.
    5. With the scan tool, record and erase Diagnostic Trouble Codes (DTC)s from all modules.
    6. If an electronic control module was replaced, select the applicable module from the scan tool. If the

module has programmable features, program as necessary.

7. (Export only) If the Intrusion Transceiver Module (ITM) and/or Siren was replaced, select the ITM from the scan tool and perform the applicable replacement procedure.
8. Turn the ignition off, wait 10 seconds, and then turn the ignition on.
9. Operate all functions of the system that caused the original concern. If a repair or module replacement was done to the power windows, operate the motor fully down and then to the full up position and stall it for two seconds.
10. With the scan tool, view all the modules and check for DTC's.

Are DTC's present in any of the modules or is the original condition still present?

Yes

- The repair is not complete. Refer to the appropriate Electrical Diagnostic Information for the DTC or symptom that is still present.

No

- The repair is complete.

DESCRIPTION

DESCRIPTION

The HomeLink® transceiver for this vehicle is integral to the Remote Compass Module (RCM) and is sometimes referred to as an Electronic Overhead Module (EOM) located in the front overhead console. The only visible component of the HomeLink® transceiver are the three push buttons (4). The buttons are marked with one, two or three dots, respectively, for identification of each channel.

Fig. 1: View Of Electronic Overhead Module (EOM)
Courtesy of CHRYSLER GROUP, LLC

Each of the HomeLink® transceiver push buttons controls an independent radio transmitter channel. Each of these three channels can be trained to transmit a different radio frequency signal for the remote operation of garage door openers, motorized gate openers, home or office lighting, security systems or just about any other device that can be equipped with a radio receiver in the 286 to 399 Megahertz (MHz) frequency range for remote operation. The HomeLink® transceiver is capable of operating systems using either rolling code or non-rolling code technology. For information on programing, refer to **STANDARD PROCEDURE**.

The HomeLink® transceiver cannot be repaired, and is only available for service as part of the EOM. This unit includes the electronics and push button switches for the HomeLink® transceiver, the electronics for the Remote Compass Module (RCM) and the plastic module case. For service information, refer to **MODULE, COMPASS, REMOVAL** and **MODULE, COMPASS, INSTALLATION** .

OPERATION

OPERATION

The HomeLink® transceiver receives battery feed through the Ignition Off Draw (IOD) fuse circuit of the vehicle. It operates on a non-switched source of battery current so the unit will remain functional, regardless of the ignition switch position. It can learn and store three separate transmitter radio frequency codes to operate garage door openers, security gates and security lighting. The Electronic Vehicle Information Center (EVIC) display provides visual feedback to the driver, showing which transmitter button is pressed. The system will not send operating signals if the vehicle theft security alarm is armed. This prevents a perpetrator from breaking into a vehicle parked outside a home and using the HomeLink® transceiver system to enter the home.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HOMELINK® TRANSCEIVER

Fig. 2: Radio Frequency Detector #9001
Courtesy of CHRYSLER GROUP, LLC

If the HomeLink® transceiver is inoperative, but the Electronic Vehicle Information Center (EVIC) Vacuum-Fluorescent Display (VFD) is operating normally, for instructions on training the HomeLink® transceiver. Refer to **STANDARD PROCEDURE**. Retrain the HomeLink® transceiver with a known good hand held transmitter as instructed and test the HomeLink® transceiver operation again. If the unit is still inoperative, test it with the Radio Frequency Detector special tool (special tool #9001, Rf Detector) as described below:

1. Turn the Radio Frequency (RF) Detector ON. A "chirp" will sound and the green power Light Emitting Diode (LED) indicator will light. If the green LED does not light, replace the battery.
2. Hold the RF detector within one inch of the **TRAINED** HomeLink® transceiver and press any of the transceiver buttons.
3. The red signal detection LEDs will light and the tool will beep if a radio signal is detected. Repeat this test for each button. If any button is inoperative, replace the Electronic Overhead Module (EOM) module.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information

includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

STANDARD PROCEDURE

PROGRAMMING HOMELINK® TRANSCEIVER CODES

WARNING: Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the engine while training the universal transmitter. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Your motorized door or gate may open and close while you are training the universal transmitter if the vehicle is in range of the motorized device. Do not train the universal transmitter if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.

NOTE: When programming a garage door opener, it is advised to park outside the garage. It is also recommended that a new battery be placed in the hand-held transmitter of the device being programmed to the HomeLink® transceiver for quicker training and accurate transmission of the radio-frequency signal.

NOTE: If programing the HomeLink® transceiver is unsuccessful using the following procedure, refer to the Owner's Manual for the current customer assistance phone number.

PROGRAMMING COMMON HOMELINK® TRANSCEIVER CODES (ELECTRONIC VEHICLE INFORMATION CENTER (EVIC) EQUIPPED MODELS)

1. Press and hold the two outer HomeLink® transceiver buttons, the EVIC will display "CLEARING CHANNELS", do not release the buttons until "CHANNELS CLEARED" is displayed on the EVIC (after approximately 20 seconds). **Do not** hold the buttons for longer than 30 seconds and **do not** repeat step one to program a second and/or third hand-held transmitter to the remaining two HomeLink® transceiver buttons. The HomeLink® transceiver is now in the train (or learning) mode
2. Position the end of your hand-held transmitter 3-8 cm (1-3 inches) away from the HomeLink® transceiver buttons while keeping the EVIC display in view.
3. Simultaneously press and hold both the HomeLink® transceiver button that you want to train and the hand-held transmitter button. **Do not release the buttons until step 4 has been completed.** The EVIC will display "CHANNEL X TRAINING", once the HomeLink® transceiver is programmed the EVIC will display "CHANNEL X TRAINED". X refers to the desired channel being trained (1, 2 or 3).

NOTE: Some gate operators and garage door openers may require you to replace this Programming Step 3. Refer to <u>CANADIAN PROGRAMMING/GATE PROGRAMMING</u>.

4. Once "CHANNEL X TRAINED" is displayed on the EVIC, release both buttons. Programming is now complete. When the HomeLink® transceiver button is subsequently pressed, "CHANNEL X TRANSMIT" is displayed on the EVIC and your device should be activated, (garage door should open).

NOTE: **To program the remaining two buttons, begin with "Programming" step 2. Do not repeat step 1.**

If the EVIC display shows "CHANNEL X TRANSMIT" (where X is channel 1, 2 or 3) but your device does not activate, the device may be equipped with a "rolling code" system. Continue with the following steps five through seven to complete the programming of a rolling code equipped device (most commonly a garage door opener manufactured after 1995). The assistance of a second person may make the following programming steps quicker and easier.

5. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
6. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.)

NOTE: **There are 30 seconds in which to initiate step 8.**

7. Return to the vehicle and firmly **press, hold for two seconds and release** the programmed HomeLink® transceiver button. Repeat the **"press/hold/release"** sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming.

   The HomeLink® transceiver should now activate your rolling code equipped device.

NOTE: **To program the remaining two HomeLink® transceiver buttons, begin with "Programming" step 2. Do not repeat step 1.**

CANADIAN PROGRAMMING/GATE PROGRAMMING

Canadian radio-frequency laws require transmitter signals to "time-out" (or quit) after several seconds of transmission which may not be long enough for the HomeLink® transceiver to pick up the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to "time-out" in the same manner.

If you live in Canada or you are having difficulties programming a gate operator by using the "Programming" procedures (regardless of where you live), **replace "Programming Common HomeLink® Transceiver Codes" step 3** with the following:

NOTE: **When programming a garage door opener or gate operator, it is advised to unplug the device or move the vehicle out of range during the "cycling" process to prevent possible overheating.**

3. Continue to press and hold the HomeLink® transceiver button while you **press and release every two seconds** ("cycle") your hand-held transmitter until the frequency signal has successfully been accepted. On EVIC equipped vehicles, the EVIC will display "CHANNEL X TRAINING" and then "CHANNEL X TRAINED". Continue with "Programming". Refer to 4.

ERASING HOMELINK® TRANSCEIVER CODES

NOTE: Individual channels cannot be erased. Erasing the HomeLink® transceiver codes will erase ALL programmed codes.

ERASING HOMELINK® TRANSCEIVER CODES (ELECTRONIC VEHICLE INFORMATION CENTER (EVIC) EQUIPPED VEHICLES.

To erase programming from all three buttons (individual buttons cannot be erased but can be "reprogrammed"), follow the step noted:

- Press and hold the two outer HomeLink® transceiver buttons until the EVIC displays "CLEARING CHANNELS", do not release the buttons until "CHANNELS CLEARED" is displayed on the EVIC (after approximately 20 seconds). Release both buttons. Do not hold for longer that 30 seconds. HomeLink® is now in the train (or learning) mode and can be programmed at any time beginning with "Programming". Refer to **STANDARD PROCEDURE**.

REPROGRAMMING HOMELINK® TRANSCEIVER CODES

WARNING: **Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the engine while training the universal transmitter. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **Your motorized door or gate may open and close while you are training the universal transmitter if the vehicle is in range of the motorized device. Do not train the universal transmitter if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.**

NOTE: If programing the HomeLink® transceiver is unsuccessful using the following procedure, refer to the Owner's Manual for the current customer assistance phone number.

REPROGRAMMING BASIC HOMELINK® TRANSCEIVER CODES (ELECTRONIC VEHICLE INFORMATION CENTER (EVIC) EQUIPPED VEHICLES)

To program a device to the HomeLink® transceiver using a button previously trained, follow these steps:

1. Press and hold the desired HomeLink® transceiver button. **DO NOT** release the button. The EVIC will display "CHANNEL X TRANSMIT" for 20 seconds and then change to "CHANNEL X TRAINING". Without releasing the HomeLink® transceiver button, proceed to step 2.

2. Position the end of your hand-held transmitter 3-8 cm (1-3 inches) away from the HomeLink® transceiver button while keeping the EVIC display in view.
3. Simultaneously press and hold both the HomeLink® transceiver button that you want to train and the hand-held transmitter buttons. **Do not release the buttons until step 4 has been completed.** The EVIC will display "CHANNEL X TRAINING", once the HomeLink® transceiver is programmed the EVIC will display "CHANNEL X TRAINED". X refers to the desired channel being trained (1, 2 or 3).

NOTE: Some gate operators and garage door openers may require you to replace this Reprogramming Step 3. Refer to <u>CANADIAN PROGRAMMING/GATE PROGRAMMING</u>.

4. Once "CHANNEL X TRAINED" is displayed on the EVIC, release both buttons. Programming is now complete. When the HomeLink® transceiver button is subsequently pressed, "CHANNEL X TRANSMIT" is displayed on the EVIC and your device should be activated, (garage door should open).

NOTE: If the EVIC display shows "CHANNEL X TRANSMIT" (where X is channel 1, 2 or 3) but your device does not activate, the device may be equipped with a "rolling code" system. Continue with the following steps 5 through 7 to complete the programming of a rolling code equipped device (most commonly a garage door opener manufactured after 1995). The assistance of a second person may make the following programming steps quicker and easier.

5. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
6. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.)

NOTE: There are 30 seconds in which to initiate step 7.

7. Return to the vehicle and firmly **press, hold for two seconds and release** the reprogrammed HomeLink® transceiver button. Repeat the **"press/hold/release"** sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the reprogramming.

   The HomeLink® transceiver should now activate your rolling code equipped device.

CANADIAN PROGRAMMING/GATE PROGRAMMING

Canadian radio-frequency laws require transmitter signals to "time-out" (or quit) after several seconds of transmission which may not be long enough for the HomeLink® transceiver to pick up the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to "time-out" in the same manner.

If you live in Canada or you are having difficulties programming a gate operator by using the "Programming" procedures (regardless of where you live), **replace "Programming Common HomeLink® Transceiver**

Codes" step 3 with the following:

NOTE: **When programming a garage door opener or gate operator, it is advised to unplug the device or move the vehicle out of range during the "cycling" process to prevent possible overheating.**

3. Continue to press and hold the HomeLink® transceiver button while you **press and release every two seconds** ("cycle") your hand-held transmitter until the frequency signal has successfully been accepted. On EVIC equipped vehicles, the EVIC will display "CHANNEL X TRAINING" and then "CHANNEL X TRAINED". Continue with "Programming". Refer to 4.

DIAGNOSIS AND TESTING

SENTRY KEY IMMOBILIZER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Sentry Key Immobilizer System (SKIS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls or communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient, and accurate means to diagnose the SKIS or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

CONDITION	POSSIBLE CAUSES	CORRECTION
SECURITY INDICATOR FAILS TO LIGHT DURING BULB TEST	1. Ineffective Light-Emitting Diode (LED).	1. Use a diagnostic scan tool to perform the instrument cluster actuator test. Refer to the appropriate diagnostic information.
	2. Ineffective fuse.	2. Check the WIN fused B(+) fuse and the fused ignition switch output (run-start) fuse in the Junction Block (JB). Replace the fuses, if required.
	3. Ineffective ground circuit.	3. Test and repair the open ground circuit at the connector for the WIN, if required.
	4. Ineffective battery feed circuit.	4. Test and repair the open battery feed circuit at the connector for the WIN, if required.
	5. Ineffective ignition feed	5. Test and repair the open ignition

	circuit.	feed circuit at the connector for the WIN, if required.
SECURITY INDICATOR FLASHES FOLLOWING BULB TEST	1. Invalid key in ignition switch lock cylinder.	1. Replace the key with a known valid key.
	2. Key-related fault.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.
SECURITY INDICATOR LIGHTS SOLID FOLLOWING BULB TEST	1. SKIS system malfunction/fault detected.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.
	2. SKIS system ineffective.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.

VEHICLE THEFT SECURITY SYSTEM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

The hard wired circuits between components related to the Vehicle Theft Security System (VTSS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTSS or the electronic controls or communication between other modules and devices that provide some features of the VSS. The most reliable, efficient, and accurate means to diagnose the VTSS or the electronic controls and communication related to VTSS operation requires the use of a diagnostic scan tool. See the **Vehicle Theft Security System** menu item on the scan tool. Refer to the appropriate diagnostic information.

Vehicle Theft Security - Service Information - Ram Pickup

DESCRIPTION

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) provides passive vehicle protection by preventing the engine from operating unless a valid electronically encoded key is detected in the ignition lock cylinder. The SKIS used in combination with the export premium version of the VTSS adds a steering shaft lock feature that provides passive protection by preventing the vehicle from being steered unless a valid electronically encoded key is detected in the ignition lock cylinder.

The SKIS includes the following major components, which are described in further detail elsewhere in this service information:

- **Powertrain Control Module (1) -** The Powertrain Control Module (PCM) is located in the engine compartment. Refer to appropriate Electrical Diagnostic article. .
- **Security Indicator -** A security indicator is integral to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). Refer to **DESCRIPTION** .
- **Sentry Key Remote Entry Module/Wireless Ignition Node (WIN) -** The WIN located on the right side of the steering column concealed beneath the instrument panel.
- **Sentry Key Transponder (3) -** The Sentry Key transponder is contained within the Remote Keyless Entry (RKE) transmitter on the ignition key.

VEHICLE THEFT SECURITY SYSTEM

Fig. 1: Vehicle Theft Security System Components
Courtesy of CHRYSLER GROUP, LLC

The Vehicle Theft Security System (VTSS) is designed to provide perimeter protection against unauthorized use or tampering by monitoring the vehicle door ajar circuits, the power lock and unlock circuits, and the ignition switch circuit. If unauthorized use or tampering is detected, the system responds by pulsing the horn for up to about 3 minutes and flashing the hazard warning lamps for up to about 18 minutes.

The VTSS includes the following major components, which are described in further detail elsewhere in this service information:

- **Door Ajar Switches (4)** - A door ajar switch is integral to the door latch mechanism of each front door, as well as the rear doors on quad cab and mega cab vehicles. Refer to **SWITCH, DOOR AJAR, DESCRIPTION** .
- **ElectroMechanical Instrument Cluster (2)** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Compartment Node (CCN) in this vehicle. The EMIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. The EMIC provides the VTA system logic and security indicator control. Refer to **DESCRIPTION** .
- **Ignition Switch (3)** - The ignition switch is located on the steering column in the passenger compartment.
- **Security Indicator** - The security indicator is integral to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). Refer to **DESCRIPTION** .
- **Totally Integrated Power Module (1)** - The Totally Integrated Power Module (TIPM) is located in the engine compartment, near the battery. Refer to **DESCRIPTION** .

Hard wired circuitry connects the VTSS components to the electrical system of the vehicle. These hard wired

circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the VTSS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

IMMOBILIZER SYSTEM

The Immobilizer System is designed to provide passive protection against unauthorized vehicle use by disabling the engine after about two seconds of running, whenever any method other than a valid Sentry Key is used to start the vehicle. The Immobilizer System is considered a passive protection system because it is always active when the ignition system is energized and does not require any customer intervention. The Immobilizer System uses Radio Frequency (RF) communication to obtain confirmation that the key in the ignition switch is a valid key for operating the vehicle. The Immobilizer System hardware and software also uses electronic messages to communicate with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, OPERATION** .

Pre-programmed Sentry Key transponders are provided with the vehicle from the factory. Each Wireless Ignition Node (WIN) will recognize a maximum of eight Sentry Keys. If the customer would like additional keys other than those provided with the vehicle, they may be purchased from any authorized dealer. These additional keys must be programmed to the WIN in the vehicle in order for the system to recognize them as valid keys. This can be done by the dealer using a diagnostic scan tool or, if Customer Learn programming is an available Immobilizer System feature in the market where the vehicle was purchased, the customer can program the additional keys, as long as at least two valid Sentry Keys are already available. Refer to **STANDARD PROCEDURE** .

The hard wired circuits between components related to the Immobilizer System may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the Immobilizer System or the electronic controls or communication between other modules and devices that provide some features of the Immobilizer System. The most reliable, efficient, and accurate means to diagnose the Immobilizer System or the electronic controls and communication related to Immobilizer System operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

VEHICLE THEFT SECURITY SYSTEM

The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) is used on this vehicle to control and integrate many of the functions and features included in the Vehicle Theft Security System (VTSS). In the VTSS, the EMIC receives inputs indicating the status of the door ajar switches and the ignition switch. The EMIC will process the information from all of these inputs, internally controls the

security indicator as appropriate, and sends electronic messages to the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus. The TIPM internally controls the output to the hazard warning lamps and sends a control output to energize or de-energize the horn relay as appropriate.

The hard wired circuits between components related to the VTSS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTSS or the electronic controls or communication between modules and devices that provide some features of the VTSS. The most reliable, efficient, and accurate means to diagnose the VTSS or the electronic controls and communication related to VTSS operation requires the use of a diagnostic scan tool. See the **Vehicle Theft Security System** menu item on the scan tool. Refer to the appropriate diagnostic information.

Following are paragraphs describing the operation of each of the VTSS features. See the owner's manual in the vehicle glove box for more information on the features, use and operation of the VTSS.

ENABLING

The EMIC must have the VTSS function electronically enabled in order for the VTSS to perform as designed. The logic in the EMIC keeps its VTSS function dormant until it is enabled using a diagnostic scan tool. The VTSS function of the EMIC is enabled on vehicles equipped with the VTSS option at the factory, but a service replacement EMIC must be VTSS-enabled by the dealer using a diagnostic scan tool. Refer to the appropriate diagnostic information.

ARMING

Passive arming of the VTSS occurs when the vehicle is exited with the key removed from the ignition switch, the headlamps are turned OFF, and the doors are LOCKED while they are open using the power lock switch. Active arming occurs when the LOCK button on the Remote Keyless Entry (RKE) transmitter is depressed to lock the vehicle. For active arming to occur, the doors must be closed and the ignition switch must be in the OFF position when the RKE transmitter LOCK button is depressed. The power lock switch will not function if the key is in the ignition switch or the headlamps are turned ON with the driver side front door open.

Pre-arming of the VTSS is initiated when a door is open when the vehicle is locked using a power door lock switch or when the RKE transmitter LOCK button is depressed. Pre-arming will not occur if the key is in the ignition switch or the headlamps are turned ON with the driver side front door open. When the VTSS is pre-armed, the arming sequence is delayed until all of the doors have been closed. The VTSS will remain in pre-armed mode until after all doors have been closed, or until the interior lighting load shed threshold is surpassed (about eight minutes).

Once the VTSS begins the passive or active arming sequence, the security indicator in the instrument cluster will flash rapidly for about 16 seconds. This indicates that VTSS arming is in progress. If the ignition switch is turned to the ON position, a door is opened, a door is unlocked by any means, or the RKE PANIC button is depressed during the 16 second arming process, the security indicator will stop flashing and the arming process will abort. Once the 16 second arming sequence is successfully completed, the security indicator will flash at a slower rate, indicating that the VTSS is armed.

DISARMING

Since this vehicle is not equipped with lock cylinder switches, passive disarming of the VTSS is only possible if the vehicle is equipped with the optional Sentry Key Immobilizer System (SKIS). On vehicles with SKIS, turning the ignition switch to the ON position using a valid SKIS key will passively disarm VTSS. Active disarming of the VTSS occurs when the vehicle is unlocked by depressing the UNLOCK button of the RKE transmitter. Once the alarm has been activated, either disarming method will also deactivate the alarm. Depressing the PANIC button on the RKE transmitter will **not** disarm the VTSS.

POWER-UP MODE

When the armed VTSS senses that the battery has been disconnected and reconnected, it enters the power-up mode. In the power-up mode the alarm system remains armed following a battery failure or disconnect. If the VTSS was armed prior to a battery disconnect or failure, the technician or vehicle operator will have to actively or passively disarm the alarm system after the battery is reconnected. The power-up mode will also apply if the battery goes dead while the system is armed, and battery jump-starting is attempted. The VTSS will be armed until the technician or vehicle operator has actively or passively disarmed the alarm system. If the VTSS is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.

TAMPER ALERT

The VTSS tamper alert feature will pulse the horn 3 times upon VTSS disarming, if the alarm was triggered and has since timed-out (about 18 minutes), or if the battery has been disconnected and reconnected. This feature alerts the vehicle operator that the VTSS alarm was activated while the vehicle was unattended.

DIAGNOSIS AND TESTING

SENTRY KEY IMMOBILIZER SYSTEM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

The hard wired circuits between components related to the Sentry Key Immobilizer System (SKIS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls or communication between other modules and devices that provide some features of the

SKIS. The most reliable, efficient, and accurate means to diagnose the SKIS or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

CONDITION	POSSIBLE CAUSES	CORRECTION
SECURITY INDICATOR FAILS TO LIGHT DURING BULB TEST	1. Ineffective Light-Emitting Diode (LED).	1. Use a diagnostic scan tool to perform the instrument cluster actuator test. Refer to the appropriate diagnostic information.
	2. Ineffective fuse.	2. Check the WIN fused B(+) fuse and the fused ignition switch output (run-start) fuse in the Junction Block (JB). Replace the fuses, if required.
	3. Ineffective ground circuit.	3. Test and repair the open ground circuit at the connector for the WIN, if required.
	4. Ineffective battery feed circuit.	4. Test and repair the open battery feed circuit at the connector for the WIN, if required.
	5. Ineffective ignition feed circuit.	5. Test and repair the open ignition feed circuit at the connector for the WIN, if required.
SECURITY INDICATOR FLASHES FOLLOWING BULB TEST	1. Invalid key in ignition switch lock cylinder.	1. Replace the key with a known valid key.
	2. Key-related fault.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.
SECURITY INDICATOR LIGHTS SOLID FOLLOWING BULB TEST	1. SKIS system malfunction/fault detected.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.
	2. SKIS system ineffective.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.

VEHICLE THEFT SECURITY SYSTEM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

The hard wired circuits between components related to the Vehicle Theft Security System (VTSS) may be

diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTSS or the electronic controls or communication between other modules and devices that provide some features of the VSS. The most reliable, efficient, and accurate means to diagnose the VTSS or the electronic controls and communication related to VTSS operation requires the use of a diagnostic scan tool. See the **Vehicle Theft Security System** menu item on the scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

SKIS INITIALIZATION

The Sentry Key Immobilizer System (SKIS) must be initialized following a Wireless Ignition Node (WIN) replacement. SKIS initialization requires the use of a diagnostic scan tool. Initialization will also require that you have access to the unique four-digit PIN code that was assigned to the original WIN. The PIN code **must** be used to enter the Secured Access Mode in the WIN. This PIN number may be obtained from the vehicle owner, from the original vehicle invoice, or from the Chrysler Customer Center. Refer to **STANDARD PROCEDURE** .

NOTE: **If a Powertrain Control Module (PCM) is replaced on a vehicle equipped with the Sentry Key Immobilizer System (SKIS), the unique Secret Key data must be transferred from the Wireless Ignition Node (WIN) to the new PCM using the appropriate programming procedure. This procedure also requires the use of a diagnostic scan tool and the unique four-digit PIN code to enter the Secured Access Mode in the WIN. Refer to the appropriate diagnostic information for the proper PCM replacement procedures.**

SENTRY KEY TRANSPONDER PROGRAMMING

All Sentry Keys included with the vehicle are pre-programmed to work with the Sentry Key Immobilizer System (SKIS) when it is shipped from the factory. The Wireless Ignition Node (WIN) may be programmed to recognize up to a total of eight Sentry Keys. When programming a blank Sentry Key transponder, the key must first be cut to match the ignition switch lock cylinder in the vehicle for which it will be used. Once the additional or new key has been cut, the WIN must be programmed to recognize it as a valid key. There are two possible methods to program the WIN to recognize a new or additional valid key, the Secured Access Method and the Customer Learn Method. Following are the details of these two programming methods.

SECURED ACCESS METHOD

The Secured Access method applies to all vehicles. This method requires the use of a diagnostic scan tool. This method will also require that you have access to the unique four-digit PIN code that was assigned to the original WIN. The PIN code **must** be used to enter the Secured Access Mode in the WIN. This PIN number may be obtained from the vehicle owner, from the original vehicle invoice, or from the Chrysler Customer Center. Refer to **STANDARD PROCEDURE** .

CUSTOMER LEARN METHOD

NOTE: **The Customer Learn feature is only available on domestic vehicles, or those vehicles which have a U.S. country code designator. This programming method also requires access to at least two valid Sentry Keys. If two valid Sentry Keys are not available, or if the vehicle does not have a U.S. country code designator, the Secured Access Method MUST be used to program new or additional valid keys to the WIN.**

The Customer Learn programming method procedures are as follows:

1. Obtain the blank Sentry Key(s) that are to be programmed as valid keys for the vehicle. Cut the blank key (s) to match the ignition switch lock cylinder mechanical key codes.
2. Insert one of the two valid Sentry Keys into the ignition switch and turn the ignition switch to the ON position.
3. After the ignition switch has been in the ON position for longer than 3 seconds, but no more than 15 seconds, cycle the ignition switch back to the OFF position. Replace the first valid Sentry Key in the ignition switch lock cylinder with the second valid Sentry Key and turn the ignition switch back to the ON position. The second valid Sentry Key must be inserted in the lock cylinder within 15 seconds of removing the first valid key.
4. About 10 seconds after the completion of, the security indicator in the instrument cluster will start to flash to indicate that the system has entered the Customer Learn programming mode. Refer to 3.
5. Within 60 seconds of entering the Customer Learn programming mode, turn the ignition switch to the OFF position, replace the valid Sentry Key with a blank Sentry Key transponder, and turn the ignition switch back to the ON position.
6. About 10 seconds after the completion of, the security indicator will stop flashing, stay ON solid for 3 seconds, then turn OFF to indicate that the blank Sentry Key has been successfully programmed. Refer to 5. The SKIS will immediately exit the Customer Learn programming mode. After the ignition is cycled the vehicle may be started using the newly programmed valid Sentry Key.

Each of these steps must be repeated and completed in their entirety for each additional Sentry Key that is to be programmed. If the above steps are not completed in the given sequence, or within the allotted time, the WIN will exit the Customer Learn programming mode and the programming will be unsuccessful. The WIN will also automatically exit the Customer Learn programming mode if it sees a non-blank Sentry Key transponder when it should see a blank, if it has already programmed eight (8) valid Sentry Keys, or if the ignition switch is turned to the OFF position for more than about 50 seconds.

NOTE: **If an attempt is made to start the vehicle while in the Customer Learn mode (security indicator flashing), the SKIS will respond as though the vehicle were being started with an invalid key. In other words, the engine will stall after about two seconds of operation. No faults will be set.**

NOTE: **Once a Sentry Key has been programmed as a valid key to a vehicle, it cannot be programmed as a valid key for use on any other vehicle.**

KEY, TRANSPONDER

DESCRIPTION

DESCRIPTION

Fig. 2: Transponder Key
Courtesy of CHRYSLER GROUP, LLC

The Sentry Key Immobilizer System (SKIS) has a transponder chip included on the circuit board beneath the cover of each FOB with Integrated Key (FOBIK) (1) included with the vehicle. The FOBIK includes an integral mechanical valet key which is stored within the bottom of the FOBIK housing until it is released using the latch button (2). The valet key is cut to match the mechanical coding of the door and glove box lock cylinders. Each

new replacement FOBIK must be programmed for operation of the Remote Keyless Entry (RKE) system and has a unique transponder identification code that is permanently programmed into it by the manufacturer. This identification code must be programmed into the Wireless Ignition Node (WIN) to be recognized by the SKIS as a valid key.

The FOBIK transponder cannot be adjusted or repaired. If ineffective or damaged, the entire FOBIK and RKE transmitter unit must be replaced.

OPERATION

OPERATION

When the ignition switch is turned to the ON position, the Wireless Ignition Node (WIN) communicates through its antenna with the Sentry Key transponder within the FOB with Integrated Key (FOBIK) using a Low Frequency (LF) signal. The Sentry Key transponder chip is within the range of the WIN transceiver antenna ring when it is inserted into the ignition switch.

The WIN determines whether a valid FOBIK is present in the ignition switch based upon the signal from the transponder. If a valid FOBIK is detected, that fact is communicated by the WIN to the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus, and the PCM allows the engine to start. If the PCM receives an **invalid key** message, or receives no message from the WIN over the CAN data bus, the engine will be disabled. The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) will also respond to the **invalid key** message on the CAN data bus by flashing the security indicator ON and OFF.

Each Sentry Key FOBIK has a unique transponder identification code permanently programmed into it by the manufacturer. Likewise, the WIN has a unique Secret Key code programmed into it by the manufacturer. When a Sentry Key FOBIK is programmed into the memory of the WIN, the WIN stores the transponder identification code from the Sentry Key FOBIK and the Sentry Key FOBIK learns the Secret Key code from the WIN. Once the Sentry Key FOBIK learns the Secret Key code of the WIN, it is permanently stored in the memory of the transponder. Therefore, once a FOBIK has been programmed to a particular vehicle, it cannot be used on any other vehicle. Refer to **STANDARD PROCEDURE** .

The Sentry Key Immobilizer System (SKIS) performs a self-test each time the ignition switch is turned to the ON position, and will store key-related fault information in the form of a Diagnostic Trouble Code (DTC) in WIN memory if a Sentry Key FOBIK transponder problem is detected. The Sentry Key FOBIK transponder chip can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, HOOD AJAR

DESCRIPTION

DESCRIPTION

There are two types of hood ajar switches used on this vehicle. One type is a stand-alone switch that is serviceable. The second type is integrated into the hood latch assembly and is not serviceable separately from the hood latch. The stand-alone hood ajar switches are a normally closed, single pole, spring-loaded plunger

actuated switch and the hood latch mounted hood ajar switch is a normally open single pole, spring-loaded plunger actuated switch. Only one type of switch is used per vehicle. Both types of hood ajar switches function with both the Vehicle Theft Alarm (VTA) system the optional remote starter system.

Fig. 3: Hood Ajar Switch
Courtesy of CHRYSLER GROUP, LLC

On the stand-alone switch the molded plastic switch body (5) has an integral molded connector receptacle (1) on the lower end containing two terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out of the headlamp and dash wire harness. Two integral latches (2) lock the switch into a keyed mounting hole in the switch mounting bracket. The mounting bracket is secured to the upper radiator crossmember. A molded plastic striker secured to the underside of the hood panel inner reinforcement actuates the switch plunger as the hood panel is closed. The switch plunger (3) extends through a mounting collar (4) and a sleeve-like retainer ring on the upper end of the switch body. The retainer ring has a one time, self-adjustment feature that is activated after the switch is installed by closing the hood. The retainer ring is also color-coded to aid in identifying the switch application. A dark brown retainer ring identifies the underhood security switch application, while a white retainer ring identifies the remote starter system application.

Once a stand-alone hood ajar switch is installed it cannot be readjusted or repaired. If the switch is damaged, ineffective, or requires readjustment, it must be replaced with a new unit. The hood ajar switch striker is not intended for reuse. If the striker is removed from the hood inner reinforcement for any reason, it must be replaced with a new unit.

Fig. 4: Hood Latch Mounted Hood Ajar Switch
Courtesy of CHRYSLER GROUP, LLC

The hood latch mounted hood ajar switches are similar to the stand-alone hood ajar switches in the fact that they can not be adjusted or repaired. If damaged or inoperable this type of switch must be replaced but it is not serviceable separately from the hood latch and the hood latch assembly must be replaced.

REMOVAL

BRACKET

Fig. 5: Hood Ajar Switch & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Remove the hood ajar switch (4) from the mounting bracket (3).
2. Remove the fastener (2) that secure the hood ajar switch bracket (3) to the upper radiator cross member (1).
3. Remove the hood ajar switch mounting bracket from upper radiator cross member.

STRIKER

Fig. 6: Hood Striker & Lock Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Unlatch and open the hood.
2. Release the three lock tabs (2) on the hood striker (3) and pull the striker away from the inner hood panel (1) to remove the striker from the vehicle.

SWITCH

Fig. 7: Hood Ajar Switch & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Some vehicles are equipped with the hood ajar switch integrated into the hood latch assembly. This type of hood ajar switch is not serviced separately and the hood latch assembly must be replaced. Refer to LATCH, HOOD, REMOVAL .**

1. Unlatch and open the hood.
2. Disconnect and isolate the battery negative cable.
3. Remove the push pin retainers and upper radiator seal.
4. From the top of the mounting bracket (3) on the upper radiator cross member (1), squeeze the two hood ajar switch latch tabs (5) together and pull the switch (4) upward.
5. Pull the hood ajar switch up through the hole in the mounting bracket far enough to access and disconnect the jumper wire harness connector from the switch connector receptacle.
6. Remove the hood ajar switch from the mounting bracket.

INSTALLATION

BRACKET

Fig. 8: Hood Ajar Switch & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the hood ajar switch mounting bracket (3) onto the upper radiator cross member (1)
2. Install and tighten the fastener (2) that secure the mounting bracket to the upper radiator cross member, tighten the bolt to 5.5 N.m (4 ft lbs.).
3. Reinstall the hood ajar switch (2) into the mounting bracket.

STRIKER

Fig. 9: Hood Striker & Lock Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Position the hood ajar switch striker (3) over the mounting hole in the inner hood panel (1) over the hood ajar switch.
2. Using hand pressure, press the hood ajar switch striker (3) upward into the mounting hole in the inner hood panel (1) until all three integral lock tabs (2) are fully engaged.
3. Close and latch the hood.

SWITCH

Fig. 10: Hood Ajar Switch & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Some vehicles are equipped with the hood ajar switch integrated into the hood latch assembly. This type of hood ajar switch is not serviced separately and the hood latch assembly must be replaced. Refer to LATCH, HOOD, INSTALLATION .**

1. Position the hood ajar switch (4) near the mounting bracket (3) on the upper radiator cross member (1).
2. Route the jumper wire harness connector through the switch mounting bracket and reconnect it to the switch.
3. From the top of the mounting bracket, press the switch downward into the mounting hole until the integral switch latch tabs lock it into place.
4. Install the upper radiator seal and push pin retainers.
5. Reconnect the battery negative cable.
6. Close and latch the hood.

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description

DIAGNOSIS AND TESTING

B142B-VES UNIT HIGH TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on. VES active.

SET CONDITION:

The Video Screen Module temperature is above 90°C (194°F).

POSSIBLE CAUSES

Possible Causes

VIDEO SCREEN MODULE HIGH TEMPERATURE

DIAGNOSTIC TEST

1. **VIDEO SCREEN MODULE HIGH TEMPERATURE**
    1. Turn the ignition on.
    2. With the scan tool, clear all VES DTCs.
    3. Turn the VES on.
    4. With the scan tool, read the DTC information.

    Does the scan tool read: B142B-VES UNIT HIGH TEMPERATURE?

    Yes

    - Turn the Video Screen Module off and allow the unit to cool.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test Complete.

B14CE-VES BRIGHTNESS UP INPUT BUTTON STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on. VES active.

SET CONDITION:

The Video Screen Module detects a closed switch for 60 seconds.

POSSIBLE CAUSES

Possible Causes
VIDEO SCREEN MODULE

DIAGNOSTIC TEST

1. **VERIFY OPERATION OF THE BUTTON**
    1. With the scan tool, erase DTCs.
    2. Press and release the button three times.
    3. Wait 30 seconds.
    4. With the scan tool, read DTCs.

Is DTC B14CE-VES BRIGHTNESS UP INPUT BUTTON STUCK active?

Yes

- Replace the Video Screen Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B14CF-VES BRIGHTNESS DOWN INPUT BUTTON STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on. VES active.

SET CONDITION:

The Video Screen Module detects a closed switch for 60 seconds.

POSSIBLE CAUSES

Possible Causes
VIDEO SCREEN MODULE

DIAGNOSTIC TEST

1. **VERIFY OPERATION OF THE BUTTON**
    1. With the scan tool, erase DTCs.
    2. Press and release the button three times.
    3. Wait 30 seconds.
    4. With the scan tool, read DTCs.

    Is DTC: active?

    Yes

    - Replace the Video Screen Module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

- Test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210A-SYSTEM VOLTAGE LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

This is a CAN message that the battery voltage was below 10 volts for over 20 seconds.

POSSIBLE CAUSES

Possible Causes
LOW SYSTEM VOLTAGE
BATTERY OR CHARGING SYSTEM

DIAGNOSTIC TEST

1. **CHECK ENGINE DTCs**
    1. With the scan tool, read Engine DTCs.

       Are there any ENGINE Charging or Battery DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure. Refer to Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic test procedure.

       No

       - This code is for information only. At some time there was a low battery system voltage. Check the battery and charging system in accordance with the Service Information.

B210B-SYSTEM VOLTAGE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

This is a CAN message that the battery voltage was above 16 volts for over 20 seconds.

POSSIBLE CAUSES

Possible Causes
HIGH SYSTEM VOLTAGE
BATTERY OR CHARGING SYSTEM

DIAGNOSTIC TEST

1. **CHECK ENGINE DTCs**
    1. With the scan tool, read Engine DTCs.

       Are there any ENGINE Charging or Battery DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure. Refer to Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic test procedure.

       No

       - This code is for information only. At some time there was a low battery system voltage. Check the battery and charging system in accordance with the Service Information.

B210D-BATTERY VOLTAGE LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

Battery voltage less than 10 volts for more than 20 seconds.

POSSIBLE CAUSES

Possible Causes

RESISTANCE IN THE (A1) BATTERY POSITIVE CIRCUIT
RESISTANCE IN THE GENERATOR CASE GROUND
(K125) GENERATOR FIELD CONTROL CIRCUIT OPEN
(K125) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO GROUND
(Z20) GROUND CIRCUIT OPEN
BATTERY
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS**

NOTE: **Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.**

NOTE: **Inspect the vehicle for after market accessories that may exceed the Generator System output.**

NOTE: **Make sure the generator drive belt is in good operating condition.**

NOTE: **Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.**

1. Turn the ignition on.
2. With the scan tool, read active PCM DTCs.

   Does the scan tool display any active battery or charging DTCs?

   Yes

   - Refer to **CHARGING SYSTEM - DIAGNOSIS AND TESTING** and perform the appropriate charging system diagnostic procedure.

   No

   - Check the above conditions that can cause a low voltage condition. Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210E-BATTERY VOLTAGE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

Battery voltage greater than 16 volts for more than 20 seconds.

POSSIBLE CAUSES

Possible Causes
(K125) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE
BATTERY
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS**

NOTE: **Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.**

NOTE: **Inspect the vehicle for after market accessories that may exceed the Generator System output.**

NOTE: **Make sure the generator drive belt is in good operating condition.**

NOTE: **Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.**

1. Turn the ignition on.
2. With the scan tool, read active PCM DTCs.

   Does the scan tool display any active battery or charging system DTCs?

   Yes

   - Refer to **CHARGING SYSTEM - DIAGNOSIS AND TESTING** and perform the appropriate charging system diagnostic procedure.

   No

   - Check the above conditions that can cause a high voltage condition. Repair as necessary.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21A1-ECU RESET/RECOVERY OCCURRED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on.

SET CONDITION:

Video Screen Module experiences a reset event.

POSSIBLE CAUSES

Possible Causes
LOW BATTERY VOLTAGE

DIAGNOSTIC TEST

1. **LOW BATTERY VOLTAGE**
    1. Turn the ignition on.
    2. With the scan tool, clear all VES DTCs.
    3. Turn the ignition off, then on again.
    4. With the scan tool read VES DTCs.

    Does the scan tool display: B21A1-ECU RESET/RECOVERY OCCURRED?

    Yes

    - Check for intermittent condition by inspecting the wiring harness and cables for chafed, pierced, pinched, and partially broken wires.
    - Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test Complete.

B222B-VEHICLE ENTERTAINMENT SYSTEM INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

The Video Screen Module detects an internal failure.

POSSIBLE CAUSES

Possible Causes
VIDEO SCREEN MODULE

DIAGNOSTIC TEST

1. **REPLACE THE VIDEO SCREEN MODULE**
    1. When this DTC is active, replace the Video Screen Module.

    Repair

    - Replace the Video Screen Module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B222C-VEHICLE CONFIGURATION NOT PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

Vehicle configuration information not programmed into the TIPM.

POSSIBLE CAUSES

POSSIBLE CAUSES
NO COMMUNICATION WITH TOTALLY INTEGRATED CONTROL MODULE
ACTIVE TIPM DTCs
TOTALLY INTEGRATED CONTROL MODULE (TIPM)

DIAGNOSTIC TEST

1. **TEST FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Turn the ignition off, wait ten seconds then turn the ignition on.

3. With the scan tool, read DTCs.

   Does the scan tool display: B222C-VEHICLE CONFIGURATION NOT PROGRAMMED?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY COMMUNICATION WITH TIPM**
   1. With the scan tool, read the active modules on the bus.

      D8s the scan tool show the TIPM active on the bus?

      Yes

      - Go To 3.

      No

      - Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response from TIPM diagnostic procedure.

3. **CHECK TIPM FOR ACTIVE DTCS**
   1. With the scan tool, erase TIPM DTCs.
   2. Turn the ignition off. Wait approximately ten seconds.
   3. Turn the ignition on.
   4. With the scan tool, read TIPM DTCs.

      Are any active DTCs present?

      Yes

      - Refer to **TIPM - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 4.

4. **CHECK THE VEHICLE CONFIGURATION INFORMATION WITH SCAN TOOL**

1. With the scan tool run an ECU Details Report, read the Original and Current VINs, and the Body Style of the vehicle.

   Does the information displayed match the vehicle?

   Yes

   - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5.

5. **RESTORE THE VEHICLE CONFIGURATION**
   1. With the scan tool, restore the vehicle configuration.
   2. Turn the ignition off, then back on.
   3. With the scan tool, read the active DTCs.

      Does the scan tool display B222C-VEHICLE CONFIGURATION NOT PROGRAMMED as active?

      Yes

      - Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0010-CAN INTERIOR BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

SET CONDITION:

The controller detects a short to ground on the CAN Interior Bus (125K) (+) circuit or a short to voltage on the CAN Interior Bus (125K) (-) circuit.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. Using the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - **Refer to <u>TIPM - DIAGNOSIS AND TESTING</u>** and perform the U0010-CAN Interior Bus diagnostic procedure.

      No

      - **Refer to <u>COMMUNICATION - DIAGNOSIS AND TESTING</u>** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0011-CAN INTERIOR BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

SET CONDITION:

The controller detects a short to ground on the CAN Interior Bus (125K) (+) circuit or a short to voltage on the CAN Interior Bus (125K) (-) circuit.

POSSIBLE CAUSES

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO THE (D265) CAN INTERIOR BUS (+) (125k) CIRCUIT
TOTALLY INTEGRATED POWER MODULE (TIPM)
ANY CAN INTERIOR BUS MODULE

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. Using the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - **Refer to <u>TIPM - DIAGNOSIS AND TESTING</u>** and perform the U0011-CAN Interior Bus Off Performance diagnostic procedure.

      No

      - **Refer to <u>COMMUNICATION - DIAGNOSIS AND TESTING</u>** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WIPER AND WASHER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

If the wiper motor operates, but the wipers do not move on the windshield, replace the ineffective wiper linkage module. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wipers operate, but chatter, lift, or do not clear the glass, clean and inspect the wiper and washer system components as required. Refer to **CLEANING** and **INSPECTION** .

The hard wired wiper and washer system circuits and components may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the wiper and washer system or the electronic controls or communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient, and accurate means to diagnose the wiper and washer system or the electronic controls and communication related to wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: The wiper and washer switches are integral to the multi-function switch/Steering Control Module (SCM), which communicates with the ElectroMechanical Instrument Cluster (EMIC)/Cab Compartment Node (CCN) over the Local Interface Network (LIN) data bus. Before performing any of the following tests, determine whether the other functions of the multi-function switch/SCM are operational. If other multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Wiper and Washer System.

CONDITION	POSSIBLE CAUSES	CORRECTION
WIPER MOTOR DOES NOT	1. Ineffective motor ground	1. Test and repair open wiper motor

OPERATE IN ANY SWITCH POSITION	circuit.	ground circuit if required.
	2. Ineffective motor feed circuits.	2. Test and repair low speed and high speed feed circuits between TIPM and wiper motor if required.
	3. Ineffective EMIC (CCN) inputs or outputs.	3. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective wiper motor.	5. Test and replace open or shorted wiper motor as required.
WIPER MOTOR OPERATES SLOWLY IN ALL SWITCH POSITIONS	1. Ineffective wiper motor.	1. Check amperage draw with linkage disconnected from wiper motor output shaft. Correct draw should be about 6 amperes. If incorrect, refer to the appropriate Possible Cause that follows:
	2. Amperage draw too low.	2. Test and repair shorted low and high speed feed circuits if required.
	3. Amperage draw too high.	3. With linkage disconnected from wiper motor output shaft, check linkage and pivots for binding. If binding is detected, repair or replace wiper linkage module if required. If no linkage binding detected, replace the wiper motor if required.
WIPERS RUN AT HIGH SPEED WITH SWITCH LOW SPEED SELECTED OR AT LOW SPEED WITH SWITCH HIGH SPEED SELECTED	1. Ineffective motor feed circuit wiring.	1. Test and repair low speed and high speed feed circuits between TIPM and wiper motor if required.

DESCRIPTION

DESCRIPTION

Fig. 1: Locating Wiper/Washer Components
Courtesy of CHRYSLER GROUP, LLC

An electrically operated intermittent wiper and washer system is standard factory-installed safety equipment on this vehicle. The wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **ElectroMechanical Instrument Cluster -** The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) is located on the instrument panel above the steering column opening, directly in front of the driver. Refer to **DESCRIPTION** .
- **Multi-Function Switch (5) -** The multi-function switch is secured to a bracket integral to the clockspring housing on the top of the steering column, just below the steering wheel. The Steering Control Module (SCM) is internal to the multi-function switch housing. Only the control stalk that extends from the left side of the steering column is visible, while the remainder of the switch housing containing the SCM is concealed beneath the steering column shrouds. The switch control stalk has a control knob on the end that is dedicated to providing all of the driver controls for the wiper and washer systems. Refer to **SWITCH, MULTIFUNCTION, DESCRIPTION** .

- **Steering Control Module** - The Steering Control Module (SCM) is internal to the multi-function switch housing, which is secured to a bracket integral to the left side of the clockspring housing on the top of the steering column just below the steering wheel. Only the switch control stalk extending from the left side of the steering column is visible, while the remainder of the switch housing containing the SCM is concealed beneath the steering column shrouds. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .
- **Totally Integrated Power Module** - The Totally Integrated Power Module (TIPM) is located in the engine compartment, near the battery. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), DESCRIPTION** .
- **Washer Fluid Level Switch** - On vehicles with a gasoline engine, the washer fluid level switch is located in a dedicated hole on the lower, rearward facing surface of the washer reservoir on the front of the Front End Module (FEM) carrier (also known as the radiator closure) just to the left of the cooling module. On vehicles with a diesel engine, the washer fluid level switch is located in a dedicated hole on the lower, forward facing surface of the washer reservoir on the back of the left vertical post of the left fender support hydroform just outboard of the FEM carrier.
- **Washer Nozzle (2)** - Two fluidic washer nozzles with integral check valves are secured by latch features to dedicated openings in the hood panel near the base of the windshield.
- **Washer Plumbing** - The plumbing for the washer system consists of rubber hoses and molded plastic fittings. The reservoir hose is routed from the washer pump near the base of the reservoir through a trough integral to the reservoir to the outboard side of the reservoir, then through the FEM carrier (also known as the radiator closure) to the engine compartment where it is joined to the engine compartment hose. The engine compartment hose is routed along the left side of the engine compartment from the FEM to the cowl along with the left headlamp and dash wire harness through a molded plastic trough. The engine compartment hose is joined to the hood hose near the left hood hinge. The hood hose is routed between the underside of the inner hood panel reinforcement and the hood silencer pad to the washer nozzles.
- **Washer Pump/Motor** - On vehicles with a gasoline engine, the electric washer pump/motor unit is located in a dedicated hole in a sump area on the lower, forward facing surface of the washer reservoir on the front of the FEM carrier (also known as the radiator closure), to the left of the cooling module. On vehicles with a diesel engine, the electric washer pump/motor unit is located in a dedicated hole in a sump area on the lower, forward facing surface of the washer reservoir on the back of the left vertical post of the left fender support hydroform just outboard of the FEM carrier.
- **Washer Reservoir (1)** - On vehicles with a gasoline engine, the washer reservoir is located on the front of the FEM carrier (also known as the radiator closure), to the left of the cooling module. On vehicles with a diesel engine, the washer reservoir is located on the back of the left vertical post of the left fender support hydroform just outboard of the FEM carrier. On all vehicles, regardless of engine type, the clearly identified washer reservoir filler cap is accessed from the left front corner of the engine compartment.
- **Wiper Arms and Blades (4)** - The two unique right and left wiper arms are secured with nuts to the threaded ends of the two wiper pivot shafts, which extend through the cowl plenum cover/grille panel located near the base of the windshield. The two equal length wiper blades are each secured to their wiper arm with an integral latch, and are parked on the glass near the bottom of the windshield when the wiper system is not in operation.
- **Wiper Linkage Module (3)** - The wiper pivot shafts are the only visible components of the wiper linkage module. The remainder of the module is concealed within the cowl plenum area beneath the cowl plenum cover/grille panel. The wiper linkage module includes the wiper linkage module bracket, three rubber-isolated wiper linkage module mounts, the wiper motor, the wiper motor crank arm, the two wiper drive

links, and the two wiper pivots.

Hard wired circuitry connects the wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the wiper and washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

Fig. 2: Control Knob & Control Stalk
Courtesy of CHRYSLER GROUP, LLC

The wiper and washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the windshield glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blades to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the outside windshield glass surface that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all wiper and washer system functions with the control knob (1) on the end of the control stalk (2) of the multi-function switch that extends from the left side of the steering column, just below the steering wheel. Rotating the control knob on the end of the control stalk, selects the OFF, DELAY, LOW, or HIGH wiper system operating modes. In the DELAY mode, the control knob also allows the vehicle operator to select from one of five intermittent wipe delay intervals.

Depressing the control knob towards the steering column to the first detent actuates a momentary switch and selects the MIST mode, which cycles the wiper blades for as long as the switch is held closed then completes the current cycle and parks the blades at the base of the windshield after the switch is released. Depressing the control knob to the second detent actuates the momentary washer system switch, which selects the WASH or WIPE-AFTER-WASH modes depending upon when and how long the switch is held closed.

The multi-function switch provides hard wired analog and resistor multiplexed inputs to the Steering Control Module (SCM) internal to the multi-function switch housing for all of the wiper and washer system functions. The SCM then sends electronic **wiper** and **washer switch** status messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over a Local Interface Network (LIN) data bus. The EMIC responds to the SCM inputs by sending electronic **wiper** and **washer system** request messages to the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus requesting the appropriate wiper and washer system operating modes.

Wiper and washer system operation are completely controlled by the SCM, EMIC and TIPM logic circuits, and that logic will only allow these systems to operate when the ignition switch is in the ACCESSORY or ON positions. The TIPM uses intelligent, high current, self-protected high side switches to control wiper system operation by energizing or de-energizing the wiper motor low and high speed brushes. The TIPM uses a high side driver to control the operation of the washer pump/motor unit. The multi-function switch circuitry receives battery current and a clean ground output from the SCM, then provides analog and resistor multiplexed inputs to the SCM to indicate the selected wiper and washer system mode.

The hard wired circuits and components of the wiper and washer system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the wiper and washer system or the electronic controls or communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient, and accurate means to diagnose the wiper and washer system or the electronic controls and communication related to wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the wiper and washer system operating modes.

CONTINUOUS WIPE MODE

When the LOW position of the control knob on the control stalk of the multi-function switch is selected the SCM sends an electronic **wiper switch low** status message to the EMIC over the LIN data bus, the EMIC relays an electronic **wiper switch low** request message to the TIPM over the CAN data bus, then the TIPM directs battery current to the low speed brush of the wiper motor, causing the wipers to cycle at low speed.

When the HIGH position of the control knob is selected the SCM sends an electronic **wiper switch high** status message to the EMIC, the EMIC relays an electronic **wiper switch high** request message to the TIPM, then the TIPM directs battery current to the high speed brush of the wiper motor, causing the wipers to cycle at high speed.

When the OFF position of the multi-function switch control knob is selected, the SCM sends an electronic

wiper switch off status message to the EMIC, the EMIC relays an electronic **wiper switch off** request message to the TIPM, then one of two events will occur. The event that occurs depends upon the position of the wiper blades on the windshield at the moment the OFF position is selected.

If the wiper blades are in the down position on the windshield when the OFF position is selected, the park switch that is integral to the wiper motor is closed to ground, which provides a hard wired park switch sense input to the TIPM. The TIPM then de-energizes the wiper motor and the wiper motor ceases to operate. If the wiper blades are not in the down position on the windshield at the moment the OFF position is selected, the park switch is an open circuit and the TIPM continues running the wiper motor at low speed until the wiper blades are in the down position on the windshield and the park switch input to the TIPM is again closed to ground.

INTERMITTENT WIPE MODE

When the control knob on the control stalk of the multi-function switch is moved to one of the five DELAY interval positions the SCM sends an electronic **wiper switch delay interval** status message to the EMIC, the EMIC relays an electronic **wiper switch delay interval** request message to the TIPM, then the TIPM electronic intermittent wipe logic circuit responds by calculating the correct length of time between wiper sweeps based upon the selected delay interval input.

The TIPM monitors the changing state of the wiper motor park switch through a hard wired park switch sense input. This input allows the TIPM to determine the proper intervals at which to energize and de-energize the wiper motor low speed brush to operate the wiper motor intermittently for one low speed cycle at a time.

The TIPM logic is also programmed to provide vehicle speed sensitivity to the selected intermittent wipe delay intervals. In order to provide this feature the TIPM monitors electronic **vehicle speed** messages from the Controller Antilock Brake (CAB) or the Powertrain Control Module (PCM) and doubles the selected delay interval whenever the vehicle speed is about 16 kilometers-per-hour (10 miles-per-hour) or less.

MIST WIPE MODE

When the control knob on the control stalk of the multi-function switch is depressed to the momentary MIST position, the SCM sends an electronic **wiper mist mode** status message to the EMIC, the EMIC relays an electronic **wiper mist mode** request message to the TIPM, then the TIPM energizes the low speed brush of the wiper motor for as long as the switch is held closed, then de-energizes the motor when the state of the switch changes to open, parking the wiper blades near the base of the windshield. The TIPM can operate the wiper motor in this mode for only one low speed cycle at a time, or for an indefinite number of sequential low speed cycles, depending upon how long the switch is held closed.

WASH MODE

When the control knob on the control stalk of the multi-function switch is depressed to the momentary WASH position for more than about one-half second with the wiper system operating, the SCM sends an electronic **washer switch** status message to the EMIC, the EMIC relays an electronic **washer switch** request message to the TIPM, then the TIPM directs battery current and ground to the washer pump/motor unit. This will cause the washer pump/motor unit to be energized for as long as the switch is held closed (up to approximately 10 seconds) and to be de-energized when the control knob is released.

When the control knob is depressed to the momentary WASH position while the wiper system is operating in one of the DELAY interval positions, the washer pump/motor operation is the same. However, the TIPM also overrides the selected delay interval and operates the wiper motor in a continuous low speed mode for as long as the control knob is held depressed, then reverts to the selected delay interval several wipe cycles after the control knob is released. If the WASH switch is held closed for more than approximately 10 seconds, the TIPM will suspend washer pump/motor operation until the knob is released for about 2 seconds, then cycled back to the WASH position.

WIPE-AFTER-WASH MODE

When the control knob on the control stalk of the multi-function switch is depressed to the momentary WASH position for more than about one-half second while the wiper system is not operating, the SCM sends an electronic **washer switch** status message to the EMIC, the EMIC relays an electronic **washer switch** request message to the TIPM, and the TIPM directs battery current and ground to the washer pump/motor unit and energizes the wiper motor in a continuous low speed mode for as long as the switch is held closed (up to approximately 10 seconds). When the control knob is released, the TIPM de-energizes the washer pump/motor immediately, but allows the wiper motor to operate for several additional wipe cycles before it de-energizes the wiper motor and parks the wiper blades near the base of the windshield.

If the control knob is held depressed for more than about 10 seconds, the TIPM will suspend washer pump/motor operation until the knob is released for about 2 seconds and then cycled back to the WASH position; however, the wipers will continue to operate for as long as the WASH switch is held closed. The TIPM monitors the changing state of the wiper motor park switch through a hard wired wiper park switch sense circuit input. This input allows the TIPM to count the number of wipe cycles that occur after the WASH switch is released, and to determine the proper interval at which to de-energize the wiper low speed brush to complete the WIPE-AFTER-WASH mode cycle.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WIPER AND WASHER SYSTEM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

If the wiper motor operates, but the wipers do not move on the windshield, replace the ineffective wiper linkage module. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wipers operate, but chatter, lift, or do not clear the glass, clean and inspect the wiper and washer system components as required. Refer to **CLEANING** and **INSPECTION**.

The hard wired wiper and washer system circuits and components may be diagnosed and tested using

conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the wiper and washer system or the electronic controls or communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient, and accurate means to diagnose the wiper and washer system or the electronic controls and communication related to wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: **The wiper and washer switches are integral to the multi-function switch/Steering Control Module (SCM), which communicates with the ElectroMechanical Instrument Cluster (EMIC)/Cab Compartment Node (CCN) over the Local Interface Network (LIN) data bus. Before performing any of the following tests, determine whether the other functions of the multi-function switch/SCM are operational. If other multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Wiper and Washer System.**

CONDITION	POSSIBLE CAUSES	CORRECTION
WIPER MOTOR DOES NOT OPERATE IN ANY SWITCH POSITION	1. Ineffective motor ground circuit.	1. Test and repair open wiper motor ground circuit if required.
	2. Ineffective motor feed circuits.	2. Test and repair low speed and high speed feed circuits between TIPM and wiper motor if required.
	3. Ineffective EMIC (CCN) inputs or outputs.	3. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective wiper motor.	5. Test and replace open or shorted wiper motor as required.
WIPER MOTOR OPERATES SLOWLY IN ALL SWITCH POSITIONS	1. Ineffective wiper motor.	1. Check amperage draw with linkage disconnected from wiper motor output shaft. Correct draw should be about 6 amperes. If incorrect, refer to the appropriate Possible Cause that follows:
	2. Amperage draw too low.	2. Test and repair shorted low and high speed feed circuits if required.
	3. Amperage draw too high.	3. With linkage disconnected from wiper motor output shaft, check linkage and pivots for binding. If binding is detected, repair or replace wiper linkage module if required. If no linkage binding detected,

		replace the wiper motor if required.
WIPERS RUN AT HIGH SPEED WITH SWITCH LOW SPEED SELECTED OR AT LOW SPEED WITH SWITCH HIGH SPEED SELECTED	1. Ineffective motor feed circuit wiring.	1. Test and repair low speed and high speed feed circuits between TIPM and wiper motor if required.

CLEANING

CLEANING

WIPER SYSTEM

CAUTION: Protect the rubber squeegees of the wiper blades from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegees.

The squeegees of wiper blades exposed to the elements for a long time tend to lose their wiping effectiveness. Periodic cleaning of the squeegees is suggested to remove any deposits of salt or road film. The wiper blades, arms, and windshield glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blades continue to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

WASHER SYSTEM

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegees of the wiper blades.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor from the reservoir. Clean foreign material from the inside of the washer pump inlet filter screen and the washer reservoir using clean washer fluid, a mild detergent, or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hoses from the washer nozzles, then running the washer pump/motor to run clean washer fluid or water through the system. Plugged or restricted washer nozzles should be carefully back-flushed using compressed air. If the washer nozzle obstruction cannot be cleared, replace the washer nozzle.

INSPECTION

INSPECTION

WIPER SYSTEM

Fig. 3: Inspecting Wiper Blade
Courtesy of CHRYSLER GROUP, LLC

The wiper blades and wiper arms should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blades for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4), or splitting (5). Inspect the wiper blade support components and the wiper arms for damage (6) or corrosion. If the wiper arms and blades are contaminated with any foreign material, clean them and the glass as required. Refer to **CLEANING**. If a wiper blade or arm is damaged, or if corrosion is evident, replace the affected wiper arm or blade with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. Remove the wiper blade from the wiper arm. Either place a small postal scale between the blade end of the wiper arm and the glass, or carefully lift the blade end of the arm away from the glass using a small fish scale. On vehicles with unequal wiper arm lengths, be certain that measurements are taken at a point an equal distance from their wiper arm hinge pins. Compare the scale readings between the right and left wiper arms. Replace a wiper arm if it has comparatively lower spring tension, as evidenced by a lower scale reading.
4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade.

WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. Refer to **CLEANING**.
2. Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

ARM, WIPER

DESCRIPTION

DESCRIPTION

Fig. 4: Front Wiper Arm
Courtesy of CHRYSLER GROUP, LLC

The wiper arms are the rigid members located between the wiper pivots that protrude from the cowl plenum cover/grille panel near the base of the windshield and the wiper blades on the windshield glass. These wiper arms feature an over-center hinge that allows easy access to the windshield glass for cleaning.

The wiper arm has a die cast metal pivot end (4) with a large tapered mounting hole (5) at one end. A molded black plastic cap fits over the wiper arm retaining nut to conceal the nut and the mounting hole following wiper arm installation.

The wide end of a tapered, stamped steel channel (3) hinges on and is secured with a hinge pin (6) to the blade end of the wiper arm pivot end. One end of a long, rigid, stamped steel strap (2), with a small hole near its pivot end, is riveted and crimped within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook (1). Concealed within the stamped steel channel is a long tension spring (7) which is engaged with a wire hook on the underside of the die cast pivot end and is hooked through a small hole in the steel strap. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

The right and left wiper arms are unique and are not interchangeable. A wiper arm cannot be adjusted or repaired. If damaged or ineffective, the entire wiper arm unit must be replaced.

OPERATION

OPERATION

The wiper arms are designed to mechanically transmit the motion from the wiper pivots to the wiper blades. The wiper arm must be properly indexed to the wiper pivot in order to maintain the proper wiper blade travel on the glass. The tapered mounting hole in the wiper arm pivot end interlocks with the serrations on the tapered outer circumference of the wiper pivot shaft, allowing positive engagement and finite adjustment of this connection.

The mounting nuts lock the wiper arms to the threaded studs of the wiper pivot shafts. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The

hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

REMOVAL

REMOVAL

Fig. 5: Wiper Arm, Nut & Nut Cap
Courtesy of CHRYSLER GROUP, LLC

1. Lift the wiper arm (3) to its over-center position to hold the wiper blade off of the glass and relieve the spring tension on the wiper arm to pivot shaft connection.
2. Carefully pry the plastic nut cap (1) off of the nut (2) on the pivot end of the wiper arm.
3. Remove the nut that secures the wiper arm to the wiper pivot shaft.

CAUTION: The use of a battery terminal puller when removing the wiper arm is NOT recommended as this may damage the wiper arm.

4. Use a slight rocking action to disengage the wiper arm pivot end from the pivot shaft and remove the wiper arm.

INSTALLATION

INSTALLATION

NOTE: Be certain that the wiper motor is in the park position before attempting to install the wiper arms. Turn the ignition switch to the ON position and move the multi-function switch control knob to turn the wiper motor ON, then turn it back to the OFF position. Wait until the wiper pivot shafts stop moving, then turn the ignition switch back to the OFF position. The wiper motor is now in the park position.

NOTE: **The right and left wiper arms are not interchangeable. The right wiper arm is slightly longer than the left. Be certain that each wiper arm is installed on the proper wiper pivot.**

Fig. 6: Wiper Arm, Nut & Nut Cap
Courtesy of CHRYSLER GROUP, LLC

1. The wiper arms (3) must be indexed to the pivot shafts with the wiper motor in the park position to be properly installed. Loosely position the wiper arm pivot end onto the wiper pivot shaft so that the wiper blade is aligned with the wiper alignment line, which is a horizontal **T** mark located just above the upper margin of the lower windshield blackout area.
2. Once the wiper blade is aligned, hold the pivot end of the arm over the pivot shaft while lifting the wiper blade away from the windshield slightly to relieve the spring tension on the pivot end. Now push the pivot end of the wiper arm down firmly and evenly over the pivot shaft until it is fully engaged.
3. Install and tighten the nut (2) that secures the wiper arm to the pivot shaft. Tighten the nut to 24 N.m (18 ft. lbs.).
4. Wet the windshield glass, then operate the wipers. Turn the wiper switch to the OFF position, then check for correct wiper blade alignment and readjust as required.
5. Reinstall the plastic nut cap (1) onto the wiper arm mounting nut.

BLADE, WIPER

DESCRIPTION

DESCRIPTION

Fig. 7: Identifying Wiper Blade Components
Courtesy of CHRYSLER GROUP, LLC

Each wiper blade is secured by an integral latching pivot block (3) to the hook formation on the tip of each wiper arm, and rests on the glass near the base of the windshield when the wipers are not in operation. The wiper blade consists of the following components:

- **Superstructure (1) -** The superstructure includes several stamped steel bridges and links with claw formations (6) that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.
- **Element (2) -** The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor (7) -** The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

The right and left wiper blades are 56.50 centimeters (22.24 inches) long, and are interchangeable. They have non-replaceable rubber elements (squeegees). The wiper blades cannot be adjusted or repaired. If ineffective, worn, or damaged the entire wiper blade unit must be replaced.

OPERATION

OPERATION

The wiper blades are moved back and forth across the glass by the wiper arms when the wipers are being operated. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature that may be encountered across the glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even

cleaning edge as it is drawn across the glass, yet resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REMOVAL

REMOVAL

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

Fig. 8: Wiper Arm, Latch Release Tab, Pivot Block, Hook & Wiper Blade Superstructure
Courtesy of CHRYSLER GROUP, LLC

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

1. Lift the wiper arm (2) to raise the wiper blade and element (6) off of the glass, until the wiper arm hinge is in its over-center position.
2. To remove the blade from the arm, depress the latch release tab (4) on the pivot block (3) under the tip of the arm downward (toward the wiper element and away from the wiper arm) and slide the blade away from the tip towards the pivot end of the arm far enough to disengage the pivot block from the hook formation (5) on the end of the arm.
3. Extract the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure (1) just ahead of the pivot block.
4. Gently lower the tip of the wiper arm onto the glass.

INSTALLATION

INSTALLATION

CAUTION: Do not allow the wiper arm to spring back against the glass without the

wiper blade in place or the glass may be damaged.

Fig. 9: Wiper Arm, Latch Release Tab, Pivot Block, Hook & Wiper Blade Superstructure
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.**

1. Lift the wiper arm (2) off of the windshield glass, until the wiper arm hinge is in its over-center position.
2. Position the wiper blade near the hook formation (5) on the tip of the arm with the notched end of the wiper element flexor oriented towards the end of the wiper arm that is nearest to the wiper pivot.
3. Insert the hook formation on the tip of the arm through the opening in the blade superstructure (1) ahead of the pivot block (3) far enough to engage the pivot block into the hook.
4. Slide the pivot block up into the hook formation on the tip of the wiper arm until the latch release tab (4) snaps into its locked position. Latch engagement will be accompanied by an audible click.
5. Gently lower the wiper blade and element (6) onto the glass.

HOSES AND TUBES, WASHER

DESCRIPTION

DESCRIPTION

Fig. 10: Washer Hoses & Tubes
Courtesy of CHRYSLER GROUP, LLC

The washer plumbing consists of a small diameter rubber reservoir washer hose that is routed from the barbed outlet nipple of the electric washer pump/motor unit on the washer reservoir. On vehicles with a gasoline engine, the hose is routed through a trough molded into the front of the reservoir above the washer pump to the outboard side of the reservoir, then through the Front End Module (FEM) carrier (also known as the radiator closure) to the engine compartment to the left side of the cooling module. On vehicles with a diesel engine, the hose is also routed through a trough molded into the front of the reservoir above the washer pump to the outboard side of the reservoir, but the reservoir is already located inn the engine compartment to the left of the cooling module.

In the left front corner of the engine compartment, the washer reservoir hose is connected to the engine compartment washer hose. The engine compartment washer hose is contained within the left headlamp and dash wire harness (2), which is routed through the engine compartment along the top of the left front fender wheel house (1) to the dash panel. This hose is connected to the washer reservoir washer hose at one end and to the hood mounted washer tube at the other end with molded plastic in-line fittings.

The hood mounted washer hose (3) is routed from the engine compartment to the underside of the hood panel inner reinforcement near the left hood hinge. The hood washer hose is then routed between the hood reinforcement and the hood silencer pad to the left washer nozzle (4), then from the left washer nozzle to the right washer nozzle.

Washer hose is available for service only as roll stock, which must then be cut to length. The molded plastic washer hose fittings cannot be repaired. If these fittings are ineffective or damaged, they must be replaced.

OPERATION

OPERATION

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor unit through the washer

system plumbing and fittings to the two washer nozzles. Whenever routing the washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the hose must be avoided.

LINKAGE, WIPER ARM

DESCRIPTION

DESCRIPTION

Fig. 11: Wiper Linkage Module
Courtesy of CHRYSLER GROUP, LLC

The wiper linkage module is secured by a rubber insulated mounting tab and two screws through two rubber grommet-type insulators to the cowl plenum panel. The module is concealed beneath the molded plastic cowl plenum cover/grille panel between the base of the windshield and the rear edge of the hood panel. The ends of the pivot shafts that protrude through openings in the cowl plenum cover/grille panel to drive the wiper arms and blades are the only visible components of the wiper linkage module. The wiper linkage module consists of the following major components:

- **Bracket -** The wiper linkage module bracket consists of two long tubular steel main members (1) that are each crimped at their outboard ends to a die cast pivot bracket (3) to which the two wiper pivots are secured. A die cast center motor bracket (4) is secured by crimps at the inboard ends of the tubular main members to provide both a mounting point for the wiper motor and a center support for mounting the wiper linkage module to the cowl plenum panel.
- **Crank Arm -** The wiper motor crank arm is a stamped steel unit with a hole on the driven end that is secured to the finely splined wiper motor output shaft with a nut, and has a long ball stud secured to the drive end to accept the wiper linkage.
- **Linkage -** Two tubular steel drive links (2) connect the wiper motor crank arm to the wiper pivot lever arms. The right side drive link has a plastic socket-type bushing on each end. The left side drive link has a

plastic socket-type bushing on one end, and a plastic sleeve-type bushing on the other end. The socket-type bushing on one end of each drive link is snap-fit over the ball stud on the lever arm of its respective pivot. The left side drive link sleeve-type bushing end is then fit over the motor crank arm ball stud, and the other socket-type bushing of the right side drive link is snap-fit over the exposed end of the wiper motor crank arm ball stud.

- **Motor** - The wiper motor (5) features a transmission housing from which the wiper motor output shaft exits, and has three mounting bosses with internal threads to which the motor is mounted to the center wiper linkage module bracket with screws. A nut secures the wiper motor crank arm to the motor output shaft. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch, and an internal automatic resetting circuit breaker. A short pigtail wire and connector connect the wiper motor to the vehicle electrical system through a dedicated take out and connector of the left headlamp and dash wire harness.
- **Pivots** - The two wiper pivots (6) are secured within the die cast pivot brackets on the outboard ends of the wiper linkage module main members. The lever arms that extend from the center of the pivot shafts each have a ball stud on their end. The upper end of each pivot shaft where the wiper arms will be fastened each has a finely splined and tapered driver with a threaded stud extending from the top. The lower ends of the pivot shafts are installed through permanently lubricated bushings in the pivot brackets.

The wiper linkage module cannot be adjusted or repaired. The wiper motor is available for separate service replacement. If any other component of the linkage module is ineffective or damaged, the entire wiper linkage module unit must be replaced.

OPERATION

OPERATION

The wiper linkage module operation is controlled by the battery current inputs received by the wiper motor from the Totally Integrated Power Module (TIPM). The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes.

The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately opens and closes the wiper park switch sense circuit to ground, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned OFF, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads.

The wiper motor crank arm, the two wiper linkage members, and the two driven wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

The hard wired inputs and outputs of the wiper motor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide some features of the wiper motor. The most reliable, efficient, and accurate means to diagnose the wiper motor or the electronic controls and communication related to wiper motor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 12: Wiper Linkage Module & Wiper Motor Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The wiper linkage module includes the wiper motor. The wiper motor is also available for separate service replacement and can be removed from the wiper linkage module without removing the module from the vehicle. Refer to MOTOR, WIPER, REMOVAL.**

1. Unlatch and open the hood.
2. Remove both wiper arms from the wiper pivots. Refer to **ARM, WIPER, REMOVAL**.
3. Disconnect and isolate the battery negative cable.
4. Remove the cowl plenum cover/grille panel from over the cowl plenum (6). Refer to **COVER, COWL PANEL, REMOVAL** .
5. Disconnect the left headlamp and dash wire harness connector (4) from the wiper motor pigtail wire connector.
6. Remove the two screws (3) that secure the wiper linkage module (2) to the top of the cowl plenum panel.
7. Lift the left end of the wiper linkage module upward out of the cowl plenum far enough to disengage the rubber insulated tab (1) on the end of the right pivot bracket from the slot (7) in the cowl plenum.
8. Remove the wiper linkage module from the cowl plenum panel as a unit.

INSTALLATION

INSTALLATION

Fig. 13: Wiper Linkage Module & Wiper Motor Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The wiper linkage module includes the wiper motor. The wiper motor is also available for separate service replacement and can be removed from the wiper linkage module without removing the module from the vehicle. Refer to MOTOR, WIPER, REMOVAL.**

1. Be certain that the spring nut (5) that secures the left end of the wiper linkage module is in position in the cowl plenum (6) and is in good condition.
2. Position the wiper linkage module (2) into the cowl plenum as a unit.
3. Lift the left end of the wiper linkage module upward out of the cowl plenum far enough to engage the rubber insulated tab (1) on the outboard end of the right pivot bracket into the slot (7) in the cowl plenum.
4. Lower the left end of the wiper linkage module into the cowl plenum and align it to the two mounting points.
5. Install the two screws (3) that secure the wiper linkage module to the top of the cowl plenum panel. Tighten the screw on the left (driver) side pivot bracket, followed by the screw on the center (motor) bracket. Tighten the screws to 8 N.m (75 in. lbs.).
6. Reconnect the left headlamp and dash wire harness connector (4) to the wiper motor pigtail wire connector.
7. Reinstall the cowl plenum cover/grille panel over the cowl plenum. Refer to **COVER, COWL PANEL, INSTALLATION** .
8. Reconnect the battery negative cable.
9. Reinstall both wiper arms onto the wiper pivots. Refer to **ARM, WIPER, INSTALLATION**.
10. Close and latch the hood.

MOTOR, WIPER

REMOVAL

REMOVAL

Fig. 14: Wiper Linkages & Wiper Motor
Courtesy of CHRYSLER GROUP, LLC

1. Unlatch and open the hood.
2. Remove both wiper arms from the wiper pivots. Refer to **ARM, WIPER, REMOVAL**.
3. Disconnect and isolate the battery negative cable.
4. Remove the cowl plenum cover/grille panel from over the cowl plenum. Refer to **COVER, COWL PANEL, REMOVAL** .
5. Disconnect the left headlamp and dash wire harness connector (4) from the wiper motor (6) pigtail wire connector.
6. Remove the nut (5) that secures the crank arm (3) to the wiper motor output shaft.

Fig. 15: Wiper Motor Bracket
Courtesy of CHRYSLER GROUP, LLC

7. Remove the three screws (1) that secure the wiper motor to the center bracket of the wiper linkage module.
8. Remove the wiper motor from under the wiper linkage module bracket and out of the cowl plenum.

INSTALLATION

INSTALLATION

Fig. 16: Wiper Motor Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the wiper motor beneath the wiper linkage module in the cowl plenum.
2. Align the mounting bosses of the wiper motor to the mounting holes of the wiper linkage module center

(motor) bracket.

3. Install and tighten the three screws (1) that secure the wiper motor to the center bracket of the wiper linkage module. Tighten the screws to 12.5 N.m (110 in. lbs.).
4. Reconnect the left headlamp and dash wire harness connector to the wiper motor pigtail wire connector.
5. Reconnect the battery negative cable.

NOTE: Be certain that the wiper motor is in the park position before attempting to reinstall the crank arm to the motor output shaft.

6. Turn the ignition switch to the ON position and move the multi-function switch control knob to turn the wiper motor ON. Turn the switch back to the OFF position. Wait until the wiper motor output shaft stops moving, then turn the ignition switch back to the OFF position. The wiper motor is now in the park position.
7. Position the crank arm onto the wiper motor output shaft (3) so that the crank arm is oriented between the two alignment marks (2) on the wiper linkage module center bracket, then press the crank arm down firmly over the output shaft.

Fig. 17: Wiper Linkages & Wiper Motor
Courtesy of CHRYSLER GROUP, LLC

8. Install and tighten the nut (5) that secures the crank arm to the wiper motor (6) output shaft. Tighten the nut to 28 N.m (21 ft. lbs.).
9. Reinstall the cowl plenum cover/grille panel over the cowl plenum. Refer to **COVER, COWL PANEL, INSTALLATION** .
10. Reinstall both wiper arms onto the wiper pivots. Refer to **ARM, WIPER, INSTALLATION**.
11. Close and latch the hood.

NOZZLE, WASHER

DESCRIPTION

DESCRIPTION

Fig. 18: Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

The fluidic washer nozzles are constructed of molded plastic and include an integral check valve. Each nozzle has two integral latches (3) that secure them in dedicated holes in the hood panel near the base of the windshield. The domed upper surface (2) of the washer nozzle is visible on the outside of the hood panel, and the dual nozzle orifices (1) are oriented towards the windshield glass.

An integral diaphragm type check valve is contained within the body of each nozzle. The washer plumbing fittings (4) for the washer nozzles extend below the hood panel and are accessible from the engine compartment.

The washer nozzles cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced.

OPERATION

OPERATION

The two washer nozzles are designed to dispense washer fluid into the wiper pattern area on the outside of the windshield glass. Pressurized washer fluid is fed to each nozzle from the washer reservoir by the washer pump/motor unit through a single hose, which is attached to a barbed nipple on each washer nozzle below the inner hood panel. A fluidic matrix within the washer nozzle causes the pressurized washer fluid to be emitted from the two nozzle orifices as oscillating streams to more effectively cover a larger area of the glass to be cleaned.

The integral check valve in each nozzle prevents washer fluid from draining out of the washer supply hoses back to the washer reservoir. This drain-back would result in a lengthy delay after the washer switch is actuated until washer fluid was dispensed through the nozzles, because the washer pump would have to refill the washer plumbing from the reservoir to the nozzles. Such a drain-back condition could also result in water, dirt, or other outside contaminants being siphoned into the washer system through the washer nozzle orifice. This water

could subsequently freeze and plug or damage the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning through the washer nozzles after the washer pump stops operating.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing, the fluid pressure unseats a diaphragm from over a sump well within the nozzle by overriding the spring pressure applied to it by a piston. With the diaphragm unseated, washer fluid is allowed to flow toward the nozzle orifice. When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well in the nozzle and fluid flow in either direction within the washer plumbing is prevented.

REMOVAL

REMOVAL

Fig. 19: Washer Hoses & Tubes
Courtesy of CHRYSLER GROUP, LLC

1. From the underside of the hood, remove the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood reinforcement as necessary to access the washer nozzle hose connections (4).
2. From the underside of the hood, disconnect the washer nozzle hose from the barbed nipple of the washer nozzle.

Fig. 20: Locating Washer Nozzles
Courtesy of CHRYSLER GROUP, LLC

3. From the underside of the hood, release the integral latch features of the washer nozzle (1) and push the nozzle out through the mounting hole toward the top side of the hood.
4. Remove the washer nozzle from the top of the hood panel.

INSTALLATION

INSTALLATION

Fig. 21: Locating Washer Nozzles
Courtesy of CHRYSLER GROUP, LLC

1. From the top of the hood, position the washer nozzle (1) to the mounting hole on the outside of the hood panel.
2. Align the anti-rotation tabs of the nozzle with the anti-rotation notches in the mounting hole.
3. Using hand pressure, push firmly and evenly on the top of the washer nozzle until the integral latch features lock into place on the underside of the hood.

Fig. 22: Washer Hoses & Tubes
Courtesy of CHRYSLER GROUP, LLC

4. From the underside of the hood, reconnect the washer hose fitting (4) to the barbed nipple of the washer nozzle.
5. Reinstall the washer nozzle hose into its routing clips as necessary on the underside of the hood.
6. Reinstall the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood reinforcement.

PUMP, WINDSHIELD WASHER

DESCRIPTION

DESCRIPTION

Fig. 23: Washer Pump/Motor Unit
Courtesy of CHRYSLER GROUP, LLC

On vehicles with a gasoline engine, the washer pump/motor unit is located on the top of a sump area on the forward facing side of the washer reservoir on the front of the Front End Module (FEM) carrier (also known as the radiator closure), to the left of the cooling module. On vehicles with a diesel engine, the washer pump/motor unit is located on the top of a sump area on the forward facing side of the washer reservoir on the back of the left vertical post of the left fender support hydroform just outboard of the FEM carrier. A small permanently lubricated and sealed electric motor (6) is coupled to the rotor-type washer pump (5).

An inlet nipple (4) on the bottom of the pump housing passes through a rubber grommet seal/filter screen installed in a dedicated mounting hole in the sump area near the base of the washer reservoir. When the pump is installed in the reservoir, a barbed outlet nipple (3) on the pump housing connects the unit to the reservoir washer hose, which is engaged in an integral trough molded into the reservoir unit.

The washer pump/motor unit is retained on the reservoir by the interference fit between the pump inlet nipple and the grommet seal, which is a light press fit. The top of the washer pump/motor unit is also secured to the washer reservoir by a light snap fit into a receptacle molded into the reservoir that allows for mounting of the washer pump without the use of additional fasteners. An integral connector receptacle (2) on the top of the motor housing connects the unit to the vehicle electrical system through a dedicated take out and connector of the FEM wire harness.

Service replacement washer pumps may also include a snap post (1) at the top of the pump motor housing, but this feature is not used in this application. The washer pump/motor unit cannot be repaired. If ineffective or damaged, the entire washer pump/motor unit must be replaced.

OPERATION

OPERATION

The washer pump/motor unit features a small Direct Current (DC) electric motor. The motor is connected to the vehicle electrical system through a single take out and two-cavity connector of the Front End Module (FEM)

wire harness. The motor is grounded at all times through another take out of the FEM wire harness with a single eyelet terminal connector that is secured by a screw to the left front fender upper hydroform support in the engine compartment.

The Totally Integrated Power Module (TIPM) controls the washer pump/motor control circuit through a high side driver based upon electronic **washer request** messages received over the Controller Area Network (CAN) data bus from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). The EMIC receives electronic **washer switch status** messages over a Local Interface Network (LIN) bus connection from the Steering Control Module (SCM) within the multi-function switch housing. The SCM monitors hard wired analog and multiplex inputs from the washer switch circuitry contained within the multi-function switch to determine the proper electronic messages to send.

Washer fluid is drawn through the pump inlet nipple from the washer reservoir to the inlet port of the washer pump housing. A filter screen integral to the pump grommet seal prevents most debris from entering the pump housing. When the pump motor is energized, the motor spins the rotor within the washer pump. The spinning pump rotor pressurizes the washer fluid and forces it through the pump outlet nipple, the washer plumbing, and the washer nozzles onto the windshield glass.

The washer pump/motor unit and the hard wired circuits connected to the unit may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide many features of the wiper and washer system. The most reliable, efficient, and accurate means to diagnose the washer pump/motor unit or the electronic controls and communication related to washer pump/motor unit operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

DIESEL ENGINE

Fig. 24: Left Front Fender Wheel Housing
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The washer pump/motor unit can be removed from the washer reservoir without removing the reservoir from the vehicle.**

1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir (3) into a clean container for reuse.
3. Remove the splash shield from the left front fender (1) wheel housing of the vehicle. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
4. Disconnect the Front End Module (FEM) wire harness connector (6) from the washer pump/motor unit (2) connector receptacle on the top of the motor housing.
5. Pull lightly outward on the top of the washer pump/motor housing, away from the washer reservoir to disengage the top of the motor from the receptacle in the reservoir.
6. Pull the washer pump/motor unit straight up and out of the washer reservoir far enough to disengage the inlet nipple on the base of the pump housing from the rubber grommet seal/filter screen in the reservoir.
7. Raise the washer pump/motor unit far enough to access and disconnect the washer hose from the barbed pump outlet nipple.
8. Remove the washer pump/motor unit from the front of the washer reservoir.
9. Remove the rubber grommet seal/filter screen from the washer pump mounting hole in the reservoir and discard.

GASOLINE ENGINE

Fig. 25: Locating Washer Reservoir
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The washer pump/motor unit can be removed from the washer reservoir without removing the reservoir from the vehicle.**

1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir (1) into a clean container for reuse.

3. Remove the grille from the front of the vehicle. Refer to **GRILLE, REMOVAL** .
4. Disconnect the Front End Module (FEM) wire harness connector (3) from the washer pump/motor unit connector receptacle on the top of the motor housing.
5. Pull lightly outward on the top of the washer pump/motor housing, away from the washer reservoir to disengage the top of the motor from the receptacle in the reservoir.
6. Pull the washer pump/motor unit straight up and out of the washer reservoir far enough to disengage the inlet nipple on the base of the pump housing from the rubber grommet seal/filter screen in the reservoir.
7. Raise the washer pump/motor unit far enough to access and disconnect the washer hose (4) from the barbed pump outlet nipple.
8. Remove the washer pump/motor unit from the front of the washer reservoir.
9. Remove the rubber grommet seal/filter screen from the washer pump mounting hole in the reservoir and discard.

INSTALLATION

DIESEL ENGINE

Fig. 26: Left Front Fender Wheel Housing
Courtesy of CHRYSLER GROUP, LLC

1. Install a new rubber grommet seal/filter screen into the washer pump mounting hole in the washer reservoir (3). Always use a new rubber grommet seal/filter screen on the reservoir.
2. Reconnect the reservoir washer hose to the barbed pump outlet nipple of the washer pump/motor unit (2).
3. Position the inlet nipple on the base of the pump housing of the washer pump/motor unit to the rubber grommet seal/filter screen in the reservoir.
4. Using hand pressure, press firmly and evenly downward on the top of washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal/filter screen in the pump mounting hole of the reservoir.
5. Align the top of the washer pump/motor unit housing with the receptacle in the washer reservoir.

6. Using hand pressure, press firmly and evenly on the top of washer pump/motor unit until the housing snaps into the receptacle.
7. Reconnect the Front End Module (FEM) wire harness connector (6) to the washer pump/motor unit connector receptacle at the top of the motor housing.
8. Reinstall the splash shield into the front fender (1) wheel housing of the vehicle. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
9. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.
10. Reconnect the battery negative cable.

GASOLINE ENGINE

Fig. 27: Locating Washer Reservoir
Courtesy of CHRYSLER GROUP, LLC

1. Install a new rubber grommet seal/filter screen into the washer pump mounting hole in the washer reservoir (1). Always use a new rubber grommet seal/filter screen on the reservoir.
2. Reconnect the reservoir washer hose (4) to the barbed pump outlet nipple of the washer pump/motor unit.
3. Position the inlet nipple on the base of the pump housing of the washer pump/motor unit to the rubber grommet seal/filter screen in the reservoir.
4. Using hand pressure, press firmly and evenly downward on the top of washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal/filter screen in the pump mounting hole of the reservoir.
5. Align the top of the washer pump/motor unit housing with the receptacle in the washer reservoir.
6. Using hand pressure, press firmly and evenly on the top of washer pump/motor unit until the housing snaps into the receptacle.
7. Reconnect the Front End Module (FEM) wire harness connector (3) to the washer pump/motor unit connector receptacle at the top of the motor housing.
8. Reinstall the grille onto the front of the vehicle. Refer to **GRILLE, INSTALLATION** .
9. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

10. Reconnect the battery negative cable.

RESERVOIR, WINDSHIELD WASHER

DESCRIPTION

DESCRIPTION

Fig. 28: Windshield Washer Reservoir (Gasoline)
Courtesy of CHRYSLER GROUP, LLC

Fig. 29: Windshield Washer Reservoir (Diesel)
Courtesy of CHRYSLER GROUP, LLC

On vehicles with a gasoline engine, the molded plastic washer fluid reservoir (1) is mounted on the front of the Front End Module (FEM) carrier (also known as the radiator closure), just to the left of the cooling module. The filler neck for the reservoir extends upward just past the upper radiator closure member and through the upper radiator seal. On vehicles with a diesel engine, the molded plastic washer fluid reservoir is mounted on the back of the left vertical member of the left fender support hydroform. Both reservoirs are constructed of opaque black plastic, which does not allow the fluid level to be inspected without removing the reservoir filler cap (2).

The bright yellow plastic filler cap with a rubber seal and an International Control and Display Symbol icon for **Windshield Washer** molded into it snaps over the open end of the washer reservoir filler neck. The cap hinges on and is secured to an integral molded hook formation on the top of the reservoir just to the left of the filler neck when it is removed for inspecting or adjusting the fluid level in the reservoir.

On vehicles with a gasoline engine, the washer reservoir is secured through an integral mounting bracket at the top and bottom on the inboard side by two screws to the upper and lower members of the radiator closure. Two integral tabs on the outboard side of the reservoir engage through two slotted loops integral to the FEM carrier just inboard of the front lamp unit. On vehicles with a diesel engine, the washer reservoir is located and supported by an integral post formation on the bottom of the reservoir in a locator hole in the support bracket at the base of the left vertical member of the fender support hydroform, then secured by two screws through two integral tabs to the back of the vertical member.

There is a dedicated mounting hole in the top of the sump area at the front of the reservoir with a receptacle provided for the mounting of the washer/pump motor unit (4) without the use of fasteners. A separate dedicated mounting hole is provided in the rearward facing (gasoline engine) or forward facing (diesel engine) side of the reservoir for the washer fluid level switch (3). An integral molded routing trough for the washer hose and washer pump/motor unit wiring routes the hose and wiring bundle from the washer pump to the outboard side of the reservoir.

A washer reservoir cannot be repaired and, if ineffective or damaged, the unit must be replaced. The washer pump/motor unit, the washer fluid level switch, their rubber grommet seals, as well as the reservoir filler cap are each available for individual service replacement.

OPERATION

OPERATION

The washer fluid reservoir provides a secure, on-vehicle storage location for a large reserve of washer fluid for operation of the washer system. The washer reservoir filler cap provides a clearly marked and readily accessible point at which to add washer fluid to the reservoir.

The washer/pump motor unit is located in a sump area near the bottom of the reservoir to be certain that washer fluid will be available to the pump as the fluid level in the reservoir becomes depleted. The washer fluid level switch is mounted far enough above the washer pump inlet nipple in the sump area of the reservoir so that there will be adequate warning to the vehicle operator that the washer fluid level is low, well before the washer system will no longer operate.

REMOVAL

DIESEL ENGINE

Fig. 30: Washer Reservoir, Vertical Member, Mounting Post & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir (4) into a clean container for reuse.
3. Remove the two screws (1) that secure the mounting brackets of the washer reservoir filler neck to the left fender support hydroform vertical member (2), just to the left of the cooling module.
4. Pull the washer reservoir upward just far enough to disengage the mounting post (3) integral to the bottom of the reservoir from the locator hole in the support bracket at the base of the hydroform vertical member.

Fig. 31: Left Front Fender Wheel Housing

Courtesy of CHRYSLER GROUP, LLC

5. Remove the splash shield from the left front fender (1) wheel housing of the vehicle. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
6. Disconnect the Front End Module (FEM) wire harness connector (6) from the washer pump/motor unit (2) connector receptacle on the top of the motor housing.
7. Disconnect the FEM wire harness connector (5) from the washer fluid level switch connector receptacle (4) on the front of the reservoir.
8. Disconnect the reservoir washer hose from the barbed pump outlet nipple of the washer pump/motor unit.
9. Disengage the reservoir washer hose from the routing trough integral to the reservoir.
10. Move the washer reservoir away from the support bracket at the base of the hydroform vertical member far enough to enable lowering the reservoir down and out of the vehicle through the left front fender wheel housing.

GASOLINE ENGINE

Fig. 32: Locating Washer Reservoir
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir (1) into a clean container for reuse.
3. Remove the grille from the front of the vehicle. Refer to **GRILLE, REMOVAL** .
4. Remove the two screws (5) that secure the inboard washer reservoir mounting brackets at the top and bottom members of the Front End Module (FEM) carrier (also known as the radiator closure), just to the left of the cooling module.
5. Pull the washer reservoir upward far enough to disengage the two mounting tabs (2) on the outboard side of the reservoir from the two slotted loops integral to the FEM carrier.
6. Disconnect the FEM wire harness connector (3) from the washer pump/motor unit connector receptacle on the top of the motor housing.

7. Disconnect the reservoir washer hose (4) from the barbed pump outlet nipple of the washer pump/motor unit.
8. Disengage the reservoir washer hose and FEM wiring bundle from the routing trough integral to the front of the reservoir.

Fig. 33: Washer Reservoir & Level Switch Connector
Courtesy of CHRYSLER GROUP, LLC

9. Rotate the outboard side of the washer reservoir (3) away from the FEM carrier far enough to access and disconnect the FEM wire harness connector (1) from the washer fluid level switch connector receptacle (2) on the back of the reservoir.
10. Remove the washer reservoir from the left side of the FEM carrier.

INSTALLATION

DIESEL ENGINE

Fig. 34: Left Front Fender Wheel Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the washer reservoir (3) up into the vehicle through the left front fender (1) wheel housing and engage the post on the bottom of the reservoir in the locator hole in the support bracket at the base of the left front fender support hydroform vertical member.
2. Reconnect the reservoir washer hose to the barbed pump outlet nipple of the washer pump/motor unit (2).
3. Engage the reservoir washer hose into the routing trough integral to the reservoir.
4. Reconnect the Front End Module (FEM) wire harness connector (5) to the washer fluid level switch connector receptacle (4).
5. Reconnect the FEM wire harness connector (6) to the washer pump/motor unit connector receptacle at the top of the motor housing.
6. Reinstall the splash shield into the left front fender wheel housing of the vehicle. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .

Fig. 35: Washer Reservoir, Vertical Member, Mounting Post & Screws
Courtesy of CHRYSLER GROUP, LLC

7. Push the washer reservoir (4) downward far enough to ensure the mounting post (3) integral to the bottom of the reservoir is fully seated in the locator hole in the support bracket at the base of the left fender support hydroform vertical member (2), just to the left of the cooling module.
8. Install and tighten the two screws (1) that secure the mounting brackets of the washer reservoir filler neck to the hydroform vertical member. Tighten the screws securely.
9. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.
10. Reconnect the battery negative cable.

GASOLINE ENGINE

Fig. 36: Washer Reservoir & Level Switch Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the washer reservoir (3) to the left side of the Front End Module (FEM) carrier (also known as the radiator closure).
2. Rotate the outboard side of the washer reservoir away from the FEM carrier far enough to access and reconnect the FEM wire harness connector (1) to the washer fluid level switch connector receptacle (2) on the back of the reservoir.

Fig. 37: Locating Washer Reservoir
Courtesy of CHRYSLER GROUP, LLC

3. Engage the reservoir washer hose (4) and FEM wiring bundle into the routing trough integral to the front of the reservoir (1).
4. Reconnect the reservoir washer hose to the barbed pump outlet nipple of the washer pump/motor unit.
5. Reconnect the FEM wire harness connector (3) to the washer pump/motor unit connector receptacle on the top of the motor housing.
6. Align and insert the two mounting tabs (2) on the outboard side of the reservoir into the two slotted loops integral to the FEM carrier.
7. Install and tighten the two screws (5) that secure the inboard washer reservoir mounting brackets at the top and bottom members of the FEM carrier, just to the left of the cooling module. Tighten the screws securely.
8. Reinstall the grille onto the front of the vehicle. Refer to **GRILLE, INSTALLATION** .
9. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.
10. Reconnect the battery negative cable.

SWITCH, WASHER FLUID LEVEL

DESCRIPTION

DESCRIPTION

Fig. 38: Washer Fluid Level Switch
Courtesy of CHRYSLER GROUP, LLC

The washer fluid level switch (3) is a two-pin conductivity sensor with no moving parts. On vehicles with a gasoline engine, the switch is mounted on the rearward facing side of the washer reservoir on the front of the Front End Module (FEM) carrier (also known as the radiator closure), just to the left of the cooling module. On vehicles with a diesel engine, the washer fluid level switch is located in a dedicated hole on the lower, forward facing surface of the washer reservoir on the back of the left vertical post of the left fender support hydroform just outboard of the FEM carrier. Only the molded plastic switch mounting flange and the integral connector receptacle (4) are visible when the switch is installed in the reservoir.

A short nipple formation (1) extends from the inner surface of the switch mounting flange, and a barb on the nipple is pressed through a rubber grommet seal installed in the mounting hole of the reservoir. Two over-molded pins or electrodes (2) extend from the back of the nipple formation. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the FEM wire harness.

The washer fluid level switch cannot be adjusted or repaired. If ineffective or damaged, the switch must be replaced.

OPERATION

OPERATION

The washer fluid level switch uses fluid conductivity to monitor the level of the washer fluid in the washer reservoir. Electricity is conducted between the two switch pins or electrodes only when they are immersed in the washer fluid, which closes the switch circuit. When the fluid level in the washer reservoir falls below the pins, electrical current cannot be conducted and the switch becomes an open circuit, which signals a low fluid condition.

In order to prevent an electrical charge from accumulating in the electrical leads of the switch, the switch receives current that is pulsed from the Totally Integrated Power Module (TIPM) located in the engine

compartment near the battery. The TIPM monitors the switch return signal and is programmed to respond to three consecutive open switch readings by sending an electronic **washer fluid indicator lamp-ON request** message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the Controller Area Network (CAN) data bus. The EMIC responds to this message by illuminating the washer fluid indicator and by sounding an audible chime tone warning.

The washer fluid level switch is connected to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness. The switch is connected in series between a sensor return circuit and the washer fluid switch sense input to the TIPM.

The washer fluid level switch and the hard wired circuits between the switch and the TIPM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the washer fluid level indicator or the electronic controls or communication between other modules and devices that provide some features of the washer system. The most reliable, efficient, and accurate means to diagnose the washer fluid level indicator or the electronic controls and communication related to washer fluid level switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

DIESEL ENGINE

Fig. 39: Left Front Fender Wheel Housing
Courtesy of CHRYSLER GROUP, LLC

NOTE: The washer fluid level switch can be removed from the washer reservoir without removing the reservoir from the vehicle.

1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir (3) into a clean container for reuse.
3. Remove the splash shield from the left front fender (1) wheel housing of the vehicle. Refer to **SHIELD,**

SPLASH, FRONT WHEELHOUSE, REMOVAL .

4. Disconnect the Front End Module (FEM) wire harness connector (5) from the washer fluid level switch connector receptacle (4) on the front of the reservoir.
5. Using a trim stick or another suitable wide flat-bladed tool, gently pry the barbed nipple of the washer fluid level switch out of the rubber grommet seal in the washer reservoir. Care must be taken not to damage the reservoir.
6. Remove the switch from the washer reservoir.
7. Remove the rubber grommet seal from the switch mounting hole in the washer reservoir and discard.

GASOLINE ENGINE

Fig. 40: Washer Reservoir & Level Switch Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the windshield washer reservoir (3) from the Front End Module (FEM) carrier (also known as the radiator closure), but it is not necessary to disconnect the wiring or washer hose from the washer pump/motor unit. Refer to **RESERVOIR, WINDSHIELD WASHER, REMOVAL**.
3. Rotate the outboard side of the washer reservoir away from the FEM carrier far enough to access and disconnect the FEM wire harness connector (1) from the washer fluid level switch connector receptacle (2) on the back of the reservoir.
4. Using a trim stick or another suitable wide flat-bladed tool, gently pry the barbed nipple of the washer fluid level switch out of the rubber grommet seal in the washer reservoir. Care must be taken not to damage the reservoir.
5. Remove the switch from the washer reservoir.
6. Remove the rubber grommet seal from the switch mounting hole in the washer reservoir and discard.

INSTALLATION

DIESEL ENGINE

Fig. 41: Left Front Fender Wheel Housing
Courtesy of CHRYSLER GROUP, LLC

1. Install a new rubber grommet seal into the washer fluid level switch mounting hole of the washer reservoir (3). Always use a new rubber grommet seal on the reservoir.
2. Insert the nipple formation of the switch (4) through the rubber grommet seal in the reservoir.
3. Using hand pressure, press firmly and evenly on the switch mounting flange until the barbed nipple is fully seated in the rubber grommet seal in the reservoir. The flat edge of the switch mounting flange should be pointed upward.
4. Reconnect the Front End Module (FEM) wire harness connector (5) to the switch connector receptacle.
5. Reinstall the splash shield into the front fender (1) wheel housing of the vehicle. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
6. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.
7. Reconnect the battery negative cable.

GASOLINE ENGINE

Fig. 42: Washer Reservoir & Level Switch Connector
Courtesy of CHRYSLER GROUP, LLC

1. Install a new rubber grommet seal into the washer fluid level switch mounting hole of the washer reservoir (3). Always use a new rubber grommet seal on the reservoir.
2. Insert the nipple formation of the switch (2) through the rubber grommet seal in the reservoir.
3. Using hand pressure, press firmly and evenly on the switch mounting flange until the barbed nipple is fully seated in the rubber grommet seal in the reservoir. The flat edge of the switch mounting flange should be pointed upward.
4. Reconnect the Front End Module (FEM) wire harness connector (1) to the switch connector receptacle.
5. Reinstall the washer reservoir onto the FEM carrier (also known as the radiator closure). Refer to **RESERVOIR, WINDSHIELD WASHER, INSTALLATION**.

DIAGNOSIS AND TESTING

B1A08-RKE FOB 1 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

Scrambled messages to the Wireless Ignition Node (WIN) from the FOBIK transmitter.

POSSIBLE CAUSES

NOTE: **The most probable cause that sets this code is the RKE transmitter being pressed over 1023 times when it is out of range of the Wireless Ignition Node and it loses synchronization with the rolling code of the WIN. To correct, insert the FOBIK in the ignition and turn to the on position to synchronize the rolling code.**

Possible Causes
EXCESSIVE PRESSES FROM TRANSMITTER WHEN OUT OF RANGE
FOBIK TRANSMITTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Put the FOBIK in the ignition and turn the ignition on.

2. With the scan tool, record and erase DTCs.
3. Turn the ignition off and operate the FOBIK in all positions several times.
4. With the scan tool, read the DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the FOBIK and program using the scan tool.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

   No

   - The conditions that caused this code to set are not present at this time. Inform the owner of the most probable cause for this code to set and therefore causes the RKE system to be inoperative.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A09-RKE FOB 2 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

Scrambled messages to the Wireless Ignition Node (WIN) from the FOBIK transmitter.

POSSIBLE CAUSES

NOTE: **The most probable cause that sets this code is the FOBIK transmitter being pressed over 1024 times when it is out of range of the Wireless Ignition Node and it loses synchronization with the rolling code of the WIN. To correct, insert the FOBIK in the ignition and turn to the on position to synchronize the rolling code.**

Possible Causes
EXCESSIVE PRESSES FROM TRANSMITTER WHEN OUT OF RANGE
FOBIK TRANSMITTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

1. Put the FOBIK in the ignition and turn the ignition on.
2. With the scan tool, record and erase the DTCs.
3. Turn the ignition off and remove the FOBIK.
4. Operate the FOBIK in all positions several times.
5. With the scan tool, read the DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace and program the FOBIK using the scan tool.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

   No

   - The conditions that caused this code to set are not present at this time. Inform the owner of the most probable cause for this code to set and therefore causes the RKE to be inoperative.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A0A-RKE FOB 3 PERFORMANCE

    4. Operate the FOBIK in all positions several times.
    5. With the scan tool, read the DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Replace and program the FOBIK using the scan tool.
    - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

    No

    - The conditions that caused this code to set are not present at this time. Inform the owner of the most probable cause for this code to set and therefore causes the RKE system to be inoperative.
    - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A0E-RKE FOB 7 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

Scrambled messages to the Wireless Ignition Node (WIN) from the transmitter.

POSSIBLE CAUSES

NOTE: **The most probable cause that sets this code is the FOBIK transmitter being pressed over 1024 times when it is out of range of the Wireless Ignition Node and it loses synchronization with the rolling code of the WIN. To correct, insert the FOBIK in the ignition and turn to the on position to synchronize the rolling**

code.

Possible Causes
EXCESSIVE PRESSES FROM TRANSMITTER WHEN OUT OF RANGE
FOBIK TRANSMITTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Put the FOBIK in the ignition and turn the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Turn the ignition off and remove the FOBIK.
    4. Operate the FOBIK in all positions several times.
    5. With the scan tool, read the DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Replace and program the FOBIK using the scan tool.
    - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

    No

    - The conditions that caused this code to set are not present at this time. Inform the owner of the most probable cause for this code to set and therefore causes the RKE system to be inoperative.
    - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A0F-RKE FOB 8 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

Scrambled messages to the Wireless Ignition Node (WIN) from the transmitter.

POSSIBLE CAUSES

NOTE: The most probable cause that sets this code is the FOBIK transmitter being pressed over 1024 times when it is out of range of the Wireless Ignition Node

and it loses synchronization with the rolling code of the WIN. To correct, insert the FOBIK in the ignition and turn to the on position to synchronize the rolling code.

Possible Causes
EXCESSIVE PRESSES FROM TRANSMITTER WHEN OUT OF RANGE
FOBIK TRANSMITTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Put the FOBIK in the ignition and turn the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Turn the ignition off and remove the FOBIK.
    4. Operate the FOBIK in all positions several times.
    5. With the scan tool, read the DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Replace and program the FOBIK using the scan tool.
    - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

    No

    - The conditions that caused this code to set are not present at this time. Inform the owner of the most probable cause for this code to set and therefore causes the RKE system to be inoperative.
    - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A10-RKE FOB 1 BATTERY LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

During key interrogation and when a valid RKE transmission is read.

SET CONDITION:

If the battery in the Fob-Integrated-Key (FOBIK) is low during key interrogation, with a valid key, this code will set. It may also set during a valid RKE button press.

POSSIBLE CAUSES

Possible Causes
LOW BATTERY
FOBIK TRANSMITTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Verify that the FOBIK in use is the FOBIK causing the DTC to set.

1. Turn the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Turn the ignition off and remove the FOBIK.
4. Operate the RKE transmitter in all positions several times.
5. Turn the ignition on.
6. Using the scan tool, read the active DTCs.

Does the scan tool display: B1A10-RKE FOB 1 BATTERY LOW as active?

Yes

- Replace the FOBIK battery. Test the FOBIK using the RF Detector (special tool #9001, Rf Detector). If the Strength Display does not display "Strong", replace and program the FOBIK using the scan tool.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Test complete. The conditions that caused this code to set are not present at this time.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A11-RKE FOB 2 BATTERY LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

During key interrogation and when a valid RKE transmission is read.

SET CONDITION:

If the battery in the Fob-Integrated-Key (FOBIK) is low during key interrogation, with a valid key, this code will set. It may also set during a valid RKE button press.

POSSIBLE CAUSES

Possible Causes
LOW BATTERY
FOBIK TRANSMITTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Verify that the FOBIK in use is the FOBIK causing the DTC to set.

1. Turn the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Turn the ignition off and remove the FOBIK.
4. Operate the FOBIK transmitter in all positions several times.
5. Turn the ignition on.
6. Using the scan tool, read the active DTCs.

Does the scan tool display: B1A11-RKE FOB 2 BATTERY LOW as active?

Yes

- Replace the FOBIK battery. Test the FOBIK using the RF Detector (special tool #9001, Rf Detector). If the Strength Display does not display "Strong", replace and program the FOBIK using the scan tool.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Test complete. The conditions that caused this code to set are not present at this time.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A12-RKE FOB 3 BATTERY LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

During key interrogation and when a valid RKE transmission is read.

SET CONDITION:

If the battery in the Fob-Integrated-Key (FOBIK) is low during key interrogation, with a valid key, this code will set. It may also set during a valid RKE button press.

POSSIBLE CAUSES

Possible Causes
LOW BATTERY
FOBIK TRANSMITTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using the scan tool, record and erase the DTCs.
    3. Turn the ignition off and remove the FOBIK.
    4. Operate the FOBIK in all positions several times.
    5. Turn the ignition on.
    6. Using the scan tool, read the active DTCs.

    Does the scan tool display: B1A12-RKE FOB 3 BATTERY LOW as active?

    Yes

    - Replace the FOBIK battery. Test the FOBIK using the RF Detector (special tool #9001, Rf Detector). If the Strength Display does not display "Strong", replace and program the FOBIK using the scan tool.
    - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

    No

    - Test complete. The conditions that caused this code to set are not present at this time.
    - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A13-RKE FOB 4 BATTERY LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

During key interrogation and when a valid RKE transmission is read.

SET CONDITION:

If the battery in the Fob-Integrated-Key (FOBIK) is low during key interrogation, with a valid key, this code will set. It may also set during a valid RKE button press.

POSSIBLE CAUSES

Possible Causes
LOW BATTERY

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Verify that the FOBIK in use is the FOBIK causing the DTC to set.

1. Turn the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Turn the ignition off and remove the FOBIK.
4. Operate the FOBIK transmitter in all positions several times.
5. Turn the ignition on.
6. Using the scan tool, read the active DTCs.

Does the scan tool display: B1A13-RKE FOB 4 BATTERY LOW as active?

Yes

- Replace the FOBIK battery. Test the FOBIK using the RF Detector (special tool #9001, Rf Detector). If the Strength Display does not display "Strong", replace and program the FOBIK using the scan tool.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Test complete. The conditions that caused this code to set are not present at this time.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A14-RKE FOB 5 BATTERY LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

During key interrogation and when a valid RKE transmission is read.

SET CONDITION:

If the battery in the Fob-Integrated-Key (FOBIK) is low during key interrogation, with a valid key, this code will set. It may also set during a valid RKE button press.

POSSIBLE CAUSES

Possible Causes

LOW BATTERY
FOBIK TRANSMITTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Verify that the FOBIK in use is the FOBIK causing the DTC to set.

   1. Turn the ignition on.
   2. Using the scan tool, record and erase the DTCs
   3. Turn the ignition off and remove the FOBIK.
   4. Operate the RKE transmitter in all positions several times.
   5. Turn the ignition on.
   6. Using the scan tool, read the active DTCs.

   Does the scan tool display: B1A14-RKE FOB 5 BATTERY LOW as active?

   Yes

   - Replace the FOBIK battery. Test the FOBIK using the RF Detector (special tool #9001, Rf Detector). If the Strength Display does not display "Strong", replace and program the FOBIK using the scan tool.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

   No

   - Test complete. The conditions that caused this code to set are not present at this time.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A15-RKE FOB 6 BATTERY LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

During key interrogation and when a valid RKE transmission is read.

SET CONDITION:

If the battery in the Fob-Integrated-Key (FOBIK) is low during key interrogation, with a valid key, this code will set. It may also set during a valid RKE button press.

POSSIBLE CAUSES

Possible Causes
LOW BATTERY
FOBIK TRANSMITTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Verify that the FOBIK in use is the FOBIK causing the DTC to set.

1. Turn the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Turn the ignition off and remove the FOBIK.
4. Operate the FOBIK in all positions several times.
5. Turn the ignition on.
6. Using the scan tool, read the active DTCs.

Does the scan tool display; B1A15-RKE FOB 6 BATTERY LOW?

Yes

- Replace the FOBIK battery. Test the FOBIK using the RF Detector (special tool #9001, Rf Detector). If the Strength Display does not display "Strong", replace and program the FOBIK using the scan tool.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Test complete The conditions that caused this code to set are not present at this time.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A16-RKE FOB 7 BATTERY LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

During key interrogation and when a valid RKE transmission is read.

SET CONDITION:

If the battery in the Fob-Integrated-Key (FOBIK) is low during key interrogation, with a valid key, this code will set. It may also set during a valid RKE button press.

POSSIBLE CAUSES

Possible Causes
LOW BATTERY
FOBIK TRANSMITTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Verify that the FOBIK in use is the FOBIK causing the DTC to set.

1. Turn the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Turn the ignition off and remove the FOBIK.
4. Operate the FOBIK in all positions several times.
5. Turn the ignition on.
6. Using the scan tool, read the active DTCs.

Does the scan tool display: B1A16-RKE FOB 7 BATTERY LOW as active?

Yes

- Replace the FOBIK battery. Test the FOBIK using the RF Detector (special tool #9001, Rf Detector). If the Strength Display does not display "Strong", replace and program the FOBIK using the scan tool.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Testy complete. The conditions that caused this code to set are not present at this time.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A17-RKE FOB 8 BATTERY LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

During key interrogation and when a valid RKE transmission is read.

SET CONDITION:

If the battery in the Fob-Integrated-Key (FOBIK) is low during key interrogation, with a valid key, this code will set. It may also set during a valid RKE button press.

POSSIBLE CAUSES

Possible Causes
LOW BATTERY
FOBIK TRANSMITTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Verify that the FOBIK in use is the FOBIK causing the DTC to set.

1. Turn the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Turn the ignition off and remove the FOBIK.
4. Operate the RKE transmitter in all positions several times.
5. Turn the ignition on.
6. Using the scan tool, read the active DTCs.

Does the scan tool display: B1A17-RKE FOB 8 BATTERY LOW as active?

Yes

- Replace the FOBIK battery. Test the FOBIK using the RF Detector (special tool #9001, Rf Detector). If the Strength Display does not display "Strong", replace and program the FOBIK using the scan tool.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Test complete. The conditions that caused this code to set are not present at this time.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A24-KEY NOT PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Whenever a Fob-Integrated-Key (FOBIK) is inserted in the Wireless Ignition Node (WIN) basestation, the WIN performs a self test and resynchronization routine. During the routine, the WIN interrogates the FOBIK, performing various validity and performance tests. The repair of this fault condition relies on the programmed status of the FOBIK.

WHEN MONITORED:

During interrogation, the FOBIK sends a low frequency (LF) signal to the WIN that includes the FOBIK

identification information.

SET CONDITION:

This DTC sets if the WIN receives the default, secret key status from a FOBIK. Once set, this DTC will remain active until a valid, programmed FOBIK is inserted in the basestation and rotated through the ON position.

POSSIBLE CAUSES

Possible Causes
FOBIK
WIRELESS IGNITION NODE (WIN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY THAT THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Verify that the FOBIK in use is the FOBIK causing the DTC to set.

   1. Turn the ignition on.

      NOTE: Before continuing, review and check for the following:

      - **Review the repair history of the vehicle.**
      - **Make sure that the vehicle has the correct PCM and WIN installed by verifying the part numbers.**
      - **With the scan tool, make sure that the PCM and WIN are programmed correctly. Compare the PCM VIN to the WIN VIN and ensure the two VINs match.**

   2. With the scan tool, record and erase the DTCs.
   3. Perform two ignition cycles, leaving the ignition switch on for a minimum of one minute per cycle.
   4. With the scan tool, read the active DTCs.

      Does the scan tool display; B1A24-KEY NOT PROGRAMMED

      Yes

      - Go To 2.

      No

- Refer to **STANDARD PROCEDURE** and perform the WIN INTERMITTENT TEST.

2. **ENGINE WILL NOT CRANK**

NOTE: When diagnosing any WIN system concern, all the FOBIKS should be present

1. If this vehicle does not crank, use the table below to determine if the key is functional or not. With the scan tool under Data Display, Bussed Outputs, put the key in each position and check the "Ignition Status". Then with the key in the Run position, check "Valid Skim Key" and "SCREEM Status" reported by the WIN (or WCM). Compare all six readings with the "Good Key" column. If the engine does crank, answer "Yes" to the question below.

BUSSED OUTPUTS				
Ignition Status	**Good Key**	**Bad Key (Failed)**	**Wrong Key**	**New Key (Blank)**
Ignition Position = Lock	---------- --- or Lock	---------- --	---------- ----	---------- -- or Lock
Ignition Position = Acc.	Off/Acc.	---------- --	---------- ----	Off/Acc.
Ignition Position = Run Or ON	Run	Lock	Lock	Run
Ignition Position = Start Engine Off - Trans. in Gear	Start or Run	Lock	Lock	Run
SKREEM Status	Normal Status	Service SKREEM	Invalid Key	SNA (Signal Not Available)
Valid Skim Key	Yes/True	No/False	No/False	No/False
Trouble Code (DTC)		B1A35	B1A6C, B1A25	B1A24

Does the key (FOBIK) pass All Six Comparisons that are in the "Good Key" column?

Yes

- Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the WIN INTERMITTENT TEST.

No

- Go To 3.

3. **CHECK OPERATION OF THE FOBIK IN USE**
   1. Using the scan tool, program the FOBIK to the WIN.
   2. Use the scan tool and erase all codes in the WIN.
   3. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   4. Wait one minute, and read active codes.

   Does the scan tool display: B1A24-KEY NOT PROGRAMMED?

   Yes

   - Replace the key (FOBIK) and program using the scan tool.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

   No

   - Repair is complete.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A25-INVALID KEY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Whenever a Fob-Integrated-Key (FOBIK) is inserted in the Wireless Ignition Node (WIN) basestation, the WIN performs a self test and resynchronization routine. During the routine, the WIN interrogates the FOBIK, performing various validity and performance tests. The repair of this fault condition relies on whether the ID of the FOBIK is recognized as valid in the WIN.

WHEN MONITORED:

During interrogation, the FOBIK sends a low frequency (LF) signal to the WIN that includes the inserted FOBIK ID.

SET CONDITION:

This DTC sets if the WIN receives an ID from the FOBIK that does not match any of the eight possible FOBIK

IDs currently programmed in the WIN. This DTC will remain active until a valid, programmed FOBIK is inserted in the basestation and rotated through the ON position.

POSSIBLE CAUSES

Possible Causes
FOBIK
WIRELESS IGNITION NODE (WIN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY THAT THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

NOTE: **An external Radio-Frequency Identification (RFID) key (and/or pass/radio key), such as one used to gain access to a 24 hour gym, can cause this DTC to set and create a no start condition. Inspect the customer's key chain for any type of RFID key. If one is not found, question the customer to see if a spare key chain has this RFID key on it or if it was removed from the original key chain before the vehicle was released for service. If a RFID key is present, remove the ignition key from the vehicle and remove the RFID key from the key chain. For GPEC equipped vehicles, disconnect the battery and wait a minimum of five minutes, reconnect and attempt to start the vehicle. For NGC equipped vehicles, turn the ignition on a minimum for one hour, and then attempt to start the vehicle. If the vehicle does not start, continue with the diagnostic test.**

NOTE: **Verify that the FOBIK in use is the FOBIK causing this DTC to set.**

1. Turn the ignition on.

NOTE: **Before continuing, review and check for the following:**

- **Review the repair history of the vehicle.**
- **Make sure that the vehicle has the correct PCM and WIN installed by verifying the part numbers.**
- **With the scan tool, make sure that the PCM and WIN are programmed correctly. Compare the PCM VIN to the WIN VIN and make sure the two VINs match.**

2. With the scan tool, record and erase the DTCs.
3. Perform two ignition cycles, leaving the ignition switch on for a minimum of one minute per cycle.
4. With the scan tool, read the active DTCs.

Does the scan tool display; B1A25-INVALID KEY as active?

Yes

- If the engine does not crank, Go To 2.
- If the engine does crank, Go To 2 and answer "Yes" to the question in step 2.

No

- Refer to **STANDARD PROCEDURE** and perform the WIN INTERMITTENT TEST.

2. **ENGINE DOES NOT CRANK**

NOTE: When diagnosing any WIN system concern, all the FOBIKS should be present

1. If this vehicle does not crank, use the table below to determine if the key is functional or not. With the scan tool under Data Display, Bussed Outputs, put the key in each position and check the "Ignition Status". Then with the key in the Run position, check "Valid Skim Key" and "SCREEM Status" reported by the WIN (or WCM). Compare all six readings with the "Good Key" column.

BUSSED OUTPUTS				
Ignition Status	**Good Key**	**Bad Key (Failed)**	**Wrong Key**	**New Key (Blank)**
Ignition Position = Lock	---------- or Lock	----------	----------	---------- or Lock
Ignition Position = Acc.	Off/Acc.	----------	----------	Off/Acc.
Ignition Position = Run Or ON	Run	Lock	Lock	Run
Ignition Position = Start Engine Off - Trans. in Gear	Start or Run	Lock	Lock	Run
SKREEM Status	Normal Status	Service SKREEM	Invalid Key	SNA (Signal Not Available)
Valid	Yes/True	No/False	No/False	No/False

Skim Key				
Trouble Code (DTC)		B1A35	B1A6C, B1A25	B1A24

Does the key (FOBIK) pass All Six Comparisons that are in the "Good Key" column?

Yes

- Replace and program the Wireless Ignition Node (WIN). Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the WIN INTERMITTENT TEST.

No

- If the customer affirms that the FOBIK being used in this test is the correct one for this vehicle, use the scan tool and perform the "Program Ignition Keys or Key FOBs" routine. If the key fails, replace the key (FOBIK) and program using the scan tool.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A26-MAXIMUM NUMBER OF KEYS PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Wireless Ignition Node (WIN) is preprogrammed from the factory with 2 Fob-Integrated-Keys (FOBIKS), with the capability to have a maximum of 8 FOBIKS programmed in total. Additional programmed FOBIKS are automatically learned to the next available FOBIK position in the WIN software and do not overwrite any previous positions. The repair of this fault condition relies on the current number of FOBIKS programmed into the WIN and the number of available positions in the WIN software.

WHEN MONITORED:

When the WIN is placed into FOBIK programming mode, the module references the number of unique FOBIK identifications stored in its memory.

SET CONDITION:

In the event the WIN detects the user is attempting to program a 9th FOBIK, this DTC will be set as active.

POSSIBLE CAUSES

Possible Causes
MAXIMUM NUMBER OF FOBIKS (8) HAVE BEEN PROGRAMMED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   Is the DTC active or stored?

   WIN - ACTIVE DTC

   - Go To 2.

   WIN - STORED DTC

   - Refer to **STANDARD PROCEDURE** and perform the WIRELESS IGNITION NODE (WIN) INTERMITTENT TEST.

2. **CLEAR FOBIKS PROGRAMMED INTO WIRELESS IGNITION NODE (WIN) AND REPROGRAM FOBIKS**

   NOTE: The below procedure clears all FOBIKS currently programmed in the WIN software. It is important to obtain all the customer FOBIKS so they may be reprogrammed to the module. Any FOBIKS not present for the following procedure will be inoperable and require additional programming to function.

   1. Using the scan tool, use the Erase All Ignition Keys feature under Miscellaneous Functions.
   2. Using the scan tool, use the Program Ignition Keys or Key Fobs feature under Miscellaneous Functions.
   3. Program all the customer key(s) into the WIN (up to eight).
   4. Use the scan tool and erase all DTCs in the WIN.
   5. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   6. Wait one minute, and read active DTCs.

   Does the scan tool display: B1A26-MAXIMUM NUMBER OF KEYS PROGRAMMED?

   Yes

   - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

   No

- Repair is complete.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A27-SKREEM PROGRAMMING PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Sentry Key Remote Entry Module (SKREEM) is one of the many functions that is a subset of the Wireless Ignition Node (WIN). SKREEM programming takes place during the Fob-Integrated-Key (FOBIK) programming procedure. The repair of this fault condition is dependant on the programmed status of the FOBIK attempting to be programmed. Once the WIN requests the FOBIK to send its identification information, the FOBIK will attempt to send the information up to three times for redundancy to ensure "Good" information has been received.

WHEN MONITORED:

During FOBIK programming mode when the FOBIK and the WIN module are communicating over LF (low frequency) communication.

SET CONDITION:

The WIN will set this DTC if one or more of the three FOBIK transmissions, during FOBIK programming, failed to be properly received by the WIN. The FOBIK may still get programmed because the transmission was successful on one of the other attempts.

POSSIBLE CAUSES

Possible Causes
FOBIK
WIRELESS IGNITION NODE (WIN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

NOTE: All FOBIKs programmed to this vehicle should be present before continuing.

DIAGNOSTIC TEST

1. **DELETE FOBIKS AND REPROGRAM**
    1. With the scan tool, use the "Erase All Ignition Keys" feature under Miscellaneous Functions to delete all stored FOBIKs.
    2. With the scan tool, use the "Program Ignition Keys or Key FOBs" feature under Miscellaneous Functions to reprogram all applicable FOBIKs.
    3. With the scan tool, erase the WIN DTCs.

4. Turn the ignition off, wait 15 seconds, turn the ignition on.
5. Wait one minute, and read the active DTCs.

   Does the scan tool display; B1A27-SKREEM PROGRAMMING PERFORMANCE?

   Yes

   - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

   No

   - Repair is complete.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A28-ECM MISMATCH WITH SKIM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

For the engine to start, the Sentry Key Immobilizer (SKIM) feature of the Wireless Ignition Node (WIN) and the Powertrain Control Module (PCM) must successfully communicate data over the data bus. Once the WIN sends the message that a valid Fob-Integrated-Key (FOBIK) is being used, the PCM and WIN perform a "handshake" routine, encrypted with the VIN, to validate this information, and a match allows the engine to run when the ignition state transitions to START. The repair of this fault is determined by the ability of the WIN and PCM/ECM to complete a successful handshake routine over the bus.

WHEN MONITORED:

Whenever a valid FOBIK is inserted in the basestation and turned to the ON position, the WIN/PCM handshake takes place. The WIN validates that the message is sent to and received by the PCM.

SET CONDITION:

When a valid FOBIK is used and the WIN receives a mismatching cryptology code from the PCM as part of the routine, the WIN will send the command to flash the Security warning lamp and set this DTC as active. The engine will not start and the DTC will remain active until the WIN and PCM complete a successful handshake.

POSSIBLE CAUSES

Possible Causes
WIRELESS IGNITION NODE (WIN)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DIAGNOSTIC TROUBLE CODE (DTC)**

   Is the DTC active or stored?

   WIN - ACTIVE DTC

   - Go To 2.

   WIN - STORED DTC

   - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.
2. **VERIFY THE VEHICLE IDENTIFICATION NUMBER (VIN) STORED IN THE POWERTRAIN CONTROL MODULE (PCM).**
   1. Using the scan tool, access the VIN number stored in the PCM.

      NOTE: Make sure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct VIN before continuing.

   2. Compare the VIN displayed, with the VIN of the vehicle.

      Does the VIN recorded in the PCM match the VIN of the vehicle?

      Yes

      - **Using the scan tool, verify the VIN in the WIN matches the VIN of the vehicle. If it DOES, Go To 3. If it does NOT match, replace the Wireless Ignition Node in accordance with the Service Information. Refer to RECEIVER, WIRELESS IGNITION NODE, REMOVAL . Prior to replacing the WIN, the RUN circuits must be checked at the PCM. A missing run circuit at the PCM can cause this DTC to set.**
      - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

      No

      - Using the scan tool, perform the PCM Replaced Procedure to update the VIN in the PCM. Then, Go To 3.
3. **PCM STARTING DTCS**
   1. Use the scan tool and erase all DTCs in the WIN and PCM.

2. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
3. Try to start the engine. If the engine starts, leave it run for one minute and then turn the engine off (ignition on)
4. Wait one minute, and read the active PCM DTCs.

   Does the scan tool display any Starting related DTCs?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate Diagnostic Procedure.

   No

   - Go To 4.

4. **VERIFY PCM PROGRAMMING**
   1. Use the scan tool and erase all DTCs in the WIN and PCM.
   2. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   3. Wait one minute, and read the active WIN DTCs.

      Does the scan tool display: B1A28-ECM MISMATCH WITH SKIM as active?

      Yes

      - Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Refer to **STANDARD PROCEDURE** for 3.7L/4.7L/5.7L or **STANDARD PROCEDURE** for 6.7L and perform the POWERTRAIN VERIFICATION TEST.

      No

      - Repair is complete.
      - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A29-SKIM BASESTATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

For the engine to start, the Sentry Key Immobilizer (SKIM) feature of the Wireless Ignition Node (WIN) and the Powertrain Control Module (PCM) must successfully communicate VIN data over the serial data bus. Once the WIN sends the message that a valid Fob-in-Key (FOBIK) is being used, the PCM and WIN perform a "handshake" routine to validate this VIN information, including a positive response from the PCM which allows the engine to run when the ignition state transitions to START. The repair of this fault is determined by the

WIN recognition of a valid FOBIK and the ability of the WIN and PCM to complete a successful VIN handshake routine over the bus.

WHEN MONITORED:

Whenever a FOBIK is inserted in the basestation, the WIN determines its validity status. If determined valid, the WIN allows rotation to the ON position and the WIN/PCM handshake takes place.

SET CONDITION:

When an invalid FOBIK is used and the WIN receives a mismatching or no secret key data from the FOBIK, the WIN will send the command to illuminate the Security warning lamp, send an invalid key status in the handshake with the PCM, and set this DTC as active. The "B1A28 ECM/PCM Mismatch with SKIM" DTC will probably be accompanied along with this B1A29.

POSSIBLE CAUSES

Possible Causes
WIRELESS IGNITION NODE (WIN)
FOBIK

Always perform the WIN Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

NOTE: When diagnosing any WIN system DTCs, all FOBIK used on the vehicle should be present.

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the WIN DTCs.
    3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
    4. With the scan tool, read the active WIN DTCs.

    NOTE: This DTC identifies two fault conditions together, an unknown or non communicating FOBIK and a negative response from the PCM to start the engine. First, root cause why the FOBIK is unknown or not responsive. Once the FOBIK issue is corrected, the B1A29 DTC should go to a stored status. Once the B1A29 becomes stored, the B1A28 DTC can be corrected.

    Does the scan tool display: B1A29-SKIM BASESTATION MISMATCH as Active?

    Yes

- Go To 2.

No

- Verify the FOBIK in use is the FOBIK that caused this DTC to set. If it was, refer to **STANDARD PROCEDURE** and perform the WIN INTERMITTENT TEST.

2. **VERIFY FOBIK COMMUNICATION**

NOTE: When diagnosing any WIN concern, all FOBIKs should be present

1. With the scan tool, read the WIN active DTCs again.

   Does the scan tool display; B1A35-UNIDENTIFIED KEY COMMUNICATION ERROR as Active?

   Yes

   - Go To 3.

   No

   - Go To 4.

3. **TEST LF COMMUNICATION**
   1. With the scan tool, in the WIN menu, go to Data Display, Bussed Outputs and check the "SKREEM Status" for the current FOBIK that is being used. Record that status.
   2. Remove the FOBIK.
   3. Insert one of the other known good FOBIKs used with this vehicle.

   NOTE: If another FOBIK is not available, insert a new unprogrammed FOBIK to test the WIN module's low frequency (LF) communication (do not program the FOBIK).

   4. Check the "SKREEM Status" for the current FOBIK. Verify that the status changed from the first FOBIK that was in the ignition.

      Did the "SKREEM Status" change?

      Yes

      - Replace and program the FOBIK in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

      No

      - Replace and program the Wireless Ignition Node (WIN) in accordance with the Service

Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

4. **VERIFY THE STATE OF THE WIN MODULE**
   1. Currently the secret key in the FOBIK does not match the secret key in the WIN module. Find out which component has the correct secret key for this vehicle.

      Has the WIN module just been replaced?

      Yes

      - Go To 5.

      No

      - Replace and program the FOBIK in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.
5. **VERIFY THE WIN MODULE HAS BEEN INITIALIZED**
   1. Using the scan tool, go to Miscellaneous Functions and run the "Reset WIN" routine.
   2. Enter the unique 4 digit PIN number assigned to this vehicle.

      Was the 4 digit PIN accepted?

      Yes

      - Replace and program the FOBIK in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

      No

      NOTE: **If the PCM was replaced at the same time the WIN was, install the old PCM before continuing or else the correct secret key value will not get transferred and replacing all FOBIKs will be necessary.**

      -
      - Using the scan tool, go to Miscellaneous Functions and run the "WIN Replaced" routine.
      - Using the scan tool, go to Miscellaneous Functions and run the "Program Ignition Keys or Key Fobs" routine.
      - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

B1A35-UNIDENTIFIED KEY COMMUNICATION ERROR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Whenever a Fob-Integrated-Key (FOBIK) is inserted in the Wireless Ignition Node (WIN) basestation, the WIN performs a self test and resynchronization routine. During the routine, the WIN interrogates the FOBIK, performing various validity and performance tests. The repair of this fault condition relies on whether the FOBIK ID is received by the WIN.

WHEN MONITORED:

During interrogation, the FOBIK sends an LF (Low frequency) signal to the WIN that includes the programmed FOBIK ID.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets if a FOBIK is inserted in the WIN basestation but the WIN does not receive or is unable to read an ID from the FOBIK. This DTC will remain active until a valid programmed FOBIK is inserted in the WIN and its ID is received.

POSSIBLE CAUSES

Possible Causes
FOBIK
WIRELESS IGNITION NODE (WIN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**

NOTE: **An external Radio-Frequency Identification (RFID) key (and/or pass/radio key), such as one used to gain access to a 24 hour gym, can cause this DTC to set and create a no start condition. Inspect the customer's key chain for any type of RFID key. If one is not found, question the customer to see if a spare key chain has this RFID key on it or if it was removed from the original key chain before the vehicle was released for service. If a RFID key is present, remove the ignition key from the vehicle and remove the RFID key from the key chain. For GPEC equipped vehicles, disconnect the battery and wait a minimum of five (5) minutes, reconnect and attempt to start the vehicle. For NGC equipped vehicles, turn the ignition on a minimum for one hour, and then attempt to start the vehicle. If the vehicle does not start, continue with the diagnostic test.**

NOTE: **Verify the FOBIK in use is the FOBIK causing this DTC to set.**

1. Turn the ignition on.

2. With the scan tool, record and erase the WIN DTCs.
3. Cycle the ignition switch from on to off, wait five seconds and then crank the engine.
4. Turn the engine off, key on.
5. With the scan tool, read the active WIN DTCs.

   Does the scan tool display: B1A35-UNIDENTIFIED KEY COMMUNICATION ERROR as Active?

   Yes

   - Go To 2.

   No

   - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

2. **TEST LF COMMUNICATION**
   1. With the scan tool, in the WIN menu, go to Data Display, Bussed Outputs and check the "SKREEM Status" for the current FOBIK that is being used. Record that status.
   2. Turn the ignition off and remove the FOBIK.
   3. Insert one of the other known good FOBIKs used with this vehicle.

      NOTE: If another FOBIK is not available, insert a new FOBIK (Do not program) to test the WIN module's low frequency (LF) communication

   4. Check the "SKREEM Status" for the current FOBIK. Verify that the status changed from the first FOBIK that was in the ignition.

      Did the "SKREEM Status" change?

      Yes

      - Replace and program the FOBIK in accordance with the Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

      No

      - Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .

        NOTE: With the scan tool, perform the "PEM Replace" routine in the Passive Entry Module (PEM) after the FOBIKs have been programmed.

      - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

B1A6C-SECRET KEY MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Whenever a Fob-Integrated-Key (FOBIK) is inserted in the Wireless Ignition Node (WIN) basestation, the WIN performs a self test and resynchronization routine. During the routine, the WIN interrogates the FOBIK for the secret key information and start the vehicle. The repair of this fault condition relies on whether the current secret key in the FOBIK is recognized by the WIN.

WHEN MONITORED:

During interrogation, the FOBIK sends a low frequency (LF) signal to the WIN that includes the current secret key.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets if the WIN receives a secret key ID from the FOBIK that is not the correct secret key value stored in the WIN. This DTC will remain active until a valid, programmed FOBIK, with the correct secret key is inserted in the basestation and rotated through the ON position.

POSSIBLE CAUSES

Possible Causes
FOBIK
WIRELESS IGNITION NODE (WIN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY THAT THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: When diagnosing any WIN system concern, all the FOBIKS should be present.

   1. Turn the ignition on.

      NOTE: Before continuing, review and check for the following:

      - **Review the repair history of the vehicle.**
      - **Make sure that the vehicle has the correct PCM and WIN installed by verifying the part numbers.**
      - **With the scan tool, ensure that the PCM and WIN are**

programmed correctly. Compare the PCM VIN to the WIN VIN and ensure the two VINs match.

2. With the scan tool, record and erase the DTCs.
3. Perform five ignition cycles, leaving the ignition switch on for a minimum of one minute per cycle.
4. With the scan tool, read the active DTCs.

   Does the scan tool display; B1A6C-SECRET KEY MISMATCH as active?

   Yes

   - If the engine does not crank, Go To 2.
   - If the engine does crank, Go To 3.

   No

   - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

2. **ENGINE DOES NOT CRANK**
   1. If this vehicle does not crank, use the table below to determine if the key is functional or not. With the scan tool under Data Display, Bussed Outputs, put the key in each position and check the "Ignition Status". Then with the key in the Run position, check "Valid Skim Key" and "SKREEM Status" reported by the WIN (or WCM). Compare all six readings with the "Good Key" column.

BUSSED OUTPUTS				
Ignition Status	**Good Key**	**Bad Key (Failed)**	**Wrong Key**	**New Key (Blank)**
Ignition Position = Lock	---------- or Lock	----------	----------	---------- or Lock
Ignition Position = Acc.	Off/Acc.	----------	----------	Off/Acc.
Ignition Position = Run Or ON	Run	Lock	Lock	Run
Ignition Position = Start Engine Off - Trans. in Gear	Start or Run	Lock	Lock	Run
SKREEM	Normal	Service	Invalid	"SNA" Signal

Status	Status	SKREEM	Key	Not Available
Valid Skim Key	Yes/True	No/False	No/False	No/False
Trouble Code (DTC)		B1A35	B1A6C, B1A25	B1A24

Does the key (FOBIK) pass All Six Comparisons that are in the "Good Key" column?

Yes

- Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

No

- Go To 3.

3. **VERIFY THE WIN HAS BEEN PROPERLY INITIALIZED**
   1. Using the scan tool, read the Number of Key/Fobs Programmed under Data Display.

      Does the scan tool show any Key/Fobs Programmed?

      Yes

      - Go To 4.

      No

      - Using the scan tool, program the FOBIKS.
      - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

4. **CHECK OPERATION OF THE FOBIK IN USE**

   NOTE: Verify the FOBIK in use is the FOBIK causing the DTC to set.

   1. Replace the FOBIK currently in use.
   2. Using the scan tool, program the new FOBIK to the WIN.
   3. Use the scan tool and erase all codes in the WIN.
   4. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   5. Wait one minute, and read active codes.

      Does the scan tool display this DTC as active?

Yes

- Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

No

- Repair is complete.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1A77- REMOTE START ANTENNA CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on. Remote start present and configured.

SET CONDITION:

Short to ground detected on the Remote Start Antenna.

POSSIBLE CAUSES

Possible Causes
REMOTE START ANTENNA
WIRELESS IGNITION NODE (WIN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the WIN DTCs.
    3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
    4. With the scan tool, read the active WIN DTCs.

    Does the scan tool display: B1A77- REMOTE START ANTENNA CIRCUIT LOW as Active?

    Yes

    - Go To 2.

No

- Verify the FOBIK in use is the FOBIK that caused this DTC to set. If it was, refer to **STANDARD PROCEDURE** and perform the WIN INTERMITTENT TEST.

2. **CHECK WIN**
    1. Unplug the Remote Start Antenna from the WIN module.
    2. With the scan tool, record and erase the WIN DTCs.
    3. Cycle the ignition switch from on to off, wait five seconds and then back to on, wait five seconds.
    4. With the scan tool, read the active WIN DTCs.

    Does the scan tool display; "B1A79-Remote Start Antenna Circuit Open or Not Connected" as Active?

    Yes

    - Replace the Remote Start Antenna in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

    No

    - Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

B1A79- REMOTE START ANTENNA CIRCUIT OPEN OR NOT CONNECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on. Remote start present and configured.

SET CONDITION:

No Remote Start Antenna detected by the Wireless Ignition Node (WIN).

POSSIBLE CAUSES

Possible Causes
REMOTE START ANTENNA NOT CONNECTED
REMOTE START ANTENNA
WIRELESS IGNITION NODE (WIN)

DIAGNOSTIC TEST

1. **REMOTE START ANTENNA NOT CONNECTED**
    1. Verify that the Remote Start Antenna is connected to the WIN.
    2. Disconnect the Remote Start Antenna and reconnect it to make sure that it is seated correctly.
    3. Turn the ignition on.
    4. With the scan tool, record and erase the WIN DTCs.
    5. Cycle the ignition switch from on to off, wait five seconds and then back to on, wait five seconds.
    6. With the scan tool, read the active WIN DTCs.

    Does the scan tool display: B1A79- REMOTE START ANTENNA CIRCUIT OPEN OR NOT CONNECTED as Active?

    Yes

    - Go To 2.

    No

    - Test complete.
    - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.
2. **CHECK REMOTE START ANTENNA**
    1. Turn the ignition off.
    2. Secure a new Remote Start Antenna and connect the connector to the WIN.
    3. Turn the ignition on.
    4. With the scan tool, record and erase the WIN DTCs.
    5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
    6. With the scan tool, read the active WIN DTCs.

    Does the scan tool display: B1A79- REMOTE START ANTENNA CIRCUIT OPEN OR NOT CONNECTED as Active?

    Yes

    - Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

    No

    - Finish the installation of the Remote Start Antenna in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B210A-SYSTEM VOLTAGE LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

At all times.

SET CONDITION:

This is a CAN message that the battery voltage was below 10.0 volts for over 15 seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW SYSTEM VOLTAGE BATTERY OR CHARGING SYSTEM

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN CONTROL MODULE DTCs**
    1. With the scan tool, read Powertrain DTCs.

       Are there any Powertrain Charging or Battery DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate Diagnostic Procedure.

       No

       - This code is for information only. At some time there was a low battery system voltage. Check the battery and charging system in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B210B-SYSTEM VOLTAGE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

At all times.

SET CONDITION:

This is a CAN message that the system voltage was above 16.0 volts for over 15 seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
HIGH BATTERY SYSTEM VOLTAGE CHARGING SYSTEM

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN DTCs**
    1. With the scan tool, read Powertrain Control Module DTCs.

       Are there any Powertrain Charging or Battery DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate Diagnostic Procedure.

       No

       - This code is a CAN system message for information only. Check the charging system in accordance with the Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B210D-BATTERY VOLTAGE LOW - DD/DP

Fig. 1: Wireless Ignition Node (WIN) CAN C Bus & Fused B+ Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition switch on.

SET CONDITION:

The Wireless Ignition Node (WIN) has detected the Fused (B+) input voltage was below 10.5 volts for over 15 seconds except during cranking or when the FOBIK removal process is engaged.

POSSIBLE CAUSES

Possible Causes
RESISTANCE IN THE BATTERY POSITIVE CIRCUIT
RESISTANCE IN THE GENERATOR CASE GROUND
GENERATOR OPERATION
(K20) GENERATOR FIELD CONTROL CIRCUIT OPEN
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO GROUND
(Z911) GROUND CIRCUIT RESISTED
(A106) FUSED (B+) CIRCUIT RESISTED
POWERTRAIN CONTROL MODULE (PCM)
WIRELESS IGNITION NODE (WIN)

DIAGNOSTIC TEST

1. **CHECK PCM FOR CHARGING SYSTEM DTCs**

   NOTE: Be sure the battery is fully charged before proceeding.

   1. With a scan tool, read the Powertrain Control Module (PCM) DTCs.

      Are there any Charging or Starting System DTCs set in the PCM?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate Diagnostic Procedure.

      No

      - Go To 2.

2. **VERIFY THAT DTC B210D-BATTERY VOLTAGE LOW IS ACTIVE**
   1. With the scan tool, record and erase the DTCs.
   2. Turn the ignition switch to the OFF position then start the engine and let run for one minute.
   3. With the scan tool, read the WIN active DTCs.

Does the scan tool display: B210D-BATTERY VOLTAGE LOW active?

Yes

- Go To 3.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

3. **(A106) FUSED (B+) CIRCUIT OR (Z911) GROUND CIRCUIT HAS HIGH RESISTANCE**

Fig. 2: Checking Fused (B+) Circuit Or Ground Circuit Has High Resistance

Courtesy of CHRYSLER GROUP, LLC

NOTE: **Check the related fuses to the Fused (B+) circuit. If the fuse is found to be open, repair the circuit for a shorted condition.**

1. Turn the ignition off.
2. Disconnect the WIN harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light, connect it between the (A106) Fused (B+) circuit and the (Z911) Ground circuit in the WIN harness connector.
5. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Is the test light as bright at the module as it is at the battery?

   Yes

   - Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

   No

   - Test the (A106) Fused B(+) circuit and the Ground circuit to determine which one has the high resistance. Repair the Fused B(+) circuit or the Ground circuit for high resistance.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B210D-BATTERY VOLTAGE LOW - DS/DJ/D2

Fig. 3: Wireless Ignition Node (WIN) CAN C Bus & Fused B+ Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition switch on.

SET CONDITION:

The Wireless Ignition Node (WIN) has detected the Fused (B+) input voltage was below 10.5 volts for over 15 seconds except during cranking or when the FOBIK removal process is engaged.

POSSIBLE CAUSES

Possible Causes
RESISTANCE IN THE BATTERY POSITIVE CIRCUIT
RESISTANCE IN THE GENERATOR CASE GROUND
GENERATOR OPERATION
(K20) GENERATOR FIELD CONTROL CIRCUIT OPEN
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO GROUND
(Z911) GROUND CIRCUIT RESISTED
(A106) FUSED (B+) CIRCUIT RESISTED
POWERTRAIN CONTROL MODULE (PCM)
WIRELESS IGNITION NODE (WIN)

DIAGNOSTIC TEST

1. **CHECK PCM FOR CHARGING SYSTEM DTCs**

   NOTE: Be sure the battery is fully charged before proceeding.

   1. With a scan tool, read the Powertrain Control Module (PCM) DTCs.

      Are there any Charging or Starting System DTCs set in the PCM?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate Diagnostic Procedure.

      No

      - Go To 2.

2. **VERIFY THAT DTC B210D-BATTERY VOLTAGE LOW IS ACTIVE**
   1. With the scan tool, record and erase the DTCs.

2. Turn the ignition switch to the OFF position then start the engine and let run for one minute.
3. With the scan tool, read the WIN active DTCs.

   Does the scan tool display: B210D-BATTERY VOLTAGE LOW active?

   Yes

   - Go To 3.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

3. **(A106) FUSED (B+) CIRCUIT OR (Z911) GROUND CIRCUIT HAS HIGH RESISTANCE**

Fig. 4: Checking Fused (B+) Circuit Or Ground Circuit Has High Resistance
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Check the related fuses to the Fused (B+) circuit. If the fuse is found to be open, repair the circuit for a shorted condition.**

1. Turn the ignition off.
2. Disconnect the WIN harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light, connect it between the (A106) Fused (B+) circuit and the (Z911) Ground circuit in the WIN harness connector.
5. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Is the test light as bright at the module as it is at the battery?

Yes

- Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

No

- Test the (A106) Fused B(+) circuit and the Ground circuit to determine which one has the high resistance. Repair the Fused B(+) circuit or the Ground circuit for high resistance.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B210E-BATTERY VOLTAGE HIGH - DD/DP

Fig. 5: Wireless Ignition Node (WIN) CAN C Bus & Fused B+ Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition switch on.

SET CONDITION:

The Wireless Ignition Node (WIN) has detected the Fused (B+) input voltage to be above 15.5 volts for over 15 seconds.

POSSIBLE CAUSES

Possible Causes
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE
(Z911) GROUND CIRCUIT RESISTED
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)
WIRELESS IGNITION NODE (WIN)

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM RELATED DTCs IN THE POWERTRAIN CONTROL MODULE (PCM)**

   NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.

   1. Turn the ignition on.
   2. With the scan tool in ECU View, select PCM and check for any Battery or Charging System related DTCs.

      Does the scan tool display any Battery or Charging System related DTCs?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate Diagnostic Procedure.

      No

      - Go To 2.
2. **INTERMITTENT CONDITION**

   NOTE: Be sure the battery is fully charged before proceeding.

   1. With the scan tool, record and erase the WIN DTCs.

2. Perform five ignition cycles, leaving the ignition switch on for a minimum of one minute per cycle.
3. Start the engine and run for two minutes.
4. With the scan tool, read the active WIN DTCs.

   Does the scan tool display: B210E-BATTERY VOLTAGE HIGH?

   Yes

   - Go To 3.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

3. **CHECK THE GROUND CIRCUIT AT THE WIN**

Fig. 6: Checking The Ground Circuit At The WIN
Courtesy of CHRYSLER GROUP, LLC

NOTE: A dirty (partial) ground can cause abnormal conditions within a system.

1. Turn the ignition off.
2. Disconnect the WIN connector.
3. Using a 12-volt test light, connect it between the (A106) Fused (B+) circuit and the (Z911) Ground circuit in the WIN harness connector.
4. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Is the test light as bright at the module connector as it is at the battery?

   Yes

- Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

No

- Repair the (Z911) Ground circuit for high resistance.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B210E-BATTERY VOLTAGE HIGH - DS/DJ/D2

Fig. 7: Wireless Ignition Node (WIN) CAN C Bus & Fused B+ Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition switch on.

SET CONDITION:

The Wireless Ignition Node (WIN) has detected the Fused (B+) input voltage to be above 15.5 volts for over 15 seconds.

POSSIBLE CAUSES

Possible Causes
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE
(Z911) GROUND CIRCUIT RESISTED
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)
WIRELESS IGNITION NODE (WIN)

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM RELATED DTCs IN THE POWERTRAIN CONTROL MODULE (PCM)**

   NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.

   1. Turn the ignition on.
   2. With the scan tool in ECU View, select PCM and check for any Battery or Charging System related DTCs.

      Does the scan tool display any Battery or Charging System related DTCs?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate Diagnostic Procedure.

      No

      - Go To 2.
2. **INTERMITTENT CONDITION**

NOTE: Be sure the battery is fully charged before proceeding.

1. With the scan tool, record and erase the WIN DTCs.
2. Perform five ignition cycles, leaving the ignition switch on for a minimum of one minute per cycle.
3. Start the engine and run for two minutes.
4. With the scan tool, read the active WIN DTCs.

   Does the scan tool display: B210E-BATTERY VOLTAGE HIGH?

   Yes

   - Go To 3.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

3. **CHECK THE GROUND CIRCUIT AT THE WIN**

Fig. 8: Checking The Ground Circuit At The WIN
Courtesy of CHRYSLER GROUP, LLC

NOTE: A dirty (partial) ground can cause abnormal conditions within a system.

1. Turn the ignition off.
2. Disconnect the WIN connector.
3. Using a 12-volt test light, connect it between the (A106) Fused (B+) circuit and the (Z911) Ground circuit in the WIN harness connector.
4. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Is the test light as bright at the module connector as it is at the battery?

   Yes

- Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

No

- Repair the (Z911) Ground circuit for high resistance.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B2204-ECU CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Wireless Ignition Node (WIN) must be configured for various parameters such as model year and vehicle line, after a service replacement. The WIN checks for the proper configuration by comparing the values stored to those sent out on the serial data bus. The repair of this fault does not involve any external circuitry and centers on verifying the module is configured correctly.

WHEN MONITORED:

The WIN checks the feature configuration at power up during the initialization process, and continuously through the ignition cycle.

SET CONDITION:

This DTC sets when the WIN detects a mismatch of Model Year, vehicle line, body style or market country between the current vehicle configuration of the module and the information sent out on the CAN bus. Once set, this DTC is latched for the entire ignition cycle.

POSSIBLE CAUSES

Possible Causes
WIRELESS IGNITION NODE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   Is the DTC active or stored?

   WIN - ACTIVE DTC

- Go To 2.

WIN - STORED DTC

- Refer to **STANDARD PROCEDURE** and perform the WIRELESS IGNITION NODE (WIN) INTERMITTENT TEST.

2. **RESET/RECONFIGURE THE TOTALLY INTEGRATED POWER MODULE (TIPM)**
   1. Turn the ignition on.
   2. Using the scan tool, select ECU View. This will list the modules on the vehicle. Read and record the listed modules.

      NOTE: A Scan Report will list all the modules on the vehicle.

   3. Using the scan tool, select the Totally Integrated Power Module (TIPM) and then press Miscellaneous Functions.
   4. Press Reset ECU.
   5. Cycle the ignition from on to off three times and read the active WIN DTCs.

      Does the scan tool display: B2204-ECU CONFIGURATION MISMATCH active?

      Yes

      - Go To 3.

      No

      - Repair is complete.
      - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

3. **RESET/RECONFIGURE THE WIN**
   1. Using the scan tool, select the WIN and then press Miscellaneous Functions.
   2. Press Reset ECU.
   3. Cycle the ignition from on to off three times and read the active WIN DTCs.

      Does the scan tool display: B2204-ECU CONFIGURATION MISMATCH active?

      Yes

      - Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

      No

      - Repair is complete.

- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B2205-ORIGINAL VIN MISSING/MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When a valid Fob-Integrated-Key (FOBIK) is used and the ignition is rotated to the RUN position, the Wireless Ignition Node (WIN) "listens" to the CAN C bus for the broadcast of the Vehicle Identification Number (VIN) by the Powertrain Control Module (PCM).

WHEN MONITORED:

The WIN monitors the VIN broadcast on the CAN C bus three times, when the ignition is turned to the RUN position. When the full VIN has been received by the WIN, all further broadcasts of the VIN are ignored for that ignition cycle.

SET CONDITION:

When the VIN received from the CAN C bus does not match the VIN stored in the memory of the Wireless Ignition Node, the WIN will send the command to flash the Security warning lamp and set this DTC as active and the vehicle will immobilize. The DTC will remain active until a VIN matching the one stored in WIN memory is received by the module from the bus.

POSSIBLE CAUSES

Possible Causes
WIRELESS IGNITION NODE (WIN)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DIAGNOSTIC TROUBLE CODE (DTC)**

   Is the DTC active or stored?

   WIN - ACTIVE DTC

   - Go To 2.

   WIN - STORED DTC

   - Refer to **STANDARD PROCEDURE** and perform the WIRELESS IGNITION NODE (WIN)

INTERMITTENT TEST.

2. **CHECK THE VIN STORED IN THE PCM**
    1. Using the scan tool, compare the VIN that is stored in the PCM to the VIN of the vehicle's VIN plate.

       Does the VIN stored in the PCM match the vehicle's VIN?

       Yes

       - Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
       - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

       No

       - Replace the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
       - Refer to **STANDARD PROCEDURE** for 3.7L/4.7L/5.7L or **STANDARD PROCEDURE** for 6.7L and perform the POWERTRAIN VERIFICATION TEST.

B2224-SKREEM INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

During key insertion and removal and at module power up.

SET CONDITION:

When the internal memory is corrupted. This DTC can also set if the vehicle is equipped with a Steering Column Lock module (BUX). If after any three consecutive unsuccessful Steering Column Lock and/or Unlock (ELV) attempts, which could be caused by an encoded data mismatch or the bolt did not reach the intended position when requested.

POSSIBLE CAUSES

Possible Causes
WIRELESS IGNITION NODE (WIN)

DIAGNOSTIC TEST

1. **VERIFY THAT THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**
    1. Turn the ignition on.

       NOTE: Before continuing, review and check for the following:

- **Review the repair history of the vehicle.**
- **Make sure that the vehicle has the correct PCM and WIN installed by verifying the part numbers.**
- **With the scan tool, ensure that the PCM and WIN are programmed correctly. Compare the PCM VIN to the WIN VIN and ensure the two VINs match.**

2. With the scan tool, erase the DTCs.
3. Perform three ignition cycles, leaving the ignition switch on for a minimum of one minute per cycle.
4. With the scan tool, read the active DTCs.

   Does the scan tool display: B2224-SKREEM INTERNAL as active?

   Yes

   - Replace and program the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the WIN VERIFICATION TEST.

   No

   - Refer to **STANDARD PROCEDURE** and perform the WIRELESS IGNITION NODE (WIN) INTERMITTENT TEST.

C0077-LOW TIRE PRESSURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

A low pressure condition will exist when the tire pressure falls below or is equal to the low pressure threshold value as specified for the vehicle.

POSSIBLE CAUSES

Possible Causes
INCORRECT TIRE PRESSURE
INCORRECT PLACARD VALUES
TIRE PRESSURE MONITORING (TPM) SENSOR

DIAGNOSTIC TEST

1. **DTC STATUS**

NOTE: **If the incorrect Placard Values were programmed into the WIN, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

NOTE: **If any the following conditions are present repair them first before continuing with this test.**

- **Low Tire Pressure**
- **Individual Low Tire Pressure Sensor DTCs**
- **Tire Pressure Monitoring (TPM) Sensor Internal fault**
- **Spare Tire is not equipped with a TPM Sensor and is currently on the vehicle**

NOTE: **Seasonal temperature changes will affect tire pressure, and may have caused the tire pressure to fall below the low pressure warning threshold. Tire pressure should always be set based on cold inflation tire pressure (placard). This is defined as the tire pressure after a vehicle has not been driven for more then three hours, and in outside ambient temperatures.**

1. Correct all tire pressures to the recommended cold inflation tire pressure specifications and wait two minutes for the system to update.
2. Ignition on engine not running.
3. With the scan tool, record and erase the DTCs.
4. Test drive the vehicle at speeds greater than 15 mph (24 km/h) for minimum of 10 minutes.
5. With the scan tool, read the DTCs.

Is the DTC status Active at this time?

Yes

- Go To 2.

No

- Go To 8.

2. **LOW TIRE PRESSURE**

NOTE: **This DTC can be caused by many different factors and might not be a TPM Sensor or a WIN fault. Interference from other elements can over power the sensor/transmitter RF frequency to the WIN making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

1. Correct all tire pressures to the recommended cold inflation tire pressure specifications and wait two minutes for the system to update.
2. With the scan tool, erase DTCs.
3. With the scan tool, read DTCs.

   Does the DTC reset or is the status Active for this DTC?

   Yes

   - Go To 3.

   No

   - Go To 8.

3. **TIRE PRESSURE MONITORING (TPM) SENSOR**

NOTE: **The following tests are used to locate the Tire Pressure Sensor/Transmitter that is setting the low pressure fault. If the tires have been rotated, the Tire Pressure Sensor/Transmitter is no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor/Transmitter that set the fault before.**

NOTE: **Before continuing with any TPM diagnostic test, using the scan tool and read first set of the Tire Placard Pressure Front and Tire Placard Pressure Rear under Data Display in the WIN. (under the Left Rear Transponder Status) Confirm that the values match the Tire Inflation Pressure (Placard) label located on the Drivers Side B-Pillar. If the incorrect Placard Values have been programmed in the WIN, go to Update Pressure Thresholds under Miscellaneous Functions for the WIN and follow the procedure.**

If the vehicle is equipped with a WIN Module, go into the Totally Integrated Power Module (TIPM), select Data Display and read "Tire Placard Pressure - Front" and "Tire Placard Pressure - Rear" to confirm the values were programmed correctly. If the Placard values are incorrect in the TIPM, select the Totally Integrated Power Module (TIPM) then under "Miscellaneous" select "Update Pressure Threshold" and enter the placard pressure value as seen on the Tire Inflation Pressure (Placard) label. Repeat step 2 for Diagnostics.

1. With the scan tool, select View Data Display in the WIN and find the compensated tire pressure values located under each of the Sensor Identification locations.

   Are any of the compensated tire pressure values below the Placard Value?

   Yes

   - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Go To 4.

4. **TPM/RKE ANALYZER**

   Is their a TPM/RKE Analyzer CH9936 available?

   Yes

   - Go To 5.

   No

   - Go To 7.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR NON-RESPONSIVE**
   1. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE), check to see if the any of the TPM Sensors do not respond after repeated attempts or display the following:
      - "Damaged Accel"
      - "Damaged Temp"
      - "Damaged Temp"
      - "Damaged Press"

      Are any of the TPM Sensors not responding or displaying the information listed above?

      Yes

      - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

      No

- Go To 6.

6. **TPM SENSOR INTERNAL FAULT SET USING TPM/RKE ANALYZER**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the sensor internal fault. If the tires have been rotated, the Tire Pressure Sensor is no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor that set the fault before continuing. Use the following method below at every tire location.**

NOTE: **If the sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM sensors and repeat this step.**

1. With the scan tool, select Data Display for the WIN.
2. Check to see if the Sensor IDs match what is programmed into the WIN.

Has the Tire Pressure Sensor been located?

Yes

- Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

No

- Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

7. **TIRE PRESSURE SENSOR INTERNAL FAULT SET**

NOTE: **Some vehicles will not receive TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 15 mph (24 km/h) for about a minute in order to receive TPM Sensor data.**

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values
2. Look for a tire location whose sensor ID that is not responding.
3. Repeat this test on each wheel on the vehicle until the sensor in question has been identified

Has the Tire Pressure Sensor been located?

Yes

- Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

No

- Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

8. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Perform any Technical Service Bulletins that may apply to this condition.
   3. With the scan tool, erase DTCs.
   4. Test drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 24 km/h (15 mph).
   5. With the scan tool, read the DTCs.

   Does the DTC reset or is the status Active for this DTC?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

C1501-TIRE PRESSURE SENSOR 1 INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code.

WHEN MONITORED:

With vehicle speed greater than 24 km/h (15 mph).

SET CONDITION:

The Wireless Ignition Node (WIN) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

POSSIBLE CAUSES

Possible Causes
INCORRECT SENSORS
TIRE PRESSURE MONITORING (TPM) SENSOR
WIRELESS IGNITION NODE (WIN)

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

   NOTE: Seasonal temperature changes will affect tire pressure, and may have caused the tire pressure to fall below the low pressure warning threshold. Tire pressure should always be set based on cold inflation tire pressure (placard). This is defined as the tire pressure after a vehicle has not been driven for more then three hours, and in outside ambient temperatures.

   1. Correct all tire pressures to the recommended cold inflation tire pressure specifications and wait two minutes for the system to update.
   2. Ignition on engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for a minimum of 10 minutes in order to receive TPM Sensor data and allow for the system to update.
   5. With the scan tool, read the DTCs.

   Is the DTC status Active at this time?

   Yes

   - Go To 2.

   No

   - Go To 9.

2. **TPM-RKE ANALYZER CH9936**

   Is there a TPM-RKE Analyzer CH9936 available?

   Yes

- Go To 3.

No

- Go To 8.

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

NOTE: **This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle. If the spare tire is currently installed on the vehicle, and it is not equipped with a TPM Sensor, this DTC can be set. Replace the spare with a TPM Sensor equipped wheel and tire assembly. Test drive the vehicle. If the DTC resets, continue with the diagnostic procedure.**

1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

   Is the correct TPM Sensor installed on the vehicle?

   Yes

   - Go To 4.

   No

   - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE). If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.

   Has the faulty TPM Sensor been located?

Yes

- Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

No

- Go To 5.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the WIN. The TPM Sensor Identifications are located under "Data Display" for the WIN.

   Do the TPM Sensor IDs match what is stored in the WIN?

   Yes

   - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Go To 6.

6. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT**
   1. Using the data taken by the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE), program the current sensor ID's into the WIN module in the corresponding locations.
   2. With the scan tool, erase the DTCs.
   3. Drive the vehicle for a minimum of 20 minutes with the vehicle speed greater than 24 km/h (15 mph) to verify that the DTC does not return in an active state.
   4. With the scan tool, read the active DTCs.

   Does the scan tool display: C1501-TIRE PRESSURE SENSOR 1 INTERNAL

   Yes

   - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

No

- Go To 7.

7. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**
   1. With the TPM-RKE Analyzer, read the sensor ID's.

      Do the sensor ID's match the ID's just learned in the previous step?

      Yes

      - Test complete.
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

      No

      - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.
8. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

   NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.

   1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
   2. Look for a tire location with a non-responsive TPM Sensor ID.
   3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

      Has the faulty TPM Sensor been located?

      Yes

      - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

      No

      - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.
9. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTCs in the Wireless Ignition Node (WIN) Module.
4. Test drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 24 km/h (15 mph).
5. With the scan tool, select View DTCs in the Wireless Ignition Node (WIN) Module.

   Does the DTC reset or is the status Active for this DTC?

   Yes

   - Return to the beginning of this test and perform the diagnostic procedure as necessary.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

C1502-TIRE PRESSURE SENSOR 2 INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Ignition Node (WIN).

WHEN MONITORED:

With vehicle speed greater than 24 km/h (15 mph).

SET CONDITION:

The Wireless Ignition Node (WIN) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

POSSIBLE CAUSES

Possible Causes
INCORRECT SENSORS
TIRE PRESSURE MONITORING (TPM) SENSOR

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

   NOTE: **Seasonal temperature changes will affect tire pressure, and may have caused the tire pressure to fall below the low pressure warning threshold. Tire pressure should always be set based on cold inflation tire pressure (placard). This is defined as the tire pressure after a vehicle has not been driven for more then three hours, and in outside ambient temperatures.**

   1. Correct all tire pressures to the recommended cold inflation tire pressure specifications and wait two minutes for the system to update.
   2. Ignition on engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for a minimum of 10 minutes in order to receive TPM Sensor data and allow for the system to update.
   5. With the scan tool, read DTCs.

   Is the DTC status Active at this time?

   Yes

   - Go To 2.

   No

   - Go To 9.

2. **TPM-RKE ANALYZER CH9936**

   Is there a TPM-RKE Analyzer CH9936 available?

   Yes

   - Go To 3.

   No

   - Go To 8.

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

   NOTE: **This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle. If the spare tire is currently installed on the vehicle, and it is not equipped with a TPM Sensor, this DTC can be set. Replace the spare with**

a TPM Sensor equipped wheel and tire assembly. Test drive the vehicle. If the DTC resets, continue with the diagnostic procedure.

1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

   Is the correct TPM Sensor installed on the vehicle?

   Yes

   - Go To 4.

   No

   - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE). If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.

   Has the faulty TPM Sensor been located?

   Yes

   - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Go To 5.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the WIN. The TPM Sensor Identifications are located under "Data Display" for the WIN.

   Do the TPM Sensor IDs match what is stored in the WIN?

   Yes

   - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Go To 6.

6. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT**
   1. Using the data taken by the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE), program the current sensor ID's into the WIN module in the corresponding locations.
   2. With the scan tool, erase the DTCs.
   3. Drive the vehicle for a minimum of 20 minutes with the vehicle speed greater than 24 km/h (15 mph) to verify that the DTC does not return in an active state.
   4. With the scan tool, read the active DTCs.

      Does the scan tool display: C1502-TIRE PRESSURE SENSOR 2 INTERNAL

      Yes

      - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

      No

      - Go To 7.

7. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**
   1. With the TPM-RKE Analyzer, read the sensor ID's.

      Do the sensor ID's match the ID's just learned in the previous step?

Yes

- Test complete.
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

No

- Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

8. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

NOTE: **Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.**

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

Has the faulty TPM Sensor been located?

Yes

- Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

No

- Replace the WIN module in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

9. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTCs in the Wireless Ignition Node (WIN) Module.
4. Test drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 24 km/h (15 mph).
5. With the scan tool, select View DTCs in the Wireless Ignition Node (WIN) Module.

Does the DTC reset or is the status Active for this DTC?

Yes

- Return to the beginning of this test and perform the diagnostic procedure as necessary.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

C1503-TIRE PRESSURE SENSOR 3 INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Ignition Node (WIN).

WHEN MONITORED:

With vehicle speed greater than 24 km/h (15 mph).

SET CONDITION:

The Wireless Ignition Node (WIN) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

   Is there a TPM-RKE Analyzer CH9936 available?

   Yes

   - Go To 3.

   No

   - Go To 8.

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

   NOTE: **This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle. If the spare tire is currently installed on the vehicle, and it is not equipped with a TPM Sensor, this DTC can be set. Replace the spare with a TPM Sensor equipped wheel and tire assembly. Test drive the vehicle. If the DTC resets, continue with the diagnostic procedure.**

   1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
   2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

      Is the correct TPM Sensor installed on the vehicle?

      Yes

- Go To 4.

No

- Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE). If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.

   Has the faulty TPM Sensor been located?

   Yes

   - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Go To 5.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the WIN. The TPM Sensor Identifications are located under "Data Display" for the WIN.

   Do the TPM Sensor IDs match what is stored in the WIN?

Yes

- Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

No

- Go To 6.

6. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT**
   1. Using the data taken by the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE), program the current sensor ID's into the WIN module in the corresponding locations.
   2. With the scan tool, erase the DTCs.
   3. Drive the vehicle for a minimum of 20 minutes with the vehicle speed greater than 24 km/h (15 mph) to verify that the DTC does not return in an active state.
   4. With the scan tool, read the active DTCs.

      Does the scan tool display: C1503-TIRE PRESSURE SENSOR 3 INTERNAL

      Yes

      - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

      No

      - Go To 7.

7. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**
   1. With the TPM-RKE Analyzer, read the sensor ID's.

      Do the sensor ID's match the ID's just learned in the previous step?

      Yes

      - Test complete.
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

      No

      - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

8. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

NOTE: **Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.**

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

   Has the faulty TPM Sensor been located?

   Yes

   - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

9. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Perform any Technical Service Bulletins that may apply to this condition.
   3. Using the scan tool, clear DTCs in the Wireless Ignition Node (WIN) Module.
   4. Test drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 24 km/h (15 mph).
   5. Using the scan tool, select View DTCs in the Wireless Ignition Node (WIN) Module.

      Does the DTC reset or is the status Active for this DTC?

      Yes

      - Return to the beginning of this test and perform the diagnostic procedure as necessary.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

C1504-TIRE PRESSURE SENSOR 4 INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Ignition Node (WIN).

WHEN MONITORED:

With vehicle speed greater than 15 m.p.h. (24 km/h).

SET CONDITION:

The Wireless Ignition Node (WIN) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

   NOTE: **This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle. If the spare tire is currently installed on the vehicle, and it is not equipped with a TPM Sensor, this DTC can be set. Replace the spare with a TPM Sensor equipped wheel and tire assembly. Test drive the vehicle. If the DTC resets, continue with the diagnostic procedure.**

   1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
   2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

      Is the correct TPM Sensor installed on the vehicle?

      Yes

      - Go To 4.

      No

      - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE). If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.

   Has the faulty TPM Sensor been located?

   Yes

   - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Go To 5.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the WIN. The TPM Sensor Identifications are located under "Data Display" for the WIN.

   Do the TPM Sensor IDs match what is stored in the WIN?

   Yes

   - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Go To 6.

6. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT**

1. Using the data taken by the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE), program the current sensor ID's into the WIN module in the corresponding locations.
2. With the scan tool, erase the DTCs.
3. Drive the vehicle for a minimum of 20 minutes with the vehicle speed greater than 24 km/h (15 mph) to verify that the DTC does not return in an active state.
4. With the scan tool, read the active DTCs.

   Does the scan tool display: C1504-TIRE PRESSURE SENSOR 4 INTERNAL

   Yes

   - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Go To 7.

7. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**
   1. With the TPM-RKE Analyzer, read the sensor ID's.

      Do the sensor ID's match the ID's just learned in the previous step?

      Yes

      - Test complete.
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

      No

      - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

8. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

   NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.

   1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
   2. Look for a tire location with a non-responsive TPM Sensor ID.
   3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

Has the TPM Sensor been located?

Yes

- Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the service information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

No

- Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

9. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Perform any Technical Service Bulletins that may apply to this condition.
    3. Using the scan tool, clear DTCs in the Wireless Ignition Node (WIN) Module.
    4. Test drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 24 km/h (15 mph).
    5. Using the scan tool, select View DTCs in the Wireless Ignition Node (WIN) Module.

    Does the DTC reset or is the status Active for this DTC?

    Yes

    - Return to the beginning of this test and perform the diagnostic procedure as necessary.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

C151C-TIRE PRESSURE MONITORING (TPM) SENSORS MISSING

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When installing a new Wireless Ignition Node (WIN), the module is programed with universal IDs for the Tire Pressure Monitoring (TPM) Sensors. The WIN must be programmed with the correct TPM Sensor IDs.

WHEN MONITORED:

During vehicle TPM Sensor ID locate process.

SET CONDITION:

When installing a new Wireless Ignition Node (WIN).

POSSIBLE CAUSES

Possible Causes
INCORRECT TIRE PRESSURE MONITORING (TPM) SENSOR ID(S)
TIRE PRESSURE MONITORING (TPM) SENSOR
WIRELESS IGNITION NODE (WIN)

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: **The DTC can be caused by many different factors and might not be a sensor/transmitter or a WIN fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

   1. Correct all tire pressures to the recommended cold inflation tire pressure specifications and wait two minutes for the system to update.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for a minimum of 10 minutes in order to receive TPM data and allow for the system to update.
   5. With the scan tool, read DTCs.

   Is the DTC status Active at this time?

   Yes

   - Go To 2.

   No

   - Go To 5.

2. **TPM-RKE ANALYZER CH9936**

   Is there a TPM-RKE Analyzer CH9936 available?

Yes

- Go To 3.

No

- Go To 4.

3. **WITH TPM-RKE ANALYZER CHECK TIRE PRESSURE MONITORING (TPM) SENSOR ID (S)**

NOTE: **Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the Sensor. If the incorrect vehicle line and/or model year is selected, the Sensor will not respond to the tool.**

NOTE: **If you receive no response from any of the tire pressure sensors, check to make sure that the TPM-RKE Analyzer is set correctly, and repeat the process on each of the non-responsive wheel(s)**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for an ID, store in the proper location in the TPM-RKE Analyzer.
2. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to upload the correct IDs and proper locations in the scan tool.
3. With the scan tool, select the TIPM Module under "Miscellaneous Functions", follow the procedure for uploading TPM Sensor IDs.
4. With the scan tool, erase DTCs.
5. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for a minimum of 10 minutes in order to receive TPM data and allow for the system to update.
6. With the scan tool, check to see if the TPM Module IDs match what is programmed into the WIN.

   Do the TPM IDs match?

   Yes

   - Test complete.
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

4. **WITHOUT TPM-RKE TOOL CHECK TIRE PRESSURE MONITORING (TPM) SENSOR ID(S)**
   1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan

tool for changes to any compensated tire pressure values.

2. Repeat the above step on each wheel of the vehicle.
3. With the scan tool, erase DTCs.
4. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for a minimum of 10 minutes in order to receive TPM data and allow for the system to update.
5. With the scan tool, check to see if the TPM IDs are programmed into the WIN.

   Are the TPM Sensor IDs in the WIN?

   Yes

   - Test complete.
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

   No

   - Replace the Wireless Ignition Node (WIN) in accordance with the Service Information. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the TPM VERIFICATION TEST.

5. **INTERMITTENT TIRE PRESSURE SENSOR DTC**

NOTE: **The DTC can be caused by many different factors and might not be a sensor/transmitter or a WIN fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

1. Perform any Technical Service Bulletins that may apply to this condition.
2. With the scan tool, erase DTCs.
3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for a minimum of 10 minutes in order to receive TPM data and allow for the system to update.
4. With the scan tool, read DTCs.

   Does the DTC reset or is the status Active for this DTC?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs

of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

P0928-BTSI CONTROL CIRCUIT

Fig. 9: Shift Lever Assembly (SLA) Circuit Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The brake switch signal must be active before the shift lever can be moved out of the park position. The Shifter Lever Assembly (SLA) Electronic Shift Module (ESM) receives two brake switch signals. The first signal is a CAN C Bus message sent to the shifter lever assembly. The second signal is a hard wired brake switch signal to the shifter lever assembly from the Wireless Ignition Node (WIN). The CAN C Bus message is the primary brake switch signal and the hard wired signal serves as the backup brake switch signal. These two brake switch signals are compared against each other to verify proper brake switch operation.

WHEN MONITORED:

Continuously with the ignition on.

SET CONDITION:

The Diagnostic Trouble Code (DTC) will set if the high side driver detects a short to ground for 10 seconds.

POSSIBLE CAUSES

Possible Causes
ENGINE BRAKE DTCS PRESENT
(K321) BRAKE TRANSMISSION SHIFT INTERLOCK (BTSI) CONTROL CIRCUIT SHORT TO GROUND
(K321) BTSI CONTROL CIRCUIT OPEN
(K321) BTSI CONTROL CIRCUIT SHORTED TO VOLTAGE
SHIFTER ASSEMBLY
WIRELESS IGNITION NODE (WIN)

DIAGNOSTIC TEST

1. **ENGINE DTCS PRESENT**
    1. With the scan tool, read PCM DTCs.

       Are there any Powertrain Control Module (PCM) brake switch related DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate Diagnostic Procedure.

       No

- Go To 2.

2. **CHECK THE (K321) BTSI CONTROL CIRCUIT**

Fig. 10: Checking BTSI Control Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Shift Lever Assembly harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Using a 12-volt test light, connect one end to the (Z911) Ground circuit and the other to the (K321) BTSI Control circuit in the Shifter connector.
4. Turn the Ignition on, engine not running.
5. With the scan tool under WIN, select Actuators and actuate the BTSI.

Does the test light illuminate brightly while the actuator is cycling the (K321) BTSI Control circuit on and off?

Yes

- Replace the Shift Lever Assembly in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- With the scan tool, stop the actuation.
- Go To 3.

3. **CHECK THE (Z911) GROUND CIRCUIT**

Fig. 11: Checking Ground Circuit In Shifter Connector
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12-volts, check the (Z911) Ground circuit in the Shifter connector.

   Does the test light illuminate brightly?

   Yes

   - Go To 4.

   No

   - Repair the open in the (Z911) Ground circuit.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

4. **(K321) BTSI CONTROL CIRCUIT SHORT TO GROUND**

Fig. 12: Checking BTSI Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the WIN harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Measure the resistance between ground and the (K321) BTSI Control circuit in the WIN and the

Shift Lever connectors.

Is the resistance below 10k Ohms at either connector?

Yes

- Repair the short to ground in the (K321) BTSI Control circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Go To 5.

5. **(K321) BTSI CONTROL CIRCUIT OPEN**

Fig. 13: Measuring Resistance Of BTSI Control Circuit Between Shift Lever Harness Connector & WIN Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (K321) BTSI Control circuit between the Shift Lever harness connector and the WIN harness connector.

   Is the resistance above 5.0 Ohms?

Yes

- Repair the open in the (K321) BTSI Control circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Go To 6.

6. **(K321) BTSI CONTROL CIRCUIT SHORTED TO VOLTAGE**

Fig. 14: Measuring Voltage Between Ground & BTSI Control Circuit In Shift Lever Harness Connector & WIN Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage between ground and the (K321) BTSI Control circuit in the Shift Lever harness connector and the WIN harness connector.

   Is there any voltage present at either connector?

Yes

- Repair the short to voltage in the (K321) BTSI Control circuit.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

No

- Replace the Wireless Ignition Node in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

U0001-CAN C BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

Whenever the CAN C Bus (+) or CAN C Bus (-) circuit is open, shorted to voltage or shorted to ground.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DIAGNOSTIC TROUBLE CODES (DTC) RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES PRESENT
TOTALLY INTEGRATED POWER MODULE (TIPM) NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM) POWER AND GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM)
ANY CAN C MODULE SHORTED

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTCS**
    1. With the scan tool, read the active WIN DTCs.
    2. Cycle the ignition switch from off to on at least 3 times, leaving the ignition on for a minimum of one minute per cycle.
    3. With the scan tool, read the active WIN DTCs.

    Does the scan tool display: U0001-CAN C BUS as active?

    Yes

- **Refer to DIAGNOSIS AND TESTING** and perform the U0001-CAN C Bus diagnostic procedure.

No

- **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0100-LOST COMMUNICATION WITH THE ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view DTCs.

    Does the scan tool display as active: U0100-LOST COMMUNICATION WITH THE ECM/PCM?

    Yes

    - **Refer to DIAGNOSIS AND TESTING** and perform the U0100-Lost Communication with

PCM diagnostic procedure.

No

- **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0121-LOST COMMUNICATION WITH ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Anti Lock Brake Module (ABS) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
ABS MODULE
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, select view DTCs.

    Is the DTC Active at this time?

    Yes

    - **Refer to DIAGNOSIS AND TESTING** and perform the U0121-Lost Communication with Anti-Lock Brake Module diagnostic procedure.

No

- **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0146-LOST COMMUNICATION WITH CENTRAL GATEWAY (TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read the active DTCs.

      Does the scan tool display active: U0146-LOST COMMUNICATION WITH CENTRAL GATEWAY?

Yes

- **Refer to DIAGNOSIS AND TESTING** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

No

- **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U1197-SECURITY SEED RESPONSE NOT RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Whenever a Fob Integrated Key (FOBIK) is inserted in the Wireless Ignition Node (WIN), the WIN performs a self test and resynchronization routine. During the routine, the WIN interrogates the FOBIK for the secret key information and performs a CAN Bus message handshake with the Powertrain Control Module (PCM). The PCM must reply to the WIN that the secret key information matches to initiate the start sequence or this code will set on the third attempt.

WHEN MONITORED:

Whenever a FOBIK is rotated to the Run position.

SET CONDITION:

This DTC sets if the WIN does not receive a CAN Bus message from the ECM/PCM. This code will set on the 20th start attempt.

POSSIBLE CAUSES

Possible Causes
PCM PROGRAMMING

DIAGNOSTIC TEST

1. **VERIFY PCM PROGRAMMING**
    1. Using the scan tool, record and erase all DTCs in the PCM.
    2. Turn the Ignition Off, and wait fifteen seconds before turning the Ignition On.
    3. Wait one minute, and read the active PCM DTCs.

    Does the scan tool display: U1197-SECURITY SEED RESPONSE NOT RECEIVED FROM ECM/PCM as active?

    Yes

- Refer to **STANDARD PROCEDURE** for 3.7L/4.7L/5.7L or **STANDARD PROCEDURE** for 6.7L and perform the PCM/ECM REPROGRAMMING procedure.
- Refer to **STANDARD PROCEDURE** for 3.7L/4.7L/5.7L or **STANDARD PROCEDURE** for 6.7L and perform the POWERTRAIN VERIFICATION TEST.

No

- Repair is complete.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

STANDARD PROCEDURE

WIRELESS IGNITION NODE (WIN) INTERMITTENT TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **RECORD AND ERASE ALL WIN DIAGNOSTIC TROUBLE CODES (DTCS)**

   Using the scan tool, record and erase all DTCs from the WIN. Monitor for any active codes as you work through the following steps.

   - Review the code monitor and set conditions for any DTCs that are stored and attempt to reproduce the conditions listed.
   - Wiggle the wiring harness and connectors of the related circuit, sensor or component.
   - Turn the ignition off. Perform any Technical Service Bulletins (TSBs) that may apply.

   Was the source of the customer complaint found or did any DTCs appear and stay active?

   Yes

   - Make the appropriate repairs and perform the WIN VERIFICATION TEST, Refer to **STANDARD PROCEDURE** or **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Go To 2.
2. **ATTEMPT TO REPRODUCE THE CONDITION**

   In the event the customer complaint cannot be duplicated due to an intermittent condition in the theft/security system, the following may aid in attempting to reproduce the condition.

   - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors related to the stored code or component in question.

- Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
- If the customer concern was related to a specific Fob-Integrated-Key (FOBIK), ensure the FOBIK in question is used while attempting reproduce the condition.
- Reconnect any disconnected components and harness connectors and ensure they are properly seated.
- If numerous trouble codes were set, use a schematic and inspect any common ground or supply circuits.

Was the source of the intermittent condition located?

Yes

- Make the appropriate repairs and perform the WIN VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- The problem cannot be found at this time. If repeated intermittent failures are encountered that cannot be reproduced and the condition has prompted multiple customer visits to the dealership, document any findings on the repair order.

WIRELESS IGNITION NODE (WIN) PRE-DIAGNOSTIC PROCEDURE

Before attempting to repair any WIN system, technicians should be familiar with and fully understand the system operation. for complete details. Refer to **OPERATION** . The following should be used as a checklist to be completed in its entirety prior to referencing specific WIN diagnostic procedures.

DIAGNOSTIC TEST

1. **FOLLOW THE BASIC OUTLINE SET FORTH IN THE SIX-STEP TROUBLESHOOTING PROCEDURE**
    1. Verification of complaint.
    2. Verification of any related symptoms.
    3. Symptom analysis.
    4. Problem isolation.
    5. Repair of isolated problem.
    6. Verification of proper operation.
2. **TAKE INTO ACCOUNT CURRENT VEHICLE CONDITION, REPAIR HISTORY, AND TECHNICAL SERVICE BULLETINS (TSBs)**
    - Verify there are no outward signs of vehicle damage that could impact the proper operation of the theft or security system. Check for aftermarket vehicle accessories that may have been installed improperly or could interfere with the system
    - Check the vehicle repair history for repairs that may relate to the current condition.

- Perform a check of current Technical Service Bulletins (TSB) for the WIN system related to the customer concern. If a TSB applies, follow the procedure outlined in the TSB.

3. **DIAGNOSE ONLY THOSE FAILURES THAT ARE ACTIVE AND CAN BE REPRODUCED**
   - Check the control module that is central to the subsystem which is exhibiting the condition for the active DTCs.
   - For an intermittent failure that is not current at the time of vehicle inspection, Refer to **STANDARD PROCEDURE** and perform the WIN INTERMITTENT TEST and document the event on the repair order.
4. **ADDRESS ACTIVE DIAGNOSTIC TROUBLE CODES (DTCS) IN THE CORRECT ORDER**

   As a general rule, for any WIN module that exhibits more than one active DTC, address the codes in the order indicated:

   1. Low/High Voltage and Serial Data Loss of Communication Codes
   2. Module Internal Failure and Configuration Mismatch Codes
   3. Circuit specific DTC failures

   Should the malfunction still be present after conducting this Pre-diagnostic Procedure, technicians should continue to the appropriate DTC procedure or symptom diagnostic.

WIRELESS IGNITION NODE (WIN) VERIFICATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Perform the following after completion of a diagnostic repair:

NOTE: **When entering the Personal Identification Number (PIN), care should be taken because the WIN will only allow three consecutive attempts to enter the correct PIN. If three consecutive incorrect PIN's are entered the WIN will Lock Out the scan tool. To exit Lock Mode, the ignition key must remain in the Run position for one hour. All accessories must be off. A battery charger connected to the battery during this time period is recommended.**

NOTE: **On vehicles equipped with a Base Tire Pressure Monitoring (TPM) system, when the WIN and/or the spare tire pressure sensor is replaced with a new unit, a diagnostic scan tool MUST be used to run a routine that allows the WIN to be programmed with the ID number and location of the spare tire pressure sensor mounted in the wheel of the spare tire. Follow the programming steps outlined in the diagnostic scan tool for "Learn Spare Tire Sensor ID" under "Miscellaneous Functions" for the "WIN" menu item as appropriate. In addition, if the WIN is replaced, the spare tire must be dismounted from its wheel to access and note the ID number on the spare tire pressure sensor so that the ID code for that sensor can be programmed into the new WIN.**

1. Reconnect the previously disconnected components and connectors.

2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original WIN. This number can be obtained from the original vehicle invoice or from your Service Manager or Parts Manager.

NOTE: If the Powertrain Control Module (PCM) and the WIN are replaced at the same time, program the PCM VIN into the PCM first.

NOTE: The PCM stores the secret key information. If the WIN ever needs to be replaced, the secret key information can be retrieved from the PCM and then transferred to the WIN for security use.

During PCM/ECM replacement, use the following steps to verify the transfer of the secret key information from the WIN to the new PCM:

1. If the PCM is to be replaced, first, replace the PCM/ECM with the original WIN still connected to the vehicle. If the PCM is not being replaced, go to step 3.
2. Using the appropriate Service Information to program the new PCM/ECM. (This will verify the Secret Key Transfer from the original WIN into the new PCM/ECM).
3. Now replace and program (WIN Replaced) the WIN (if necessary). This will cause the WIN to receive the Secret Key from the PCM/ECM back into the new WIN.

   NOTE: If this vehicle is equipped with a Steering Column Lock Module, it must be replaced along with the WIN. Whenever a WIN is replaced the Steering Wheel Lock Module MUST be replaced.

4. Using the scan tool, select Miscellaneous Functions, WIN. Then select the desired procedure and follow the display on the scan tool.
5. If the vehicle is equipped with the Base Tire Pressure Monitoring System, program the Placard Pressure Values into the WIN.
6. Make sure all the customer's keys have been programmed into the new module if necessary.
7. Using the scan tool, erase all DTCs. Perform five ignition key cycles, leaving the key on for at least 90 seconds per cycle.
8. Using the scan tool, read WIN DTCs.

DIAGNOSTIC TEST

1. Are there any WIN DTCs present?

   Yes

   - Repair not complete, refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

   No

- Repair is complete.

TPM VERIFICATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **TIRE PRESSURE MONITORING (TPM)**

   Was the Wireless Ignition Node (WIN) replaced during the test procedure?

   Yes

   - Go To 2.

   No

   - Go To 3.
2. **WIRELESS IGNITION NODE (WIN)**

   NOTE: When entering the PIN, care should be taken because the WIN will only allow three consecutive attempts to enter the correct PIN. If three consecutive incorrect PIN's are entered the WIN will Lock Out the scan tool. To exit Lock Mode, the ignition key must remain in the Run position for one hour. All accessories must be off. A battery charger connected to the battery during this time period is recommended.

   1. Reconnect the previously removed and/or disconnected components and connectors.
   2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to its original WIN. This number can be obtained from the vehicle invoice or from the Chrysler Customer Center (Phone 1-800-992-1997).
   3. With the scan tool, select Miscellaneous Functions, Wireless Ignition Node (WIN). Then select the desired procedure and follow the display on the scan tool.
   4. If the WIN was replaced, all the customer's keys must be programmed to the new module. Use the scan tool and the Program Key procedure
   5. With the scan tool, erase all DTCs. Perform five ignition key cycles, leaving the key on for at least 90 seconds per cycle.
   6. Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the new sensor ID code and will clear any DTC(s) automatically.
   7. With the scan tool, read DTCs.

   Are there any DTCs present?

Yes

- Repair not complete, perform the appropriate diagnostic procedure.

No

- Repair is complete.

3. **TIRE PRESSURE SENSOR REPLACE**
    1. Reconnect the previously removed and/or disconnected components and harness connectors.
    2. If available, use a TPM-RKE Analyzer tool with the scan tool to program the WIN with the tire pressure sensors ID's on the vehicle.
    3. Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the new sensor IDs.
    4. With the scan tool, read DTCs.

Are there any DTCs present?

Yes

- Repair not complete, refer to **DIAGNOSTIC CODE INDEX** perform the appropriate diagnostic procedure.

No

- Repair is complete.

WARNING

WARNINGS

WARNING: Use an Occupational Safety and Health Administration (OSHA) approved breathing filter, when spraying paint or solvents in a confined area. Failure to follow these instructions may result in possible serious or fatal injury.

- **avoid prolonged skin contact with petroleum or alcohol based cleaning solvents.**
- **do not stand under a hoisted vehicle that is not properly supported on safety stands. Failure to follow these instructions may result in possible serious or fatal injury.**

CAUTION: When holes are drilled or punched in an inner body panel, verify the depth of space to the outer body panel, electrical wiring or other components. Damage to the vehicle can result.

- **do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
- **always have a fire extinguisher ready for use when welding.**
- **disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is off. Damage to electrical system can result.**
- **do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
- **do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
- **do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

RESTRAINT WARNINGS

WARNING: To avoid potential physical injury, or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the ORC capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental

Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 30 cm (12 in) of an electronic module/harness, then that module/harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens. Failure to follow these instructions may result in serious or fatal injury.

WARNING: **To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.**

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side curtain airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain airbags will deploy. Disconnect and isolate the**

battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.**

WARNING: **To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.**

WARNING: **To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.**

WARNING: **To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.**

USE OF HEAT DURING REPAIR

WARNING: **Chrysler Group LLC engineering's position on the use of heat during collision repair is as follows:**

- **Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.**
- **During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.**

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler Group LLC.

Failure to follow these instructions may result in serious or fatal injury.

DIAGNOSIS AND TESTING

GENERAL WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate service information for proper procedures.

WATER LEAK TESTS

WARNING: Do not use electric shop lights or tools in water test area. Personal injury can result.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations. Refer to **HOISTING, STANDARD PROCEDURE** .

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears,

find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WATER LEAKS

GENERAL NOTES

NOTE:

- **This service information applies to all Ram models, 2009 MY and beyond.**
- **Each leak area can have multiple root causes, as noted in the diagnosis chart. It is important to water test each repair before starting the next.**
- **If a leak cannot be reproduced, it is due to the period of time the vehicle is under wet conditions. Some leaks may take hours before leaking.**
- **If a leak cannot be reproduced, apply all the repairs as noted in the diagnosis chart.**
- **It is important to understand where the leak ENDS up when diagnosing the vehicle. Where the leak ends up, does not always explain where the leak originates. Refer to DIAGNOSIS CHART when determining which repairs to perform.**
- **This repair procedure does NOT cover every possible water leak on the RAM. The issues identified in this document are the severe leaks that may**

occur in the field.

- **Generally, a car wash is the preferred method to diagnose a vehicle.**
- **The content identifies the known areas of water leaks, the critical characteristics of each area and how to repair them.**

DIAGNOSIS CHART

	Water Leak Conditions	
Water entering the vehicle through the grab handle or overhead console	**Water entering the vehicle at the back glass area (C-pillars)**	**Water is on the rear carpet between the rear seats**
Refer to **REPAIR PROCEDURE FOR WINDSHIELD URETHANE**.	Refer to **REPAIR PROCEDURE FOR CHMSL (3RD BRAKE LIGHT)**.	Refer to **REPAIR PROCEDURE FOR CAB-BACK EXHAUSTER**.
Refer to **REPAIR PROCEDURE FOR ROOF/BODY SEAMS**.	Refer to **REPAIR PROCEDURE FOR BACK-GLASS/POWER SLIDER**.

WATER ENTERING THE VEHICLE THROUGH THE GRAB HANDLE OR OVERHEAD CONSOLE

REPAIR PROCEDURE FOR WINDSHIELD URETHANE

Required Parts:

- Mopar Glass Sealer
- Paintable Clear Seam Sealer

Potential Parts Required:

- Molding, Windshield, Right (Only replace if damage occurs during removal)
- Molding, Windshield, Left (Only replace if damage occurs during removal)

TWO METHODS OF TESTING:

METHOD 1:

With a person inside the vehicle, run water around windshield starting at the lower left or right side A-Pillar

slowly moving up the A-pillar and watch for water to drip inside the vehicle from A-Pillar and/or Grab Handle. Next, move across the top of the windshield. If water is seen dripping from any area, stop running water and proceed with the applicable repair procedure below.

METHOD 2:

Gain access to both body exhausters and tape off to block air escaping. Turn the ignition to the run position and turn the HVAC blower on High. Make sure all windows are up and close all the doors. Depending on the size of cabin area will affect the time it could take to pressurize the cabin. Next, spray soapy water or foaming window cleaner around the windshield molding. As cabin begins to pressurize inspect for air bubbles to form around windshield molding. If any air bubbles are noticed proceed with the applicable repair procedure below.

WINDSHIELD URETHANE SKIP REPAIR

Fig. 1: A-Pillar Windshield Molding
Courtesy of CHRYSLER GROUP, LLC

1. If the leak is determined to be adjacent to the windshield, then the A-Pillar windshield molding (1) should be removed. The windshield molding can be removed pulling it away from the cab at its four attach points (2), Refer to **WEATHERSTRIP, WINDSHIELD, A-PILLAR, REMOVAL**.

Fig. 2: Exposed Body Seam
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Sealer skips or pinholes can be seen along the exposed body seams (1)**

NOTE: **A special area of concern is where the windshield and body seams meet at the upper a-pillar (1), which is shown in illustration.**

2. Once the windshield molding is removed, inspect for sealer skips. Apply Mopar Glass Sealer to any skip in the urethane around windshield.
3. For sealer skips in the A-Pillar body seam apply a Clear Hi-Flow Paintable Seam Sealer.
4. Prior to re-assembly, re-test the area to ensure it is properly sealed.
5. Carefully reinstall windshield molding. Refer to **WEATHERSTRIP, WINDSHIELD, A-PILLAR, INSTALLATION**.

REPAIR PROCEDURE FOR ROOF/BODY SEAMS

Required Parts:

- Paintable Clear Seam Sealer

Potential Parts Required:

- Molding - Roof Ditch Right
- Molding - Roof Ditch Left

1. Gain access to the A-Pillar body seam and roof ditch seam by removing the windshield A-Pillar molding and roof ditch molding. Refer to **WEATHERSTRIP, WINDSHIELD, A-PILLAR, REMOVAL**.

Fig. 3: Roof Ditch Molding
Courtesy of CHRYSLER GROUP, LLC

NOTE: Dashed line indicates starting and ending points (path) for clear sealer

2. Using the diagram above apply Paintable Clear Seam Sealer along the whole length of the roof ditch (1), beginning at the A-pillar (3) and ending at the Roof to Aperture/Rap Joint (2). Be certain to cover any and all pin holes.
3. Prior to re-assembly, re-test the area to be certain it is properly sealed.
4. Reinstall windshield A-Pillar molding and Roof Ditch molding. Refer to **WEATHERSTRIP, WINDSHIELD, A-PILLAR, INSTALLATION**.

REPAIR PROCEDURE FOR SUNROOF DRAIN SYSTEM

1. Inspect for water dripping from Overhead Console, also inspect for water marks/stains and/or dampness on Headliner.

Fig. 4: Sunroof Drain Tubes
Courtesy of CHRYSLER GROUP, LLC

2. Lower the headliner. Inspect all four sunroof drain tubes (2) and make certain all connections are secure to each barb (3). Refer to **HEADLINER, REMOVAL**.
3. Verify that all four drain tubes are securely fastened, prior to re-assembly. Re-test the area by opening sunroof and using a small cup of water, slowly pour water into sunroof trough (1) to make certain water flows and the drains are properly sealed.
4. Install Headliner. Refer to **HEADLINER, INSTALLATION**.

Fig. 5: Sunroof Drain Tube Grommets
Courtesy of CHRYSLER GROUP, LLC

5. Inspect both rear sunroof drain tube grommets (1) behind rear seat to make sure they are fully seated into the inner rear cab (2).

REPAIR PROCEDURE FOR SUNROOF GLASS SYSTEM

Fig. 6: Checking Sunroof Glass Flushness
Courtesy of CHRYSLER GROUP, LLC

1. Using the specifications listed, Visually inspect sunroof glass (1) flushness to roof panel (2). Refer to **GLASS, SUNROOF, ADJUSTMENTS**.
2. If adjustments need to be made to the sunroof glass (1) height and gap tolerances, refer to **GLASS, SUNROOF, ADJUSTMENTS**.

WATER ENTERING THE VEHICLE AT THE BACK GLASS AREA (C-PILLARS)

REPAIR PROCEDURE FOR CHMSL (3RD BRAKE LIGHT)

Parts Required:

- Mopar Glass Sealer

Fig. 7: Center High Mounted Stop Lamp Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Remove the CHMSL (Center High Mounted Stop Lamp) assembly. Refer to **LAMP, CENTER HIGH MOUNTED STOP, REMOVAL** .

Fig. 8: Bead Of Heavy Bodied Sealer
Courtesy of CHRYSLER GROUP, LLC

2. Apply 1/8 inch bead of Heavy Bodied Sealer (3) around the lamp (1) on the foam gasket material (2), leaving no gaps.
3. Install the CHMSL assembly. Refer to **LAMP, CENTER HIGH MOUNTED STOP, INSTALLATION** .
4. Remove any excess sealer that squeezes out onto the painted surface or exterior lamp assembly.

REPAIR PROCEDURE FOR BACK-GLASS/POWER SLIDER

Parts Required:

- Mopar Glass Sealer

Fig. 9: Back Glass Drains
Courtesy of CHRYSLER GROUP, LLC

1. For the back-glass drains (1) being plugged or restricted the back-glass will have to be removed and replaced.
2. If the water leak is found around the parameter of the back-glass due to urethane skips it is recommended to apply Mopar Glass Sealer.
3. Water test area inspecting for water entering vehicle. If water still enters vehicle, back-glass will have to be replaced.

REPAIR PROCEDURE FOR APERTURE/CAB-BACK SEAMS

Parts Required:

- Paintable Clear Seam Sealer

Fig. 10: Rat Hole Locations
Courtesy of CHRYSLER GROUP, LLC

1. Inspect both areas indicated.
2. If a skip crack or pinhole is found use Paintable Clear Seam Sealer. Apply sealer as indicated in illustrations below.

NOTE: **It is important to fill the entire seam located within the brackets to be certain of full coverage and proper sealing of the rat hole.**

Fig. 11: Roof/Aperture Rap Joint
Courtesy of CHRYSLER GROUP, LLC

3. Apply clear sealer on entire seam indicated within the bracket.

Fig. 12: Cab Back/Body Seam
Courtesy of CHRYSLER GROUP, LLC

4. Apply clear sealer on entire seam indicated within the bracket.

WATER IS ON THE REAR CARPET BETWEEN THE REAR SEATS

REPAIR PROCEDURE FOR CAB-BACK EXHAUSTER

1. Review examples below of what to look for and make certain they are properly installed and seated against the body of the vehicle. Example1: Seal folded - Example 2: Exhauster not fully seated
2. If any of the conditions are found remove exhauster from vehicle inspect for tearing or ripping of the seal. If seal has no tears or rips then reinstall on to vehicle making sure it clicks in on all four corners and that the seal is not rolled.
3. If seal is damaged or torn then replace body exhauster.

Fig. 13: Cab-Back Exhauster
Courtesy of CHRYSLER GROUP, LLC

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate service information for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.
- Improperly installed roof rack cross bars.
- Side door mirror leaks.

STANDARD PROCEDURE

BODY LUBRICATION

LUBRICATION REQUIREMENTS

Locks and all body pivot points, including such items as seat tracks, door hinge pivot points and rollers, liftgate, tailgate, sliding doors and hood hinges, should be lubricated periodically with a lithium based grease such as Mopar ® Spray White Lube to ensure quiet, easy operation and to protect against rust and wear. Prior to the application of any lubricant, wipe the parts clean, to remove dust and grit. After lubricating, excess oil and grease should be removed. Particular attention should also be given to hood latching components to make sure they function properly. When performing other underhood services, clean and lubricate the hood latch release mechanism and safety catch.

The external lock cylinders should be lubricated twice a year, preferably in the fall and spring. Apply a small amount of a high quality lubricant such as Mopar ® Lock Cylinder Lubricant directly into the lock cylinder.

LUBRICANT APPLICATION

DOOR LOCK CYLINDERS

1. Apply a small amount of lubricant directly into the lock cylinder.
2. Apply a small amount of lubricant to the key.
3. Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

   NOTE: Do not add more lubricant.

4. Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.
5. Wipe all lubricant from exterior of lock cylinder and key.

ALL OTHER BODY MECHANISMS

1. Clean component as described above.
2. Apply specified lubricant to all pivoting and sliding contact areas of component.

LUBRICANT USAGE

Engine Oil

- door hinges - hinge pin and pivot contact areas
- hood hinges - pivot points
- liftgate hinges

Mopar ® Spray White Lube or Equivalent

- door check straps
- liftgate latches
- liftgate prop pivots
- ash receiver
- fuel filler door remote control latch mechanism
- parking brake mechanism
- sliding seat tracks
- liftgate latch

Mopar ® Multipurpose Grease or Equivalent

- all other hood mechanisms

Mopar ® Lock Cylinder Lubricant or Equivalent

- door lock cylinders
- liftgate lock cylinder

HEAT STAKING

1. Remove trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.
    1. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
    2. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
4. Allow the repaired area to cool and verify the repair.

5. Install trim panel.

BUZZ, SQUEAK AND RATTLE

Buzz, squeak and rattles (BSR) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using the Mopar® Parts BSR Noise Reduction Kit. This kit contains various tapes including foam, flock and anti-squeak used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to **BUZZ, SQUEAK AND RATTLE KIT**.

BUZZ, SQUEAK AND RATTLE KIT

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
Itch And Squeak Tape	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40° to 107° C (-40° to 225° F)
Black Nylon Flock	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40° to 82° C (-40° to 180° F)
High Density Urethane Foam	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40° to 82° C (-40° to 180° F)
Open Cell Foam Tape	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40° to 82° C (-40° to 180° F)
Closed Cell Low Density Foam Tape	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P.	-40° to 82° C (-40° to 180° F)
NYE® Grease 880	Long life.	Suspensions.	-40° to 200° C

		Examples: Strut bushings, sway bars.	(-40° to 390° F)
Krytox® Oil	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-34° to 205° C (-30° to 400° F)
Krytox® Grease	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-34° to 205° C (-30° to 400° F)

NET, FORM AND PIERCE REPAIR

CAUTION: Failure to follow these recommendations could result in damage or failure to the part and the related parts.

Net, form and pierce is a manufacturing process which takes place during the original build of the vehicle. The original part will have a beveled platform that will decrease toward the fastener location mounting hole. Replacement parts in these areas may not include bevel (form) and / or fastener hole (pierce) and will need to be adapted for proper fit and finish.

The primary locations which may utilize net, form and pierce are:

- Fender Reinforcement (at front end module mount)
- Fender Tower Mounts
- Hood Hinge (lower half)
- Rear Body Header (liftgate hinge mounts)
- Strut Tower (at upper control arm mount)

NOTE: Shock tower is net, pierce only.

NOTE: The thickness of shims is not to exceed the original thickness of the factory bevel. If more shims are needed damage is still present and must be repaired properly.

If the replacement part did not come with a fastener hole, one of equal size and location will have to be drilled. Body shims should be used in the fender reinforcement to front end module. The hood hinge area, fender tower mounts, and rear body header will utilize washers as spacers where a specific spacer does not exist. The shims and spacers should be sealed between each other and to the stationary surface. Care should be taken when smoothing sealer around washers to ensure undetectable repair. Refinish the repair area per the paint manufacturers recommendations for corrosion resistance and appearance purposes.

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on Chrysler LLC vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

RIGID PLASTICS:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

SEMI-RIGID PLASTICS:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

FLEXIBLE PLASTICS:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

REPAIR PROCEDURE:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

ADHESION PROMOTER/SURFACE MODIFIER:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **Eye protection should be used when servicing components. Personal injury can result.**
- **Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.**
- **Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.**
- **Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

WARNING: Failure to follow these instructions may result in serious or fatal injury.

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	ACRYLONITRILE STYRENE ACRYLITE	LURAN S	CONSOLES, GRILLES
ABS	ACRYLONITRILE BUTADIENE STYRENE	TERLURAN	"A" PILLARS, CONSOLES, GRILLES
ABS/PC	ABS/PC ALLOY	PULSE, PROLOY, BAYBLEND	DOORS, INSTRUMENT PANELS
ABS/PVC	ABS/PV ALLOY	PROLOY, PULSE, LUSTRAN, CYCLOVIN	DOOR PANELS, GRILLES, TRIM
BMC	BULK MOLDING COMPOUND	BMC	FENDER EXTENSIONS
EMA	EHTYLENE METHYL ACRYLATE/IONOMER	SURLYN, EMA, IONOMER	BUMPER GUARDS, PADS
METTON	METTON	METTON	GRILLES, KICK PANELS, RUNNING BOARDS
MPPO	MODIFIED POLYPHENYLENE OXIDE	MPPO	SPOILER ASSEMBLY
PA	POLYAMID	ZYTEL, VYDYNE, PA, MINLON	FENDERS, QUARTER PANELS
PET	THERMOPLASTIC POLYESTER	RYNITE	TRIM
PBT/PPO	PBT/PPO ALLOY	GERMAX	CLADDINGS
PBTP	POLYBUTYLENE THEREPTHALATE	PBT, PBTP, POCAN, VALOX	WHEEL COVERS, FENDERS, GRILLES
PBTP/EEBC	POLYBUTYLENE THEREPTHALATE/EEBC ALLOY	BEXLOY, "M", PBTP/EEBC	FASCIAS, ROCKER PANEL, MOLDINGS
PC	POLYCARBONATE	LEXAN, MERLON, CALIBRE, MAKROLON PC	TAIL LIGHT LENSES, IP TRIM, VALANCE PANELS
PC/ABS	PC/ABS ALLOY	GERMAX, BAY BLENDS, PULSE	DOORS, INSTRUMENT PANELS
PPO	POLYPHENYLENE OXIDE	AZDEL, HOSTALEN,	INTERIOR TRIM, DOOR

		MARLEX, PRFAX, NORYL, GTX, PPO	PANELS, SPLASH SHIELDS, STEERING COLUMN SHROUD
PPO/PA	POLYPHENYLENE/POLYAMID	PPO/PA, GTX 910	FENDERS, QUARTER PANELS
PR/FV	FIBERGLASS REINFORCED PLASTIC	FIBERGLASS, FV, PR/FV	BODY PANELS
PS	POLYSTYRENE	LUSTREX, STYRON, PS	DOOR PANELS, DASH PANELS
RTM	RESIN TRANSFER MOLDING COMPOUND	RTM	BODY PANELS
SMC	SHEET MOLDED COMPOUND	SMC	BODY PANELS
TMC	TRANSFER MOLDING COMPOUND	TMC	GRILLES
UP	UNSATURATED POLYESTER (THERMOSETTING)	SMC, BMC, TMC, ZMC, IMC, XSMC, UP	GRILLE OPENING PANEL, LIFTGATES, FLARESIDE FENDERS, FENDER EXTENSIONS
EEBC	ETHER/ESTER BLOCKED CO-POLYMER	EEBC	BUMPERS
EEBC/PBTP	EEBC/POLYBUTYLENE TEREPTHALATE	EEBC, PBTP, BEXLOY	BUMPER, ROCKER PANELS
EMPP	ETHYLENE MODIFIED POLYPROPYLENE	EMPP	BUMPER COVERS
EPDM	ETHYLENE/PROPROPYLENE DIENE MONOMER	EPDM, NORDEL, VISTALON	BUMPERS
EPM	ETHYLENE/PROPROPYLENE CO-POLYMER	EPM	FENDERS
MPU	FOAM POLYURETHANE	MPU	SPOILERS
PE	POLYETHYLENE	ALATHON, DYLAN, LUPOLEN, MARLEX	"?
PP	POLYPROPYLENE (BLENDS)	NORYL, AZDEL, MARLOX, DYLON, PRAVEX	INNER FENDER, SPOILERS, KICK PANELS
PP/EPDM	PP/EPDM ALLOY	PP/EPDM	SPOILERS, GRILLES
PUR	POLYURETHANE	COLONELS, PUR, PU	FASCIAS, BUMPERS
PUR/PC	PUR/PC ALLOY	TEXIN	BUMPERS
PVC	POLYVINYL CHLORIDE	APEX, GEON, VINYLITE	BODY MOLDINGS, WIRE INSULATION, STEERING WHEELS
RIM	REACTION INJECTED MOLDED POLYURETHANE	RIM, BAYFLEX	FRONT FASCIAS, MODULAR WINDOWS
RRIM	REINFORCED REACTION INJECTED MOLDED	PUR, RRIM	FASCIAS, BODY PANELS, BODY TRIMS

TPE	THERMO POLYETHYLENE	TPE, HYTREL, BEXLOY-V	FASCIAS, BUMPERS, CLADDINGS
TPO	THERMOPOLYOLEFIN	POLYTROPE, RENFLEX, SANTOPRENE, VISAFLEX, ETA, APEX, TPO, SHIELDS, CLADDINGS	BUMPERS, END CAPS, TELCAR, RUBBER, STRIPS, SIGHT, INTERIOR B POST
TPP	THERMO-POLYPROPYLENE	TPP	BUMPERS
TPU	THERMOPOLYURETHANE, POLYESTER	TPU, HYTREL, TEXIN, ESTANE	BUMPERS, BODY SIDE, MOLDINGS, FENDERS, FASCIAS

PANEL SECTIONING

Fig. 14: Panel Sectioning
Courtesy of CHRYSLER GROUP, LLC

1 - EXISTING PANEL 2 - NEW PANEL 3 - PANEL ADHESIVE 4 - BONDING STRIP

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth

the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Fig. 15: Identifying Softened Edges, Panel Adhesive, & Bonding Strip
Courtesy of CHRYSLER GROUP, LLC

1 - SOFTENED EDGES 2 - PANEL ADHESIVE 3 - BONDING STRIP

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement and open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Fig. 16: Panel Reinforcement
Courtesy of CHRYSLER GROUP, LLC

1 - PANEL ADHESIVE 2 - REINFORCEMENT

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous

amount of overlap on either side of the cracked or broken area.

Fig. 17: Beveling Area Around Crack At 20 Degree Angle
Courtesy of CHRYSLER GROUP, LLC

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20° angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

Fig. 18: Identifying Bonding Surface Repair Area
Courtesy of CHRYSLER GROUP, LLC

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when ever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

Fig. 19: Puncture
Courtesy of CHRYSLER GROUP, LLC

1 - PUNCTURE

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture (1) or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Sand surfaces around repair area with 80 -120 grit sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

Fig. 20: Damaged Panel, Cutout & Patch
Courtesy of CHRYSLER GROUP, LLC

1 - CUTOUT 2 - DAMAGED BODY PANEL 3 - 4 MM (0.160 IN.) HOLES 4 - PATCH CUT TO SIZE

A panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20° to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

Fig. 21: Fabricated Panel
Courtesy of CHRYSLER GROUP, LLC

1 - STRUCTURAL ADHESIVE 2 - FIBERGLASS CLOTH OR FIBERGLASS MESH TAPE

3 - WIDTH OF V-GROOVE
4 - WAXED PAPER

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

Fig. 22: Securing Support Squares To Body Panel
Courtesy of CHRYSLER GROUP, LLC

1 - SUPPORT SQUARES
2 - SCREWS
3 - DAMAGED BODY PANEL

1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch

in the cutout.

5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.

Fig. 23: Identifying Cutout & Support Squares
Courtesy of CHRYSLER GROUP, LLC

1 - CUTOUT 2 - SUPPORT SQUARES

12. Position patch in cutout (1) against support squares (2) and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

Fig. 24: Applying Adhesive
Courtesy of CHRYSLER GROUP, LLC

1 - APPLICATOR 2 - SUPPORT SQUARES 3 - ADHESIVE

14. Apply a coat of adhesive (3) to the exposed ends of the support squares (2).

Fig. 25: Installing Screws Holding Patch To Support Squares
Courtesy of CHRYSLER GROUP, LLC

1 - PATCH 2 - GAP

15. Install screws to hold the patch (1) to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.

Fig. 26: Grinding Surface
Courtesy of CHRYSLER GROUP, LLC

1 - PATCH 2 - GAP 3 - DISC GRINDER

17. Using a 125 mm (5 in.) 24 grit disc grinder (3), grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 75% - 80% deep (original material thickness) path across the gaps (2) around the patch (1). With compressed air, blow dust from around patch.

Fig. 27: Covering Gaps With Mesh
Courtesy of CHRYSLER GROUP, LLC

1 - GROUND DOWN AREA 2 - PATCH 3 - MESH

18. Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.

19. Mix enough adhesive to cover the entire patch area.

Fig. 28: Applying Adhesive Over Mesh Around Patch
Courtesy of CHRYSLER GROUP, LLC

1 - ADHESIVE 2 - MESH 3 - PATCH 4 - SPREADER

20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

SPECIFICATIONS

CAUTION: ** Whenever a body isolator bolts requires servicing or tightening, it is necessary to remove the bolt and install new thread locker compound to the threads.

SPECIAL TOOLS

SPECIAL TOOLS

	C-4755 - Trim Stick (Originally Shipped In Kit Number(s) 9299, 9299CC, 9299CC, 9300A-CAN.)

DECKLID/HATCH/LIFTGATE/TAILGATE

CABLE, TAILGATE

REMOVAL

REMOVAL

Fig. 29: Tailgate Check Cable Lock Tab
Courtesy of CHRYSLER GROUP, LLC

1. Open the tailgate and locate the tailgate check cable (3) on the left and right of the cargo box below the tailgate striker (1) as necessary.
2. Pry the cable lock tab(s) (4) outward using a screwdriver or flat bladed tool (2) and remove the tailgate check cable(s) from the cargo box.

Fig. 30: Tailgate Check Cable & Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Remove the bolt (4) that secures the tailgate check cable (3) to the left and right side of the tailgate.
4. Remove the tailgate check cable(s) from the tailgate.

INSTALLATION

INSTALLATION

Fig. 31: Tailgate Check Cable & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Position the tailgate check cable (3) onto the left and right side of the tailgate as necessary.
2. Install the bolt (4) that secures the small end of the tailgate check cable(s) to the tailgate and tighten the bolt(s) to 23 N.m (17 ft. lbs.).

Fig. 32: Tailgate Check Cable Lock Tab
Courtesy of CHRYSLER GROUP, LLC

3. Position the tailgate check cable (3) to the left and right side of the cargo box below the tailgate striker (1) as necessary.
4. Install the large end of the tailgate check cable(s) onto the cargo box. Make sure that the cable lock tab(s) (4) fully engage.

COVER, TAILGATE

REMOVAL

REMOVAL

Fig. 33: Tailgate Liner
Courtesy of CHRYSLER GROUP, LLC

1. Open the tailgate (3).
2. Remove the screws (1) and remove the tailgate liner (2), if equipped.

Fig. 34: Tailgate Cover
Courtesy of CHRYSLER GROUP, LLC

3. Remove the bolts (1) that secure the tailgate cover (2) to the inside of the tailgate and remove the cover.

INSTALLATION

INSTALLATION

Fig. 35: Tailgate Cover
Courtesy of CHRYSLER GROUP, LLC

1. For vehicles without a tailgate liner, install the cover (2) onto the tailgate (1) and install the bolts (3).
2. Tighten the bolts using the sequence shown in illustration.

Fig. 36: Tailgate Liner

Courtesy of CHRYSLER GROUP, LLC

3. On vehicles with a tailgate liner, position the tailgate cover onto the inside of the tailgate (3).
4. Install the liner (2) onto the tailgate.
5. Install the screws (1) that secure the tailgate cover to the tailgate.
6. Tighten the screws using the sequence shown in illustration.

CYLINDER, LOCK

REMOVAL

REMOVAL

Fig. 37: Lock Cylinder & Handle
Courtesy of CHRYSLER GROUP, LLC

1. Remove the latch release handle (3). Refer to **HANDLE, LATCH RELEASE, REMOVAL**.
2. Remove the screws (1) and remove the lock cylinder (2).

INSTALLATION

INSTALLATION

Fig. 38: Lock Cylinder & Handle
Courtesy of CHRYSLER GROUP, LLC

1. Install the lock cylinder (2) and install the screws (1).
2. Install the latch release handle (3). Refer to **HANDLE, LATCH RELEASE, INSTALLATION**.

LOCK CYLINDER CODING INSTRUCTIONS

1. If present, remove the protective label off of the new lock cylinder.
2. Insert the key that is intended for everyday use, fully into the cylinder.
3. Slowly rotate the key clockwise, while maintaining full key insertion, to 180 degrees or slightly more (6 or 7 o'clock position).

NOTE: The lock will code at 180 degrees.

4. Then rotate the key counter-clockwise to 90 degrees or 3 o'clock.
5. You will hear the lock activate, then rotate the key to vertical key-out position and remove the key.

HANDLE, LATCH RELEASE

REMOVAL

REMOVAL

Fig. 39: Tailgate Control Rod
Courtesy of CHRYSLER GROUP, LLC

1. Open the tailgate and remove the cover and liner, if equipped. Refer to **REMOVAL**.
2. Using a grease pencil or equivalent, mark the location of the actuator rods (2) at the control.
3. Disconnect the actuator rods from the control.

Fig. 40: Backup Camera Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the backup camera electrical connector (1), if equipped.

Fig. 41: Tailgate Release Handle & Actuator Rods
Courtesy of CHRYSLER GROUP, LLC

5. Remove the two nuts (3) that secure the release handle (1) and the control (2) to the tailgate.
6. Remove the control (2) and the release handle (1) from the tailgate.

INSTALLATION

INSTALLATION

Fig. 42: Tailgate Release Handle & Actuator Rods
Courtesy of CHRYSLER GROUP, LLC

1. Position the release handle (1) and the control (2) onto the tailgate.

2. Install the two nuts (3) that secure the release handle and control to the tailgate. Tighten the nuts to 6 N.m (53 in. lbs.).

Fig. 43: Backup Camera Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

3. Connect the backup camera electrical connector (1), if equipped.

Fig. 44: Tailgate Control Rod
Courtesy of CHRYSLER GROUP, LLC

4. Locate the actuator rods (2) to the control using the reference marks made during the removal procedure and connect the rods to the control.
5. Install the tailgate cover and liner, if equipped. Refer to **COVER, TAILGATE, INSTALLATION**.

LATCH

REMOVAL

REMOVAL

Fig. 45: Actuator Rod
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tailgate cover. Refer to **COVER, TAILGATE, REMOVAL**.
2. Using a grease pencil or equivalent, mark the actuator rod (3) at the control (2) for the latch (1) being serviced.
3. Disconnect the actuator rod from the control.

Fig. 46: Tailgate Check Cable & Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Remove the two bolts (1 and 4) that secure the latch (2) to the tailgate and position the tailgate check cable (6) out of the way.
5. Remove the latch from the tailgate.

INSTALLATION

INSTALLATION

Fig. 47: Tailgate Check Cable & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Loose assemble the latch (2) to the tailgate.
2. Install the cable and anchor bolt (4) to the latch.
3. Install the bolt (1) securing the latch (2).
4. Tighten the fasteners to 23 N.m (17 ft. lbs.).

Fig. 48: Actuator Rod
Courtesy of CHRYSLER GROUP, LLC

5. Install the actuator rod (3) and secure the clip (1) fully.
6. Install the tailgate cover. Refer to **COVER, TAILGATE, INSTALLATION**.

SPOILER

REMOVAL

REMOVAL

Fig. 49: Spoiler
Courtesy of CHRYSLER GROUP, LLC

1. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, release the retaining clips and remove the spoiler (1) from the tailgate (2).

INSTALLATION

INSTALLATION

Fig. 50: Spoiler
Courtesy of CHRYSLER GROUP, LLC

1. Position the spoiler (1) to the holes in the top of the tailgate (2).
2. Insert the locating pin into the center of the tailgate top and line up the retaining clips into the holes.
3. Working from the center out tap the retaining clips into the holes fully.

STRIKER, LATCH

REMOVAL

REMOVAL

Fig. 51: Identifying Tailgate Latch Striker
Courtesy of CHRYSLER GROUP, LLC

1. Open the tailgate and using a grease pencil or equivalent, mark the location of the tailgate striker (1) being serviced.
2. Remove the striker from the cargo box (2).

INSTALLATION

INSTALLATION

Fig. 52: Identifying Tailgate Latch Striker
Courtesy of CHRYSLER GROUP, LLC

1. Position the striker (1) onto the cargo box (2) using the reference mark made during the removal procedure.
2. Tighten the striker to 34 N.m (25 ft. lbs.).

TAILGATE

REMOVAL

REMOVAL

Fig. 53: Tailgate Check Cable Lock Tab
Courtesy of CHRYSLER GROUP, LLC

1. Open the tailgate and locate the tailgate check cable (3) on the left and right of the cargo box below the tailgate striker (1) as necessary.
2. Pry the cable lock tab(s) (4) outward using a screwdriver or flat bladed tool (2) and remove the tailgate check cable(s) from the cargo box.

Fig. 54: Tailgate
Courtesy of CHRYSLER GROUP, LLC

3. If equipped, disconnect the electrical connectors.
4. Partially close the tailgate so that the notch in the right side tailgate pivot pocket (2) aligns with the flats on the right side tailgate pivot pin.
5. Lift the tailgate upward far enough to disengage the tailgate pivot pocket from the right side tailgate pivot pin.
6. Carefully slide the tailgate to the right far enough to disengage it from the left side tailgate pivot pin and remove the tailgate.

Fig. 55: Tailgate Pivot Pocket & Bushing
Courtesy of CHRYSLER GROUP, LLC

7. If required, remove the bushing (2) from each tailgate pivot pocket (3).

INSTALLATION

INSTALLATION

Fig. 56: Tailgate Pivot Pocket & Bushing
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the bushing (2) into each tailgate pivot pocket (3).

Fig. 57: Tailgate
Courtesy of CHRYSLER GROUP, LLC

2. Position the tailgate (1) onto the left side tailgate pivot pin (3).
3. Partially close the tailgate so that the notch in the right side tailgate pivot pocket (2) aligns with the flats on the right side tailgate pivot pin.
4. Lower the tailgate onto the right side tailgate pivot pin.

Fig. 58: Tailgate Check Cable Lock Tab
Courtesy of CHRYSLER GROUP, LLC

5. If equipped, connect the electrical connectors.
6. Connect the tailgate check cables (3) to the cable bolts (2) located below each tailgate striker (1). Refer to **CABLE, TAILGATE, INSTALLATION**.

DOOR - FRONT

CYLINDER, DOOR LOCK

REMOVAL

REMOVAL

Fig. 59: Lock Cylinder
Courtesy of CHRYSLER GROUP, LLC

1. Remove the exterior door handle. Refer to **HANDLE, EXTERIOR, REMOVAL**.
2. Separate the lock cylinder (1) from the handle.

INSTALLATION

INSTALLATION

Fig. 60: Lock Cylinder
Courtesy of CHRYSLER GROUP, LLC

1. Position the door lock cylinder (1) into the exterior door handle.

2. Install the exterior handle. Refer to **HANDLE, EXTERIOR, INSTALLATION**.

DOOR

ADJUSTMENTS

ADJUSTMENTS

NOTE: **For quad cab vehicles, it is recommended that you adjust the rear door before adjusting the front door. Refer to DOOR, REAR, ADJUSTMENTS.**

- **Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.**
- **During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.**
- **A suitable body sealant should be used when removing or moving the hinges.**

FORE/AFT

Fig. 61: Hinge Pillar & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.**

1. Support the door with a suitable lifting device.

2. Loosen the upper and lower hinge to hinge pillar fasteners (2). Refer to **HINGE, DOOR, REMOVAL**.
3. Adjust the door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
4. Tighten the hinge to hinge pillar bolts (2) to 24 N.m (18 ft. lbs.).

UP/DOWN

Fig. 62: Door Latch Striker & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.**

NOTE: **When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. Refer to GAP AND FLUSH, SPECIFICATIONS.**

1. Support the door with a suitable lifting device.
2. Remove the latch striker (1). Refer to **STRIKER, DOOR LATCH, REMOVAL**.

Fig. 63: Door Hinges
Courtesy of CHRYSLER GROUP, LLC

3. If necessary, loosen the hinge to door fasteners (1) and (3). Refer to **DOOR, REMOVAL**.

Fig. 64: Hinge Pillar & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. If necessary, loosen the hinge to hinge pillar fasteners (2). Refer to **HINGE, DOOR, REMOVAL**.
5. Adjust the door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.

Fig. 65: Door Hinges
Courtesy of CHRYSLER GROUP, LLC

6. Tighten the door to hinge fasteners to 22 N.m (16 ft. lbs.)

Fig. 66: Hinge Pillar & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Tighten the hinge to hinge pillar bolts (2) to 24 N.m (18 ft. lbs.).

Fig. 67: Door Latch Striker & Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install the latch striker (1). Refer to **STRIKER, DOOR LATCH, INSTALLATION**.

IN/OUT

Fig. 68: Door Latch Striker & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.**

NOTE: **When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.**

1. Support the door with a suitable lifting device.
2. Remove the latch striker (1). Refer to **STRIKER, DOOR LATCH, REMOVAL**.

Fig. 69: Door Hinges
Courtesy of CHRYSLER GROUP, LLC

3. Loosen the hinge to door fasteners. Refer to **DOOR, REMOVAL**.
4. Adjust the door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
5. Tighten the door to hinge fasteners to 22 N.m (16 ft. lbs.).

Fig. 70: Door Latch Striker & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Install the latch striker (1). Refer to **STRIKER, DOOR LATCH, INSTALLATION**.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Disconnect the door electrical connector.

Fig. 71: Door Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following illustration shows a typical door harness connector.

3. Peel the A Pillar grommet (1) off of the connector/retainer and move it up the wire harness.
4. Grasp the wire harness (2) by the convolute section of the grommet and gently pull the wire harness down

towards the floor to expose the connector lock tabs.

CAUTION: Do not force the locking tab past the connector body, as damage to the connector may occur.

5. While still pulling down on the harness, use a small slotted screw driver (3) to **gently** push one of the top lock tabs until the lock feature is flush with the connector/retainer body.
6. Repeat the step 3 for the remaining top lock tab.
7. The connector should now be able to rock out of the sheet metal hole without causing any damage to the connector or sheet metal.

Fig. 72: Door Hinges
Courtesy of CHRYSLER GROUP, LLC

8. Using a grease pencil or equivalent, mark the location of the door hinges on the door.
9. Support the door with a suitable lifting device and remove the nuts (1 and 3) that secure the door to the hinges.
10. Carefully remove the door from the hinges.

INSTALLATION

INSTALLATION

Fig. 73: Door Hinges
Courtesy of CHRYSLER GROUP, LLC

1. Carefully position the door studs (2) onto the hinges and support the door with a suitable lifting device.
2. Loosely install the nuts (1 and 3) secure the door to the hinges.
3. Align the door to the hinges using the reference marks made during the removal procedure
4. Tighten the nuts to 22 N.m (16 ft. lbs.) using the following sequence;
    1. Tighten the upper nut of the top hinge.
    2. Tighten the lower nut of the bottom hinge.
    3. Tighten the upper nut of the bottom hinge.
    4. Tighten the lower nut of the top hinge.
5. Connect the door wire harness to the body wire harness.
6. Install the grommet over the connector and seat the connector into the A-pillar fully.
7. Reconnect the negative battery cable.
8. If necessary, adjust the door. Refer to **DOOR, ADJUSTMENTS**.

FLAG, MIRROR

REMOVAL

REMOVAL

Fig. 74: Mirror Flag
Courtesy of CHRYSLER GROUP, LLC

1. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, remove the mirror flag (1).

INSTALLATION

INSTALLATION

Fig. 75: Mirror Flag
Courtesy of CHRYSLER GROUP, LLC

1. Position the mirror flag (1) onto the door and seat the clips fully.

GLASS, DOOR

REMOVAL

REMOVAL

Fig. 76: Belt Moldings & Seals
Courtesy of CHRYSLER GROUP, LLC

1. Remove the trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
2. Remove the door speaker. Refer to **SPEAKER, REMOVAL** .
3. Remove the inner belt molding (3).

Fig. 77: Window Switch
Courtesy of CHRYSLER GROUP, LLC

4. Install the window switch if required and lower the glass (1) down in the door to position the glass attachment clips (2) for access through the speaker opening and the service access plug.
5. Separate the glass clips (2) from the regulator lift plates (3 and 4).

Fig. 78: Door Glass
Courtesy of CHRYSLER GROUP, LLC

6. Rotate the top of the glass (1) forward in the door to release the glass from the run channels.
7. Remove the door glass (1) from the door (3) and separate the clips (2) if necessary.

INSTALLATION

INSTALLATION

Fig. 79: Door Glass
Courtesy of CHRYSLER GROUP, LLC

1. Install the mounting clips (2) onto the glass, if necessary.
2. Insert the narrow end of the glass (1) into the door through the opening between the inner and outer panels (3). Then engage the front edge of the glass into the front portion of the glass run weatherstrip before rotating the back edge of the glass rearward into the B-pillar portion of the weatherstrip.

Fig. 80: Window Switch
Courtesy of CHRYSLER GROUP, LLC

3. Pull the glass upward evenly far enough so it can be verified that the glass is seated into both glass run channels.
4. Push the glass down to seat the clips (2) into regulator lift plates (3 and 4) fully.
5. Pull up on the glass and make sure that it is secure.

Fig. 81: Belt Moldings & Seals
Courtesy of CHRYSLER GROUP, LLC

6. Install the inner belt molding (3) onto the door and seat fully.
7. Install the door speaker. Refer to **SPEAKER, INSTALLATION** .
8. Install the trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.

HANDLE, INTERIOR

REMOVAL

REMOVAL

Fig. 82: Interior Handle
Courtesy of CHRYSLER GROUP, LLC

1. Remove the door trim panel.
2. Remove the handle mounting screw (1).
3. Disconnect the control rod (3) from the handle (2).
4. Remove the handle from the door.

INSTALLATION

INSTALLATION

Fig. 83: Interior Handle
Courtesy of CHRYSLER GROUP, LLC

1. Place the handle (2) into position at the door.

2. Connect the control rod (3) to the handle.
3. Install the handle mounting screw (1).
4. Install the door trim panel.

HANDLE, EXTERIOR

REMOVAL

REMOVAL

Fig. 84: Carrier Plate Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the carrier plate (1). Refer to **PLATE, CARRIER, REMOVAL**.

Fig. 85: Exterior Handle Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the bolts (1) and remove the exterior handle (2) from the door.

Fig. 86: Exterior Handle Linkages
Courtesy of CHRYSLER GROUP, LLC

4. Release the clips (1) and disconnect the linkages (2 and 3) from the handle.

INSTALLATION

INSTALLATION

Fig. 87: Exterior Handle Linkages
Courtesy of CHRYSLER GROUP, LLC

1. Install the linkages (2 and 3) onto the door handle and secure the clips (1).

Fig. 88: Exterior Handle Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Position the linkages (3) into the door and install the handle (2).
3. Install the bolts (1) and tighten to 7 N.m (62 in. lbs.).

Fig. 89: Carrier Plate Assembly
Courtesy of CHRYSLER GROUP, LLC

4. Install the carrier plate. Refer to **PLATE, CARRIER, INSTALLATION**.
5. Connect the battery negative cable.

HINGE, DOOR

STANDARD PROCEDURE

STANDARD PROCEDURE - HINGE LUBRICATION

Fig. 90: Door Hinge
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Door hinge pivot points (1) including the roller (3) and detent lever (2), should be lubricated periodically using Mopar ® Spray White Lube with Lithium or equivalent.

1. Spray parts as necessary using Mopar ® Spray White Lube with Lithium or equivalent.
2. Remove any excess grease.

REMOVAL

REMOVAL

Fig. 91: Door Hinges
Courtesy of CHRYSLER GROUP, LLC

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Remove the door. Refer to **DOOR, REMOVAL**.

Fig. 92: Hinge Pillar & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Using a grease pencil or equivalent, mark the hinge location and remove the bolts (2) for the hinge being serviced.

INSTALLATION

INSTALLATION

Fig. 93: Hinge Pillar & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Install the hinges (3) and bolts (2).
2. Tighten the hinge bolts to 24 N.m (18 ft. lbs.).

Fig. 94: Door Hinges
Courtesy of CHRYSLER GROUP, LLC

3. Install the door. Refer to **DOOR, INSTALLATION**.

LATCH, DOOR

REMOVAL

REMOVAL

Fig. 95: Carrier Plate Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Remove the carrier plate (1). Refer to **PLATE, CARRIER, REMOVAL**.
2. Disconnect the door wire harness connector from the door latch (4).
3. Separate the latch assembly from the latch presenter bracket and remove.

INSTALLATION

INSTALLATION

Fig. 96: Carrier Plate Assembly

Courtesy of CHRYSLER GROUP, LLC

1. Seat the latch (4) onto the presenter bracket fully.
2. Connect the door wire harness electrical connector to the latch.
3. Install the carrier plate (1). Refer to **PLATE, CARRIER, INSTALLATION**.

MOLDING, DOOR BELT, INNER

REMOVAL

REMOVAL

Fig. 97: Belt Moldings & Seals
Courtesy of CHRYSLER GROUP, LLC

1. Remove the door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
2. Separate the belt molding (3) from the door mounting flange from the back to the front.

INSTALLATION

INSTALLATION

Fig. 98: Belt Moldings & Seals
Courtesy of CHRYSLER GROUP, LLC

1. Position the belt molding (3) and seat onto the door mounting flange fully.
2. Install the door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.

MOLDING, DOOR BELT, OUTER

REMOVAL

REMOVAL

Fig. 99: Belt Moldings & Seals
Courtesy of CHRYSLER GROUP, LLC

1. Remove the screw from the rear of the outer belt molding (2).
2. Starting from the rear of the door, carefully lift the belt molding upward and disengage the inner portion of the molding from the tabs on the door.
3. Pull the molding rearward to disengage the molding from the outside mirror.
4. Remove the belt molding from the door.

INSTALLATION

INSTALLATION

Fig. 100: Belt Moldings & Seals
Courtesy of CHRYSLER GROUP, LLC

1. Place the belt molding (2) into position and insert the front portion under the outside mirror housing.
2. Working from the front of the door, press down on the molding and engage the clips to the door.
3. Install the screw at the rear of the belt molding.

PANEL, DOOR TRIM

REMOVAL

REMOVAL

Fig. 101: Door Switch/Bezel
Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear door switch shown in illustration, front doors are similar.

1. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, release the door switch/bezel (1) from the door trim and disconnect the electrical connectors (2), if equipped.

Fig. 102: Removing Manual Window Crank
Courtesy of CHRYSLER GROUP, LLC

2. If equipped, remove the manual window crank (1) using a window crank removal tool (2).

Fig. 103: Interior Door Handle Trim & Interior Door Panel
Courtesy of CHRYSLER GROUP, LLC

3. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, remove the mirror flag (4).
4. Remove the screw (2) and remove the interior handle bezel (3).
5. Release the plastic push pins (1).
6. Raise the trim panel (6) upward far enough to disengage the hooks on the back of the panel from the inner door and the door lock knob from the top of the panel.

INSTALLATION

INSTALLATION

Fig. 104: Interior Door Handle Trim & Interior Door Panel
Courtesy of CHRYSLER GROUP, LLC

1. Position the lower end of the trim panel (6) to the carrier plate on the inner door aligning the hooks on the back of the panel to the slotted holes in the carrier. Then, using a rotating arc motion, feed the lock knob through the hole at the upper rear corner of the trim panel, and align and push down the trim panel to seat the hooks into the holes in the carrier plate.

NOTE: Make sure the upper flange of trim is fully seated into inner belt molding.

2. Install the plastic push pins (1) around the perimeter of the panel and seat fully.
3. Install the interior handle bezel (3) and install the screw (2).
4. Position the mirror flag (4) onto the door and seat the clips fully.
5. If equipped, verify that the window handle clip is installed correctly and seat the handle onto the window regulator shaft fully.

Fig. 105: Door Switch/Bezel
Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear door switch shown in illustration, front doors are similar.

6. If equipped, connect the window switch electrical connectors (2) and seat the window switch/bezel into the door trim fully.

PLATE, CARRIER

REMOVAL

REMOVAL

Fig. 106: Interior Door Handle Trim & Interior Door Panel
Courtesy of CHRYSLER GROUP, LLC

1. Remove the trim panel (6). Refer to **PANEL, DOOR TRIM, REMOVAL**.
2. Remove the door speaker. Refer to **SPEAKER, REMOVAL** .

Fig. 107: Window Switch
Courtesy of CHRYSLER GROUP, LLC

3. If required, reinstall the regulator handle or window switch to enable lowering of the glass (1) for access to the glass attachment clips (2) through the speaker opening and the service access plug.
4. Separate the glass clips (2) from the regulator lift plates (3 and 4).
5. Raise the glass (1) into the full up position and secure in place using tape or equivalent.

6. Disconnect the door electrical connector.

Fig. 108: Door Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following illustration shows a typical door harness connector.

7. Peel the A Pillar grommet (1) off of the connector/retainer and move it up the wire harness.
8. Grasp the wire harness (2) by the convolute section of the grommet and gently pull the wire harness down towards the floor to expose the connector lock tabs.

CAUTION: Do not force the locking tab past the connector body, as damage to the connector may occur.

9. While still pulling down on the harness, use a small slotted screw driver (3) to **gently** push one of the top lock tabs until the lock feature is flush with the connector/retainer body.
10. Repeat the step 3 for the remaining top lock tab.
11. The connector should now be able to rock out of the sheet metal hole without causing any damage to the connector or sheet metal.

Fig. 109: Exterior Handle
Courtesy of CHRYSLER GROUP, LLC

12. Remove the service access plug (2) and disconnect the exterior handle linkages (1).

Fig. 110: Door Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

13. Remove the screws (2) and separate the wire harness (1) from the door.

Fig. 111: Lower Belt Channel
Courtesy of CHRYSLER GROUP, LLC

14. On standard cab models only, remove the lower belt channel (2) shut face screw (1).

Fig. 112: Door Latch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

15. Remove the door latch (2) mounting screws (3).

Fig. 113: Carrier Plate Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: Standard cab model shown in illustration, all others similar.

16. Remove the bolts (5) (quantity of 13 on standard cab, 12 on all other models) and remove the carrier plate assembly (1) from the door.

INSTALLATION

INSTALLATION

Fig. 114: Carrier Plate Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: On standard cab models perform the following steps.

1. Insert the carrier plate assembly (1) into door, latch (4) side first, and tip the regulator rails into place through the door opening.
2. Lift the carrier plate and seat the two locating pins into the locating holes.
3. Install the 13 bolts (5) and, moving clockwise starting at position (2), tighten the bolts in a clockwise direction to 5.5 N.m (49 in. lbs.).

Fig. 115: Carrier Plate Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: On crew/club cab models perform the following steps.

4. Insert the carrier plate assembly (1) into door, latch (4) side first, and tip the regulator rails into place through the door opening.
5. Lift the carrier plate and seat the two locating pins into the locating holes.
6. Install the 12 bolts (5) and, moving clockwise starting at position (2), tighten the bolts in a clockwise direction to 5.5 N.m (49 in. lbs.).

Fig. 116: Door Latch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

7. Install the latch screws (3) and tighten to 7 N.m (62. in. lbs.)

Fig. 117: Lower Belt Channel
Courtesy of CHRYSLER GROUP, LLC

8. On standard cab models only, install the lower belt channel (2) shut face screw (1) and tighten to 8 N.m (71 in. lbs.).

Fig. 118: Door Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

9. Install the wire harness (1) and install the screws (2).

Fig. 119: Exterior Handle
Courtesy of CHRYSLER GROUP, LLC

10. Connect the linkages (1) to the latch and secure the clips.

Fig. 120: Window Switch
Courtesy of CHRYSLER GROUP, LLC

11. Pull the glass up evenly so front of glass can be verified it is seated into both glass run channels.
12. Push the glass down to seat the clips (2) into regulator liftplates (3 and 4) fully.
13. Pull up on the glass and make sure that it is secure.
14. Install the door speaker. Refer to **SPEAKER, INSTALLATION** .

Fig. 121: Interior Door Handle Trim & Interior Door Panel
Courtesy of CHRYSLER GROUP, LLC

15. Install the door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.

Fig. 122: Door Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following illustration shows a typical door harness connector.

16. Connect the electrical connector and secure the grommet (1) back over the connector/retainer and seat the connector into the pillar fully.

REGULATOR, WINDOW, MANUAL

DESCRIPTION

DESCRIPTION

Fig. 123: Window Regulators & Carrier Plate (Manual)
Courtesy of CHRYSLER GROUP, LLC

The window regulators (1) are serviced as an assembly with the carrier plate (2) and include the following parts:

- glass bumpers
- lock grommets
- release rod grommet
- handle bumper
- service plug

Refer to **PLATE, CARRIER, REMOVAL**.

REGULATOR, WINDOW, POWER

DESCRIPTION

DESCRIPTION

Fig. 124: Window Regulators & Carrier Plate (Manual)
Courtesy of CHRYSLER GROUP, LLC

The window regulators (1) are serviced as an assembly with the carrier plate (2) and include the following parts:

- glass bumpers
- lock grommets
- release rod grommet
- handle bumper
- service plug

Refer to **PLATE, CARRIER, REMOVAL**.

STRIKER, DOOR LATCH

ADJUSTMENTS

ADJUSTMENTS

Fig. 125: Door Latch Striker & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Using a grease pencil or equivalent, mark the location of the door latch striker (1) on the B-pillar (2) to aid in adjustment.
2. Loosen the two bolts (3) that secure the door latch striker to the B-pillar.
3. To adjust the rear gap and flush measurement, change the position of the door latch striker and then tighten the two bolts to 30 N.m (22 ft. lbs.). Refer to **GAP AND FLUSH, SPECIFICATIONS**.
4. Verify correct door and latch position.

REMOVAL

REMOVAL

Fig. 126: Door Latch Striker & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Using a grease pencil or equivalent, mark the location of the door latch striker (1) on the B-pillar (2).
2. Remove the two bolts (3) that secure the door latch striker to the B-pillar and remove the striker.

INSTALLATION

INSTALLATION

Fig. 127: Door Latch Striker & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the door latch striker (1) onto the B-pillar (2) and loosely install the two bolts (3).
2. Align the door latch striker to the B-pillar using the reference marks made during the removal procedure and tighten the bolts to 30 N.m (22 ft. lbs.).
3. If necessary, adjust the door latch striker. Refer to **STRIKER, DOOR LATCH, ADJUSTMENTS**.

DOORS - REAR

DOOR, REAR

ADJUSTMENTS

ADJUSTMENTS

NOTE: **For quad cab vehicles, it is recommended that you adjust the rear door before adjusting the front door.**

- **Door adjustment measurements should be taken from stationary or**

welded body panels like the roof, rocker or quarter panels.

- **During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper fasteners to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.**
- **A suitable body sealant should be used when removing or moving the hinges.**

FORE/AFT

Fig. 128: Hinge Pillar & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.**

1. Support the door with a suitable lifting device.
2. Loosen the upper and lower (2) hinge to hinge pillar fasteners. Refer to **HINGE, DOOR, REMOVAL**.
3. Adjust the door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
4. Tighten the remaining hinge to hinge pillar bolts (2) to 24 N.m (18 ft. lbs.).

UP/DOWN

Fig. 129: Rear Door Striker
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.**

NOTE: **When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. Refer to GAP AND FLUSH, SPECIFICATIONS.**

1. Support the door with a suitable lifting device.
2. Remove the latch striker (1). Refer to **STRIKER, DOOR LATCH, REMOVAL**.

Fig. 130: Rear Door
Courtesy of CHRYSLER GROUP, LLC

3. If necessary, loosen the hinge to door fasteners (3). Refer to **HINGE, DOOR, REMOVAL**.

Fig. 131: Hinge Pillar & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. If necessary, loosen the hinge to hinge pillar fasteners (2). Refer to **DOOR, REAR, REMOVAL**.
5. Adjust the door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.

Fig. 132: Rear Door
Courtesy of CHRYSLER GROUP, LLC

6. Tighten the door to hinges fasteners to 22 N.m (16 ft. lbs.)

Fig. 133: Hinge Pillar & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Tighten the hinge to hinge pillar bolts (2) to 24 N.m (18 ft. lbs.).

Fig. 134: Rear Door Striker
Courtesy of CHRYSLER GROUP, LLC

8. Install the latch striker. Refer to **STRIKER, DOOR LATCH, INSTALLATION**.

Fig. 135: Rear Door Striker
Courtesy of CHRYSLER GROUP, LLC

NOTE: **In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.**

NOTE: **When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.**

1. Support the door with a suitable lifting device.
2. Remove the latch striker. Refer to **STRIKER, DOOR LATCH, REMOVAL**.

Fig. 136: Rear Door
Courtesy of CHRYSLER GROUP, LLC

3. Loosen the hinge to door fasteners (3). Refer to **DOOR, REAR, REMOVAL**.
4. Adjust the front of the door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
5. Tighten the door to hinges fasteners to 22 N.m (16 ft. lbs.).

Fig. 137: Rear Door Striker
Courtesy of CHRYSLER GROUP, LLC

6. Install the latch striker (1). Refer to **STRIKER, DOOR LATCH, INSTALLATION**.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Disconnect the door electrical connector.
    - **GROMMET - A PILLAR**

Fig. 138: Door Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following illustration shows a typical door harness connector.

1. Peel the A Pillar grommet (1) off of the connector/retainer and move it up the wire harness.
2. Grasp the wire harness (2) by the convolute section of the grommet and gently pull the wire harness down towards the floor to expose the connector lock tabs.

CAUTION: Do not force the locking tab past the connector body, as damage to the connector may occur.

3. While still pulling down on the harness, use a small slotted screw driver (3) to **gently** push one of the top lock tabs until the lock feature is flush with the connector/retainer body.
4. Repeat the step 3 for the remaining top lock tab.
5. The connector should now be able to rock out of the sheet metal hole without causing any damage to the connector or sheet metal.

Fig. 139: Rear Door
Courtesy of CHRYSLER GROUP, LLC

3. Using a grease pencil or equivalent, mark the location of the door hinges on the door (1).
4. Support the door with a suitable lifting device and remove the nuts (3) that secure the door to the hinges.
5. Carefully remove the door from the hinges.

INSTALLATION

INSTALLATION

Fig. 140: Rear Door
Courtesy of CHRYSLER GROUP, LLC

1. Carefully position the door studs (2) onto the hinges and support the door with a suitable lifting device.
2. Loosely install the nuts (3) and secure the door to the hinges.
3. Align the door to the hinges using the reference marks made during the removal procedure
4. Tighten the nuts to 22 N.m (16 ft. lbs.) using the following sequence;
    1. Tighten the upper nut of the top hinge.
    2. Tighten the lower nut of the bottom hinge.
    3. Tighten the upper nut of the bottom hinge.
    4. Tighten the lower nut of the top hinge.
5. Connect the door wire harness to the body wire harness.
6. Install the grommet over the connector and seat the connector into the A-pillar fully.
7. Reconnect the negative battery cable.
8. If necessary, adjust the door. Refer to **DOOR, REAR, ADJUSTMENTS**.

GLASS, DOOR

REMOVAL

REMOVAL

Fig. 141: Carrier Plate
Courtesy of CHRYSLER GROUP, LLC

1. Remove the carrier plate (3). Refer to **PLATE, CARRIER, REMOVAL**.

Fig. 142: Door Glass
Courtesy of CHRYSLER GROUP, LLC

2. Lower the glass (1) and remove from the lower door opening.

Fig. 143: Glass Clips
Courtesy of CHRYSLER GROUP, LLC

3. If necessary, remove the glass clips (3 - 4) from the glass.

INSTALLATION

INSTALLATION

Fig. 144: Glass Clips
Courtesy of CHRYSLER GROUP, LLC

1. Install the mounting clips (3 - 4) onto the glass, if necessary.

Fig. 145: Door Glass
Courtesy of CHRYSLER GROUP, LLC

2. Install the glass (1) into the door through the lower door opening and secure in the full up position using tape or equivalent.

Fig. 146: Carrier Plate
Courtesy of CHRYSLER GROUP, LLC

3. Install the carrier plate (3). Refer to **PLATE, CARRIER, INSTALLATION**.

HANDLE, INTERIOR

REMOVAL

REMOVAL

Fig. 147: Interior Handle
Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door shown in illustration, rear door similar.

1. Remove the door trim panel.
2. Remove the handle mounting screw (1).
3. Disconnect the control rod (3) from the handle (2).
4. Remove the handle from the door.

INSTALLATION

INSTALLATION

Fig. 148: Interior Handle
Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door shown in illustration, rear door similar.

1. Place the handle (2) into position at the door.
2. Connect the control rod (3) to the handle.
3. Install the handle mounting screw (1).
4. Install the door trim panel.

HANDLE, EXTERIOR

REMOVAL

REMOVAL

Fig. 149: Carrier Plate
Courtesy of CHRYSLER GROUP, LLC

1. Remove the carrier plate (3). Refer to **PLATE, CARRIER, REMOVAL**.

Fig. 150: Exterior Handle Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the bolts (1) and remove the exterior handle (2) from the door.

Fig. 151: Door Handle Linkage
Courtesy of CHRYSLER GROUP, LLC

3. Release the clips (1) and disconnect the linkage (2) from the handle.

INSTALLATION

INSTALLATION

Fig. 152: Door Handle Linkage
Courtesy of CHRYSLER GROUP, LLC

1. Install the linkage (2) onto the door handle and secure the clips (1).

Fig. 153: Exterior Handle Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door shown in illustration, rear doors are similar.

2. Position the linkages (3) into the door and install the handle (2).
3. Install the bolts (1) and tighten to 7 N.m (62 in. lbs.)

Fig. 154: Carrier Plate
Courtesy of CHRYSLER GROUP, LLC

4. Install the carrier plate (3). Refer to **PLATE, CARRIER, INSTALLATION**.

HINGE, DOOR

STANDARD PROCEDURE

STANDARD PROCEDURE - HINGE LUBRICATION

Fig. 155: Door Hinge
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Door hinge pivot points (1) including the roller (3) and detent lever (2), should be lubricated periodically using Mopar ® Spray White Lube with Lithium or equivalent.

1. Spray parts as necessary using Mopar ® Spray White Lube W/Lithium or equivalent.
2. Remove any excess grease.

REMOVAL

REMOVAL

Fig. 156: Rear Door
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It is not necessary to remove the door to replace the hinges if they are replaced one at a time.**

NOTE: **A suitable body sealant should be used when removing or moving the hinges.**

1. Open the front door
2. Using a grease pencil or equivalent, mark the position of the hinge on the door and B-pillar.
3. Remove the nuts (3) attaching the hinge to the door (1).

Fig. 157: Hinge Pillar & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolts (2) attaching the hinge (1) to the B-pillar and remove the hinge.

INSTALLATION

INSTALLATION

Fig. 158: Hinge Pillar & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Install the hinge (1) and install the B-pillar bolts (2).
2. Tighten the bolts to 24 N.m (18 ft. lbs.).

Fig. 159: Rear Door
Courtesy of CHRYSLER GROUP, LLC

3. Position rear door assy studs (2), through appropriate holes in hinge assy.

NOTE: **The shoulders of the studs (2) must be fully engaged into hinges, prior to securing.**

4. Install the nuts and tighten to 22 N.m (16 ft. lbs.).
5. Adjust the door if needed. Refer to **DOOR, REAR, ADJUSTMENTS**.

LATCH, DOOR

REMOVAL

REMOVAL

Fig. 160: Carrier Plate
Courtesy of CHRYSLER GROUP, LLC

1. Remove the carrier plate (1). Refer to **PLATE, CARRIER, REMOVAL**.
2. Disconnect the door wire harness connector from the door latch (4).
3. Separate the latch assembly from the latch presenter bracket and remove.

INSTALLATION

INSTALLATION

Fig. 161: Carrier Plate
Courtesy of CHRYSLER GROUP, LLC

1. Seat the latch onto the presenter bracket fully.
2. Connect the electrical connector.
3. Install the carrier plate (1). Refer to **PLATE, CARRIER, INSTALLATION**.

MOLDING, DOOR BELT, INNER

REMOVAL

REMOVAL

Fig. 162: Belt Moldings & Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door shown in illustration, rear door similar.

1. Remove the door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
2. Separate the belt molding (3) the door mounting flange from the back to the front.

INSTALLATION

INSTALLATION

Fig. 163: Belt Moldings & Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door shown in illustration, rear door similar.

1. Position the belt molding (3) and seat onto the door mounting flange fully.
2. Install the door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.

MOLDING, DOOR BELT, OUTER

REMOVAL

REMOVAL

Fig. 164: Belt Moldings & Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door shown in illustration, rear door similar

1. Remove the screw from the rear of the outer belt molding (2).
2. Starting from the rear of the door, carefully lift the belt molding upward and disengage the inner portion of the molding from the tabs on the door.
3. Pull the molding rearward to disengage the molding from the outside mirror.
4. Remove the belt molding from the door.

INSTALLATION

INSTALLATION

Fig. 165: Belt Moldings & Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door shown in illustration, rear door similar.

1. Place the belt molding (2) into position and insert the front portion under the outside mirror housing.
2. Working from the front of the door, press down on the molding and engage the clips to the door.
3. Install the screw at the rear of the belt molding.

PANEL, REAR DOOR TRIM

REMOVAL

REMOVAL

Fig. 166: Door Switch/Bezel
Courtesy of CHRYSLER GROUP, LLC

1. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, release the door switch/bezel (1) from the door trim and disconnect the electrical connectors (2).

Fig. 167: Upper Trim Bezel
Courtesy of CHRYSLER GROUP, LLC

2. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, release the upper trim bezel (1).

Fig. 168: Removing Manual Window Crank
Courtesy of CHRYSLER GROUP, LLC

3. If equipped, remove the manual window crank (1) using a window crank removal tool (2).

Fig. 169: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screw (3) and remove the interior handle bezel (5).
5. Release the plastic screw/rivets (4).
6. Raise the trim panel (2) up and off the hooks and door lock knob (1).

INSTALLATION

INSTALLATION

Fig. 170: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Load the trim panel (2) bottom first on an angle then rotate toward inner aligning window crank shaft, feed lock knob (1) through the trim panel (2), then align and push down hooks into holes in door module, (this will be an arc motion).

NOTE: Make sure the upper flange of trim is fully seated into inner belt molding.

2. Install the plastic screw/rivets (4) and seat fully.
3. Install the interior handle bezel (5) and install the screw (3).
4. If equipped, verify that the window handle clip is installed correctly and seat the handle onto the window regulator shaft fully.

Fig. 171: Upper Trim Bezel
Courtesy of CHRYSLER GROUP, LLC

5. Position the trim bezel (1) onto the door and seat the clips fully.

Fig. 172: Door Switch/Bezel
Courtesy of CHRYSLER GROUP, LLC

6. If equipped, connect the window switch electrical connectors (2) and seat the window switch/bezel into the door trim fully.

PLATE, CARRIER

REMOVAL

REMOVAL

Club Cab

Fig. 173: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Remove the trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.

Fig. 174: Power Window Motor
Courtesy of CHRYSLER GROUP, LLC

2. If equipped, using a punch or similar tool, carefully remove the glass disconnect hole plugs (1).
3. Install the window switch if required and lower the glass down in the door to position the glass attachment clip for access through the service access plug (1).
4. Release the two glass retainer tabs and separate the glass clip from the regulator lift plate.
5. Raise the glass into the full up position and secure in place using tape or equivalent.

Crew Cab

Fig. 175: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Remove the trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
2. Remove the door speaker. Refer to **SPEAKER, REMOVAL** .

Fig. 176: Power Window Motor
Courtesy of CHRYSLER GROUP, LLC

3. Install the window switch if required and lower the glass down in the door to position the glass attachment clips for access through the speaker opening (4) and the service access plug.
4. Release the two glass retainer tabs and separate the glass clip from the regulator lift plate.
5. Raise the glass into the full up position and secure in place using tape or equivalent.

- **GROMMET - A PILLAR**

Fig. 177: Door Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the door electrical connector.

NOTE: The following illustration shows a typical door harness connector.

2. Peel the A Pillar grommet (1) off of the connector/retainer and move it up the wire harness.
3. Grasp the wire harness (2) by the convolute section of the grommet and gently pull the wire harness down towards the floor to expose the connector lock tabs.

CAUTION: Do not force the locking tab past the connector body, as damage to the connector may occur.

4. While still pulling down on the harness, use a small slotted screw driver (3) to **gently** push one of the top lock tabs until the lock feature is flush with the connector/retainer body.
5. Repeat the step 3 for the remaining top lock tab.
6. The connector should now be able to rock out of the sheet metal hole without causing any damage to the connector or sheet metal.

Fig. 178: Exterior Handle
Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door shown in illustration, rear doors are similar.

1. Remove the service access plug (2) and disconnect the exterior handle linkages (1).

Fig. 179: Door Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door shown in illustration, rear doors are similar.

2. Remove the screws (2) and separate the wire harness (1) from the door.

Fig. 180: Door Latch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

3. Remove the door latch (2) mounting screws (3).

Fig. 181: Carrier Plate
Courtesy of CHRYSLER GROUP, LLC

4. Remove the 11 bolts (2) on the club cab or the 12 bolts on the crew cab model and remove the carrier plate assembly (3) from the door.

INSTALLATION

INSTALLATION

Fig. 182: Carrier Plate
Courtesy of CHRYSLER GROUP, LLC

1. Insert the carrier plate assembly (3) into door, latch side first, and tip the regulator rails into place through the door opening.
2. Lift the carrier plate and seat the two locating pins into the retaining holes.
3. Install the bolts (2) and starting at position (1) tighten the bolts in a clockwise direction to 5.5 N.m (49 in. lbs.)

Fig. 183: Door Latch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

4. Install the latch screws (3) and tighten to 7 N.m (62. in. lbs.)

Fig. 184: Door Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Install the wire harness (1) and install the screws (2).

Fig. 185: Exterior Handle
Courtesy of CHRYSLER GROUP, LLC

6. Connect the linkages (1) to the latch and secure the clips.

Fig. 186: Door Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following illustration shows a typical door harness connector.

7. Connect the electrical connector and secure the grommet (1) back over the connector/retainer and seat the connector into the pillar fully.

CLUB CAB

Fig. 187: Power Window Motor
Courtesy of CHRYSLER GROUP, LLC

1. Pull the glass up evenly so front of glass can be verified it is seated into both glass run channels.
2. Push the glass down to seat the clips into regulator liftplates fully.
3. Pull up on the glass and make sure that it is secure.
4. Seal the glass disconnect holes (1) with a suitable foam tape or equivalent.

Fig. 188: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

5. Install the door trim panel. Refer to **PANEL, REAR DOOR TRIM, INSTALLATION**.

CREW CAB

Fig. 189: Power Window Motor
Courtesy of CHRYSLER GROUP, LLC

1. Pull the glass up evenly so front of glass can be verified it is seated into both glass run channels.
2. Push the glass down to seat the clips into regulator liftplates fully.
3. Pull up on the glass and make sure that it is secure.
4. Seal the glass disconnect holes (3) with a suitable foam tape or equivalent.

Fig. 190: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

5. Install the door speaker. Refer to **SPEAKER, INSTALLATION** .
6. Install the door trim panel. Refer to **PANEL, REAR DOOR TRIM, INSTALLATION**.

REGULATOR, WINDOW, MANUAL

DESCRIPTION

DESCRIPTION

Fig. 191: Window Regulators & Carrier Plate (Manual)
Courtesy of CHRYSLER GROUP, LLC

The window regulators (1) are serviced as an assembly with the carrier plate (2) and include the following parts:

- glass bumpers
- lock grommets
- release rod grommet
- handle bumper
- service plug

Refer to **PLATE, CARRIER, REMOVAL**.

REGULATOR, WINDOW, POWER

DESCRIPTION

DESCRIPTION

Fig. 192: Window Regulators & Carrier Plate (Manual)
Courtesy of CHRYSLER GROUP, LLC

The window regulators (1) are serviced as an assembly with the carrier plate (2) and include the following parts:

- glass bumpers
- lock grommets
- release rod grommet
- handle bumper
- service plug

Refer to **PLATE, CARRIER, REMOVAL**.

STRIKER, DOOR LATCH

ADJUSTMENTS

ADJUSTMENTS

Fig. 193: Rear Door Striker
Courtesy of CHRYSLER GROUP, LLC

1. Using a grease pencil or equivalent, mark the location of the door latch striker (1) on the C-pillar (2) to aid in adjustment.
2. Loosen the two bolts (3) that secure the door latch striker to the C-pillar.
3. To adjust the rear gap and flush measurement, change the position of the door latch striker and then tighten the two bolts to 28 N.m (21 ft. lbs.). Refer to **GAP AND FLUSH, SPECIFICATIONS**.
4. Verify correct door and latch position.

REMOVAL

REMOVAL

Fig. 194: Rear Door Striker
Courtesy of CHRYSLER GROUP, LLC

1. Using a grease pencil or equivalent, mark the location of the door latch striker (1) on the C-pillar (2).
2. Remove the two bolts (3) that secure the door latch striker to the C-pillar and remove the striker.

INSTALLATION

INSTALLATION

Fig. 195: Rear Door Striker
Courtesy of CHRYSLER GROUP, LLC

1. Position the door latch striker (1) onto the C-pillar (2) and loosely install the two bolts (3).
2. Align the door latch striker to the C-pillar using the reference marks made during the removal procedure and tighten the bolts to 28 N.m (21 ft. lbs.).
3. If necessary, adjust the door latch striker. Refer to **STRIKER, DOOR LATCH, ADJUSTMENTS**.

EXTERIOR

BOX, PICKUP

REMOVAL

PICKUP BOX

Fig. 196: Fuel Filler
Courtesy of CHRYSLER GROUP, LLC

NOTE: Long cargo box shown in illustration. Short cargo box similar.

1. Disconnect the fuel filler neck from the fuel tank. Refer to **TANK, FUEL, REMOVAL** or **TANK, FUEL, REMOVAL** .
2. Remove the fuel filler from the cargo box and position it out of the way.
3. If necessary, remove the fuel filler door from the cargo box. Refer to **DOOR, FUEL FILL, REMOVAL**.

Fig. 197: Pickup Box
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the tail lamp wire harness from the underbody wire harness.
5. If necessary, remove the tail lamp units and wire harness from the cargo box. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .
6. If necessary, remove the tailgate. Refer to **TAILGATE, REMOVAL**.
7. If necessary, remove the rear bumper. Refer to **BUMPER, REAR, REMOVAL** .
8. Remove the bolts (3) that secure the cargo box (1) to the frame (2) (six short box, eight long box) and remove the cargo box.

RAM BOX LOCK CYLINDER

Fig. 198: Lock Cylinder Cover
Courtesy of CHRYSLER GROUP, LLC

1. Open the Ram Box lid (1).
2. Remove the two screws (2) that secure the cover (3) to the lid latch.

Fig. 199: Lock Cylinder
Courtesy of CHRYSLER GROUP, LLC

3. Remove the nut (1) that secures the lock cylinder (3) to the lid latch (2).
4. Push the lock cylinder out through the latch and remove it from the outside of the lid.

RAM BOX STORAGE

Fig. 200: Removing/Installing Ram Box
Courtesy of CHRYSLER GROUP, LLC

1. Open the Ram Box lid (3).
2. Remove the four hinge bolts (2).
3. Remove the four bolts from the bottom (6).

4. Remove the two outboard bolts (5).
5. Remove the three inboard bolts (4).
6. Disconnect the electrical connector (1) and remove the ram box.

BED LINER

Fig. 201: Bed Liner
Courtesy of CHRYSLER GROUP, LLC

1. Open the tailgate.
2. Remove the plastic screw type rivets (3).
3. Lift up the center of the bottom of the linger and release the sides (2) from the box rails.
4. Remove the liner (1).

INSTALLATION

PICKUP BOX

Fig. 202: Pickup Box
Courtesy of CHRYSLER GROUP, LLC

NOTE: Long cargo box shown in illustration. Short cargo box similar.

1. Position the cargo box (1) onto the frame (2) and loosely install the bolts (3) (six short box, eight long box).
2. Align the cargo box to the cab and tighten the bolts to 108 N.m (80 ft. lbs.).
3. If removed, install tail lamp units and wire harness onto the cargo box. Refer to **LAMP, TAIL STOP TURN, INSTALLATION** .
4. Connect the tail lamp wire harness to the underbody wire harness.
5. If removed, install the tailgate. Refer to **TAILGATE, INSTALLATION**.
6. If removed, install the rear bumper. Refer to **BUMPER, REAR, INSTALLATION** .

Fig. 203: Fuel Filler
Courtesy of CHRYSLER GROUP, LLC

7. If removed, install the fuel filler door. Refer to **DOOR, FUEL FILL, INSTALLATION**.
8. Position the fuel filler (2) to the cargo box (3).
9. Connect the fuel filler neck at the fuel tank. Refer to **TANK, FUEL, INSTALLATION** or **TANK, FUEL, INSTALLATION** .

RAM BOX LOCK CYLINDER

Fig. 204: Lock Cylinder
Courtesy of CHRYSLER GROUP, LLC

1. Position the lock cylinder (3) to the outside of the Ram Box lid and push it through the lid latch (2).

2. Install and tighten the nut (1) that secures the lock cylinder to the lid latch. Tighten the nut to 8.6 N.m (6 ft. lbs.).

Fig. 205: Lock Cylinder Cover
Courtesy of CHRYSLER GROUP, LLC

3. Position the cover (3) over the latch on the underside of the lid (1).
4. Install and tighten the two screws (2) that secure the cover to the lid latch.
5. Close the Ram Box lid.

LOCK CYLINDER CODING INSTRUCTIONS

1. If present, remove the protective label from over the key slot on the face of the new lock cylinder.
2. Fully insert the key into the lock cylinder.
3. Slowly rotate the key clockwise 270 degrees.
4. Rotate the key counterclockwise back to the vertical position.
5. Remove the key from the lock cylinder.

RAM BOX STORAGE

Fig. 206: Removing/Installing Ram Box
Courtesy of CHRYSLER GROUP, LLC

1. Install the ram box.
2. Install the three inboard bolts (4).
3. Install the two outboard bolts (5).
4. Install the four bolts from the bottom (6).
5. Install the four hinge bolts (2).
6. Connect the electrical connector (1).

Fig. 207: Box Storage Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Tighten the bolts to 7 N.m (5 ft. lbs.) using the sequence shown in the illustration.

BED LINER

Fig. 208: Bed Liner
Courtesy of CHRYSLER GROUP, LLC

1. Place the liner (1) into the cargo box with the liner extension on top of the box front panel. Bend the liner along the middle of the floor and position the sides of the bed liner (2) under the box side rails.
2. Adjust as necessary to square the bed liner to the cargo box.
3. Drive the rivets (3) through the holes in the liner and into the holes in the d-pillar using a rubber mallet or equivalent.

COVER, COWL PANEL

REMOVAL

REMOVAL

Fig. 209: Front Cowl Cover
Courtesy of CHRYSLER GROUP, LLC

1. Remove the wiper arms. Refer to **ARM, WIPER, REMOVAL** .
2. Remove the push pins (2) that secure the front of the cowl cover (1) to the dash panel.
3. Pull the cowl cover forward to disengage the hooks from the windshield.
4. If necessary, remove the washer hose from the cowl cover.

INSTALLATION

INSTALLATION

1470837

Fig. 210: Front Cowl Cover
Courtesy of CHRYSLER GROUP, LLC

1. Position the panel assembly cowl cover (1) over the pivot shafts.
2. Push down on the cowl cover while moving it forward to make sure the six hooks are forward of the windshield edge.
3. Center cowl cover over the wiper pivot shafts, push down on the cowl cover then push rearward with both hands and slide hooks under the edge of the windshield.
4. Secure the front edge to the cowl by installing the push pins (2).
5. Fit soft rubber ends to fender by pulling up molded in feature to engage to fender flange.
6. Install the wiper arms. Refer to **ARM, WIPER, INSTALLATION** .

DOOR, FUEL FILL

REMOVAL

REMOVAL

Fig. 211: Removing/Installing Fuel Fill Door
Courtesy of CHRYSLER GROUP, LLC

1. Open the fuel filler door (1).
2. Remove the two bolts (2) that secure the fuel filler door to the cargo box and remove the door.

INSTALLATION

INSTALLATION

Fig. 212: Removing/Installing Fuel Fill Door
Courtesy of CHRYSLER GROUP, LLC

1. Position and align the fuel filler door (1) to the cargo box.
2. Install the two bolts (2) that secure the fuel filler door to the cargo box. Tighten the bolts to 9 N.m (80 in. lbs.).

FENDER, FRONT

REMOVAL

REMOVAL

Fig. 213: Radio Antenna Connector
Courtesy of CHRYSLER GROUP, LLC

1. Remove the radio antenna if necessary. Refer to **MAST, ANTENNA, REMOVAL** .

Fig. 214: Rear Upper Screw
Courtesy of CHRYSLER GROUP, LLC

2. Remove the headlamp unit. Refer to **UNIT, FRONT LAMP, REMOVAL** .
3. Open the door and remove the rear upper screw (1).

Fig. 215: Support Screws
Courtesy of CHRYSLER GROUP, LLC

4. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
5. Remove the front wheel opening molding. Refer to **MOLDING, FRONT WHEEL OPENING, REMOVAL**.
6. Remove the wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL**.
7. Remove the support screws (4).

Fig. 216: Fender Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Remove the battery tray (depending on fender being serviced). Refer to **TRAY, BATTERY, REMOVAL** .
9. Remove the bolts (1) and on the right side (3) and remove the fender (4).

INSTALLATION

INSTALLATION

Fig. 217: Fender Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the fender (4) onto the hydroform fender supports (2).
2. Loosely install the bolts (1) and (3) for the right side.

Fig. 218: Support Screws
Courtesy of CHRYSLER GROUP, LLC

3. Loosely install the support bolts (4).
4. Check and adjust the fender gap and flush. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
5. Tighten all the bolts to 9 N.m (80 in. lbs.).

Fig. 219: Rear Upper Screw
Courtesy of CHRYSLER GROUP, LLC

6. Install the bolt (1) and tighten to 9 N.m (80 in. lbs.).
7. Install the battery tray, if required. Refer to **TRAY, BATTERY, INSTALLATION** .
8. Install the wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION**.
9. Install the front wheel opening molding. Refer to **MOLDING, FRONT WHEEL OPENING, INSTALLATION**.
10. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
11. Install the headlamp unit. Refer to **UNIT, FRONT LAMP, INSTALLATION** .

Fig. 220: Radio Antenna Connector
Courtesy of CHRYSLER GROUP, LLC

12. Install the antenna, if necessary. Refer to **MAST, ANTENNA, INSTALLATION** .

GRILLE

REMOVAL

REMOVAL

Fig. 221: Upper Radiator Seal
Courtesy of CHRYSLER GROUP, LLC

1. Remove the four push pins (1).
2. Remove the two plastic rivets (2) and remove the upper radiator seal.

Fig. 222: Upper Grille Support Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the four upper grille support bolts (1).

Fig. 223: Grille Lower Spring Clips & Hooks
Courtesy of CHRYSLER GROUP, LLC

4. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, separate the two lower spring clips (2).

5. Release the two lower hooks (1) and remove the grille.

INSTALLATION

INSTALLATION

Fig. 224: Grille Lower Spring Clips & Hooks
Courtesy of CHRYSLER GROUP, LLC

1. Position the grille onto the front of the vehicle and locate using the tab (4).
2. Working from behind the grille, make sure the lower tabs (3) are positioned through the slots in the fascia.
3. Seat the lower spring clips (2) fully.

Fig. 225: Upper Grille Support Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the four upper bolts (1).

Fig. 226: Upper Radiator Seal
Courtesy of CHRYSLER GROUP, LLC

5. Position the upper radiator seal back into place over the radiator.
6. Install the four push pin fasteners (1) and seat fully.
7. Install the two plastic rivets (2) and seat fully.

ISOLATOR, BODY

REMOVAL

REMOVAL

Fig. 227: Mounting Bolts & Body Isolators
Courtesy of CHRYSLER GROUP, LLC

NOTE: Quad and club cab model shown in the illustration. Body isolators for regular cab models are similar.

1. Loosen all cab to frame mounting bolts (2) (six regular cab, eight quad and club cab).

Fig. 228: Body Isolators & Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable lifting device, lift the body to gain access to the isolators (1).
3. Remove the nuts (2) and remove the isolators as necessary.

INSTALLATION

INSTALLATION

Fig. 229: Body Isolators & Nuts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Whenever a body isolator bolt requires servicing or tightening, it is necessary to remove the bolt and install new thread locker compound to the threads.

NOTE: Quad cab model shown in the illustration. Body isolators for regular and club cab models are similar.

1. Position the isolators (1) under the cab as necessary.
2. Install the nuts (2).
3. Lower the cab onto the isolators (1) and install the mounting nuts (2).
4. Tighten the nuts to 68 N.m (50 ft. lbs.).

Fig. 230: Mounting Bolts & Body Isolators
Courtesy of CHRYSLER GROUP, LLC

5. Lower the cab onto the isolators and install the mounting bolts (2) and mass damper (1) as necessary (six Regular cab, eight Quad Cab).
6. Tighten the mounting bolts to 108 N.m (80 ft. lbs.).

MIRROR, OUTSIDE REARVIEW

REMOVAL

REMOVAL

Fig. 231: Door Module & Outside Rearview Mirror Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Remove the door trim panel as necessary to gain access to the mirror. Refer to **PANEL, DOOR TRIM, REMOVAL**.
2. If equipped, disconnect the wire harness connector (2) from the door module (3) and separate the support clip.

Fig. 232: Outside Rearview Mirror & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Remove the three nuts (2) that secure the mirror to the door and carefully remove the mirror.

INSTALLATION

INSTALLATION

Fig. 233: Outside Rearview Mirror & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. If equipped, position the wire harness (3) through the door.
2. Position the mirror (1) onto the door.
3. Install the three nuts (2) that secure the mirror to the door. Tighten the nuts to 7 N.m (60 in. lbs.).

Fig. 234: Door Module & Outside Rearview Mirror Harness Connector
Courtesy of CHRYSLER GROUP, LLC

4. If equipped, connect the wire harness connector (2) to the door module (3).
5. Install the door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.

MIRROR, OUTSIDE REARVIEW, GLASS

REMOVAL

REMOVAL

Fig. 235: Mirror Glass Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Move the mirror into the full down position.
2. Firmly and carefully grasp the mirror at the top (1) and pull out to separate the upper mounting clips.

Fig. 236: Hinge Type Clips
Courtesy of CHRYSLER GROUP, LLC

3. Separate the lower hinge type clips (1) and remove the mirror glass assembly.
4. Disconnect the electrical connectors (2), if equipped.

INSTALLATION

INSTALLATION

Fig. 237: Hinge Type Clips
Courtesy of CHRYSLER GROUP, LLC

1. Connect the electrical connectors (2), if equipped.
2. Position the mirror glass assembly into the housing and seat the lower hinge type clips (1) fully.

Fig. 238: Mirror Glass Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Push the top of the glass (1) back into the housing and seat the mounting clips fully.

MOLDING, FRONT WHEEL OPENING

REMOVAL

REMOVAL

1500 LIGHT DUTY

Fig. 239: Front Fender Flare & Center Push-Pin
Courtesy of CHRYSLER GROUP, LLC

1. Remove the seven fender flare retainers (1).

NOTE: Make sure the push-pin is completely removed.

2. Cut off the alignment push-pin (3) located in the middle of the fender flare.

CAUTION: Use of a trim stick maybe necessary to remove the fender flare. Use care not to scratch the paint.

3. Remove the fender flare (2) by starting at the bottom rear of the fender flare.

NOTE: Make sure all adhesive tape is removed.

4. Remove the adhesive tape from the fender using 3M General Purpose Adhesive Cleaner or equivalent.

Fig. 240: Front Fender Flare & Center Push-Pin (Heavy Duty)
Courtesy of CHRYSLER GROUP, LLC

1. Remove the six fender flare retainers (3).

NOTE: Make sure the push-pin is completely removed.

2. Cut off the alignment push-pin (1) located in the middle of the fender flare.

CAUTION: Use of a trim stick maybe necessary to remove the fender flare. Use care not to scratch the paint.

3. Remove the fender flare by starting at the bottom rear of the fender flare.

NOTE: Make sure all adhesive tape is removed.

4. Remove the adhesive tape from the fender using 3M General Purpose Adhesive Cleaner or equivalent.

FLARE MOLDING

Fig. 241: Flare Molding Push Pins
Courtesy of CHRYSLER GROUP, LLC

1. Remove the seven fender flare retainers (2).

Fig. 242: Flare Molding
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure the push-pin is completely removed.

2. Cut off the alignment push-pins (1) located in the middle of the fender flare.

CAUTION: Use of a trim stick maybe necessary to remove the fender flare. Use care not to scratch the paint.

3. Remove the fender flare by starting at the bottom rear of the fender flare.

FLARE EXTENSION MOLDING

Fig. 243: Flare Extension Molding Rivets
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rivets (3).
2. Remove the flare extension (2) from the front bumper assembly (1).

INSTALLATION

INSTALLATION

1500 LIGHT DUTY

Fig. 244: Front Fender Flare & Center Push-Pin
Courtesy of CHRYSLER GROUP, LLC

NOTE: Be sure the surface is clean and dry before installing the fender flare.

1. Wipe the fender surface with alcohol or equivalent and let dry for three minutes.
2. Align new front fender flare (2) by installing the center push-pin (3) first.

NOTE: It is important for a correct fit to hold the flare tight against the fender as the screws are tightened.

3. Loosely install the seven fender flare retainers (1).

Fig. 245: Retainer Tightening Sequence

Courtesy of CHRYSLER GROUP, LLC

4. Tighten the seven retainers (1) to 2.8 N.m (25 In. lbs.) using the sequence shown in illustration.
5. If any gaps are found, loosen the nearest retainers, apply pressure to the gap area and retighten the retainers. Repeat until all gaps are gone.

NOTE: Do not remove protective film until fender flare is secured and fits with no gaps.

6. Remove the protective film from the back of the fender flare and apply inward pressure the whole length of the fender flare.

2500/3500 HEAVY DUTY

Fig. 246: Front Fender Flare & Center Push-Pin (Heavy Duty)
Courtesy of CHRYSLER GROUP, LLC

NOTE: Be sure the surface is clean and dry before installing the fender flare.

1. Wipe the fender surface with alcohol or equivalent and let dry for three minutes.
2. Align new front fender flare (2) by installing the center push-pin (1) first.

NOTE: It is important for a correct fit to hold the flare tight against the fender as the screws are tightened.

3. Loosely install the six fender flare retainers (3).

Fig. 247: Retainer Tightening Sequence (Heavy Duty)
Courtesy of CHRYSLER GROUP, LLC

4. Tighten the six retainers (1) to 2.8 N.m (25 In. lbs.) using the sequence shown in illustration.
5. If any gaps are found, loosen the nearest retainers, apply pressure to the gap area and retighten the retainers. Repeat until all gaps are gone.

NOTE: Do not remove adhesive tape protective film until fender flare is secured and fits with no gaps.

6. Remove the protective film from the back of the fender flare and apply inward pressure the whole length of the fender flare.

FLARE MOLDING

Fig. 248: Flare Molding
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is important for a correct fit to hold the flare tight against the fender as the screws are tightened.

1. Position the flare (4) onto the vehicle and insert the alignment push pins (1) first to hold the flare in place.

   NOTE: Lift and push to the inside of the vehicle the rear portion of the wheel fender in order to reduce the gap between the flare and the sheet metal.

2. While lifting and holding the flare (4) to the rear lower portion of the fender (2) seat the remaining push pins (3) fully.

Fig. 249: Flare Molding Push Pins
Courtesy of CHRYSLER GROUP, LLC

3. Tighten the sever retainers (2) in sequence starting from the front screw, then the remaining screws in the direction from front to rear.

   Tighten retainers to 2.8 N.m (25 In. lbs.).

4. If any gaps are found, loosen the nearest retainers, apply pressure to the gap area and retighten the retainers. Repeat until all gaps are gone.

FLARE EXTENSION MOLDING

Fig. 250: Flare Extension Molding Rivets
Courtesy of CHRYSLER GROUP, LLC

1. Install the flare extension (2) onto the front bumper assembly (1) and install the rivets (3).

MOLDING, REAR WHEEL OPENING

REMOVAL

REMOVAL

Fig. 251: Fender Flare Retainers
Courtesy of CHRYSLER GROUP, LLC

1. Remove the eight fender flare retainers (3).

NOTE: Make sure the push-pin is completely removed.

2. Cut off the alignment push-pin (2) located in the middle of the fender flare.

CAUTION: Use of a trim stick maybe necessary to remove the fender flare. Use care not to scratch the paint.

3. Pull the fender flare off, starting at the bottom rear of the fender flare.

NOTE: Make sure all adhesive tape is removed.

4. Remove the adhesive tape from the fender using 3M General Purpose Adhesive Cleaner or equivalent.

INSTALLATION

INSTALLATION

Fig. 252: Rear Fender Flare & Center Push-Pin
Courtesy of CHRYSLER GROUP, LLC

NOTE: Be sure the surface is clean and dry before installing the rear fender flare.

1. Wipe the fender surface with alcohol and let dry for three minutes.
2. Align new rear fender flare (1) by installing the center push-pin (2) first.

Fig. 253: Aligning Fender Flare Groove
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Incorrect fender flare to fender flange installation will cause gaps between the fender and fender flare.**

3. Align the fender flare so that the groove at the bottom of the fender flare (1) completely wraps around the fender flange (2).

Fig. 254: Fender Flare Retainers
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It is important for a correct fit to hold the flare tight against the fender as the screws are tightened.**

4. Loosely install the eight fender flare retainers (3).

Fig. 255: Rear Retainer Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

5. Tighten the retainers to 2.8 N.m (25 In. Lbs.) on fender flare (1) using the sequence shown in illustration.
6. If any gaps are found, loosen nearest retainer, apply pressure to the gap area and retighten the retainer. Repeat until all gaps are gone.

NOTE: **Do not remove protective film until fender flare is secured and fits with no gaps.**

7. Remove the protective film from the back of the fender flare and apply inward pressure the whole length of the fender flare.

NAMEPLATE

REMOVAL

REMOVAL

Fig. 256: Name Plates
Courtesy of CHRYSLER GROUP, LLC

1 - "HEMI 5.7 LITER"
2 - "RAM HEAD MEDALLION"
3 - "4X4"
4 - "FLEX FUEL E85 ETHANOL"
5 - "SLT", "LONE STAR", "BIG HORN", "LARAMIE"
6 - "TRX4 OFF-ROAD"
7- "RAM"

NOTE: Standard Cab model shown in the illustration. Exterior name plates and decals for all other cab models are similar. Exterior name plate and decal usage vary by model.

1. As a guide for installation, apply a length of masking tape on the body, parallel to the top edge and, to one end of the name plate or decal being removed.

CAUTION: Do not exceed 52° C (120° F) when heating name plates, decals or body panels. Failure to follow this caution may result in damage to the name plates, decals and/or the vehicle paint finish.

2. If the temperature is below 21° C (70° F), warm the name plate or decal with a heat lamp or heat gun.

NOTE: The exterior name plates are attached to the body with adhesive tape.

3. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, carefully remove the name plate or decal from the body panel, as necessary.

INSTALLATION

INSTALLATION

Fig. 257: Name Plates
Courtesy of CHRYSLER GROUP, LLC

1 - "RAM"
2 - "TRX4 OFF-ROAD"
3 - "SLT", "LONE STAR", "BIG HORN", "LARAMIE"
4 - "FLEX FUEL E85 ETHANOL"
5 - "4X4"
6 - "RAM HEAD MEDALLION"

NOTE: Standard Cab model shown in the illustration. Exterior name plates and decals for all other cab models are similar. Exterior name plate and decal usage vary by model.

1. Thoroughly clean all residue from the name plate or decal attachment areas of the body.
2. Wipe the attachment areas with a clean, lint-free cloth, moistened with a 50% solution of water and alcohol and then wipe dry the areas immediately with a dry, lint-free cloth.

CAUTION: Do not exceed 52° C (120° F) when heating name plates, decals or body panels. Failure to follow this caution may result in damage to the name plates, decals and/or the vehicle paint finish.

NOTE: If ambient temperatures are below 21° C (70° F), warm the name plate or decal and body panel with a heat lamp or gun to assure proper adhesion.

3. Remove the protective covering from the back of name plate or decal and position the name plate or decal onto the body using the previously installed guide tape.

NOTE: **To ensure proper name plate or decal adhesion, apply consistent and uniform pressure of approximately 40 p.s.i. over the entire surface of each name plate or decal.**

4. Install the name plate or decal onto the body.

PANEL, CLOSURE, RADIATOR

REMOVAL

REMOVAL

1. Disconnect and isolate battery negative cable.
2. Remove the grille. Refer to **GRILLE, REMOVAL**.
3. Remove the washer bottle, if necessary. Refer to **RESERVOIR, WINDSHIELD WASHER, REMOVAL** .
4. Remove the coolant bottle, if necessary. Refer to **BOTTLE, COOLANT RECOVERY, REMOVAL** .
5. Remove the hood latch. Refer to **LATCH, HOOD, REMOVAL**.
6. Remove the front bumper. Refer to **BUMPER, FRONT, REMOVAL** .
7. Remove the A/C condenser, if equipped. Refer to **CONDENSER, A/C, REMOVAL** .
8. Remove the charge air cooler, if equipped. Refer to **COOLER AND HOSES, CHARGE AIR, REMOVAL, 6.7L** .
9. Remove the headlamps. Refer to **UNIT, FRONT LAMP, REMOVAL** .
10. Remove the air cleaner. Refer to **AIR CLEANER, REMOVAL, 3.7L** or **AIR CLEANER, REMOVAL, 4.7L** or **AIR CLEANER, REMOVAL, 5.7L** or **AIR CLEANER, REMOVAL, 6.7L** .

Fig. 258: Foam & Push Pin Fasteners

Courtesy of CHRYSLER GROUP, LLC

11. Separate the push pin fasteners (2) and remove the foam (1).
12. Remove the upper radiator bolts and position back supported in the vehicle.
13. Disconnect the TIPM.
14. Remove the trim pieces below the headlights, if equipped.
15. Open the access covers in the wheelhouse splash shields and remove the bolts supporting the fender on each side.
16. Remove the bolts and disconnect any ground cables as necessary.

Fig. 259: Closure Panel & Front End Sheet Metal Mounting
Courtesy of CHRYSLER GROUP, LLC

17. Remove the upper (2) and lower (4) bolts supporting the closure panel (1) to the front end sheet metal mounting (3).
18. Carefully remove the closure making sure the paint on the front edge of the fenders is protected from damage.

INSTALLATION

INSTALLATION

Fig. 260: Closure Panel & Front End Sheet Metal Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Carefully position the closure assembly (1) up onto the front end sheet metal mounting (3) and avoid damaging the front edges of the fenders.
2. Install the lower bolts (4) and tighten to 20 N.m (15 ft. lbs.)
3. Install the upper bolts (2) and tighten to 20 N.m (15 ft. lbs.)
4. Install the ground cables and install the bolts if necessary.
5. Install the fender support bolt from inside the wheelhouse splash shield.
6. Install the trim pieces below the headlights, if equipped.
7. Connect the TIPM electrical connectors and position the TIPM back into place.
8. Position the radiator back and insert the lower radiator mounts.
9. Install the upper radiator bolts.

Fig. 261: Foam & Push Pin Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Install the foam (1) and seat the push pin fasteners (2) fully.
11. Install the air cleaner assembly. Refer to **AIR CLEANER, INSTALLATION, 3.7L** or **AIR CLEANER, INSTALLATION, 4.7L** or **AIR CLEANER, INSTALLATION, 5.7L** or **AIR CLEANER, INSTALLATION, 6.7L** .
12. Install the headlamps. Refer to **UNIT, FRONT LAMP, INSTALLATION** .
13. Install the charge air cooler, if equipped. Refer to **COOLER AND HOSES, CHARGE AIR, INSTALLATION, 6.7L** .
14. Install the A/C condenser, if equipped. Refer to **CONDENSER, A/C, INSTALLATION** .
15. Install the front bumper. Refer to **BUMPER, FRONT, INSTALLATION** .
16. Install the hood latch. Refer to **LATCH, HOOD, INSTALLATION**.
17. Install the coolant bottle, if necessary. Refer to **BOTTLE, COOLANT RECOVERY, INSTALLATION** .
18. Install the washer bottle, if necessary. Refer to **RESERVOIR, WINDSHIELD WASHER, INSTALLATION** .
19. Install the grille. Refer to **GRILLE, INSTALLATION**.

SHIELD, SPLASH, FRONT WHEELHOUSE

REMOVAL

REMOVAL

Fig. 262: Inner Shield Push Pins
Courtesy of CHRYSLER GROUP, LLC

1. Release the ABS harness push pin from the inner shield.
2. Remove the push pins (2, 3, 4).

Fig. 263: Inner Shield Screws
Courtesy of CHRYSLER GROUP, LLC

3. Remove the inner screws (3 and 4).
4. Remove the screws securing the shield to the fascia and the outer fender flange (2).
5. Release the outboard edge of the shield (1) from the fender flange and remove the shield (1).

INSTALLATION

INSTALLATION

Fig. 264: Inner Shield Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the shield (1) inside the wheelhouse opening and tuck the outboard edge of the shield behind the flange on the fender outer panel.
2. Align and secure the outboard edge of the splash shield to the outer fender. Drive the screws (2) through the fender flange and into the shield.
3. Install the screw (3) and install the screw (4).

Fig. 265: Inner Shield Push Pins
Courtesy of CHRYSLER GROUP, LLC

4. Install the push pin (2) and seat fully.
5. Install the push pin (4) and seat fully.
6. Install the push pin (3) and seat fully.
7. Secure the ABS harness push pin to the inner shield and seat fully.

SHIELD, SPLASH, REAR WHEELHOUSE

REMOVAL

REMOVAL

Fig. 266: Rear Wheelhouse Splash Shield Screws
Courtesy of CHRYSLER GROUP, LLC

1. Remove the inner screw (1).
2. Remove the three screws (3) and remove the splash shield (2).

INSTALLATION

INSTALLATION

Fig. 267: Rear Wheelhouse Splash Shield Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear splash shield (2) onto the cargo box.
2. Install the three screws (3).
3. Install the inner screw (1).

TIE DOWN, PICKUP BOX

REMOVAL

REMOVAL

Fig. 268: Tie Down Cleat
Courtesy of CHRYSLER GROUP, LLC

1. Remove the two bolts (1) that secure each cargo box tie down (2) to the cargo bed and remove the cleats as necessary.

INSTALLATION

INSTALLATION

Fig. 269: Tie Down Cleat
Courtesy of CHRYSLER GROUP, LLC

1. Position the cargo box tie downs (2) to the cargo box as necessary.
2. Install the two bolts (1) that secure each cargo box tie down to the cargo box. Tighten the bolts to 34 N.m (25 ft. lbs.).

HOOD

CABLE, HOOD RELEASE

REMOVAL

REMOVAL

Fig. 270: Hood Release Cable
Courtesy of CHRYSLER GROUP, LLC

1. Release the cable end (1) from the latch mechanism (5) and release the collar (2) from the latch.
2. Release the support clip (4).

Fig. 271: Hood Release Cable Retainers
Courtesy of CHRYSLER GROUP, LLC

3. Remove the three hood release cable retainers (2) from the upper radiator crossmember and the left fender rail.

Fig. 272: Hood Release Handle
Courtesy of CHRYSLER GROUP, LLC

4. From inside the vehicle, release the clips attaching the hood release handle to the instrument panel.
5. Remove the grommet from the cowl panel and remove the hood release cable and handle assembly.

INSTALLATION

INSTALLATION

Fig. 273: Hood Release Handle
Courtesy of CHRYSLER GROUP, LLC

1. Position the handle (1) and align the clips to the instrument panel feature location.

2. Press handle to seat the clips to the instrument panel.

Fig. 274: Hood Release Cable Retainers
Courtesy of CHRYSLER GROUP, LLC

3. Route the latch end of hood latch release cable tube through the dash panel and into the engine compartment. Feed the entire length of the cable through the dash panel.
4. Press the grommet (1) into the hole in the dash panel by hand until fully seated.
5. Route the cable along the fender rail and to the outboard and front of the vertical support post and seat the mounting clips (2) fully.

Fig. 275: Hood Release Cable
Courtesy of CHRYSLER GROUP, LLC

6. Route cable (3) through the front end module and on to the latch (5).
7. Align and insert end of cable (1) to the mechanism on the latch (5).
8. Press the collar (2) into the hole and snap into place.
9. Seat the mounting clips (4) fully.

HINGE, HOOD

REMOVAL

REMOVAL

Fig. 276: Hood Hinge
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It is not necessary to remove the hood to replace the hood hinges. Hood hinges can be replaced one at a time.**

1. Using a grease pencil or equivalent, mark the position of the hood hinge (1) on the hood for the hinge being serviced.
2. Support the hood and disconnect the gas prop from the hood. Refer to **PROP, GAS, REMOVAL**.
3. Remove the two nuts (2) that secure the hood to the hood hinge.
4. Remove the wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL**.
5. Remove the bolts (4) that secure the hood hinge (1) to the fender rail (3).
6. Slide the hood hinge forward and remove the hinge.

INSTALLATION

INSTALLATION

Fig. 277: Hood Hinge
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It is not necessary to remove the hood to replace the hood hinges. Hood hinges can be replaced one at a time.**

1. Position the hood hinge (2) onto the fender rail (1) and slide it rearward to its installed location.
2. Install the bolts (4) that secure the hood hinge to the fender rail and tighten to 19 N.m (14 ft. lbs.).
3. Loosely install the two nuts (2) that secure the hood to the hood hinge.
4. Align the hood to the hood hinge using the reference marks made during the Removal procedure and tighten the nuts to 18 N.m (13 ft. lbs.).
5. Install the support cylinder. Refer to **PROP, GAS, INSTALLATION**.
6. If required, adjust the hood to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
7. Install the wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION**.
8. Install the cowl grille. Refer to **COVER, COWL PANEL, INSTALLATION**.

HOOD

REMOVAL

REMOVAL

Fig. 278: Hood Gas Prop
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Using a grease pencil or equivalent, mark the position of the hood hinges (2) on the hood.
3. Support the hood and disconnect the gas prop (2) from the hood. Refer to **PROP, GAS, REMOVAL**.

Fig. 279: Hood Hinge
Courtesy of CHRYSLER GROUP, LLC

4. Remove the two nuts (2) that secure the hood to each hood hinge (1) and remove the hood.

INSTALLATION

INSTALLATION

Fig. 280: Hood Hinge
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Vehicle Emission Control Information (VECI) label(s) must be in place for the life of the vehicle. When replacing the component in which the VECI label is adhered, a new VECI label must also be adhered to the new component.**

1. Position the hood onto the hood hinges (1) and loosely install the two nuts (2) that secure the hood to each hood hinge.
2. Align the hood to the hood hinges using the reference marks made during the Removal procedure and tighten the nuts to 18 N.m (13 ft. lbs.).
3. Install the support cylinders to the hood. Refer to **PROP, GAS, INSTALLATION**.
4. Reconnect the negative battery cable.
5. If required, adjust the hood to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.

LATCH, HOOD

REMOVAL

REMOVAL

Fig. 281: Hood Latch
Courtesy of CHRYSLER GROUP, LLC

1. Remove the grille. Refer to **GRILLE, REMOVAL**.
2. Using a grease pencil or equivalent, mark the position of the hood latch (1) on the upper radiator crossmember.
3. Remove the two bolts (3) that secure the hood latch to the upper radiator crossmember.

Fig. 282: Hood Release Cable
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the hood latch cable (1) from the hood latch and remove the latch.

INSTALLATION

INSTALLATION

Fig. 283: Hood Release Cable
Courtesy of CHRYSLER GROUP, LLC

1. Connect the hood latch cable (1) to the hood latch (5).

Fig. 284: Hood Latch
Courtesy of CHRYSLER GROUP, LLC

2. Position the hood latch to the upper radiator crossmember and loosely install the two bolts (2) that secure the latch to the crossmember.
3. Align the hood latch to the upper radiator crossmember using the reference marks made during the Removal procedure and tighten the bolts to 11 N.m (8 ft. lbs.).
4. If required, adjust the hood to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.

PROP, GAS

REMOVAL

REMOVAL

Fig. 285: Releasing Retaining Clip While Pulling Ball Socket Away From Ball Stud
Courtesy of CHRYSLER GROUP, LLC

NOTE: The hood support cylinders can be replaced one at a time.

1. Open and support the hood.

CAUTION: Do not pull on the hood support cylinders at the middle of the support cylinder during removal. Failure to follow this caution can result in damage to the hood support cylinders.

2. Using a small flat bladed tool, or equivalent (3), release the retaining clip (2) at each end of the support cylinder while carefully pulling the ball socket (1) away from the ball stud (4).

Fig. 286: Support Cylinder Retaining Clip
Courtesy of CHRYSLER GROUP, LLC

1 - RETAINING CLIP
2 - BALL SOCKET
3 - BALL STUD

NOTE: Lift the clips (1) only enough to release the ball studs (3).

Fig. 287: Hood Gas Prop
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the hood support cylinder (2) from the hood and the fender rail (1).

INSTALLATION

INSTALLATION

Fig. 288: Hood Gas Prop
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not push on the hood support cylinders at the middle of the support cylinder during installation. Failure to follow this caution can result in damage to the hood support cylinders.

NOTE: Install the hood support cylinders with the cylinder end connected to the hood as shown in illustration.

NOTE: If required, only release each retaining clip enough to install the ball socket onto the ball stud.

1. Install the hood support cylinder (2) over the upper and lower ball studs and fully engage the retaining clips.

STRIKER, HOOD

REMOVAL

REMOVAL

Fig. 289: Hood Striker
Courtesy of CHRYSLER GROUP, LLC

1. Remove the two bolts (2) that fasten the striker to the hood and remove the striker (1).

INSTALLATION

INSTALLATION

Fig. 290: Hood Striker
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Make sure the striker assembly is seated into the pocket on the hood inner. If not seated correctly, the striker will damage the paint when

secured.

1. Install the striker and install the bolts.
2. Tighten the bolts to 17 N.m (12.5 ft. lbs.)

INSTRUMENT PANEL

WARNING

WARNING

WARNING: **To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.**

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate**

the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: **To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.**

WARNING: **To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.**

WARNING: **To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the**

service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: **To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.**

BEZEL, INSTRUMENT CLUSTER

REMOVAL

REMOVAL

WARNING: **On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and personal or fatal injury.**

Fig. 291: Instrument Cluster Bezel, Instrument Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the fasteners (2) that secure the top of the instrument cluster bezel (3) to the instrument panel (1).

Fig. 292: Instrument Panel Cluster Bezel
Courtesy of CHRYSLER GROUP, LLC

3. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retainer clips that secure the instrument cluster bezel (2) to the instrument panel (1) and remove the bezel.

INSTALLATION

INSTALLATION

Fig. 293: Instrument Cluster Bezel

Courtesy of CHRYSLER GROUP, LLC

1. Install the instrument cluster bezel onto the instrument panel and fully engage the retainer clips to the instrument panel.

Fig. 294: Instrument Cluster Bezel, Instrument Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Install the fasteners (2) that secure the instrument cluster bezel (3) to the instrument panel (1).
3. Connect the negative battery cable.

BEZEL, INSTRUMENT PANEL, CENTER

REMOVAL

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and personal or fatal injury.

1. Disconnect and isolate the negative battery cable.

BEZEL, INSTRUMENT PANEL, DRIVER SIDE

REMOVAL

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and personal or fatal injury.

Fig. 313: Lower Drivers Side Bezel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, from the notch on the bottom, remove the left instrument panel side cover.
3. Remove the left cowl trim panel. Refer to **PANEL, COWL TRIM, REMOVAL**.
4. Remove the two screws (1) that secure the lower driver side instrument panel bezel (4) to the instrument panel.
5. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining clips that secure the top of the lower driver side instrument panel bezel to the instrument panel.
6. Tilt the top of the lower driver side instrument panel bezel downward and, If equipped, disconnect the wire harness connector (3) from the adjustable pedal switch (2).
7. Remove the lower driver side instrument panel bezel from the lower retaining hooks and remove the bezel.

INSTALLATION

INSTALLATION

Fig. 314: Lower Drivers Side Bezel
Courtesy of CHRYSLER GROUP, LLC

1. Position the lower driver side instrument panel bezel onto the lower retaining hoods located on the instrument panel.
2. If equipped, connect the wire harness connector (3) to the adjustable pedal switch (2).
3. Tilt the top of the lower driver side instrument panel bezel upward and fully engage the bezel retaining clips to the instrument panel.
4. Install the two screws (1) that secure the lower driver side instrument panel bezel to the instrument panel. Tighten the screws to 2 N.m (17 in. lbs.).
5. Install the left side cowl trim panel. Refer to **PANEL, COWL TRIM, INSTALLATION**.
6. Install the left instrument panel side cover.
7. Reconnect the negative battery cable.

BIN, INSTRUMENT PANEL

REMOVAL

REMOVAL

NOTE: Add graphic of Storage box fastener.

Fig. 315: Storage Bin Fastener
Courtesy of CHRYSLER GROUP, LLC

1. Remove glove box from instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL**.
2. Through the glove box opening remove storage bin fastener (2) located at the back of the storage bin (1).

Fig. 316: Storage Bin
Courtesy of CHRYSLER GROUP, LLC

3. Open storage bin door (1).

4. Disengage the retainer clips that secure the storage bin (2) to the instrument panel (3).
5. Partial remove the storage bin and disconnect the storage bin light electrical connector.
6. Remove storage bin (2) from vehicle.

INSTALLATION

INSTALLATION

Fig. 317: Storage Bin
Courtesy of CHRYSLER GROUP, LLC

1. Partial install the storage bin and connect the storage bin light electrical connector.
2. Engage the storage bin retainer clips and fully seat the storage bin (2) to the instrument panel (3).
3. Close storage bin door (1).

NOTE: Insert storage bin fastener graphic

Fig. 318: Storage Bin Fastener
Courtesy of CHRYSLER GROUP, LLC

4. Through the glove box opening install the storage bin fastener (2) at rear of storage bin (1).
5. Install the glove box to the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION**.

COVER, INSTRUMENT PANEL

REMOVAL

REMOVAL

WARNING: **On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and personal or fatal injury.**

1. Disconnect and isolate the negative battery cable.
2. Remove the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL**.
3. Remove the steering column as necessary. Refer to **COLUMN, REMOVAL** .
4. Remove the Wireless Ignition Node from the vehicle. Refer to **RECEIVER, WIRELESS IGNITION NODE, REMOVAL** .

1433313

Fig. 319: Floor Console
Courtesy of CHRYSLER GROUP, LLC

5. Remove the floor console, if equipped. Refer to **CONSOLE, FLOOR, REMOVAL**.
6. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent remove the Lower Center Bezel.

80d407a9

Fig. 320: A-Pillar Trim/Grab Handle
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

7. Remove the left and right A-pillar trim. Refer to **PANEL, A-PILLAR TRIM, WITH GRAB HANDLE, REMOVAL**.
8. Remove the Defroster Grille

Fig. 321: Fence Line Bolt Access Covers
Courtesy of CHRYSLER GROUP, LLC

9. Remove fence line bolt access covers.
10. Remove fence line bolts.
11. Remove the instrument panel center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL**.
12. Remove the Radio. Refer to **RADIO, REMOVAL** .
13. Remove right and left power outlets and bezels.

Fig. 322: Instrument Panel Cluster Bezel
Courtesy of CHRYSLER GROUP, LLC

14. Remove the instrument panel cluster bezel. Refer to **BEZEL, INSTRUMENT CLUSTER, REMOVAL**.

Fig. 323: Instrument Cluster Housing, Rear Cover & Hood Unit
Courtesy of CHRYSLER GROUP, LLC

15. Remove the instrument cluster. Refer to **REMOVAL** .
16. Remove the parking brake Lever bezel. Refer to **HANDLE, PARKING BRAKE RELEASE, REMOVAL** .

Fig. 324: Headlamp Switch & Left Distribution Register
Courtesy of CHRYSLER GROUP, LLC

17. Remove the headlamp switch / left distribution register. Refer to **SWITCH, HEADLAMP, REMOVAL** .
18. Remove the left and right instrument panel speakers. Refer to **SPEAKER, REMOVAL** .

22. Remove the instrument panel storage bin. (2). Refer to **BIN, INSTRUMENT PANEL, REMOVAL**.

Fig. 329: Passenger Air Bag
Courtesy of CHRYSLER GROUP, LLC

23. Remove the passenger air bag (1). Refer to **AIR BAG, PASSENGER, REMOVAL** .
24. Remove the 23 instrument panel cover fasteners.
25. Partial remove the instrument panel cover to access and disconnect the PAB harness.
26. Remove the instrument panel cover from the vehicle.

INSTALLATION

INSTALLATION

1. Partial install the instrument panel cover into the vehicle access and connect the PAB harness.
2. Install the 23 instrument panel cover fasteners.

Fig. 330: Passenger Air Bag
Courtesy of CHRYSLER GROUP, LLC

3. Install the passenger air bag. Refer to **AIR BAG, PASSENGER, INSTALLATION** .

Fig. 331: Storage Bin
Courtesy of CHRYSLER GROUP, LLC

4. Install the instrument panel storage bin. Refer to **BIN, INSTRUMENT PANEL, INSTALLATION**.

Fig. 332: Glove Box
Courtesy of CHRYSLER GROUP, LLC

5. Install the glove box from the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION**.

Fig. 333: Right Distribution Register
Courtesy of CHRYSLER GROUP, LLC

6. Install the right distribution register. Refer to **OUTLET, AIR, INSTALLATION** .

Fig. 334: Sun Sensor & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

7. Install the center Instrument panel speaker and sun sensor. Refer to **SPEAKER, INSTALLATION** .
8. Install the left and right instrument panel speakers. Refer to **SPEAKER, INSTALLATION** .

Fig. 335: Headlamp Switch & Left Distribution Register
Courtesy of CHRYSLER GROUP, LLC

9. Install the headlamp switch / left distribution register. Refer to **SWITCH, HEADLAMP, INSTALLATION** .
10. Install the parking brake Lever bezel.

Fig. 336: Instrument Cluster Housing, Rear Cover & Hood Unit
Courtesy of CHRYSLER GROUP, LLC

11. Install the instrument cluster. Refer to **INSTALLATION** .

Fig. 337: Instrument Panel Cluster Bezel
Courtesy of CHRYSLER GROUP, LLC

12. Install the instrument panel cluster bezel. Refer to **BEZEL, INSTRUMENT CLUSTER, INSTALLATION**.
13. Install right and left power outlets and bezels.
14. Install the Radio. Refer to **RADIO, INSTALLATION** .
15. Install the instrument panel center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, INSTALLATION**.

Fig. 338: Fence Line Bolt Access Covers
Courtesy of CHRYSLER GROUP, LLC

16. Install fence line bolt access covers.
17. Install fence line bolts.
18. Install the Defroster Grille

Fig. 339: A-Pillar Trim/Grab Handle

Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

19. Install the left and right A-pillar trim. Refer to **PANEL, A-PILLAR TRIM, WITH GRAB HANDLE, INSTALLATION**.
20. Install the Lower Center Bezel.

Fig. 340: Floor Console
Courtesy of CHRYSLER GROUP, LLC

21. Install the floor console, if equipped. Refer to **CONSOLE, FLOOR, INSTALLATION**.
22. Install the WIC Module and install the WIC Module fasteners.
23. Connect the WIC Module electrical connectors.
24. Install the steering column as necessary. Refer to **COLUMN, INSTALLATION** .
25. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION**.
26. Connect the negative battery cable.

COVER, STEERING COLUMN OPENING

REMOVAL

REMOVAL

Fig. 341: Steering Column Opening Cover & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retainer clip that secures the hood release to the steering column opening cover, and remove the hood release handle from the cover.
2. Remove the two fasteners (2) that secure the bottom of the steering column opening cover (1) to the instrument panel.

Fig. 342: Data Link Connector
Courtesy of CHRYSLER GROUP, LLC

3. Remove the Data Link Connector (3) from the steering column opening cover (2) by pressing in the tabs (1) and pushing the connector through the opening on the back side of the cover.

Fig. 343: Steering Column Opening Cover
Courtesy of CHRYSLER GROUP, LLC

4. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, release the retainer clips that secure the steering column opening cover (1) to the instrument panel and remove the cover.

INSTALLATION

INSTALLATION

Fig. 344: Steering Column Opening Cover
Courtesy of CHRYSLER GROUP, LLC

1. Position the steering column opening cover (2) to the instrument panel and fully engage the retainer clips to the instrument panel.

Fig. 345: Data Link Connector
Courtesy of CHRYSLER GROUP, LLC

2. Install the Data Link Connector (3) to the steering column opening cover (2) by pushing the connector through the opening on the back side of the cover and fully engaging the lock tabs (1) of the connector.

Fig. 346: Steering Column Opening Cover & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Install the two fasteners (2) that secure the steering column opening cover (1) to the instrument panel.
4. Position the hood release hand onto the column opening cover and fully engage the retainer clip that secures the hood release handle to the steering column opening cover.

CUPHOLDER, INSTRUMENT PANEL

REMOVAL

REMOVAL

Fig. 347: Lower Closeout Trim
Courtesy of CHRYSLER GROUP, LLC

1. Remove the center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL**.
2. Remove the lower closeout trim (1).

Fig. 348: Side Trim & Screws
Courtesy of CHRYSLER GROUP, LLC

3. Remove the screws (1) and separate the side trim (2).

Fig. 349: Cup Holder
Courtesy of CHRYSLER GROUP, LLC

4. Remove the cup holder (1).

INSTALLATION

INSTALLATION

Fig. 350: Cup Holder
Courtesy of CHRYSLER GROUP, LLC

1. Position the cup holder (1) onto the alignment tabs and seat fully.

Fig. 351: Side Trim & Screws
Courtesy of CHRYSLER GROUP, LLC

2. Install the lower side trim panels (2) and install the screws (1).

Fig. 352: Lower Closeout Trim
Courtesy of CHRYSLER GROUP, LLC

3. Position the lower closeout trim (1) back and seat the clips fully.
4. Install the center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, INSTALLATION**.

GLOVE BOX, INSTRUMENT PANEL

REMOVAL

REMOVAL

Fig. 353: Glove Box
Courtesy of CHRYSLER GROUP, LLC

1. Open the glove box (2).
2. Release the two glove box stops (1) and lower the glove box (2) downward past the stops.

Fig. 354: Glove Box Hinges
Courtesy of CHRYSLER GROUP, LLC

3. Disengage the glove box hinges (1) from the instrument panel and remove the glove box (2).

INSTALLATION

INSTALLATION

Fig. 355: Glove Box Hinges
Courtesy of CHRYSLER GROUP, LLC

1. Engage the hinges (1) of the glove box (2) to the instrument panel.

Fig. 356: Glove Box
Courtesy of CHRYSLER GROUP, LLC

2. Press downward on the back edge of the glove box (2) and raise the glove box past the two stops (1).
3. Close the glove box.

PANEL, INSTRUMENT

REMOVAL

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and personal or fatal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the front seat assembly. Refer to **SEAT, FRONT, REMOVAL** and **SEAT, FRONT CENTER, REMOVAL**.

Fig. 357: Cowl Trim Panel & Retainer Clips
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

3. Remove the left cowl trim panel. Refer to **PANEL, COWL TRIM, REMOVAL**.

1433349

21. Remove the three bolts (1) that secure the right side instrument panel bracket to the dash panel.

1432912

Fig. 372: Fence Line Bolt Access Covers
Courtesy of CHRYSLER GROUP, LLC

22. Remove fence line bolt access covers.
23. Remove fence line bolts.
24. Pull carpet back as necessary to remove the ground eyelet fastener at ORC/YAWL Modules
25. Disconnect the ORC Module electrical connector and remove the wiring from under the carpet.
26. With the help of an assistant, lift the instrument panel up and off of the cowl panel and remove the instrument panel from the vehicle.

INSTALLATION

INSTALLATION

1. With the help of an assistant, position the instrument panel (5) into the vehicle and install the right side guide pin and the left side guide hook to the sides of the cowl panel.
2. Connect the ORC Module electrical connector and position the wiring under the carpet.
3. Install the ground eyelet fastener at ORC/YAWL Modules and position the carpet back as necessary.

Fig. 373: Fence Line Bolt Access Covers
Courtesy of CHRYSLER GROUP, LLC

4. Install the fence line bolts on top of I/P.
5. Tighten the bolts to 12 N.m (9 ft. lbs.).
6. Install the fence line bolt access covers.

Fig. 374: Right Side Instrument Panel Bracket To Dash Panel Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Install the three bolts (1) that secure the right side instrument panel bracket to the cowl panel.
8. Tighten the bolts to 12 N.m (9 ft. lbs.).

21. Install the three bolts (1) that secure the left side of the instrument panel to the dash panel.

Fig. 385: Instrument Panel Side Cover
Courtesy of CHRYSLER GROUP, LLC

22. Install the left instrument panel side cover fully engaging the retainer clips.

Fig. 386: A-Pillar Trim/Grab Handle
Courtesy of CHRYSLER GROUP, LLC

23. Install the left A-pillar trim. Refer to **PANEL, A-PILLAR TRIM, WITH GRAB HANDLE, INSTALLATION**.
24. Install the steering column as necessary. Refer to **COLUMN, INSTALLATION** .

Fig. 387: Instrument Panel Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

25. Connect the instrument panel wire harness connector (2) located above the brake pedal to the bulkhead wire harness connector (1).
26. Install the steering column opening cover Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION**.

Fig. 388: Cowl Trim Panel & Retainer Clips
Courtesy of CHRYSLER GROUP, LLC

27. Install the left cowl trim panel. Refer to **PANEL, COWL TRIM, INSTALLATION**.
28. Install the front seat assembly. Refer to **SEAT, FRONT, INSTALLATION** and **SEAT, FRONT CENTER, INSTALLATION**.
29. Reconnect the negative battery cable.

INTERIOR

CAUTION

CAUTION

CAUTION: Do not attempt to remove interior trim panels or moldings without first removing the necessary adjacent trim panels or moldings. To avoid damaging the trim panels, ensure that all the fasteners are removed or disengaged before attempting to remove interior trim panels or moldings. Trim panels are somewhat flexible but can be damaged if handled improperly.

BEZEL, CENTER CONSOLE

REMOVAL

REMOVAL

1. Position the rear storage compartment (1) onto the rear cab trim panel and install the three bolts (2).

CARPET, FLOOR

REMOVAL

REMOVAL

Fig. 397: Floor Carpet
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Carpet for quad can model shown in illustration. Regular cab similar.**

NOTE: **The floor mat hook is serviced separately from the carpet, do not replace the carpet do to a broken floor mat hook.**

1. Remove the front seats. Refer to **SEAT, FRONT, REMOVAL** and **SEAT, FRONT CENTER, REMOVAL**.
2. If equipped, remove the floor console. Refer to **CONSOLE, FLOOR, REMOVAL**.
3. If equipped, remove the storage bins. Refer to **BIN, STORAGE, REMOVAL**.
4. If equipped, remove the rear sub-woofer. Refer to **SPEAKER, REMOVAL** .
5. Remove the lower B-pillar trim panels. Refer to **PANEL, B-PILLAR TRIM, LOWER, REMOVAL**.
6. Remove the jack assemblies.
7. Remove the nine push pin fasteners (2) on the quad cab models.
8. Remove the carpet (1) from the vehicle.

Fig. 398: Rear Storage Bin Carpet
Courtesy of CHRYSLER GROUP, LLC

9. If required, separate the seat belts from the floor on both sides. Refer to **SEAT BELT, REMOVAL** .
10. Remove the rear storage bin carpet (1), if equipped.

INSTALLATION

INSTALLATION

Fig. 399: Rear Storage Bin Carpet
Courtesy of CHRYSLER GROUP, LLC

1. Install the rear storage bin carpet (1), if equipped.
2. If required, install the seatbelts to the floor. Refer to **SEAT BELT, INSTALLATION** .

Fig. 400: Floor Carpet
Courtesy of CHRYSLER GROUP, LLC

NOTE: Carpet for quad cab model shown in illustration. Regular cab similar.

3. Position the carpet (1) into the vehicle.
4. On quad cab models, install the nine push-pin fasteners (2) that secure the carpet to the floor panel.
5. Install the lower B-pillar trim panels. Refer to **PANEL, B-PILLAR TRIM, LOWER, INSTALLATION**.
6. If equipped, install the sub-woofers. Refer to **SPEAKER, INSTALLATION** .
7. Install the storage bins, if equipped. Refer to **BIN, STORAGE, INSTALLATION**.
8. If equipped, install the floor console. Refer to **CONSOLE, FLOOR, INSTALLATION**.
9. Install the front seats. Refer to **SEAT, FRONT, INSTALLATION** and **SEAT, FRONT CENTER, INSTALLATION**.

CONSOLE, OVERHEAD, FRONT

DESCRIPTION

DESCRIPTION

Fig. 414: Overhead Console Assembly
Courtesy of CHRYSLER GROUP, LLC

A front overhead console is standard factory-installed equipment on this model. All overhead consoles are equipped with two reading and courtesy lamps (2). On vehicles equipped with a power sunroof, the overhead console will contain a three button switch (1) directly between the two reading and courtesy lamps. The front overhead console will contain a two button switch (5) on vehicles equipped with rear power sliding glass, and a three button HomeLink® transceiver switch (4) - if equipped. On vehicles equipped with automatic climate control an infrared temperature sensor is located between the two switch banks.

NOTE: The overhead console reading lamp switches, bulb holders and wiring harness are serviced only as a unit and are not available individually for service.

An overhead console (1) is available on this vehicle and may include many of the following components:

- Front map/reading lamps (2)
- HomeLink® transceiver (3) - if equipped
- Compass module - if equipped
- Power sunroof switch - if equipped
- Power sliding glass switch - if equipped

REMOVAL

REMOVAL

Fig. 415: Overhead Console Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using your fingertips, grasp the sides of the overhead console and pull straight down evenly to disengage the four snap clips.

Fig. 416: Overhead Console Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Lower the overhead console from the headliner far enough to access the wire harness connectors.
4. Disconnect the reading lamp wire harness connector (1).

5. Disconnect the sunroof switch wire harness connector, if equipped.
6. Disconnect the inferred temperature sensor wire harness connector (4), if equipped.
7. Disconnect the power sliding glass wire harness connector (2), if equipped.
8. Disconnect the Homelink® transceiver wire harness connector (3), if equipped.
9. Remove the overhead console from the vehicle.

INSTALLATION

INSTALLATION

Fig. 417: Overhead Console Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Position the overhead console near the mounting location on the headliner and connect the wire harness connectors.
2. Connect the reading lamp wire harness connector (1).
3. If equipped, connect the sunroof switch wire harness connector.
4. If equipped, connect the inferred temperature sensor wire harness connector (4).
5. If equipped, connect the power sliding glass wire harness connector (2).
6. If equipped, connect the Homelink® transceiver wire harness connector (3).
7. Align the snap clips on the overhead console housing with their receptacles (5) in the overhead console bracket.
8. Push upward firmly and evenly on the sides of the overhead console housing over the snap clip locations until the snap clips are fully engaged with the receptacles in the overhead console bracket.
9. Reconnect the battery negative cable.

EXHAUSTER

REMOVAL

REMOVAL

Fig. 418: Body Vent
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear cab trim panel. Refer to **PANEL, CAB BACK TRIM, REMOVAL**.
2. Disengage the retaining tabs (1) that secure the body vent (3) to the cab back panel (2).
3. Remove the vent through the opening in the cab back panel.

INSTALLATION

INSTALLATION

Fig. 419: Body Vent
Courtesy of CHRYSLER GROUP, LLC

1. Position the body vent (3) into the opening of the cab back panel (2).
2. Install the body vent into the cab back panel and fully engage the retaining tabs (1).

3. Install the rear cab trim panel. Refer to **PANEL, CAB BACK TRIM, INSTALLATION**.

HEADLINER

REMOVAL

REMOVAL

STANDARD CAB

Fig. 420: Visor Support Screws
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Hands should be clean or clean cloth gloves used when handling the headliner to avoid damage to the headliner.

1. Remove the A-pillar trim. Refer to **PANEL, A-PILLAR TRIM, WITH GRAB HANDLE, REMOVAL**.
2. Remove the upper B-pillar trim. Refer to **PANEL, B-PILLAR TRIM, UPPER, REMOVAL**.
3. Remove the screws and remove the visor supports.
4. Remove the screws (2) and remove the visors (1). Disconnect the electrical connectors, if equipped.

Fig. 421: Coat Hook
Courtesy of CHRYSLER GROUP, LLC

5. Using a small flat bladed tool, open the coat hook screw cover (2) and remove the screws and coat hooks.

Fig. 422: CHMSL Wiring Electrical Connector

9. Remove the DVD monitor screws (2) and separate the monitor (1) from the roof, if equipped.

Fig. 430: DVD Housing Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the DVD housing electrical connectors (1), if equipped.
11. Remove the overhead console. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL**.

Fig. 431: Sunroof Module Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

12. Disconnect the sunroof module electrical connector (1) from the sunroof module takeout, if equipped.

Fig. 432: Body Harness At Left C-Pillar
Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the electrical connector (1) from the body harness at the C-pillar left hand side.
14. Remove the body harness clip from the C-pillar inner left hand side, if equipped.
15. Disconnect the main harness from the body harness at the C-pillar inner right hand side.

Fig. 433: Headliner
Courtesy of CHRYSLER GROUP, LLC

16. Remove the headliner through the windshield opening.
17. Remove the visor outboard retainer from the body.

18. Remove the overhead console backing plate from the body taking care not to break the backing plate.
19. Remove the visor center support mounting clips.
20. Remove the coat hook mounting clips.
21. Remove the DVD mounting clips.

INSTALLATION

INSTALLATION

STANDARD CAB

Fig. 434: Headliner
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Hands should be clean or clean cloth gloves used when handling the headliner to avoid damage to the headliner.

NOTE: Quad cab shown in illustration, standard cab is similar.

1. Position the coat hooks (5) onto the headliner and install the screws into the mounting clips.
2. Close the screw caps fully.
3. Position the visor supports (3) onto the headliner and install the screws into the mounting clips.
4. Install the overhead console (2). Refer to **CONSOLE, OVERHEAD, FRONT, INSTALLATION**.
5. Position the visors onto the headliner and install the screws (4) into the mounting clips.
6. Install the headliner through the front passenger door.
7. Lift the headliner into position and engage the visor center supports.

Fig. 435: A-Pillar Wiring & Clips
Courtesy of CHRYSLER GROUP, LLC

8. Position the wire harness on the A-pillar and seat the support clips (3) fully.

Fig. 436: Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

9. Connect the electrical connectors (1) and seat the support clip (2) fully.
10. Position the instrument panel side covers onto the instrument panel and seat fully.

Fig. 437: CHMSL Wiring Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

11. Connect the CHMSL wiring electrical connector.
12. Install the floor console. Refer to **CONSOLE, FLOOR, INSTALLATION**.
13. Install the upper B-pillar trim. Refer to **PANEL, B-PILLAR TRIM, UPPER, INSTALLATION**.
14. Install the A-pillar trim. Refer to **PANEL, A-PILLAR TRIM, WITH GRAB HANDLE, INSTALLATION**.

QUAD/CREW/MEGA CAB

Fig. 438: Headliner

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Hands should be clean or clean cloth gloves used when handling the headliner to avoid damage to the headliner.

1. Install the DVD monitor to the headliner, if equipped. Refer to **MONITOR, MEDIA SYSTEM, INSTALLATION** .
2. Position the coat hooks (5) onto the headliner and install the screws into the mounting clips.
3. Close the screw caps fully.
4. Position the visor supports (3) onto the headliner and install the screws into the mounting clips.
5. Install the overhead console (2). Refer to **CONSOLE, OVERHEAD, FRONT, INSTALLATION**.
6. Position the visors onto the headliner and install the screws (4) into the mounting clips.
7. Install the headliner through the front passenger door.
8. Lift the headliner into position and engage the drivers side visor center support.

Fig. 439: Sunroof Module Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

9. Connect the electrical connectors (1) for the sunroof module, if equipped.

Fig. 440: CHMSL Wiring Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

10. Connect the CHMSL electrical connector (1).

Fig. 441: DVD Housing Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

11. Connect the DVD monitor electrical connectors (1), if equipped.

Fig. 442: Body Harness At Left C-Pillar
Courtesy of CHRYSLER GROUP, LLC

12. Connect the C-pillar electrical connectors (1).
13. Insert the passenger side coat hook.
14. Insert the passenger side visor center support.
15. Install the visor outboard screws.
16. Connect the body harness electrical connector and install the body clip right hand side.
17. Install the DVD unit mounting clips into the sheet metal.
18. Install the two remaining DVD screws.
19. Seat the sunroof trim ring if equipped.

Fig. 443: A-Pillar Wiring & Clips
Courtesy of CHRYSLER GROUP, LLC

20. Position the wire harness on the A-pillar and seat the support clips (3) fully.

Fig. 444: Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

21. Connect the electrical connectors (1) and seat the support clip (2) fully.
22. Position the instrument panel side covers onto the instrument panel and seat fully.
23. Install the upper C-pillar trim. Refer to **PANEL, C-PILLAR TRIM, UPPER, INSTALLATION**.
24. Install the upper B-pillar trim. Refer to **PANEL, B-PILLAR TRIM, UPPER, INSTALLATION**.
25. Install the windshield. Refer to **WINDSHIELD, INSTALLATION**.

LOAD FLOOR, NON-SLIDING

REMOVAL

REMOVAL

Fig. 445: Load Floor & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Move the rear seat cushion (1) to the up position.
2. Remove the two nuts (2) that secure the rear of the load floor (3) to the floor panel.

Fig. 446: Load Floor & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Move the load floor (2) to the up position.

4. Remove the two bolts (3) that secure the load floor to the floor panel (1) and remove the load floor.
5. If required, remove the support cylinder (4).

INSTALLATION

INSTALLATION

Fig. 447: Load Floor & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the load floor support cylinder (4).
2. Position the load floor (2) into the vehicle and install the two bolts (3) that secure it to the floor panel (1). Tighten the bolts to 40 N.m (30 ft. lbs.).

Fig. 448: Load Floor & Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Move the load floor (3) to the down position and install the two nuts (2) that secure the load floor to the floor panel. Tighten the nuts to 25 N.m (18 ft. lbs.).
4. Move the rear seat cushion (1) to the down position.

MIRROR, REARVIEW

REMOVAL

REMOVAL

Fig. 449: Connector, Rear View Mirror, Screw, Support Button & Windshield
Courtesy of CHRYSLER GROUP, LLC

1. If equipped, disconnect the wire harness connector (1) from the rear view mirror (3).
2. Loosen the set screw (2) that secures the rear view mirror to the mounting bracket (4).
3. Slide the base of the rear view mirror upward and remove the mirror from the mounting bracket.

4. If required, remove the mirror mounting bracket from the windshield (5).

INSTALLATION

INSTALLATION

Fig. 450: Connector, Rear View Mirror, Screw, Support Button & Windshield
Courtesy of CHRYSLER GROUP, LLC

1. If required, install the mounting bracket (4) to the windshield (5).
2. Position the base of the rear view mirror (3) onto the mounting bracket and slide the mirror downward until it is fully engaged on the mounting bracket.
3. Tighten the set screw (2) that secures the rear view mirror to the mounting bracket to 1 N.m (15 in. lbs.).
4. If equipped, connect the wire harness connector (1) to the rear view mirror.

REAR VIEW MIRROR MOUNTING BRACKET

Fig. 451: Connector, Rear View Mirror, Screw, Support Button & Windshield
Courtesy of CHRYSLER GROUP, LLC

1. Mark the position for the mirror mounting bracket (4) on the outside of the windshield glass (5) with a

wax pencil.

2. Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the surface on the mounting bracket with a fine grit sandpaper. Wipe the mounting bracket surface clean with a paper towel.
4. Apply accelerator to the surface on the mounting bracket according to the following instructions:
    1. Crush the vial to saturate the felt applicator.
    2. Remove the paper sleeve.
    3. Apply accelerator to the contact surface on the mounting bracket.
    4. Allow the accelerator to dry for five minutes.
    5. Do not touch the bracket contact surface after the accelerator has been applied.
5. Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.
6. Install the mounting bracket according to the following instructions:
    1. Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
    2. Apply an even coat of adhesive to the contact surface on the mounting bracket.
    3. Align the mounting bracket with the marked position on the windshield glass.
    4. Press and hold the mounting bracket in place for at least one minute.

NOTE: Verify that the mirror mounting bracket is correctly aligned, because the adhesive will cure rapidly.

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before installing the rear view mirror (3). Refer to **MIRROR, REARVIEW, INSTALLATION**.

PANEL, A-PILLAR TRIM, WITH GRAB HANDLE

REMOVAL

REMOVAL

Fig. 452: A-Pillar Trim/Grab Handle
Courtesy of CHRYSLER GROUP, LLC

1. Using a small flat-bladed tool, carefully open the two fastener covers (3) located in the a-pillar trim panel (2).
2. Remove the two bolts (4) that secure the a-pillar trim panel to the a-pillar (1) and remove the trim panel.

INSTALLATION

INSTALLATION

Fig. 453: A-Pillar Trim/Grab Handle
Courtesy of CHRYSLER GROUP, LLC

1. Position the locating tab of the A-pillar trim panel (2) into the slot located in the top of the instrument panel.
2. Install the A-pillar trim panel onto the A-pillar (1) and install the two bolts (4). Tighten the bolts to 5 N.m (44 in. lbs.).
3. Close the two fastener covers (3) located in the A-pillar trim panel.

PANEL, B-PILLAR TRIM, LOWER

REMOVAL

REMOVAL

STANDARD CAB

Fig. 454: B-Pillar Lower Trim
Courtesy of CHRYSLER GROUP, LLC

1. If equipped, remove the rear storage bin. Refer to **BIN, STORAGE, REMOVAL**.
2. Remove the lower seat belt anchor bolt (3).
3. Separate the forward clip.
4. Separate the remaining retaining clips and remove the lower trim (1).

QUAD CAB

Fig. 455: B-Pillar Lower Trim Panel (Quad Cab)
Courtesy of CHRYSLER GROUP, LLC

1. Remove the front door cowl trim panel. Refer to **PANEL, COWL TRIM, REMOVAL**.
2. Remove the rear door scuff plate. Refer to **PLATE, SCUFF, REAR DOOR SILL, REMOVAL**.
3. Release the retaining clips and remove the trim panel (1).

INSTALLATION

INSTALLATION

STANDARD CAB

Fig. 456: B-Pillar Lower Trim
Courtesy of CHRYSLER GROUP, LLC

1. Position the lower trim (1) back into place and line up the retaining clips.
2. Seat the upper clips fully.
3. Seat the lower clips fully
4. Clip the forward foot into the sheet metal.
5. Install the lower seat belt anchor and tighten to 40 N.m (30 ft. lbs.).
6. If equipped, install the rear storage bin. Refer to **BIN, STORAGE, INSTALLATION**.

QUAD CAB

Fig. 457: B-Pillar Lower Trim Panel (Quad Cab)
Courtesy of CHRYSLER GROUP, LLC

1. Position the trim (1) back and seat the clips fully.
2. Install the rear door scuff plate. Refer to **PLATE, SCUFF, REAR DOOR SILL, INSTALLATION**.
3. Install the front door cowl trim panel. Refer to **PANEL, COWL TRIM, INSTALLATION**.

PANEL, B-PILLAR TRIM, UPPER

REMOVAL

REMOVAL

STANDARD CAB

Fig. 458: B-Pillar Upper Trim
Courtesy of CHRYSLER GROUP, LLC

1. Remove the lower B-pillar trim. Refer to **PANEL, B-PILLAR TRIM, LOWER, REMOVAL**.
2. Separate the turning loop cover (2) and remove the turning loop bolt.
3. Pull the upper trim (1) off and release the retaining clips.

QUAD CAB

Fig. 459: B-Pillar Upper Trim Panel (Quad Cab)
Courtesy of CHRYSLER GROUP, LLC

1. Remove the lower B-pillar trim. Refer to **PANEL, B-PILLAR TRIM, LOWER, REMOVAL**.

2. Using a small flat-bladed tool, carefully open the two fastener covers (2) located on the grab handle.
3. Remove the two bolts (3) that secure the grab handle to the B-pillar and remove the grab handle.
4. Separate the seat belt turning loop cover and remove the turning loop bolt.
5. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining clips that secure the upper trim (1) to the pillar and remove the trim panel.
6. Remove the seat belt from the trim.

INSTALLATION

INSTALLATION

STANDARD CAB

Fig. 460: B-Pillar Upper Trim
Courtesy of CHRYSLER GROUP, LLC

1. Position the upper trim (1) back in place and seat the clips fully.
2. Install the turning loop bolt (2) and tighten to 40 N.m (30 ft. lbs.).
3. Install the turning loop cover.
4. Install the lower B-pillar trim. Refer to **PANEL, B-PILLAR TRIM, LOWER, INSTALLATION**.

QUAD CAB

Fig. 461: B-Pillar Upper Trim Panel (Quad Cab)
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat belt through the hole in the trim.
2. Position the upper trim (1) back in place and seat the clips fully.
3. Install the turning loop bolt (2) and tighten to 40 N.m (30 ft. lbs.).
4. Install the turning loop cover.
5. Install the grab handle bolts and tighten to 5 N.m (44 in. lbs.).
6. Seat the grab handle bolt caps fully.
7. Install the lower B-pillar trim. Refer to **PANEL, B-PILLAR TRIM, LOWER, INSTALLATION**.

Courtesy of CHRYSLER GROUP, LLC

1. Position the lower trim (2) into place and line up the clips to the pillar and rear door scuff plate.
2. Seat the retaining clips fully.
3. Install the lower seat belt anchor and tighten to 40 N.m (30 ft. lbs.).

QUAD CAB

Fig. 466: C-Pillar Upper & Lower Trim (Quad Cab)
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat belt (2) through the hold in the trim (3).

2. Position the lower trim (2) into place and line up the clips to the pillar and rear door scuff plate.
3. Seat the retaining clips fully.
4. Install the lower seat belt anchor and tighten to 40 N.m (30 ft. lbs.).

MEGA CAB

Fig. 467: Lower Trim & Seat Belt Anchor
Courtesy of CHRYSLER GROUP, LLC

1. Position the lower trim (2) into place and line up the clips to the pillar and rear door scuff plate.
2. Install the lower seat belt anchor and tighten to 40 N.m (30 ft. lbs.).
3. Install the rear seat assembly. Refer to **SEAT, MEGA CAB REAR, INSTALLATION**.

PANEL, C-PILLAR TRIM, UPPER

REMOVAL

REMOVAL

CREW CAB

Fig. 468: C-Pillar Upper & Lower Trim (Crew Cab)
Courtesy of CHRYSLER GROUP, LLC

1. Remove the lower C-pillar trim (2). Refer to **PANEL, C-PILLAR TRIM, LOWER, REMOVAL**.
2. Pull the upper trim (1) off and release the retaining clips.
3. Pull the seat belt (3) through the trim and remove the trim.

QUAD CAB

Fig. 469: C-Pillar Upper & Lower Trim (Quad Cab)
Courtesy of CHRYSLER GROUP, LLC

1. Remove the lower C-pillar trim (3). Refer to **PANEL, C-PILLAR TRIM, LOWER, REMOVAL**.

2. Separate the turning loop cover (2) and remove the turning loop bolt.
3. Pull the upper trim (1) off and release the retaining clips.

MEGA CAB

Fig. 470: Turning Loop Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Remove the lower C-pillar trim. Refer to **PANEL, C-PILLAR TRIM, LOWER, REMOVAL**.
2. Separate the turning loop cover and remove the turning loop bolt. Refer to **ADJUSTER, SEAT BELT TURNING LOOP, REMOVAL** .

Fig. 471: C-Pillar Upper Trim
Courtesy of CHRYSLER GROUP, LLC

3. Pull the upper trim off and release the retaining clips.

INSTALLATION

INSTALLATION

CREW CAB

Fig. 472: C-Pillar Upper & Lower Trim (Crew Cab)
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat belt (3) through the hold in the trim (1).
2. Position the upper trim (1) back in place and seat the clips fully.
3. Install the lower C-pillar trim (2). Refer to **PANEL, C-PILLAR TRIM, LOWER, INSTALLATION**.

QUAD CAB

Fig. 473: C-Pillar Upper & Lower Trim (Quad Cab)
Courtesy of CHRYSLER GROUP, LLC

1. Position the upper trim (1) back in place and seat the clips fully.
2. Install the turning loop bolt (2) and tighten to 40 N.m (30 ft. lbs.).
3. Install the turning loop cover.
4. Install the lower C-pillar trim (2). Refer to **PANEL, C-PILLAR TRIM, LOWER, INSTALLATION**.

MEGA CAB

Fig. 474: C-Pillar Upper Trim
Courtesy of CHRYSLER GROUP, LLC

1. Position the upper trim back in place and seat the clips fully.

Fig. 475: Turning Loop Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Install the turning loop bolt (2) and tighten to 40 N.m (30 ft. lbs.).
3. Install the lower C-pillar trim. Refer to **PANEL, C-PILLAR TRIM, LOWER, INSTALLATION**.

PANEL, CAB BACK TRIM

REMOVAL

REMOVAL

Fig. 476: Utility Hook
Courtesy of CHRYSLER GROUP, LLC

1. If equipped, remove the rear storage compartment. Refer to **BIN, STORAGE, REMOVAL**.
2. If equipped, using a (special tool #C-4755, Trim Stick) or equivalent, disengage the latch (1) for the utility hook cover and open the cover to gain access to the screw (2) that secures the utility hook to the rear cab back panel.

Fig. 477: Cab Back Panel
Courtesy of CHRYSLER GROUP, LLC

3. On two door models, remove the lower B-pillar trim panels. Refer to **PANEL, B-PILLAR TRIM, LOWER, REMOVAL**.
4. On two door models, remove the lower seat belt anchor and remove the cab back panel (1).

Fig. 478: Rear Cab Back Panel

Courtesy of CHRYSLER GROUP, LLC

5. On four door models, remove the child seat tether straps from the rear cab back panel (2). Refer to **ANCHOR, CHILD SEAT, REMOVAL** .
6. On four door models, remove the center seat belt trim bezel. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
7. On four door models, remove the lower C-pillar trim panels. Refer to **PANEL, C-PILLAR TRIM, LOWER, REMOVAL**.
8. On four door models, remove the push-pin fasteners (1 and 3) that secure the rear cab trim panel (2) to the rear cab back panel and remove the trim panel.

INSTALLATION

INSTALLATION

Fig. 479: Rear Cab Back Panel
Courtesy of CHRYSLER GROUP, LLC

1. On four door models, position the rear cab trim panel (2) onto the rear cab back panel and install the push-pin fasteners (1 and 3).
2. On four door models, install the lower C-pillar trim panels. Refer to **PANEL, C-PILLAR TRIM, LOWER, INSTALLATION**.
3. On four door models, install the center seat belt trim bezel. Refer to **RETRACTOR, SEAT BELT, INSTALLATION** .
4. On four door models, install the child seat tether straps. Refer to **ANCHOR, CHILD SEAT, INSTALLATION** .

Fig. 480: Cab Back Panel
Courtesy of CHRYSLER GROUP, LLC

5. On two door models, position the rear cab trim panel (1) onto the rear cab back panel and install the utility hooks.

Fig. 481: Utility Hook
Courtesy of CHRYSLER GROUP, LLC

6. Install the lower seat belt anchor. Refer to **SEAT BELT, INSTALLATION** .
7. With the utility hook cover (1) open, install the screws (2) and close the utility hook covers.
8. On two door models, install the lower B-pillar trim panels. Refer to **PANEL, B-PILLAR TRIM, LOWER, INSTALLATION**.

9. If equipped, install the rear storage compartment. Refer to **BIN, STORAGE, INSTALLATION**.

PANEL, COWL TRIM

REMOVAL

REMOVAL

Fig. 482: Cowl Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Using a (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining tabs of the cowl trim panel (1) from the retainer clips in the door sill.
2. Pull the cowl trim panel rearward and remove it from the vehicle.

INSTALLATION

INSTALLATION

Fig. 483: Cowl Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Position the cowl trim panel (1) onto the door sill.
2. Push the cowl trim panel forward and then engage the retaining tabs that secure the sill trim panel to the rear door sill.

PLATE, SCUFF, REAR DOOR SILL

REMOVAL

REMOVAL

Fig. 484: Rear Door Sill Scuff Plate

Courtesy of CHRYSLER GROUP, LLC

1. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining tabs of the sill trim panel (1) from the retainer clips in the rear door sill and remove the trim panel.

INSTALLATION

INSTALLATION

Fig. 485: Rear Door Sill Scuff Plate
Courtesy of CHRYSLER GROUP, LLC

1. Position the sill trim panel (1) onto the rear door sill.
2. Seat the retaining tabs that secure the sill trim panel to the rear door sill fully.

SUPPORT, VISOR

REMOVAL

REMOVAL

Fig. 486: Sun Visor Support
Courtesy of CHRYSLER GROUP, LLC

1. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the release clip (3) as shown in illustration and remove the sun visor support (1) from the headliner (2)

INSTALLATION

INSTALLATION

Fig. 487: Sun Visor Support
Courtesy of CHRYSLER GROUP, LLC

1. Position the sun visor support (1) through the headliner (2) and fully seat the base of the support to the roof panel.
2. Engage the release clip (3).

VISOR

REMOVAL

REMOVAL

Fig. 488: Sun Visor, Vanity Mirror & Screws
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing or installing the screws (1), be certain to avoid any wiring or drain tube interference.

1. Remove the three screws (1) that secure each sun visor (2) to the roof panel and remove the visor from the headliner (3).
2. If equipped, disconnect the wire harness connector for the illuminated vanity mirror (4).

INSTALLATION

INSTALLATION

Fig. 489: Sun Visor, Vanity Mirror & Screws
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing or installing the screws (1), be certain to avoid any wiring or drain tube interference.

1. If equipped, connect the wire harness connector for the illuminated vanity mirror (4).
2. Position the sun visor (2) onto the headliner (3).
3. Install the three screws (1) that secure each sun visor to the roof panel. Tighten the screws to 2.2 N.m (20 in. lbs.).

SEATS

WARNING

WARNING

WARNING: **To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.**

WARNING: **To avoid serious or fatal injury during and following any seat belt or child**

restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.**

WARNING: **To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these**

instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

COVER, SEAT BACK, MEGA CAB REAR

REMOVAL

REMOVAL

1. Fold both rear seats flat.
2. Remove the filler panels from the rear seat to storage compartment.
3. Separate the J-straps at the bottom of the seat back.
4. Remove both hinge covers from the back section being worked on.
5. Remove the lower anchor for the center seat belt.
6. Disconnect the lower cable attachment from the seat back release.
7. Remove the four bolts and remove the seat back from the seat.
8. Mark the location of the cables at the cushion and remove.
9. Remove the upper cushion pivot bolts.
10. Remove the lower cushion pivot bolts.
11. Remove the cushion from the seat.
12. Remove the seat release/recline handle.

13. Separate the J-straps for the cover to the seat pan.
14. Remove the cover/cushion from the seat pan and separate the foam from the cover.

INSTALLATION

INSTALLATION

1. Place cover over the foam and install onto the seat pan.
2. Connect the J-straps to the pan.
3. Install the release/recliner handle.
4. Install the cushion assembly onto the seat assembly.
5. Install the lower cushion pivot bolts.
6. Install the upper cushion pivot bolts.
7. Install the cables at the cushion using the marks made during removal.
8. Install the seat back onto the seat and install the four bolts.
9. Connect the lower cable attachment for the seat back release.
10. Install the lower anchor for the center seat belt.
11. Install the hinge covers.
12. Connect the J-straps at the bottom of the seat back being worked on.
13. Install the filler panels.

COVER, SEAT CUSHION, FRONT

REMOVAL

REMOVAL

NOTE: While servicing seat assemblies, refer to DESCRIPTION. .

MANUAL

Fig. 490: Seat Back Cover Straps
Courtesy of CHRYSLER GROUP, LLC

1. Separate the seat back cover straps (2) from under the seat cushion.

Fig. 491: Side Shield Screws
Courtesy of CHRYSLER GROUP, LLC

2. Remove the side shield screws (2) in the back.

Fig. 492: Inboard Shield
Courtesy of CHRYSLER GROUP, LLC

3. Remove the inboard shield screw (1).
4. Remove the inboard side shield (2).

Fig. 493: Door Handle Clip Tool
Courtesy of CHRYSLER GROUP, LLC

5. Using a door handle clip tool (1) or equivalent, release the clip holding the handle (2) onto the seat and remove the handle.
6. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, release the seven tabs and separate the center bezel from the outboard side shield.
7. Pull the bezel rearward and release the front retaining tab.

Fig. 494: Outer Side Shield
Courtesy of CHRYSLER GROUP, LLC

8. Remove the screw (1).
9. Release the retaining clips (2) and remove the outer side shield.

Fig. 495: Recliner Rod
Courtesy of CHRYSLER GROUP, LLC

10. Separate the clip (1) and separate the recliner rod (2) from the lever.
11. Remove the push pin fastener (3).

Fig. 496: J-Straps
Courtesy of CHRYSLER GROUP, LLC

12. Separate the cover J-straps (1) from the sides and remove the foam/cover assembly.

Fig. 497: Hog Rings
Courtesy of CHRYSLER GROUP, LLC

13. Remove the 10 hog rings (2) and separate the cover (1) from the foam.

POWER WITHOUT VENTED SEAT

Fig. 498: Seat Back Cover Straps
Courtesy of CHRYSLER GROUP, LLC

1. Remove the front seat. Refer to **SEAT, FRONT, REMOVAL** and **SEAT, FRONT CENTER, REMOVAL**.
2. Separate the seat back cover straps (2) from under the seat cushion and disconnect the electrical connectors (1).

Fig. 499: Side Shield Screws
Courtesy of CHRYSLER GROUP, LLC

3. Remove the side shield screws (2) in the back.

Fig. 500: Inboard Shield
Courtesy of CHRYSLER GROUP, LLC

4. Remove the inboard shield screw.
5. Remove the inboard side shield.

Fig. 501: Lumbar Switch Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Disconnect the lumbar control switch electrical connector beneath the seat, prior to removing the power seat switch bezel from the seat. Failure to follow these instructions can result in damage to the lumbar control switch.

6. If equipped, disconnect the lumbar control switch electrical connector (1).

Fig. 502: Switch Bezel
Courtesy of CHRYSLER GROUP, LLC

7. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, release the seven tabs (3) and separate the bezel (1) from the outboard side shield.
8. Pull the bezel (1) rearward and release the front retaining tab (2).
9. Disconnect the wire harness connectors from the power seat switch and memory seat switch, if equipped.

Fig. 503: Outer Side Shield
Courtesy of CHRYSLER GROUP, LLC

10. Remove the screw (1).
11. Release the retaining clips (2) and remove the outer side shield.

Fig. 504: J-Straps
Courtesy of CHRYSLER GROUP, LLC

12. Separate the cover J-straps (1) from the sides and remove the foam/cover assembly.

Fig. 505: Hog Rings
Courtesy of CHRYSLER GROUP, LLC

13. Remove the 10 hog rings (2) and separate the cover (1) from the foam.

POWER WITH VENTED SEAT

Fig. 506: Seat Back Cover Straps
Courtesy of CHRYSLER GROUP, LLC

1. Remove the front seat. Refer to **SEAT, FRONT, REMOVAL** and **SEAT, FRONT CENTER, REMOVAL**.
2. Separate the seat back cover straps (2) from under the seat cushion and disconnect the electrical connectors (1).

Fig. 507: Side Shield Screws
Courtesy of CHRYSLER GROUP, LLC

3. Remove the side shield screws (2) in the back.

Fig. 508: Inboard Shield
Courtesy of CHRYSLER GROUP, LLC

4. Remove the inboard shield screw.
5. Remove the inboard side shield.

Fig. 509: Lumbar Switch Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Disconnect the lumbar control switch electrical connector beneath the seat, prior to removing the power seat switch bezel from the seat. Failure to follow these instructions can result in damage to the lumbar control switch.

6. If equipped, disconnect the lumbar control switch electrical connector (1).

Fig. 510: Switch Bezel
Courtesy of CHRYSLER GROUP, LLC

NOTE: Power seat bezel shown in illustration, manual seat bezel similar.

7. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, release the seven tabs (3) and separate the bezel (1) from the outboard side shield.
8. Pull the bezel (1) rearward and release the front retaining tab (2).
9. Disconnect the wire harness connectors from the power seat switch and memory seat switch, if equipped.

Fig. 511: Outer Side Shield
Courtesy of CHRYSLER GROUP, LLC

10. Remove the screw (1).
11. Release the retaining clips (2) and remove the outer side shield.

Fig. 512: Vented Seat Pad
Courtesy of CHRYSLER GROUP, LLC

12. Disconnect the vented seat pad (1) from the motor (2).
13. Disconnect the electrical connectors, if equipped.

Fig. 513: J-Straps
Courtesy of CHRYSLER GROUP, LLC

14. Separate the cover J-straps (1) from the sides and remove the foam/cover assembly.

Fig. 514: Hog Rings
Courtesy of CHRYSLER GROUP, LLC

15. Remove the 10 hog rings (2) and separate the cover (1) from the foam.

Fig. 515: Vented Seat Pad
Courtesy of CHRYSLER GROUP, LLC

16. Pull the vent pad (1) through the foam.

INSTALLATION

INSTALLATION

MANUAL

Fig. 516: Hog Rings
Courtesy of CHRYSLER GROUP, LLC

1. Position the cover (1) onto the foam and install 10 new hog rings (2).

Fig. 517: J-Straps
Courtesy of CHRYSLER GROUP, LLC

2. Position the foam/cover assembly onto the seat cushion frame and secure the J-straps (1) on the sides.

Fig. 518: Recliner Rod
Courtesy of CHRYSLER GROUP, LLC

3. Install the push pin fastener (3) and seat fully.
4. Install the recliner rod (1) and seat the retaining clip (2) fully.

Fig. 519: Outer Side Shield
Courtesy of CHRYSLER GROUP, LLC

5. Install the outer side shield and seat the clips (2) fully.
6. Install the screw (1).

Fig. 520: Recliner Handle
Courtesy of CHRYSLER GROUP, LLC

7. Position the bezel to the outboard side shield and engage the front retaining tab.
8. Seat the remaining tabs (3) fully.
9. Position the recliner handle (1) onto the splined shaft and seat fully.

Fig. 521: Inboard Shield
Courtesy of CHRYSLER GROUP, LLC

10. Install the inboard shield (2) and install the screw (1).

Fig. 522: Side Shield Screws
Courtesy of CHRYSLER GROUP, LLC

11. Install the side shield screws (2) in the back.

Fig. 523: Seat Back Cover Straps
Courtesy of CHRYSLER GROUP, LLC

12. Secure the seat back cover straps (2) to suspension mat.

POWER WITHOUT VENTED SEAT

Fig. 524: Hog Rings
Courtesy of CHRYSLER GROUP, LLC

1. Position the cover (1) onto the foam and install 10 new hog rings (2).

Fig. 525: J-Straps
Courtesy of CHRYSLER GROUP, LLC

2. Position the foam/cover assembly onto the seat cushion frame and secure the J-straps (1) on the sides.

Fig. 526: Outer Side Shield
Courtesy of CHRYSLER GROUP, LLC

3. Install the outer side shield and seat the clips (2) fully.
4. Install the screw (1).

Fig. 527: Switch Bezel
Courtesy of CHRYSLER GROUP, LLC

5. Connect the wire harness connectors to the power seat switch and memory seat switch, if equipped.
6. Position the bezel (1) back into place and secure the front tab (2).
7. Seat the remaining tabs (3) fully.

Fig. 528: Lumbar Switch Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

8. If equipped, connect the lumbar switch electrical connector (1).

Fig. 529: Inboard Shield
Courtesy of CHRYSLER GROUP, LLC

9. Install the inboard shield (2) and install the screw (1).

Fig. 530: Side Shield Screws
Courtesy of CHRYSLER GROUP, LLC

10. Install the side shield screws (2) in the back.

Fig. 531: Seat Back Cover Straps
Courtesy of CHRYSLER GROUP, LLC

11. Secure the seat back cover straps (2).
12. Connect the electrical connectors (1).
13. Install the front seat. Refer to **SEAT, FRONT, INSTALLATION** and **SEAT, FRONT CENTER, INSTALLATION**.

POWER WITH VENTED SEAT

Fig. 532: Vented Seat Pad
Courtesy of CHRYSLER GROUP, LLC

1. Pull the vent pad (1) through the foam.

Fig. 533: Hog Rings
Courtesy of CHRYSLER GROUP, LLC

2. Position the cover (1) onto the foam and install 10 new hog rings (2).

Fig. 534: J-Straps
Courtesy of CHRYSLER GROUP, LLC

3. Position the foam/cover assembly onto the seat cushion frame and secure the J-straps (1) on the sides.

Fig. 535: Vented Seat Pad
Courtesy of CHRYSLER GROUP, LLC

4. Position the vented seat pad (2) onto the vent motor if equipped, and seat the clips fully.
5. Connect the electrical connectors, if equipped.

Fig. 536: Outer Side Shield
Courtesy of CHRYSLER GROUP, LLC

6. Install the outer side shield and seat the clips (2) fully.
7. Install the screw (1).

Fig. 537: Switch Bezel
Courtesy of CHRYSLER GROUP, LLC

8. Connect the wire harness connectors to the power seat switch and memory seat switch, if equipped.
9. Position the bezel (1) back into place and secure the front tab (2).
10. Seat the remaining tabs (3) fully.

Fig. 538: Lumbar Switch Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

11. If equipped, connect the lumbar switch electrical connector (1).

Fig. 539: Inboard Shield
Courtesy of CHRYSLER GROUP, LLC

12. Install the inboard shield (2) and install the screw (1).

Fig. 540: Side Shield Screws
Courtesy of CHRYSLER GROUP, LLC

13. Install the side shield screws (2) in the back.

Fig. 541: Seat Back Cover Straps
Courtesy of CHRYSLER GROUP, LLC

14. Secure the seat back cover straps (2).
15. Connect the electrical connectors (1).
16. Install the front seat. Refer to **SEAT, FRONT, INSTALLATION** and **SEAT, FRONT CENTER, INSTALLATION**.

COVER, SEAT CUSHION, REAR

REMOVAL

REMOVAL

Fig. 542: J-Straps
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It is not necessary to remove the rear seat assembly in order to remove the seat cushion foam and cover.**

1. Place the cushion into the up position.
2. Disconnect the seat cushion heat mat electrical connector, if equipped.
3. Release the J-straps (2) and remove the foam/cover (1) from the seat cushion frame.

Fig. 543: Seat Back Hog Rings
Courtesy of CHRYSLER GROUP, LLC

4. Roll the cover (3) off of the foam (1) and remove the hog rings (2).

5. Separate the cover from the foam.
6. Remove the seat cushion frame bolts and remove the seat cushion frame. Refer to **DESCRIPTION**. .

INSTALLATION

INSTALLATION

Fig. 544: Seat Back Hog Rings
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the rear seat assembly in order to remove the seat cushion foam and cover.

1. Install the seat cushion frame and install the seat cushion frame bolts. Refer to **DESCRIPTION**. .
2. Tighten the seat cushion frame bolts to 55 N.m (41 ft. lbs.)
3. Position the cover (3) on to the foam (1) and install three new hog rings (2).
4. Position the foam and cover assembly over the seat cushion frame.

Fig. 545: J-Straps
Courtesy of CHRYSLER GROUP, LLC

5. Install the seat cushion foam/cover (1) over the seat cushion frame and secure the J-straps (2).
6. Connect the seat cushion heat mat electrical connector, if equipped.

COVER, SEAT CUSHION, MEGA CAB REAR

REMOVAL

REMOVAL

1. Fold both rear seats flat.
2. Remove the filler panels from the rear seat to storage compartment.
3. Separate the J-straps at the bottom of the seat back.
4. Remove both hinge covers from the back section being worked on.
5. Remove the lower anchor for the center seat belt.
6. Disconnect the lower cable attachment from the seat back release.
7. Remove the four bolts and remove the seat back from the seat.
8. Remove the screw and remove the seat back release bezel.
9. Mark the location of the release cables at the cushion and remove.
10. Remove the upper cushion pivot bolts.
11. Remove the lower cushion pivot bolts.
12. Remove the cushion from the seat.
13. Remove the seat release lever from the cushion.
14. Separate the J-straps securing the cover to the seat pan.
15. Remove the foam and cover from the seat pan.
16. Separate the foam from the cover.

INSTALLATION

INSTALLATION

1. Position the seat cushion foam into the cover.
2. Position the cushion assembly onto the seat pan.
3. Connect the J-straps securing the cover to the seat pan.
4. Install the seat release lever.
5. Install the cushion assembly onto the seat assembly.
6. Install the lower cushion pivot bolts.
7. Install the upper cushion pivot bolts.
8. Install the release cables using the marks created during removal.
9. Install the seat back release bezel and install the screw.
10. Install the seat back and install the four bolts.
11. Connect the lower cable attachment from the seat back release.
12. Install the lower anchor fro the center seat belt.
13. Install both hinge covers for the back section seat back.
14. Connect the J-straps at the bottom of the seat back.
15. Install the filler panels for the rear storage compartment.

REMOVAL

REMOVAL

DRIVER SIDE

Fig. 548: Trim Cover
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. Remove the trim cover (1).

Fig. 549: Front Seat Electrical Connectors (Driver)
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the electrical connectors (1) and (2), if equipped.

Fig. 550: Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the front mounting bolts (1) from the driver side seat.
5. Remove the rear bolts (2) and remove the diver seat.

PASSENGER SIDE

Fig. 551: Jack Cover
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. Carefully release the front clip and separate the jack cover (2) from the front of the riser (1).
3. Carefully pull the cover forward and release the rear hook from the rear of the riser (3).

Fig. 552: Front Seat Electrical Connector (Passenger)
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (1), if equipped.

Fig. 553: Seat Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the front passenger seat bolts (3).
6. Remove the center seat bolts (2), if equipped with the center seat.
7. Remove the rear bolts (1) and remove the passenger seat assembly.

Fig. 554: Rear Air Duct
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the rear air duct (1) by sliding the telescoping duct section, attached to the seat, rearward.

INSTALLATION

INSTALLATION

DRIVER SIDE

Fig. 555: Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. Install the driver seat and loosely install the front bolts (1).
3. Loosely install the driver seat rear bolts (2).

Fig. 556: Mounting Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

4. Tighten the driver seat bolts to 47 N.m (35 ft. lbs.) using the sequence shown in illustration.

Fig. 557: Front Seat Electrical Connectors (Driver)
Courtesy of CHRYSLER GROUP, LLC

5. Connect the electrical connectors (1 and 2), if equipped.

Fig. 558: Trim Cover
Courtesy of CHRYSLER GROUP, LLC

6. Install the trim cover (1) and seat the clip fully.

PASSENGER SIDE

Fig. 559: Rear Air Duct
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. Position the passenger seat assembly into the vehicle and connect the air duct (1), if equipped.

Fig. 560: Seat Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Loosely install the passenger seat front bolts (3).
4. If equipped with the center seat, loosely install the bolts (2).
5. Loosely install the passenger seat rear bolts (1).

Fig. 561: Seat Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Tighten the passenger seat bolts to 47 N.m (35 ft. lbs.) using the sequence shown in illustration.

Fig. 562: Front Seat Electrical Connector (Passenger)
Courtesy of CHRYSLER GROUP, LLC

7. Connect the electrical connectors (1), if equipped.

Fig. 563: Jack Cover
Courtesy of CHRYSLER GROUP, LLC

8. Secure the jack cover rear hook on the rear riser (3).
9. Position the front of the side shield (2) on the front of the riser (1) and seat the clip fully.

REMOVAL

REMOVAL

Fig. 575: Rear Seat Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: 60/40 bench seat shown in illustration, solid bench seat similar.

1. Disconnect the electrical connector (1), if equipped.

Fig. 576: Center Shoulder Belt
Courtesy of CHRYSLER GROUP, LLC

2. Remove the bolt (1) attaching the center shoulder belt (2) to the retractor and position the shoulder belt out of the way.

Fig. 577: Rear Inner Belts & Buckles
Courtesy of CHRYSLER GROUP, LLC

3. Remove the rear outer bolts.
4. Remove the rear inner bolts (3) and buckles (2) as necessary.

Fig. 578: Front Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the front fasteners (1).

Fig. 579: Cab Hooks
Courtesy of CHRYSLER GROUP, LLC

6. Lift the seat assemblies up and separate the cab hooks (3) from the loops (1 and 2).
7. Remove the seat assembly from the vehicle.

INSTALLATION

INSTALLATION

Fig. 580: Cab Hooks
Courtesy of CHRYSLER GROUP, LLC

NOTE: 60/40 bench seat shown in illustration, solid bench seat similar.

1. Position the rear seat assembly into the vehicle and secure the hooks (3) to the loops (1 and 2).

Fig. 581: Front Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the front mounting bolts (1).

Fig. 582: Rear Inner Belts & Buckles
Courtesy of CHRYSLER GROUP, LLC

3. Install the remaining bolts (1, 4) and tighten all bolts to 47 N.m (35 ft. lbs.).

Fig. 583: Center Shoulder Belt
Courtesy of CHRYSLER GROUP, LLC

4. Position the shoulder belt (2) back into place and install the bolt (1).
5. Tighten the bolt to 23 N.m (17 ft. lbs.).

Fig. 584: Rear Seat Electrical Connector

6. Connect the electrical connectors (1), if equipped.

SEAT BACK, FRONT

REMOVAL

REMOVAL

NOTE: While servicing seat assemblies, refer to DESCRIPTION. .

Fig. 585: Seat Back Cover Straps
Courtesy of CHRYSLER GROUP, LLC

1. Remove the front seat. Refer to **SEAT, FRONT, REMOVAL** and **SEAT, FRONT CENTER, REMOVAL**.
2. Separate the seat back cover straps (2) from under the seat cushion and disconnect the electrical connectors (1).

Fig. 586: Side Shield Screws
Courtesy of CHRYSLER GROUP, LLC

3. Remove the side shield screws (2) in the back.

Fig. 587: Inboard Shield
Courtesy of CHRYSLER GROUP, LLC

4. Remove the inboard shield screw.
5. Remove the inboard side shield.

Fig. 588: Door Handle Clip Tool
Courtesy of CHRYSLER GROUP, LLC

6. If equipped with manual seat, using a door handle clip tool (1) or equivalent, release the clip holding the handle (2) onto the seat and remove the handle.

Fig. 589: Lumbar Switch Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Disconnect the lumbar control switch electrical connector beneath the seat, prior to removing the power seat switch bezel from the seat. Failure to follow these instructions can result in damage to the lumbar control switch.

7. If equipped, disconnect the lumbar control switch electrical connector (1).

Fig. 590: Switch Bezel
Courtesy of CHRYSLER GROUP, LLC

NOTE: Power seat bezel shown in illustration, manual seat bezel similar.

8. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, release the seven tabs (3) and separate

the bezel (1) from the outboard side shield.

9. Pull the bezel (1) rearward and release the front retaining tab (2).
10. Disconnect the wire harness connectors from the power seat switch and memory seat switch, if equipped.

Fig. 591: Outer Side Shield
Courtesy of CHRYSLER GROUP, LLC

11. Remove the screw (1).
12. Release the retaining clips (2) and remove the outer side shield.

Fig. 592: Seat Cushion Suspension Mat
Courtesy of CHRYSLER GROUP, LLC

13. Release the seat cushion suspension mat (2) from the cross brace and separate the electrical connector (1).

Fig. 593: Recliner Rod
Courtesy of CHRYSLER GROUP, LLC

14. On manual reclining seats, remove the clip (1) and separate the recliner rod (2) from the lever.

Fig. 594: Seat Back Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Remove the bolts (2) and remove the seat back assembly (1).

DISASSEMBLY

DISASSEMBLY

Fig. 595: Side Shield
Courtesy of CHRYSLER GROUP, LLC

NOTE: While servicing seat assemblies, refer to DESCRIPTION. .

1. Remove the seat back. Refer to **SEAT BACK, FRONT, REMOVAL**.
2. Separate the side shield from the seat back (2) and remove the side shields (1).

Fig. 596: Brace
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two screws (1) and remove the brace (2).

Fig. 597: Headrest Release Tabs
Courtesy of CHRYSLER GROUP, LLC

4. Push in the buttons on both headrest sleeves, pull the headrest up and remove.

Fig. 598: J-Straps
Courtesy of CHRYSLER GROUP, LLC

5. Separate the J-straps (1 and 2) and pull cover up over frame.
