WINDSHIELD

WARNING

WARNING

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

Failure to follow these instructions may result in serious or fatal injury.

- **Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, PVC (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.**
- **Chrysler LLC does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets,**

and use only adhesives that their manufactures warranty and will restore a vehicle to the requirements of fmvss 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.

- **Be sure to refer to the urethane manufacturer's directions for curing time specifications and do not use adhesive after its expiration date.**
- **Vapors that are emitted from the urethane adhesive or primer could cause personal injury or death. Use them in a well-ventilated area.**
- **Skin contact with urethane adhesive should be avoided. Personal injury or death may result.**
- **Always wear eye and hand protection when working with glass.**

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

REMOVAL

REMOVAL

4. Remove the A-pillar trim panels (2). Refer to **PANEL, A-PILLAR TRIM, WITH GRAB HANDLE, REMOVAL**.

Fig. 672: Head Liner-Quad Cab
Courtesy of CHRYSLER GROUP, LLC

5. Lower the headliner (9) as needed and using windshield removal tool such as an extractor or equivalent, start at the rear section of the glass and work around the parameter to remove urethane. A pneumatic

cutting device can be used but is not recommended. Refer to **HEADLINER, REMOVAL**.

6. Separate windshield from vehicle.

INSTALLATION

INSTALLATION

Fig. 673: Windshield & Support Spacers
Courtesy of CHRYSLER GROUP, LLC

WARNING: Allow the urethane at least 24 hours to cure before returning the vehicle to use.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing windshield. This is to avoid pressurizing the passenger compartment if a door is slammed before the urethane is cured. The potential for water leaks can result.

The windshield fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

1. Place replacement windshield (1) into windshield opening and position glass in the center of the opening against the support spacers (3). Mark the outside surface of the glass at the support spacers (3) with a grease pencil or pieces of masking tape and ink pen to use as a reference (2) for installation. Remove replacement windshield from windshield opening.

Fig. 674: Windshield, Blocks & Glass Primer

2. Position the windshield (1) inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks (3), placed parallel 75 cm (2.5 ft.) apart.
3. Clean inside of windshield with MOPAR® Glass Cleaner and lint-free cloth.
4. Apply clear glass primer 25 mm (1 in.) wide around perimeter of windshield and wipe with a new clean and dry lint- free cloth.
5. Apply black-out primer onto the glass using the windshield molding as a guide. The primer should be 15 mm (5/8 in.) wide on the top and sides of the glass and 25 mm (1 in.) on the bottom of windshield. Allow at least three minutes drying time.

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position electrically by actuating a switch in the overhead console. The sunroof will operate normally with the key in any position, while the Accessory Delay system is active.

The sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the roof when open. The glass panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes a manual-sliding sunshade to cover the deep-tinted glass panel.

In addition to the standard power sunroof operation, this vehicle offers several additional features. There is an express (one-touch) opening and closing feature as well as Excessive Force Limitation (EFL). The EFL function detects obstacles trapped between the glass and the vehicle roof during a closing motion. Upon sensing an obstacle the EFL function will reverse direction of the glass to allow removal of the obstacle.

The main components of the power sunroof system are:

- The motor/module assembly
- The power sunroof glass and frame assembly
- The power sunroof switch
- The manual-sliding sunshade

OPERATION

OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open and closing feature. The sunroof system receives constant battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in the "RUN" or "ACCESSORY" position. If the sunroof is moving when the key is turned to the START position (crank engine), all motions will stop. The sunroof will also stop a requested motion if the key is turned "OFF".

A combination push-button and rocker switch module mounted in the overhead console controls sunroof operation. The sunroof switch is a rocker design with a push button in the center of the two halves of the rocker. Pressing the rocker towards the front of the car commands the sunroof closed. Pressing the rocker towards the rear of the car commands the sunroof open. Pressing the center push button commands the sunroof up into the vent position (Rear of sunroof glass raises above the vehicle roof with glass still covering the sunroof opening). All switch commands operate with the glass starting in any position. for additional information, refer to **SWITCH, SUNROOF, OPERATION** .

An electronic control system, integral to the motor/module assembly, provides the express open and close functions. During express opening, the sunroof glass panel will first open to the "Comfort Stop" position. A second press of the "OPEN" button on the rocker switch will move the glass panel to the full open position. Pressing the "close" end of the rocker switch moves the sunroof glass panel to the full closed position. During express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverse travel to avoid pinching an occupant's finger, ice in the track, etc. This function is called Excessive Force Limitation (EFL). There are two methods of overriding the EFL function.

1. When three EFL events occur without the glass being allowed to fully close, the next close attempt will only move while the close switch is continuously actuated. This allows the sunroof to be forced closed if multiple close attempts fail.
2. If the sunroof close switch is continuously actuated during an EFL event, through the reversal, and during a two second wait time, then continuing to hold the close switch will cause the roof to move towards close with the EFL protection disabled. This allows the sunroof to be forced closed if it is known that a reversal will occur. This secondary EFL override may be necessary when known debris (ice blockage for example) is preventing the glass panel from closing.

While in EFL override, the closing motion will cease if the sunroof switch is released at any time.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUNROOF

For sunroof electrical system diagnosis and testing procedures. Refer to **DIAGNOSIS AND TESTING** .

WATER DRAINAGE AND WIND NOISE DIAGNOSIS

The sliding glass panel is designed to seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a business card or equivalent, between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. Refer to **GLASS, SUNROOF, ADJUSTMENTS**.

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

NOTE: Care must be taken not to fold or kink the headliner upon removal.

1. Lower headliner as necessary to gain access to sunroof housing drain tubes. Refer to **HEADLINER, REMOVAL**.
2. Repair as necessary.

NOTE: Left side shown in illustration, right side typical.

1. Remove glass panel. Refer to **GLASS, SUNROOF, REMOVAL**.
2. Using pliers, disengage the drain channel arm (1) from the guide mechanisms (2) one at a time by pushing the drain channel arm retaining tab through the retention hole located in the guide mechanism.**Do not use excessive force to remove.**

CAUTION: Disengage the drain channel arms one at a time. Do not disengage both sides at the same time.

CAUTION: Do not pull or pry the channel arms. Doing so will result in breaking the channel arms. Only disengage the channel arms as shown in illustration.

3. Verify the sunroof glass panel is in the fully closed position.
4. Loosen the forward attaching screws (2) on each side enough to permit the front of the glass to adjust up or down.
5. Adjust the front surface of the sunroof glass panel 0.00 mm to 2 mm (0.00 in. to 0.08 in.) **below** the top surface of the roof.
6. Tighten the front glass panel attaching screws to 5.5 N.m (49 in. lbs.).

7. Loosen the rear screws (2) on each side enough to make the rear adjustment.
8. Adjust the rear surface of the sunroof glass panel 0.00 mm to 2 mm (0.00 in. to 0.08 in.) **above** the top surface of the roof.
9. Tighten the rear glass panel attaching screws to 5.5 N.m (49 in. lbs.).
10. Check for proper fit by inserting a business card between the glass seal and roof. Slide the card around the entire perimeter of the glass. The effort to slide the card should be uniform through the entire perimeter. If the effort is not uniform, repeat the glass panel adjustment.

5. Install the drain channel arms (2) into the mechanism holes (1) one at a time.

6. If necessary, repeat steps for the opposite side.

CAUTION: Do not push the guide arms at the same time or you could break the guide mechanism. Do not use excessive force to install.

7. Re-connect the negative battery cable and turn the key to the accessory run position.
8. Cycle the mechanism through all of it's functions to verify proper operation.
9. Cycle the mechanism to the closed position.
10. Install the glass as necessary. Refer to **GLASS, SUNROOF, INSTALLATION**.
11. Adjust the sunroof glass to fit flush with the roof line. Refer to **GLASS, SUNROOF, ADJUSTMENTS**.

1. Ensure the sheet metal is clean and free of debris.
2. Starting at the front of the windshield, install the windshield weatherstrip (1) to the vehicle.
3. Ensure to engage the retainers along the side of the windshield.
4. Continue to install the weatherstrip pressing down firmly to ensure proper adhesion.

WARNING

WARNING

WARNING: **Disconnect and isolate battery negative cable before attempting any troubleshooting or repairs.**

- **Do not disengage the clutch if the winch is under a load or wire rope is under tension.**
- **Do not route electrical cables across sharp edges.**
- **Do not route electrical cables through or near moving parts.**
- **Always wear heavy leather gloves when handling a wire rope.**
- **Never let wire rope slip through your hands.**
- **Always keep hands clear of wire rope, hook loop, hook and fairlead opening during installation, operation, and when spooling in or out.**

- **Always use supplied hook strap whenever spooling wire rope in or out, during installation or operation.**

Failure to follow these instructions may result in personal injury.

CAUTION: Do not leave the remote plugged into the winch when not in use. Leaving the remote plugged in, may result in a dangerous condition and/or battery drain.

- **Always make sure the clutch is fully engaged or disengaged.**

DESCRIPTION

DESCRIPTION

The winch uses the electrical power from the vehicle charging system to power a motor that winds wire rope into the winch drum by means of planetary gear reduction.

The winch assembly includes the following:

- **Motor:** The winch motor is powered by the vehicle electrical system and features a thermal protection switch that automatically stops the motor function in the power-in direction if the motor gets too hot.
- **Winch Drum:** The winch drum allows the wire rope to be stored on the winch and transmits force to the wire rope.
- **Wire Rope:** The wire rope allows the winch to be connected to an anchor to provide a pulling force.
- **Fairlead:** The fairlead consists of four rollers and acts as guide for the wire rope and minimizes damage to the rope.
- **Automatic Brake:** The winch is equipped with an automatic brake that will stop rotation of the winch drum if the winch motor is stopped.
- **Clutch Lever:** The clutch lever allows the winch drum to be disconnected from the winch motor to allow the wire rope to be pulled from the winch by hand.
- **Remote Socket:** The remote socket allows the remote control to be attached to the control pack to allow the winch to function.
- **Remote Control:** The remote control provides the interface between the winch operator and the winch. The remote control provides the ability to power the winch in, out, and stop the winch.

OPERATION

OPERATION

Winch: The winch uses the electrical power from the vehicle charging system to power a motor that winds wire rope into the winch drum via planetary gear reduction. By nature, a winch is capable of generating very high forces and should be used with care. Do not operate the winch without reading and understanding the complete winch owner's manual.

Low Voltage Interrupt: The winch is equipped with a device that will interrupt winch function if the vehicle charging system voltage drops to a low level. The winch will not power-in or out for 30 seconds if this device is tripped. If the interrupt is tripped, the vehicle should be operated at high idle for a few minutes to allow the vehicle charging system to recover before continuing to winch.

Winch Motor Thermal Protection: The winch is equipped with a thermal protection device in the motor. If the winch is operated for an excessive duration, the device may interrupt motor function to protect the winch motor. During this time the winch will power-out but will not power-in. Allow the winch motor to cool for a few minutes before continuing operation of the winch. The winch will resume normal function once the motor cools.

Remote Control: To operate the winch, the toggle switch is pressed down to power the winch in and up to power the winch out. The winch will stop if the switch is left in the neutral (center) position.

Clutch Lever: The clutch lever is used to allow free spooling of the winch drum. Rotate the clutch lever on the winch to disengage the clutch.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WINCH

CONDITION	POSSIBLE CAUSES	CORRECTION
Winch does not hold the load.	Faulty winch drum brake.	Replace the winch assembly. Refer to **WINCH, REMOVAL**.
	Load exceeds rating for the winch.	Refer to operators manual for the correct line pull rating for the winch.
Brake overheats and will not hold the load.	The wire rope is on the drum backwards.	Remove all the wire rope and respool in the proper direction.
	The wire rope is spool onto the drum in the wrong direction and working against the brake in the "power in" mode.	The wire rope must always spool onto the drum as indicated by the drum rotation label on the winch. Winches are equipped with an automatic brake and **WILL NOT FUNCTION** if the wire rope spools in the opposite direction. The wire rope spooling can accidentally be reversed by running the wire rope all the way out and re-spooling in with the control switch in the "power out" mode.
	Load exceeds rating for winch	Refer to operators manual for the correct line pull rating for the winch.
	After a very long "power out" cycle, in excess of 50 feet under high loads, the	These winches are rated for intermittent duty operations only.

	brake has overheated and needs a cool down cycle of approximately 30 minutes.	As the load is increased, the duration of power out cycles must be reduced to limit the brake temperature. Allow adequate time for the brake to cool between uses when performing extended power out cycles.
Difficult to spool the wire rope off the drum by hand.	Bent drum flanges or worn drum bushings.	Rotate the drum while it is still on the winch to see if the drum flanges appear to be bent. If the flanges appear to be bent, the winch will have to be replaced.
	Free spool clutch is damaged inside the gear train.	Replace winch. Refer to **WINCH, REMOVAL**.
	Wire rope is bound up on the drum.	Should the wire rope become bound onto the drum, connect the hook to a load, then by alternately "powering in" then "powering out", the wire rope will usually work itself free. **WARNING:** **Do not put your hands anywhere near the wire rope when working a bind free.**
	Winch is not mounted correctly, causing the drum to bind.	Check winch mounting and repair as necessary.
Winch lacks power or will not run at all.	Faulty ground cable attachment to the motor housing.	Verify that the ground cable is correctly installed to the threaded hole in the motor housing. Refer to **MOTOR GROUND TEST**.
	The vehicle battery is inadequate in size, terminals are corroded, is defective or worn out, or is not fully charged.	Use a fully charged conventional automotive battery with a minimum of 650 cold cranking amps rating to obtain peak performance from the winch. Make sure all terminals are clean and the battery is fully charged. Replace battery if necessary.
	Faulty cable connections on battery or motor terminals	Clean and tighten all terminals.
	Faulty power supply to the winch.	Check for proper power supply. Refer to **POWER TEST**.
	Faulty remote control switch or cord.	Check for faulty switch. Refer to **REMOTE SWITCH TEST**. Replace the remote switch is

		necessary.
When remote control switch is activated, there is only a "clicking" sound, and the winch does not operate in either "power in" or "power out" modes.	Low battery charge, corroded terminals, defective battery.	Use a fully charged conventional automotive battery with a minimum of 650 cold cranking amps rating to obtain peak performance from the winch. Make sure all terminals are clean and the battery is fully charged. Replace battery if necessary. Check for proper power supply. Refer to **POWER TEST**.
	Faulty ground cable attachment to the motor housing.	Check for proper ground. Refer to **MOTOR GROUND TEST**.
	Faulty motor armature, brushes, or water in the motor.	Replace the motor. Refer to **MOTOR, WINCH, REMOVAL**.
	Faulty control relay.	Check and replace relays as necessary. Refer to **RELAY PACK TEST**. Refer to **RELAY, WINCH, REMOVAL**.
Winch runs slowly and lacks power when pulling a load, won't pull load, or stalls easily.	The wire rope is spool onto the drum in the wrong direction and working against the brake in the "power in" mode.	The wire rope must always spool onto the drum as indicated by the drum rotation label on the winch. Winches are equipped with an automatic brake and WILL NOT FUNCTION if the wire rope spools in the opposite direction. The wire rope spooling can accidentally be reversed by running the wire rope all the way out and re-spooling in with the control switch in the "power out" mode.
When the remote control is activated, the winch will operate only in one direction.	One or more of the control pack relays is damaged	Check and replace relays as necessary. Refer to **RELAY PACK TEST**. Refer to **RELAY, WINCH, REMOVAL**.
	The remote control switch is damaged.	Check and replace switch as necessary. Refer to **REMOTE SWITCH TEST**.
Power-out mode only.	Tripped or damaged thermal switch	Let motor cool for at least 30 minutes, then try to power-in again.
		Check thermal switch. Refer to

		THERMAL SWITCH TEST. Replace the motor if the thermal switch is faulty. Refer to **MOTOR, WINCH, REMOVAL**.
When the remote control is activated, the winch will not operate and no "clicking" sound is heard.	Tripped or damaged Low Voltage Interrupt (LVI)	Use a fully charged conventional automotive battery with a minimum of 650 cold cranking amps rating to obtain peak performance from the winch. Make sure all terminals are clean and the battery is fully charged. Replace battery if necessary.
		Check LVI. Refer to **LOW VOLTAGE INTERRUPT (LVI) TEST**. Replace the relay pack if the LVI is faulty. Refer to **RELAY PACK, WINCH, REMOVAL**.

      - Measure the resistance between the two large studs on relay #4.
      - The resistance should be less than 1 ohm.
8. If the resistance across any of the relays doesn't go from open to closed (megaohms to tenths) then the relay is bad and needs to be replaced. Refer to **RELAY, WINCH, REMOVAL**.

REMOTE SWITCH TEST

1. To check switch, follow the steps below to check for switch continuity.

   Power-Out

Fig. 752: Remote Switch Connector Terminal Identification
Courtesy of CHRYSLER GROUP, LLC

1. Move switch to the power-out position.
2. Check for continuity between pins (1) and (4).
3. Check for continuity between pins (2) and (5).

Power-In

Fig. 753: Remote Switch Connector Terminal Identification
Courtesy of CHRYSLER GROUP, LLC

1. Move switch to the power-in position.

    2. Check for continuity between pins (1) and (4).
    3. Check for continuity between pins (2) and (3).
2. If there is no continuity, then the remote switch is bad and needs to be replaced.

THERMAL SWITCH TEST

The motor will not power-in if the thermal switch is open or if its terminals are in contact with the motor case. The switch should normally open when the temperature at the motor brushes reaches 205+°C (400+°F).

If the Thermal Switch is suspected to be failing check the following:

1. Disconnect the switch.
2. Measure the resistance of the switch at the electrical connector.
3. If the switch is open at room temperature then replace the motor.
4. If the switch is closed then the switch is good.
5. Check for resistance between both terminals and the motor case.
6. If the resistance is less than 1 megaohm then the winch is grounded. Replace the motor. Refer to **MOTOR, WINCH, REMOVAL**.

LOW VOLTAGE INTERRUPT (LVI) TEST

If the LVI is suspected to be failing check the following:

1. Check to make sure the battery has 10.5 to 12 volts.
2. If low, charge battery.
3. Wait for 30 seconds or more.
4. Check for a ground on pin 4.
5. If no ground then check control ground. Refer to **RELAY PACK TEST**.
6. If ground good then replace the relay pack. Refer to **RELAY PACK, WINCH, REMOVAL**.

MOTOR TEST

If the motor is suspected to be failing check the following:

1. Disconnect the motor power connectors F1, F2 and A.
2. Measure the resistance between F1 and F2. Resistance should be less than 1?.
3. Measure the resistance between A and ground. Resistance should be less than 1?.
4. If the resistance is greater than 1? the motor brushes could be worn or the internal wiring could be burned. Replace the motor. Refer to **MOTOR, WINCH, REMOVAL**.

POWER TEST

1. Check for a tight fit of all connections.
2. Using a volt meter, verify 12 ± 2 volts a the bus bar connecting relays #1 and #3.

MOTOR GROUND TEST

1. Check for continuity between the ground stud and the battery.
2. If no continuity then repair the ground cable from the batter to the motor.

The winch is driven on one end by a two direction electric motor powered by the vehicle electrical system. The motor is internally protected by a thermal switch that is activated when the motor gets too hot to operate efficiently.

Winch motor controls consist of a relay pack mounted to the motor, and a remote control connected to the relay pack with a cord. The winch power source cables are connected to the relay pack which in turn feeds power to the winch motor through electrical cable connections. The main function of the relay pack is to allow the operator to switch the winch on and off in both directions. The winch relay pack also includes a Low Voltage Interrupt (LVI) used to prevent winch operation in the event of battery power dropping below 10 volts.

F1 - FIELD #1 LEAD
A - ARMATURE LEAD

Electrical operation of the control assembly consists of four heavy duty relays, a thermal-switch located on the motor armature brush holder and a Low Voltage Interrupt (LVI) located in the control assembly. The thermal-switch interrupts the power-in function and the LVI affects both the power-in and power-out functions and must be reset by allowing the charging circuit voltage to rise above 10 volts for more than 30 seconds. The thermal switch is reset only by allowing the winch motor to cool adequately (about 30 minutes). Relay number 1 and 3 control current flow through the field windings and relay number 2 and 4 supply current to the motor armature.

F2 - FIELD #2 LEAD
F1 - FIELD #1 LEAD
A - ARMATURE LEAD

In the power-out mode, relay number 2 and 3 are energized by the remote control switch. Current flows from the positive battery terminal through relay number 3 then through the black motor cable to the number 2 and number 1 field windings. From the black motor cable current then flows through solenoid number 2 to the motor armature to ground.

In power-in mode, relay number 1 and 4 are energized. Current again flows from the battery positive cable, but this time current flows through solenoid number 1 then through field winding number 1. Current flowing in the reverse direction through the field windings cause the motor to turn in the opposite direction. From the red

motor cable current then flows through relay number 4 to the black cable going to the motor armature to ground.

WARNING: Always keep hands and clothing clear of the wire rope, hook and fairlead opening during operation and when spooling. Failure to follow these instructions may result in personal injury or death.

CAUTION: Wire rope must spool on the winch drum in the direction indicated.

1. Feed the new wire rope end (3) through the guide rollers.
2. Attach the flat side of the wire rope end (3) to the winch drum (1), apply red thread locker to the threads and install the bolt (2).
3. Wrap the wire rope around the spool approximately one time, in the direction indicated on the spool.
4. Tighten the bolt to 3 N.m (25 in. lbs.).

5. Arrange the wire rope so it will not kink or tangle when spooled.
6. Lock the winch drum by rotating the clutch lever (2) on the winch to "Engage."

NOTE: Always make sure the clutch is engaged or disengaged fully.

7. Connect the remote control to the socket.
8. Install the hook (5), the pin (1) and clip (2) to the end of the wire rope (4).
9. Keep the rope under light tension and spool the rope back onto the winch drum in even layers.
10. Stop frequently to tighten and straighten the layers as necessary.
11. Repeat this process until the winch hook (5) is the same distance from the winch as the full length of the remote control.

12. Using the hook strap, walk the wire rope towards the guide rollers, carefully spooling in the remaining wire rope by pulsing the remote control switch.

NOTE: **If you do not have the hook strap, use a length of cord or similar when handling the hook during servicing of the winch.**

13. Store the winch hook on the most outboard loop of the tow hook and remove the slack from the wire rope.

TIE RODS, WINCH MOTOR

REMOVAL

REMOVAL

1. Remove the winch assembly. Refer to **WINCH, REMOVAL**.
2. Remove the bolts and remove the damaged tie rod(s).

INSTALLATION

INSTALLATION

1. Install the tie rod(s) and install the bolts.
2. Tighten the bolts to 23 N.m (17 ft. lbs.).
3. Install the winch assembly. Refer to **WINCH, INSTALLATION**.

WARNING

SAFETY NOTICE

CAUTION: ALL SERVICE AND REBUILDING INSTRUCTIONS CONTAINED HEREIN ARE APPLICABLE TO, AND FOR THE CONVENIENCE OF, THE AUTOMOTIVE TRADE ONLY.

All rest and repair procedures on components or assemblies in con-automotive applications should be repaired in accordance with instructions supplied by the manufacturer of the total product.

Proper service and repair is important to the safe, reliable operation of all motor vehicles. The service produces recommended and described in this publication were developed for professional service personnel, and are effective methods for performing vehicle repair. Following these procedures will help ensure efficient economical vehicle performance and service reliability. Some service procedures require the use of special

tools designed for specific procedures. These special tools should be used as recommended throughout this publication.

Special attention should be exercised when working with spring-or tension-loaded fasteners and devices such as E-Clips, Circlips, Snap rings, etc., since careless removal may cause personal injury. Always wear safety goggles when working on vehicles or vehicle components.

It is important to note that this publication contains various Cautions and Warnings. These should be read carefully in order to minimize risk of personal injury or the possibility that improper service methods may damage the vehicle or render it unsafe. It is important to note that these Cautions and Warnings cover only the situations and procedures Chrysler Group LLC has encountered and recommended. Chrysler Group LLC cannot possibly know, evaluate, and advise the service trade of all conceivable ways in which service may be performed, or of the possible hazards of each. Consequently, Chrysler has not undertaken any such broad service review. Accordingly, anyone uses a service procedure or tool that is not recommended in this publication must be certain that neither personal safety, nor vehicle safety, will be jeopardized by the service methods they select.

USE OF HEAT DURING REPAIR

WARNING: **Chrysler Group LLC engineering's position on the use of heat during collision repair is as follows:**

- **Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.**
- **During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.**

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler Group LLC.

Failure to follow these instructions may result in serious or fatal injury.

FRAME

WARNING

USE OF HEAT DURING REPAIR

WARNING: Chrysler Group LLC engineering's position on the use of heat during collision repair is as follows:

- **Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.**
- **During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.**

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler Group LLC.

Failure to follow these instructions may result in serious or fatal injury.

WARNINGS

WARNING: Use an Occupational Safety and Health Administration (OSHA) approved breathing filter, when spraying paint or solvents in a confined area. Failure to follow these instructions may result in possible serious or fatal injury.

- **avoid prolonged skin contact with petroleum or alcohol based cleaning solvents.**
- **do not stand under a hoisted vehicle that is not properly supported on safety stands. Failure to follow these instructions may result in possible serious or fatal injury.**

CAUTION: When holes are drilled or punched in an inner body panel, verify the depth of space to the outer body panel, electrical wiring or other components. Damage to the vehicle can result.

- **do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
- **always have a fire extinguisher ready for use when welding.**
- **disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is off. Damage to electrical system can result.**
- **do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
- **do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
- **do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

RESTRAINT WARNINGS

WARNING: **To avoid potential physical injury, or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the ORC capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 30 cm (12 in) of an electronic module/harness, then that module/harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens. Failure to follow these instructions may result in serious or fatal injury.**

WARNING: **To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the Internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.**

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side curtain airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain airbags will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12**

inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

DESCRIPTION

DESCRIPTION

Fig. 1: Exploded View Of Power Sunroof System
Courtesy of CHRYSLER GROUP, LLC

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position electrically by

actuating a switch in the overhead console. The sunroof system receives battery feed through a fuse in the Totally Integrated Power Module (TIPM). The sunroof will operate normally with the key in the "RUN" or "ACCESSORY" position.

The sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the roof when open. The panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes a manual-sliding sunshade to cover the deep-tinted glass panel.

In addition to the standard power sunroof operation, this vehicle offers several additional features. There is an express (one-touch) opening and closing feature as well as Excessive Force Limitation (EFL). The EFL function detects obstacles trapped between the glass and the vehicle roof during a closing motion. Upon sensing an obstacle the EFL function will reverse direction of the glass to allow removal of the obstacle.

The main components of the power sunroof system are:

- The motor/module assembly
- The power sunroof glass and frame assembly
- The power sunroof switch
- The manual-sliding sunshade

OPERATION

OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open and closing feature. The sunroof system receives constant battery feed through a fuse in the Totally Integrated Power Module (TIPM). The sunroof will operate normally with the key in the "RUN" or "ACCESSORY" position. If the sunroof is moving when the key is turned to the START position (crank engine), all motions will stop. The sunroof will also stop a requested motion if the key is turned "OFF".

A combination push-button and rocker switch module mounted in the overhead console controls sunroof operation. The sunroof switch is a rocker design with a push button in the center of the two halves of the rocker. Pressing the rocker towards the front of the car commands the sunroof closed. Pressing the rocker towards the rear of the car commands the sunroof open. Pressing the center push button commands the sunroof up into the vent position (Rear of sunroof glass raises above the vehicle roof with glass still covering the sunroof opening). All switch commands operate with the glass starting in any position.

An electronic control system, integral to the motor/module assembly, provides the express open and close functions. During express opening, the sunroof glass panel will first open to the "Comfort Stop" position. A second press of the "OPEN" button on the rocker switch will move the glass panel to the full open position. Pressing the "close" end of the rocker switch moves the sunroof glass panel to the full closed position. During express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverse travel to avoid pinching an occupant's finger, ice in the track, etc. This function is called Excessive Force Limitation (EFL). There are two methods of overriding the EFL function.

1. When three EFL events occur without the glass being allowed to fully close, the next close attempt will only move while the close switch is continuously actuated. This allows the sunroof to be forced closed if

multiple close attempts fail.

2. If the sunroof close switch is continuously actuated during an EFL event, through the reversal, and during a two second wait time, then continuing to hold the close switch will cause the roof to move towards close with the EFL protection disabled. This allows the sunroof to be forced closed if it is known that a reversal will occur. This secondary EFL override may be necessary when known debris (ice blockage for example) is preventing the glass panel from closing.

While in EFL override, the closing motion will cease if the sunroof switch is released at any time.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor is being sent the proper hard wired output by the sunroof switch.

Check the condition of the circuit protection and inspect all wiring connector pins for proper engagement and continuity. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

Refer to the appropriate diagnostic information.

NOTE: If there is no sunroof movement when the "OPEN" or "CLOSED" button are pushed but the sunroof operates when the "VENT" button is pushed and held the sunroof motor/module is out of calibration. Complete the sunroof position calibration procedure prior to performing any sunroof diagnostics. Refer to MOTOR, SUNROOF, STANDARD PROCEDURE.

For possible causes, refer to **SUNROOF DIAGNOSIS CHART**. Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. If not, a common electrical problem may exist.

MOTOR, SUNROOF

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MOTOR/MODULE - SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor is being sent the proper hard wired output by the sunroof switch.

Refer to the appropriate diagnostic information.

NOTE: If there is no sunroof movement when the "OPEN" or "CLOSED" button are pushed but the sunroof operates when the "VENT" button is pushed and held the sunroof motor/module is out of calibration. Complete the sunroof position calibration procedure prior to performing any sunroof diagnostics. Refer to MOTOR, SUNROOF, STANDARD PROCEDURE.

The wire harness connectors for the sunroof motor/module are located above the vehicle headliner. Removal of the headliner may be necessary for access to the connector and proper diagnosis of the motor/module. Refer to **HEADLINER, REMOVAL** . **For complete circuit diagrams, refer to the appropriate wiring information.** The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Verify that all other power accessories are in proper operating condition. If not, a common electrical problem may exist.
2. Disconnect the sunroof motor/module connector directly at the motor/module (not at the headliner in-line connector). Connect a test light between the harness connector pin 6 and a known good B+ circuit. The test light should illuminate brightly. If OK, refer to 3. If not OK repair the ground circuit as necessary.
3. Connect a test light between the harness connector pin 8 and a known good ground. The test light should illuminate brightly. If OK, refer to 4. If not OK repair the B+ circuit as necessary.
4. Using an ohmmeter check the sunroof switch feed circuit for continuity between the sunroof motor/module and sunroof switch. Continuity should be present. If OK replace the inoperative motor/module. Refer to **MOTOR, SUNROOF, REMOVAL**. If not OK repair the sunroof switch feed circuit as necessary.

STANDARD PROCEDURE

SUNROOF POSITION CALIBRATION

Press the power sunroof switch (Open, Closed, and Vent). If no movement occurs when either the open switch or closed switch is pressed, but the system does move when the vent button is pressed and held, the system is not calibrated. Perform the following procedure to position calibrate the power sunroof system.

1. Turn the ignition to the RUN position.
2. Press the vent button on the power sunroof switch and hold until the sunroof glass panel has moved to the full vent position and the motor movement has stopped for at least 1 second.
3. Press the close switch on the power sunroof switch and hold for a moment (at least 100ms) and release. The sunroof glass panel should continue travel to the full close position. If the sunroof glass panel does not return to the fully closed position, refer to **DIAGNOSIS AND TESTING** for full system diagnosis.
4. Verify proper system operation.

MOTOR/MODULE INITIALIZATION

NOTE: Verify the battery is in good condition prior to performing this procedure. Do not leave the vehicle on a battery charger while performing this procedure. If the voltage at the sunroof motor/module drops below 11 volts or exceeds 15 volts at anytime while this procedure is being performed, the motor/module initialization procedure will not be properly completed.

1. Turn the ignition to the RUN position.
2. Press the vent button on the power sunroof switch and hold until the sunroof glass panel has moved to the full vent position and the motor movement has stopped for at least 1 second.
3. Press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **This will be considered the first sunroof closed position in a series of four sunroof closes.**
4. Press the vent button on the power sunroof switch and release. The sunroof glass panel should move to the full vent position. After the sunroof motor/module has stopped, press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **This will be considered the second sunroof closed position in a series of four sunroof closes.**
5. Continue to move the sunroof glass to the "vent" then "closed" positions two more times so that the sunroof glass has moved to the closed position a total of four times starting with the first sunroof close in step 3.
6. Press the open position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full open position.
7. Press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **This will be considered the first sunroof closed position in a series of five sunroof closes.**
8. Press the open position on the power sunroof switch and release. The sunroof glass panel should move to the full open position. After the sunroof motor/module has stopped, press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **Continue to move the sunroof glass to the "open" then "closed" position four more times so that the sunroof glass has moved to the closed position a total of five times starting with the first sunroof**

close in step 7.

Verify proper EFL calibration by placing a standard pencil at the front of the sunroof and then moving the sunroof to the full closed position. The sunroof should reverse direction upon contact without damage to the pencil.

REMOVAL

REMOVAL

WARNING: Do not attempt to move or reposition the sunroof glass panel or drive cables with the sunroof motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.

WARNING: The sunroof must first be calibrated and the Motor/Module Initialization Procedure must be completed any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury. For the appropriate procedure, refer to MOTOR, SUNROOF, STANDARD PROCEDURE.

1. Disconnect the battery negative cable.
2. Remove the vehicle headliner. Refer to **HEADLINER, REMOVAL** .

3. Remove the power sunroof motor/module electrical connector (2).
4. Remove the retaining screws (3) and remove the motor/module (1) from the vehicle.

INSTALLATION

INSTALLATION

WARNING: Do not attempt to move or reposition the sunroof glass panel or drive cables with the sunroof motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.

WARNING: The sunroof must first be calibrated and the Motor/Module Initialization Procedure must be completed any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury. For the appropriate procedure, refer to MOTOR, SUNROOF, STANDARD PROCEDURE.

1. Position the power sunroof motor/module (1) in the vehicle.
2. Install the motor/module retaining screws (3). Tighten the screws to 4 N.m (35 in. lbs.).
3. Connect the motor/module electrical connector (2).
4. Partially install the vehicle headliner and connect all remaining sunroof electrical connectors. Refer to **HEADLINER, INSTALLATION** .
5. Connect the battery negative cable.
6. Perform the sunroof position calibration. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE**.
7. Perform the Motor/Module Initialization Procedure. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE**.
8. Complete the vehicle headliner installation. Refer to **HEADLINER, INSTALLATION** .
9. Verify proper operation of the power sunroof system.

SWITCH, SUNROOF

DESCRIPTION

DESCRIPTION

Fig. 4: Power Sunroof Switch
Courtesy of CHRYSLER GROUP, LLC

The power sunroof switch (1) is a combination push-button and rocker switch module mounted in the overhead console. The sunroof switch is a direct contact unit that is directly wired to the sunroof motor/module assembly. The sunroof switch performs the following functions:

- Power sunroof open (back of switch pushed)
- Power sunroof closed (front of switch pushed)
- Power sunroof vent (switch center button pushed)

The power sunroof switch is part of the overhead console assembly and cannot be replaced separately. If the switch is damaged or inoperative the overhead console must be replaced. Refer to CONSOLE, OVERHEAD, FRONT, REMOVAL .

OPERATION

OPERATION

The power sunroof switch is hard wired to the sunroof motor/module assembly. The switch receives battery current from the motor/module when the ignition switch is in the RUN and ACCESSORY positions. When one of the switch positions is pressed it sends battery current back to the motor/module, signaling it to move the power sunroof to the appropriate position. The motor/module will perform one of the following functions:

- Power sunroof open (back of switch pushed)

- Power sunroof closed (front of switch pushed)
- Power sunroof vent (switch center button pushed)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SWITCH - POWER SUNROOF

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. If completing the appropriate diagnostic information results in the sunroof switch being inoperative, perform the following test prior to switch replacement.

Fig. 5: Power Sunroof Switch Connector End View

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .
3. Disconnect the power sunroof switch wire harness connector.
4. Using an ohmmeter, test the continuity of the power sunroof switch in each switch position. Refer to **POWER SUNROOF SWITCH CONTINUITY TABLE**. If OK, inspect the wiring harness and connectors for damage. Use a scan tool and the proper Diagnostic Procedures Information to complete diagnosis of the power sunroof system. If not OK, replace the overhead console.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The ABS Module detects an invalid signal between the master cylinder pressure applied and the Brake Lamp Switch Output Circuit for two minutes. If the Brake Lamp Switch Output circuit is still active with no pressure applied, code C1000 is set.

WHEN MONITORED:

Ignition Switch ON.

SET CONDITION:

POSSIBLE CAUSES

Possible Causes
(B15) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO VOLTAGE
BRAKE LAMP SWITCH OPERATION
ANTILOCK BRAKE SYSTEM (ABS) MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: **Diagnose and repair all PCM and any communication faults that are present before continuing with this test procedure.**

NOTE: **If applicable make sure the Stop Lamp Switch is properly adjusted in accordance with Service Information before continuing.**

1. Ignition on, engine not running.
2. With a scan tool, record and erase the DTC's.
3. Cycle the ignition from off to on.
4. Press the brake pedal.
5. With a scan tool, read the DTC's.

Is the DTC Active at this time?

Yes

- Go To 2.

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **(B15) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 2: Checking Brake Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Using a 12-volt test light connected to ground, back probe the (B15) Brake Signal 1 circuit.

Does the test light illuminate brightly?

Yes

- Go To 3.

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

3. **STOP LAMP BRAKE PEDAL SWITCH SHORTED**

Fig. 3: Checking Stop Lamp Brake Pedal Switch For A Short
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Stop Lamp Switch harness connector.
3. Measure the resistance of the Stop Lamp Switch between (B15) Brake Signal 1 circuit and (A108) Fused B(+) circuit at the Stop Lamp Switch harness connector.

   Is there continuity?

Yes

- Replace the Stop Lamp Switch in accordance with the Service Information
- Go To 4.

No

- Go To 5.

4. **CHECK (B15) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 4: Checking Brake Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Connect the Stop Lamp Switch harness connector.

2. Ignition on, engine not running.
3. Using a 12-volt test light connected to ground, back probe the (B15) Brake Signal 1 circuit at the Stop Lamp Switch harness connector.

   Does the test light illuminate?

   Yes

   - Go To 5.

   No

   - Repair the short to voltage in the (B15) Brake Signal 1 circuit.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

5. **CHECK ABS MODULE BACKFEEDING VOLTAGE TO (B15) BRAKE SIGNAL 1 CIRCUIT**

Fig. 5: Checking ABS Module Backfeeding Voltage To Brake Signal 1 Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn ignition off to the lock position.
2. Disconnect the ABS Module harness connector.
3. Ignition on, engine not running.
4. Using a 12-volt test light connected to ground, test the (B15) Brake Signal 1 circuit at the Stop Lamp Switch harness connector.

   Does the test light illuminate?

Yes

- Go To 6.

No

- Replace the Antilock Brake System (ABS) Module in accordance with Service Information
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

6. **CHECK TIPM MODULE BACKFEEDING VOLTAGE TO (B15) BRAKE SIGNAL 1 CIRCUIT**

Fig. 6: Checking ABS Module Backfeeding Voltage To Brake Signal 1 Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the TIPM harness connector.
3. Ignition on, engine not running.
4. Using a 12-volt test light connected to ground, test the (B15) Brake Signal 1 circuit.

   Does the test light illuminate?

   Yes

   - Repair the short to voltage in the (B15) Brake Signal 1 circuit.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Replace and program the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

C1008-BRAKE FLUID LEVEL CIRCUIT HIGH

Fig. 7: Brake Fluid Level Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) detects the Brake Fluid Level Circuit voltage is greater than expected for more than five seconds.

POSSIBLE CAUSES

Possible Causes
(B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT FOR AN OPEN
(B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE
BRAKE FLUID LEVEL SWITCH INTERNAL FAILURE
(Z907) GROUND CIRCUIT FOR AN OPEN
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read the TIPM DTC's.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **CHECK THE (B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 8: Checking Brake Fluid Level Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Brake Fluid Level Sensor harness connector.
3. Disconnect the TIPM C1 harness connector.
4. Turn the ignition on.
5. Measure the voltage between ground and the (B20) Brake Fluid Level Signal circuit.

   Is there any voltage present?

   Yes

- Repair the short to voltage in the (B20) Brake Fluid Level Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 3.

3. **CHECK THE (B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT FOR AN OPEN**

Fig. 9: Checking Brake Fluid Level Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Measure the resistance of the (B20) Brake Fluid Level Signal circuit between the Brake Fluid Level Sensor harness connector and the TIPM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4.

   No

   - Repair the open in the (B20) Brake Fluid Level Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (Z907) GROUND CIRCUIT FOR AN OPEN**

Fig. 10: Checking Brake Fluid Level Sensor For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (Z907) Ground circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5.

   No

- Repair the open in the (Z907) Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **BRAKE FLUID LEVEL SWITCH INTERNAL FAILURE**

Fig. 11: Checking Brake Fluid Level Sensor For Internal Failure
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the TIPM C1 harness connector.
2. Connect a jumper wire between the (B20) Brake Fluid Level Signal circuit and the (Z907) Ground circuit in the Brake Fluid Level Sensor harness connector.
3. Turn the ignition on.
4. With the scan tool, read the Brake Fluid Level.

Does the scan tool display Low?

Yes

- Replace the Brake Fluid Level Sensor in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the TIPM in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

C1009-BRAKE FLUID LEVEL LOW

Fig. 12: Brake Fluid Level Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

When the Totally Integrated Power Module (TIPM) indicates that the Brake Fluid Level Circuit is less then 0.10 of a volt.

POSSIBLE CAUSES

Possible Causes
BRAKE FLUID LEVEL LOW
(B20) BRAKE FLUID LEVEL SWITCH SIGNAL CIRCUIT IS SHORTED TO GROUND
BRAKE FLUID LEVEL SWITCH INTERNAL FAILURE
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **BRAKE FLUID LEVEL SWITCH SIGNAL VOLTAGE BELOW 0.10 OF A VOLT**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Ignition on, engine not running.
   2. With the scan tool, read Brake Fluid Level Switch Signal voltage.

      Is the voltage below 0.10 of a volt?

      Yes

      - Go To 2.

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK BRAKE FLUID LEVEL**

   NOTE: Visually inspect for worn brake linings or undersized rotors.

   Was low brake fluid level found?

   Yes

   - Repair as needed.

- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 3.

3. **BRAKE FLUID LEVEL SWITCH INTERNAL FAILURE**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Brake Fluid Level Switch harness connector.
   3. Ignition on, engine not running.
   4. With the scan tool, read the Brake Fluid Level Switch voltage

      Is the voltage approximately 5 volts?

      Yes

      - Replace the Brake Fluid Level Switch in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Go To 4.

4. **CHECK THE (B20) BRAKE FLUID LEVEL SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 13: Checking Brake Fluid Level Sensor Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TIPM C1 harness connector.
3. Measure the resistance of the (B20) Brake Fluid Level circuit in the Brake Fluid Level Switch harness connector to ground.

   Is the resistance below 100 Ohms?

   Yes

   - Repair the (B20) Brake Fluid Level circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 5.

5. **TOTALLY INTEGRATED POWER MODULE (TIPM)**

   Repair

   - Replace and program the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT

Fig. 14: Left Front Wheel Speed Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control**

symbol.

WHEN MONITORED:

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION:

If the measured wheel speed sensor feedback voltage is less than.304 of a volt, the sensor is considered open.

If the measured wheel speed sensor feedback voltage is greater than 1.39 volts, or if a sensor over current condition is detected, the sensor is considered shorted.

If a shorted or open condition is present for more than 100 msec, the DTC will set.

POSSIBLE CAUSES

Possible Causes
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND
(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR AN OPEN
(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE
(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT
LEFT FRONT WHEEL SPEED SENSOR
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, erase DTC's.
    3. Cycle the ignition switch from off to on.
    4. With the scan tool, select View DTC's.

    Is the status Active for this DTC?

    Yes

    - Go To 2.

    No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**. **ABS INTERMITTENT CONDITION**.

2. **WHEEL SPEED SENSOR INSPECTION**
    1. Turn the ignition off to the lock position.
    2. Inspect the Wheel Speed Sensor for proper mounting.
    3. Inspect the Wheel Speed Sensor harness and connector.
    4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

    Were any problems found?

    Yes

    - Repair as necessary in accordance with the Service Information.
    - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK (B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**

Fig. 15: Measuring Left Front Wheel Speed Sensor Supply Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Left Front Wheel Speed Sensor harness connector.
2. Turn the ignition on.
3. Measure the voltage between the (B9) Left Front Wheel Speed Sensor Supply circuit and ground.

   Is the voltage above 10 volts?

Yes

- Go To 4.

No

- Go To 6.

4. **(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 16: Measuring Left Front Wheel Speed Sensor Supply Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the ABS Module harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (B9) Left Front Wheel Speed Sensor Supply circuit at the Left Front Wheel Speed Sensor harness connector.

Is there any voltage present?

Yes

- Repair (B9) Left Front Wheel Speed Sensor Supply circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 5.

5. **(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 17: Checking Front Wheel Speed Sensor Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (B8) Left Front Wheel Speed Sensor Signal circuit and ground.

Is the resistance above 5.0 Ohms?

Yes

- Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Repair the (B8) Left Front Wheel Speed Sensor Signal circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTC's.
    3. Turn the ignition off to the lock position.
    4. Ignition on, engine not running.
    5. With the scan tool, select View DTC's.

    Is the status Active for this DTC?

    Yes

    - Go To 2.

    No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **WHEEL SPEED SENSOR INSPECTION**
   1. Turn the ignition off to the lock position.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 3.

3. **TONE WHEEL DAMAGED/MISSING**
   1. Inspect the Tone Wheel in accordance with the Service Information.

   NOTE: The Tone Wheel Teeth should be perfectly square, not bent or nicked.

   Were any problems found?

   Yes

   - Replace the Tone Wheel in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 4.

4. **EXCESSIVE WHEEL SPEED SENSOR AIR GAP**
   1. Measure the Wheel Speed Sensor Air Gap in accordance with the Service Information.

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.

- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 5.

5. **WHEEL BEARING LOOSE/BINDING**
   1. Inspect the wheel bearings for excessive run out or improper clearance in accordance with the Service Information.

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Go To 6.

6. **CHECK (B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**

3. Ignition on, engine not running.
4. Measure the voltage of the (B9) Left Front Wheel Speed Sensor Supply circuit at the Left Front Wheel Speed Sensor harness connector.

Is there any voltage present?

Yes

- Repair (B9) Left Front Wheel Speed Sensor Supply circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 8.

8. **(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WHEN MONITORED:

With the ignition on, no system under voltage or over voltage condition present, no open or shorted wheel speed sensor DTC's set, vehicle not under high acceleration, and vehicle speed greater than 0.

SET CONDITION:

This DTC will set if either one wheel is sensed above a predetermined range for 5000 msec while the other wheels are below 20% of maximum velocity of all wheels OR if more than one wheel is sensed at below 20% of maximum velocity of all wheels while at least one wheel is sensed above a predetermined range. The condition must exist for two minutes for this DTC to set.

If the number of missing sensors changes at any update, the fault monitor is reset.

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, erase DTC's.
    3. Turn the ignition off to the lock position.
    4. Ignition on, engine not running.
    5. With the scan tool, select View DTC's.

    Is the status Active for this DTC?

    Yes

    - Go To 2.

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **WHEEL SPEED SENSOR INSPECTION**
   1. Turn the ignition off to the lock position.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 3.

3. **TONE WHEEL DAMAGED/MISSING**
   1. Inspect the Tone Wheel in accordance with the Service Information.

   NOTE: The Tone Wheel Teeth should be perfectly square, not bent or nicked.

   Were any problems found?

   Yes

   - Replace the Tone Wheel in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 4.

4. **EXCESSIVE WHEEL SPEED SENSOR AIR GAP**
   1. Measure the Wheel Speed Sensor Air Gap in accordance with the Service Information.

   Were any problems found?

   Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 5.

5. **WHEEL BEARING LOOSE/BINDING**
   1. Inspect the wheel bearings for excessive run out or improper clearance in accordance with the Service Information.

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Go To 6.

6. **CHECK (B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**

Fig. 51: Measuring Right Front Wheel Speed Sensor Supply Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Right Front Wheel Speed Sensor harness connector.
2. Turn the ignition on.
3. Measure the voltage between the (B7) Right Front Wheel Speed Sensor Supply circuit and ground.

   Is the voltage above 10 volts?

   Yes

   - Go To 7.

   No

- Go To 9.

7. **(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 52: Measuring Right Front Wheel Speed Sensor Supply Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the ABS Module harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (B7) Right Front Wheel Speed Sensor Supply circuit at the Right Front Wheel Speed Sensor harness connector.

Is there any voltage present?

Yes

- Repair (B7) Right Front Wheel Speed Sensor Supply circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 8.

8. **(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 53: Checking Right Front Wheel Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (B6) Right Front Wheel Speed Sensor Signal circuit and ground.

   Is the resistance above 5.0 Ohms?

   Yes

- Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Repair the (B6) Right Front Wheel Speed Sensor Signal circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

9. **(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 54: Checking Right Front Wheel Speed Sensor Supply Circuit For A Short To Ground

1. Turn the ignition off to the lock position.
2. Disconnect the ABS Module harness connector.
3. Measure the resistance between the (B7) Right Front Wheel Speed Sensor Supply circuit and ground.

   Is the resistance above 5.0 Ohms?

   Yes

   - Go To 10.

   No

   - Repair the (B7) Right Front Wheel Speed Sensor Supply circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

10. **(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Fig. 55: Checking Right Front Wheel Speed Sensor Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (B7) Right Front Wheel Speed Sensor Supply circuit between the ABS harness connector and the Right Front Wheel Speed Sensor harness connector.

   Is the resistance below 5 Ohms?

   Yes

   - Go To 11.

   No

- Repair the open (B7) Right Front Wheel Speed Sensor Supply circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

11. **(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 56: Checking Front Wheel Speed Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (B6) Right Front Wheel Speed Sensor Signal circuit between the ABS harness connector and the Right Front Wheel Speed Sensor harness connector.

   Is the resistance below 5 Ohms?

   Yes

   - Go To 12.

No

- Repair the open (B6) Right Front Wheel Speed Sensor Signal circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

12. **(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 57: Checking Right Front Wheel Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (B6) Right Front Wheel Speed Sensor Signal circuit at the Right Front Wheel Speed Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (B6) Right Front Wheel Speed Sensor Signal circuit for a short to voltage.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 13.

13. **(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT**

Fig. 58: Checking Right Front Wheel Speed Sensor Supply Circuit For A Short To The Right Front Wheel Speed Sensor Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (B7) Right Front Wheel Speed Sensor Supply circuit and the (B6) Right Front Wheel Speed Sensor Signal circuit at the ABS Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair (B7) Right Front Wheel Speed Sensor Supply circuit for a short to the (B6) Right Front Wheel Speed Sensor Signal circuit.

- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Replace the Antilock Brakes Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

WHEN MONITORED:

With the ignition on, no system under voltage or over voltage condition present, no open or shorted wheel speed sensor DTC's set, vehicle not under high acceleration, and vehicle speed greater than 0.

SET CONDITION:

This DTC will set if either one wheel is sensed above a predetermined range for 5000 msec while the other wheels are below 20% of maximum velocity of all wheels OR if more than one wheel is sensed at below 20% of maximum velocity of all wheels while at least one wheel is sensed above a predetermined range. The condition must exist for two minutes for this DTC to set.

If the number of missing sensors changes at any update, the fault monitor is reset.

WHEN MONITORED:

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION:

If the measured wheel speed sensor feedback voltage is less than.304 of a volt, the sensor is considered open.

If the measured wheel speed sensor feedback voltage is greater than 1.39 volts, or if a sensor over current condition is detected, the sensor is considered shorted.

If a shorted or open condition is present for more than 100 msec, the DTC will set.

2. Disconnect the ABS Module harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (B4) Left Rear Wheel Speed Sensor Supply circuit.

   Is there any voltage present?

Yes

- Repair (B4) Left Rear Wheel Speed Sensor Supply circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 8.

8. **(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (B3) Left Rear Wheel Speed Sensor Signal circuit and ground.

   Is the resistance above 5.0 Ohms?

   Yes

   - Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Repair the (B3) Left Rear Wheel Speed Sensor Signal circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

9. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

1. Turn the ignition off to the lock position.
2. Disconnect the ABS Module harness connector.
3. Measure the resistance between the (B4) Left Rear Wheel Speed Sensor Supply circuit and ground.

   Is the resistance above 5.0 Ohms?

   Yes

   - Go To 10.

No

- Repair the (B4) Left Rear Wheel Speed Sensor Supply circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

10. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (B4) Left Rear Wheel Speed Sensor Supply circuit between the ABS harness connector and the Left Rear Wheel Speed Sensor harness connector.

   Is the resistance below 5 Ohms?

Yes

- Go To 11.

No

- Repair the open (B4) Left Rear Wheel Speed Sensor Supply circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

11. **(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN**

1. Measure the resistance of the (B3) Left Rear Wheel Speed Sensor Signal circuit between the ABS

harness connector and the Left Rear Wheel Speed Sensor harness connector.

Is the resistance below 5 Ohms?

Yes

- Go To 12.

No

- Repair the open (B3) Left Rear Wheel Speed Sensor Signal circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

12. **(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 84: Checking Left Rear Wheel Speed Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (B3) Left Rear Wheel Speed Sensor Signal circuit at the Left Rear Wheel Speed Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (B3) Left Rear Wheel Speed Sensor Signal circuit for a short to voltage.

- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 13.

13. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT**

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (B4) Left Rear Wheel Speed Sensor Supply circuit and the (B3) Left Rear Wheel Speed Sensor Signal circuit at the ABS Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair (B4) Left Rear Wheel Speed Sensor Supply circuit for a short to the (B3) Left Rear Wheel Speed Sensor Signal circuit.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Replace the Antilock Brakes Module in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, erase DTC's.
    3. Turn the ignition off to the lock position.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTC's.

    Is the status Active for this DTC?

    Yes

    - Go To 2.

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **WHEEL SPEED SENSOR INSPECTION**
   1. Turn the ignition off to the lock position.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 3.

3. **TONE WHEEL DAMAGED/MISSING**
   1. Inspect the Tone Wheel in accordance with the Service Information.

   NOTE: The Tone Wheel Teeth should be perfectly square, not bent or nicked.

   Were any problems found?

   Yes

   - Replace the Tone Wheel in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 4.

4. **EXCESSIVE WHEEL SPEED SENSOR AIR GAP**
   1. Measure the Wheel Speed Sensor Air Gap in accordance with the Service Information.

   Were any problems found?

   Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 5.

5. **WHEEL BEARING LOOSE/BINDING**
   1. Inspect the wheel bearings for excessive run out or improper clearance in accordance with the Service Information.

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Go To 6.

6. **CHECK (B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**

Fig. 87: Measuring Left Rear Wheel Speed Sensor Supply Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Left Rear Wheel Speed Sensor harness connector.
2. Turn the ignition on.
3. Measure the voltage between the (B4) Left Rear Wheel Speed Sensor Supply circuit and ground.

   Is the voltage above 10 volts?

   Yes

   - Go To 7.

   No

- Go To 9.

7. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

1. Turn the ignition off to the lock position.
2. Disconnect the ABS Module harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (B4) Left Rear Wheel Speed Sensor Supply circuit.

   Is there any voltage present?

Yes

- Repair (B4) Left Rear Wheel Speed Sensor Supply circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 8.

8. **(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 89: Checking Left Rear Wheel Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (B3) Left Rear Wheel Speed Sensor Signal circuit and ground.

   Is the resistance above 5.0 Ohms?

   Yes

   - Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Repair the (B3) Left Rear Wheel Speed Sensor Signal circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

9. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

1. Turn the ignition off to the lock position.
2. Disconnect the ABS Module harness connector.
3. Measure the resistance between the (B4) Left Rear Wheel Speed Sensor Supply circuit and ground.

   Is the resistance above 5.0 Ohms?

   Yes

   - Go To 10.

No

- Repair the (B4) Left Rear Wheel Speed Sensor Supply circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

10. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Fig. 91: Checking Left Rear Wheel Speed Sensor Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (B4) Left Rear Wheel Speed Sensor Supply circuit between the ABS harness connector and the Left Rear Wheel Speed Sensor harness connector.

   Is the resistance below 5 Ohms?

Yes

- Go To 11.

No

- Repair the open (B4) Left Rear Wheel Speed Sensor Supply circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

11. **(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN**

2. Measure the resistance between the (B4) Left Rear Wheel Speed Sensor Supply circuit and the (B3) Left Rear Wheel Speed Sensor Signal circuit at the ABS Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair (B4) Left Rear Wheel Speed Sensor Supply circuit for a short to the (B3) Left Rear Wheel Speed Sensor Signal circuit.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Replace the Antilock Brakes Module in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

WHEN MONITORED:

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION:

If the measured wheel speed sensor feedback voltage is less than.304 of a volt, the sensor is considered open.

If the measured wheel speed sensor feedback voltage is greater than 1.39 volts, or if a sensor over current condition is detected, the sensor is considered shorted.

If a shorted or open condition is present for more than 100 msec, the DTC will set.

symbol.

WHEN MONITORED:

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION:

If the measured wheel speed sensor feedback voltage is less than.304 volts, the sensor is considered open.

If the measured wheel speed sensor feedback voltage is greater than 1.39 volts, or if a sensor over current condition is detected, the sensor is considered shorted.

If a shorted or open condition is present for more than 100 msec, the DTC will set.

POSSIBLE CAUSES

Possible Causes
(B2) REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND
(B1) REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND
(B2) REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR AN OPEN
(B1) REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN
(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE
(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTC's.
    3. Turn the ignition off to the lock position.
    4. Ignition on, engine not running.
    5. With the scan tool, select View DTC's.

    Is the status Active for this DTC?

    Yes

- Go To 2.

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **WHEEL SPEED SENSOR INSPECTION**
   1. Turn the ignition off to the lock position.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 3.

3. **TONE WHEEL DAMAGED/MISSING**
   1. Inspect the Tone Wheel in accordance with the Service Information.

   NOTE: The Tone Wheel Teeth should be perfectly square, not bent or nicked.

   Were any problems found?

   Yes

   - Replace the Tone Wheel in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 4.

4. **EXCESSIVE WHEEL SPEED SENSOR AIR GAP**
   1. Measure the Wheel Speed Sensor Air Gap in accordance with the Service Information.

   Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 5.

5. **WHEEL BEARING LOOSE/BINDING**
   1. Inspect the wheel bearings for excessive run out or improper clearance in accordance with the Service Information.

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Go To 6.

6. **CHECK (B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**

Fig. 114: Measuring Right Rear Wheel Speed Sensor Supply Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Right Rear Wheel Speed Sensor harness connector.
2. Turn the ignition on.
3. Measure the voltage between the (B2) Right Rear Wheel Speed Sensor Supply circuit and ground.

   Is the voltage above 10 volts?

Yes

- Go To 7.

No

- Go To 9.

7. **(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 115: Measuring Right Rear Wheel Speed Sensor Supply Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the ABS Module harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (B2) Right Rear Wheel Speed Sensor Supply circuit at the Right Rear Wheel Speed Sensor harness connector.

Is there any voltage present?

Yes

- Repair (B2) Right Rear Wheel Speed Sensor Supply circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 8.

8. **(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 116: Checking Right Rear Wheel Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (B1) Right Rear Wheel Speed Sensor Signal circuit and ground.

   Is the resistance above 5.0 Ohms?

   Yes

   - Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Repair the (B1) Right Rear Wheel Speed Sensor Signal circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

9. **(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 117: Checking Right Rear Wheel Speed Sensor Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the ABS Module harness connector.
3. Measure the resistance between the (B2) Right Rear Wheel Speed Sensor Supply circuit and ground.

   Is the resistance above 5.0 Ohms?

   Yes

   - Go To 10.

No

- Repair the (B2) Right Rear Wheel Speed Sensor Supply circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

10. **(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Fig. 118: Checking Right Rear Wheel Speed Sensor Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (B2) Right Rear Wheel Speed Sensor Supply circuit between the ABS harness connector and the Right Rear Wheel Speed Sensor harness connector.

   Is the resistance below 5 Ohms?

Yes

- Go To 11.

No

- Repair the open (B2) Right Rear Wheel Speed Sensor Supply circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

11. **(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 119: Checking Right Rear Wheel Speed Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (B1) Right Rear Wheel Speed Sensor Signal circuit between the ABS

harness connector and the Right Rear Wheel Speed Sensor harness connector.

Is the resistance below 5 Ohms?

Yes

- Go To 12.

No

- Repair the open (B1) Right Rear Wheel Speed Sensor Signal circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

12. **(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 120: Checking Right Rear Wheel Speed Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (B1) Right Rear Wheel Speed Sensor Signal circuit at the Right Rear Wheel Speed Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (B1) Right Rear Wheel Speed Sensor Signal circuit for a short to voltage.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 13.

13. **(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT**

Fig. 121: Checking Right Rear Wheel Speed Sensor Supply Circuit For A Short To The Right Rear Wheel Speed Sensor Signal Circuit

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (B2) Right Rear Wheel Speed Sensor Supply circuit and the (B1) Right Rear Wheel Speed Sensor Signal circuit at the ABS Module harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Repair (B2) Right Rear Wheel Speed Sensor Supply circuit for a short to the (B1) Right Rear Wheel Speed Sensor Signal circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Replace the Antilock Brakes Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

1. Turn the ignition on.
2. Measure the voltage of the (B22) Rear Wheel Speed Sensor Signal circuit.

   Is there any voltage present?

Yes

- Repair the (B22) Rear Wheel Speed Sensor Signal circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 10.

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (B222) Rear Wheel Speed Sensor Supply circuit and the (B22) Rear Wheel Speed Sensor Signal circuit at the Antilock Brake Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair (B222) Rear Wheel Speed Sensor Supply circuit for a short to the (B22) Rear Wheel Speed Sensor Signal circuit.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Replace the Antilock Brakes Module in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on and no system under voltage condition present.

SET CONDITION:

OPEN CIRCUIT: If pump motor feedback remains greater than 0.75 of a volt for more than 50 msec (+/- 5 msec) after monitoring conditions are met, the DTC will set.

LOCKED MOTOR: If the module detects that the motor is spinning at less than 500 RPM. after monitoring conditions are met, the DTC will set.

LOW VOLTAGE: The voltage of the supply is monitored every 3 msec. If the voltage is low for 150 msec, the DTC will set.

POSSIBLE CAUSES

Possible Causes
FUSE J04 (40A)
INTERMITTENT ABS MOTOR CONTROL CIRCUIT DTC
(A107) FUSED B+ CIRCUIT FOR AN OPEN OR HIGH RESISTANCE
(Z107) OR (Z127) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTC's.
    3. Turn the ignition off to the lock position.
    4. Ignition on, engine not running.
    5. With the scan tool, actuate the ABS pump motor.

    Did the Pump Motor operate when actuated?

    No

    - Go To 2.

    Yes

    - Go To 5.
2. **(A107) FUSED B+ CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 150: Checking Fused B+ Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the ABS Module harness connector.

NOTE: **Check connector - Clean/repair as necessary.**

3. Using a 12-volt test light connected to ground, check the (A107) Fused B+ Circuit.

NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Is the test light illuminated and bright?

Yes

- Go To 3.

No

- Repair the (A107) Fused B+ Circuit for an open circuit or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

3. **(Z107) or (Z127) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 151: Checking Ground Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12-volts, check the (Z107) and (Z127) Ground circuits.

   NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

   Is the test light illuminated and bright?

   Yes

   - Go To 4.

   No

   - Repair the (Z107) or (Z127) Ground Circuit(s) for an open circuit or high resistance.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

4. **ANTILOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off to the lock position.
   2. Inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - If no other problems are found, replace the Antilock Brake Module in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

5. **WIRING HARNESS INSPECTION**
   1. Turn the ignition off to the lock position.
   2. Inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Test Complete.

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

The DTC will set if the stored tire size is out of range as received from the Totally Integrated Power Module (TIPM).

POSSIBLE CAUSES

Possible Causes
INTERMITTENT TIRE REVOLUTIONS RANGE PERFORMANCE DTC
INCORRECT TIRE SIZE PROGRAMMED INTO TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **DTC CONDITION IS PRESENT**
    1. Turn the ignition on.
    2. Observe the ABS Warning Indicator.

    Is the ABS Warning Indicator Flashing?

    Yes

    - Go To 2.

    No

    - Go To 3.

2. **INCORRECT TIRES PROGRAMMED INTO TIPM**

1. Inspect all four tires on the vehicle and note the size of each tire.

   NOTE: **A non-production size tire cannot be programmed into the TIPM. The production Powertrain, with the production size tires, is the only emissions certified configuration that is available for reprogramming.**

2. Verify the correct Tire/wheel information is programmed in the TIPM.

   Is the correct value programmed in the TIPM according to the chart?

Yes

- Test complete.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Program the correct Tire/Wheel information in the TIPM.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

3. **WIRING HARNESS INSPECTION**
   1. Turn the ignition off.
   2. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   4. Perform any Hotline letters or Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Test Complete.

C1079-TONE WHEEL TEETH COUNT RANGE PERFORMANCE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED:

Ignition on.

SET CONDITION:

The DTC will set if the stored tone wheel tooth count is out of range as received from the TIPM.

POSSIBLE CAUSES

Possible Causes
TONE WHEEL TOOTH COUNT NOT PROGRAMED IN THE TIPM TONE RING/AXLE SIZE MISMATCH

DIAGNOSTIC TEST

1. **TONE RING/AXLE SIZE MISMATCH**
    1. Turn the ignition on.
    2. With the scan tool, determine the axle size that is programmed into the Antilock Brake Module.
    3. Inspect and identify the vehicle axle size.
    4. Compare the axle size programmed into the Antilock Brake Module, and the actual axle size installed into the vehicle.

    Does the programmed axle size match the installed axle?

    Yes

    - Replace the Antilock Brake Module in accordance with the Service Information.
    - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

    No

    - Reprogram the Antilock Brake Module in accordance with the Service Information.
    - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C107B-WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

When one or more WSS reading is different from the readings received from the other WSS's. The Antilock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

POSSIBLE CAUSES

Possible Causes
UNDER INFLATED TIRE
WRONG TIRE SIZE
WSS LOOSE - SIGNAL, SUPPLY CIRCUITS/CONNECTOR/TERMINAL DAMAGE
BRAKE SYSTEM FAULT
TONE WHEEL DAMAGE
WSS - INTERNAL FAULT

DIAGNOSTIC TEST

1. **CHECK FOR DTC C107B-WHEEL SPEED COMPARATIVE PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTC's.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTC's

      NOTE: The Antilock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 m.p.h.) before it will extinguish the ABS indicators.

      Does the scan tool display: C107B-WHEEL SPEED COMPARATIVE PERFORMANCE?

      Yes

      - Go To 2.

      No

      - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.
   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

      Is one or more WSS speeds showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

      Yes

      - Go To 3.

      No

      - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

3. **CHECK WSS LOOSENESS, INSPECT SIGNAL, SUPPLY CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off.
2. Inspect the Antilock Brake Module harness connector, each WSS, and each WSS harness connector.
3. Inspect each WSS for looseness and not properly fastened.
4. Inspect each WSS Signal and WSS Supply circuits between each WSS and Antilock Brake Module for damage.

   Is any WSS loose or any of the wiring/connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK BRAKE SYSTEM**
   1. Turn the ignition off.
   2. Check the brake fluid level.
   3. Check for trapped air in brake lines.
   4. Inspect for brake fluid leakage on vehicle.
   5. Inspect for loose mounted brake hardware.

   Are any of the above conditions present?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 5.

5. **CHECK EACH TONE WHEEL FOR DAMAGE**
   1. Turn the ignition off.
   2. Inspect each Tone Wheel for damage, missing teeth, cracks, or looseness.

   NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

   Is the Tone Wheels damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 6.

6. **ANTILOCK BRAKE MODULE - INTERNAL FAULT**
   1. Turn the ignition off.
   2. Replace WSS in question and perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.
   3. With the scan tool, erase DTC's.
   4. Road test the vehicle over 40 km/h (25 m.p.h.).
   5. Turn the ignition on.
   6. With the scan tool, read DTC's

   Did the DTC C107B-WHEEL SPEED COMPARATIVE PERFORMANCE reset?

   Yes

   - Replace the Antilock Brake Module in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Test Complete.

C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic**

Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

WHEN MONITORED:

When the vehicle is driven.

SET CONDITION:

If the Powertrain Control Module (PCM) detects an implausible signal from the Stop Lamp Switch and sends a message to the ABS Module via the CAN C bus.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
STOP LAMP RELATED DTC's OR SYMPTOMS PRESENT FUSE OPEN
MISADJUSTED PEDAL SWITCH
(B15) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND
(B15) BRAKE SIGNAL 1 SIGNAL CIRCUIT FOR AN OPEN
(Z910) GROUND CIRCUIT FOR AN OPEN
STOP LAMP SWITCH
ANTILOCK BRAKES SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: **Diagnose and repair all Pressure Sensor and Voltage related DTC's and all Stop Lamp related DTC's and symptoms before diagnosing this DTC.**

1. Ignition on, engine not running.
2. With the scan tool, read DTC's.
3. With the scan tool, read and record Environmental Data (EV Data).
4. With the scan tool, erase DTC's.
5. Cycle the ignition switch.

WARNING: **Make sure brake capability is available before road testing.**

6. Test drive the vehicle as follows: Drive for more than six minutes at a speed greater than 40 km/h (25 mph) and accelerate to a speed greater than 40 km/h (25 mph) and then decelerate to a speed lower than 3 km/h (2 mph) five consecutive times.

7. Park the vehicle.
8. With the scan tool, read DTC's.

   Is the DTC active?

   Yes

   - Go To 2.

   No

   - Perform the ABS INTERMITTENT CONDITION. Refer to **ABS INTERMITTENT CONDITION**.

2. **INSPECT RELATED WIRING HARNESS, TERMINALS, AND CONNECTORS**
   1. Turn ignition off to the lock position.
   2. Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.
   3. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK (B15) BRAKE SIGNAL 1 CIRCUIT FUNCTION WHILE PRESSING AND RELEASING THE BRAKE PEDAL**

Fig. 153: Checking Brake Signal 1 Circuit Function While Pressing And Releasing The Brake Pedal
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Using a 12-volt test light connected to 12 volts, backprobe the (B15) Brake Switch No. 1 Signal circuit at the PCM C3 harness connector.
3. Press and release the brake pedal.

   Does the test light illumination toggle from off to on?

   Yes

- Go To 7.

No

- Go To 4.

4. **CHECK (B15) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**

Fig. 154: Checking Brake Signal 1 Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn ignition off to the lock position.
2. Disconnect the PCM C3 harness connector.

3. Disconnect the Stop Lamp Switch harness connector.
4. Measure the resistance of the (B15) Brake Signal 1 circuit between ground and the PCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (B15) Brake Signal 1 circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 5.

5. **CHECK (B15) BRAKE SIGNAL 1 CIRCUIT FOR AN OPEN**

Fig. 155: Checking Brake Signal 1 Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (B15) Brake Signal 1 circuit between the ABS Module harness connector and the Stop Lamp Switch harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6.

   No

   - Repair the (B15) Brake Signal 1 circuit for an open.

- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

6. **CHECK (Z910) GROUND CIRCUIT FOR A OPEN**

Fig. 156: Checking Ground Circuit For A Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance on the (Z910) Ground circuit and ground in the Stop Lamp Switch harness connector.

   Is the resistance below 5 Ohms?

   Yes

   - Replace the Stop Lamp Switch in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Repair the open in the (Z910) Ground circuit.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

7. **CHECK BRAKE PEDAL ADJUSTMENT**

Fig. 157: Checking Brake Switch No. 1 Signal Circuit In The Stop Lamp Switch Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Connect the Stop Lamp Switch harness connector.
2. Using a 12-volt test light connected to 12 volts, backprobe the (B15) Brake Switch No. 1 Signal circuit in the Stop Lamp Switch harness connector.
3. Ignition on, engine not running.
4. Press and release the brake pedal.

   Does the test light illumination toggle from off to on within 4-5 mm of brake pedal travel?

   Yes

   - Replace the Antilock Bakes System (ABS) Module in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Replace the Stop Lamp Switch in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C1086-ABS SYSTEM CONTROL TOO LONG

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED:

With the ignition on.

SET CONDITION:

When the Antilock Brake Module receives 5 seconds of dump activation without wheel speed recovery.

POSSIBLE CAUSES

Possible Causes
ABS, TCS, ESP CONTROL TOO LONG
AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS
HYDRAULIC CONTROL UNIT (HCU) INTERNAL FAILURE

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

   NOTE: If other DTC's are set they must be repaired before continuing. This DTC must be active for the results of this test to be valid and this DTC may set while driving under excessive driving conditions.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTC's.
   3. With the scan tool, erase DTC's.
   4. Depress and release the brake pedal.
   5. With the scan tool, read and record DTC's.

   Does the scan tool display: C1086-ABS SYSTEM CONTROL TOO LONG?

   Yes

   - Go To 2.

   No

   - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK FOR AIR IN BRAKE SYSTEM AND WORN MECHANICAL COMPONENTS**

   NOTE: Visually inspect for worn brake linings, undersized rotors, binding or frozen calipers. Repair as necessary.

NOTE: **Before continuing the brake system must be bled to verify there is no air in the brake system.**

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Replace the Hydraulic Control Unit in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C1090-ABS BRAKE LAMP CONTROL CIRCUIT LOW

Fig. 158: Brake Pedal Switch Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

When monitoring the Brake Lamp Activation Relay Control circuit the module detects a short to ground.

POSSIBLE CAUSES

Possible Causes
FUSE
(B401) BRAKE LAMP ACTIVATION RELAY OPEN OR SHORTED TO GROUND
(A108) FUSED B(+)T CIRCUIT FOR AN OPEN OR SHORTED TO GROUND
BRAKE LAMP ACTIVATION RELAY
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR DTC C1090-ABS BRAKE LAMP CONTROL CIRCUIT LOW**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Ignition on, engine not running.
   2. With the scan tool, record and erase DTC's.
   3. Start the engine.
   4. Apply brake pedal firmly with at least 80 bar (1160 psi.).
   5. With the scan tool, read DTC's.

   Does the scan tool display: C1090-ABS BRAKE LAMP CONTROL CIRCUIT LOW?

   Yes

   - Go To 2.

   No

   - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

   1. Turn ignition off to the lock position.
   2. Inspect the Antilock Brake System (ABS) Module harness connector and the Brake Lamp Activation Relay harness connector.

Is the Antilock Brake Module or any of the connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK (B401) BRAKE LAMP ACTIVATION RELAY SHORTED TO GROUND**

Fig. 159: Checking Brake Lamp Activation Relay For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the ABS Module.
3. Ignition on, engine not running.
4. Using a 12-volt test light connected to ground, probe the (B401) Brake Lamp Activation Relay Circuit at the ABS Module harness connector.

   Does the test light illuminate brightly?

   Yes

   - Replace the Antilock Brake System (ABS) Module in accordance with the service information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK (A108) FUSED B(+)**

Fig. 160: Measuring Voltage Fused B(+)T Circuit At The Brake Lamp Activation Relay Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Brake Lamp Activation Relay.
3. Ignition on engine not running.
4. Using a 12-volt test light connected to ground, probe the (A108) Fused B(+)t Circuit at the Brake Lamp Activation Relay harness connector.

   Does the test light illuminate brightly?

Yes

- Go To 5.

No

- Check for open Fuse, if ok repair open or short to ground in the (A108) Fused B(+)t Circuit or short to ground in (B401) Brake Lamp Inhibit Relay circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

5. **BRAKE LAMP ACTIVATION RELAY**

Fig. 161: Checking Brake Lamp Activation Relay Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn ignition off to the lock position.
2. Measure the resistance of the (B401) Brake Lamp Activation Relay Circuit between the Brake Lamp Activation relay and the ABS Module harness connector.

   Is the resistance 5 Ohms ?

   Yes

- Replace the Brake Lamp Activation Relay in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Repair open in the (B401) Brake Lamp Inhibit Relay circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic**

Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

WHEN MONITORED:

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION:

When monitoring the Brake Lamp Activation Relay circuit the module detects a short to voltage.

POSSIBLE CAUSES

Possible Causes
(B401) BRAKE LAMP ACTIVATION RELAY CONTROL SHORTED TO VOLTAGE
BRAKE LAMP ACTIVATION RELAY
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR DTC C1091-ABS BRAKE LAMP CONTROL CIRCUIT HIGH**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Ignition on, engine not running.
   2. With the scan tool, record and erase DTC's.
   3. Start the engine.
   4. Apply brake pedal firmly with at least 80 bar (1160 psi.).
   5. With the scan tool, read DTC's.

   Does the scan tool display: C1091-ABS BRAKE LAMP CONTROL CIRCUIT HIGH?

   Yes

   - Go To 2.

   No

   - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn ignition off to the lock position.
2. Inspect the Antilock Brake System (ABS) Module harness connector and the Brake Lamp Activation Relay harness connector.

   Is the Antilock Brake System (ABS) Module or any of the connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK (B401) BRAKE LAMP ACTIVATION RELAY CONTROL SHORTED TO VOLTAGE**

Fig. 163: Checking Brake Lamp Activation Relay Control For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn ignition off to the lock position.
2. Disconnect the ABS Module.
3. Disconnect the Brake Lamp Activation Relay.
4. Ignition on, engine not running.
5. Using a 12-volt test light connected to ground, probe the (B401) Brake Lamp Activation Relay Control Circuit at the Brake Lamp Activation Relay harness connector.

Does the test light illuminate brightly?

Yes

- Repair the short to voltage in the (B401) Brake Lamp Inhibit Relay Control circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 4.

4. **BRAKE LAMP ACTIVATION RELAY**

Fig. 164: Checking Brake Lamp Activation Relay Control Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn ignition off to the lock position.
2. Measure the resistance across the relay between the (B401) Brake Lamp Activation Relay Control Circuit and the (A108) Fused B(+) at the Brake Lamp Activation Relay harness connector.

   Is the resistance 75 Ohms ±5 Ohms?

   Yes

   - Replace the Antilock Brake System (ABS) Module in accordance with the service information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Replace the Brake Lamp Activation Relay in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

SET CONDITION:

The electrical feedback of the power stage does not correspond with the activation of the respective valve.

POSSIBLE CAUSES

Possible Causes
B+ CIRCUITS OPEN OR HIGH RESISTANCE
GROUND CIRCUITS OPEN OR HIGH RESISTANCE
ANTILOCK BRAKE SYSTEM (ABS) MODULE INTERNAL

DIAGNOSTIC TEST

1. **B+ CIRCUITS OPEN OR HIGH RESISTANCE**

Fig. 166: Checking ABS Module B+ Circuits For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn ignition off to the lock position.
2. Disconnect the ABS Module harness connector.

NOTE: Check connector - Clean/repair as necessary.

3. Ignition on, engine not running.
4. With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F941) Fused ignition switch output circuits at the ABS harness connector.

Does the test light illuminate brightly?

Yes

- Go To 2.

No

- Repair the B+ circuits for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

2. **GROUND CIRCUITS OPEN OR HIGH RESISTANCE**

Fig. 167: Checking ABS Module Ground Circuits For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn ignition off to the lock position.
2. With a test light Connected to B+ check (Z905) Ground circuits at the ABS harness connector.

   Does the test light illuminate brightly?

   Yes

- Replace the Antilock System Brake (ABS) Module in accordance with the service information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Repair the Ground circuits for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

DIAGNOSTIC TEST

1. **B+ CIRCUITS OPEN OR HIGH RESISTANCE**

Fig. 169: Checking ABS Module B+ Circuits For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn ignition off to the lock position.
2. Disconnect the ABS Module harness connector.

NOTE: Check connector - Clean/repair as necessary.

3. Ignition on, engine not running.
4. With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F941) Fused ignition switch output circuits at the ABS harness connector.

Does the test light illuminate brightly?

Yes

- Go To 2.

No

- Repair the B+ circuits for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

2. **GROUND CIRCUITS OPEN OR HIGH RESISTANCE**

Fig. 170: Checking ABS Module Ground Circuits For An Open Or High Resistance

DYNAMICS SENSOR

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read and record ABS DTC's.
    3. With the scan tool, read and record Environmental Data (EV Data).
    4. With the scan tool, erase ABS DTC's.
    5. Cycle the ignition switch.

    WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

    6. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 m.p.h.).
    7. Park the vehicle.
    8. With the scan tool, read ABS DTC's.

    Does this DTC reset?

Yes

- Go To 2.

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK THE DYNAMICS SENSOR INSTALLATION**

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

1. Turn the ignition off to the lock position.
2. Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.
3. Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 3.

3. **(F941) DYNAMICS SENSOR FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT FOR AN OPEN**

Fig. 178: Checking Dynamics Sensor Fused Ignition Switch Output (Run/Start) Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Dynamics Sensor harness connector.
2. Ignition on, engine not running.

NOTE: Check connector - Clean/repair as necessary.

3. Using a 12-volt test light connected to ground, check the (F941) Dynamics Sensor Fused Ignition Switch Output (RUN/START) Circuit in the ABS Module harness connector.

NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Go To 4.

No

- Repair the (F941) Dynamics Sensor Fused Ignition Switch Output (RUN/START) circuit for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

4. **(Z911) GROUND CIRCUIT FOR AN OPEN**

Fig. 179: Checking Dynamics Sensor Ground Circuit For An Open

1. Turn the ignition off to the lock position.
2. Using a 12-volt test light connected to B+, check the (Z911) Ground Circuit in the Dynamics Sensor harness connector.

NOTE: **The test light should be illuminated and bright. Compare the**

brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 5.

No

- Repair the (Z911) Ground Circuit for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

5. **(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT**

Fig. 180: Checking Dynamics Sensor High Data Link Circuit For A Short To The Dynamics Sensor Low Data Link Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between the (D465) Dynamics Sensor High Data circuit and the (D464) Dynamics Sensor Low Data circuit at the Dynamics Sensor harness connector.

   Is the resistance above 5 Ohms?

   Yes

- Go To 6.

No

- Repair the short between (D465) Dynamics Sensor High Data circuit and the (D464) Dynamics Sensor Low Data circuit.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

6. **(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 181: Checking Dynamics Sensor High Data Link Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on, engine not running.
2. Measure the voltage between ground and (D465) Dynamics Sensor High Data Link circuit in the Dynamics Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (D465) Dynamics Sensor High Data Link circuit for a short to voltage.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 7.

7. **(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN**

Fig. 182: Checking Dynamics Sensor High Data Link Circuit For An Open

1. Turn the ignition off to the lock position.
2. Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between the ABS Module harness connector and the Dynamics Sensor harness connector.

   Is the resistance above 5 Ohms?

   Yes

   - Repair the (D465) Dynamics Sensor High Data Link Circuit for an open.

- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 8.

8. **(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND**

Fig. 183: Checking Dynamics Sensor High Data Link Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (D465) Dynamics Sensor High Data Link circuit in the Dynamics Sensor harness connector.

   Is the resistance below 5 Ohms?

   Yes

- Repair the (D465) Dynamics Sensor High Data Link CIRCUIT FOR A SHORT TO GROUND.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 9.

9. **(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE**

1. Ignition on, engine not running.
2. Measure the voltage between ground and (D464) Dynamics Sensor Low Data Link circuit in the Dynamics Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to voltage.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

- Go To 10.

10. **(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN**

DIAGNOSTIC TEST

1. **CHECK FOR A DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE**

NOTE: **This DTC must be active for the results of this test to be valid. Repair all other Steering Angle Sensor codes before proceeding.**

1. Ignition on, engine not running.
2. With the scan tool, read and record DTC's.
3. With the scan tool, read and record Freeze Frame information.
4. With the scan tool, erase DTC's.
5. Cycle the ignition switch from off to on.
6. With the scan tool, read and record DTC's.

Does the scan tool display: C1219-Steering Angle Sensor Erratic Performance?

- Go To 2.

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS**

INTERMITTENT CONDITION.

2. **CHECK FOR STEERING ANGLE SENSOR ERRATIC SIGNAL**
   1. With the scan tool, graph Steering Angle while turning the steering wheel from lock to lock.

      Is Steering Angle Signal erratic?

      Yes

      - Replace the Clockspring (SAS) in accordance with service information.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Go To 3.
3. **CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

   WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

   NOTE: Proper Clockspring (SAS) installation is crucial for proper operation.

   1. Check the Clockspring (SAS) installation.
   2. Check all related wiring for bruised, chafed, pierced, or partially broken wires.
   3. Check all related connectors for broken, bent, pushed out, or corroded terminals.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Go To 4.
4. **CHECK THE VOLTAGE ON THE (F943) FUSED B(+) CIRCUIT**

Fig. 188: Measuring Voltage On The Fused B(+) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Clockspring C3 (SAS) harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (F943) Fused B(+) circuit and ground.

   Is the voltage above 10 volts?

   Yes

- Go To 5.

No

- Repair the (F943) Fused B(+) circuit for an open.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

5. **CHECK THE RESISTANCE OF THE (G211) GROUND CIRCUIT**

Fig. 189: Measuring Resistance Of The Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (G211) Ground circuit and ground.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace Antilock Brake System (ABS) Module in accordance with service information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Repair the (G211) Ground circuit for an open.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C121C-TORQUE REQUEST SIGNAL DENIED

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED:

With the ignition on.

SET CONDITION:

When the Antilock Brake Module indicates if engine management relevant for Automatic Yaw Control/Traction Control System control can be accomplished.

POSSIBLE CAUSES

Possible Causes
EXCESSIVE LOAD ON ENGINE
TRACTION CONTROL OPERATING FOR TO LONG
ANTILOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE

DIAGNOSTIC TEST

1. **CHECK FOR A DTC C121C-TORQUE REQUEST SIGNAL DENIED**

   NOTE: This DTC must be active for the results of this test to be valid and this DTC may set while driving under severe load conditions.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTC's.

3. With the scan tool, read and record Freeze Frame information.
4. With the scan tool, erase DTC's.
5. Cycle the ignition switch from off to on.
6. Start Engine.
7. With the scan tool, read and record DTC's.

   Does the scan tool display: C121C-TORQUE REQUEST SIGNAL DENIED?

   Yes

   - Go To 2.

   No

   - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK THE POWERTRAIN DTC's**
   1. With the scan tool, read and record Powertrain DTC's.

      Were any Powertrain ESP related DTC's found?

      Yes

      - Replace the Powertrain Module in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** .

      No

      - Replace the Antilock Brake Module in accordance with the Service Information.
      - Perform ABS VERIFICATION TEST - VER 1. Refer to **ABS VERIFICATION TEST**.

C121D-BRAKE PRESSURE SENSOR CIRCUIT

WHEN MONITORED:

With the ignition on.

SET CONDITION:

When the Antilock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE MODULE
ELECTRONIC CONTROL UNIT (ECU)

DIAGNOSTIC TEST

1. **CHECK FOR A DTC C121D-BRAKE PRESSURE SENSOR CIRCUIT**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTC's.
   3. With the scan tool, read and record Freeze Fame information.
   4. With the scan tool, erase DTC's.
   5. Start the engine.
   6. Depress and release the brake pedal.
   7. With the scan tool, read and record DTC's.

   Does the scan tool display: C121D-BRAKE PRESSURE SENSOR CIRCUIT?

   Yes

   - Go To 2.

   No

   - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **RECHECK FOR A DTC C121D-BRAKE PRESSURE SENSOR CIRCUIT**
   1. Turn the ignition on.
   2. With the scan tool, read and record DTC's.
   3. With the scan tool, read and record Freeze Frame information.
   4. With the scan tool, erase DTC's.
   5. Start the engine.
   6. Depress and release the brake pedal.
   7. With the scan tool, read and record DTC's.

   Does the scan tool display: C121D-BRAKE PRESSURE SENSOR CIRCUIT?

   Yes

   - Replace the ECU in accordance with the Service Information.

- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Test complete

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED:

With the ignition on.

SET CONDITION:

When the Antilock Brake Module indicates that the Brake Pressure Sensor Signal is irrational.

POSSIBLE CAUSES

Possible Causes
AIR IN BRAKE SYSTEM
BRAKE SWITCH SIGNAL OPEN
INTEGRATED CONTROL UNIT

DIAGNOSTIC TEST

1. **CHECK FOR A DTC C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE**
    1.
    2. Turn the ignition on.
    3. With the scan tool, read and record DTC's.
    4. With the scan tool, read and record Freeze Frame information.
    5. With the scan tool, erase DTC's.
    6. Start the engine.
    7. Depress and release the brake pedal.
    8. With the scan tool, read and record DTC's.

    Does the scan tool display: C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE?

    Yes

    - Go To 2.

    No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK BRAKE SWITCH**
   1. With the scan tool look at the Brake Switch Signal.
   2. Apply the brakes on and off while checking for a Brake Switch Signal change.

   Did the Brake Switch Signal change?

   Yes

   - Go To 3.

   No

   - Repair as needed.

3. **CHECK BRAKE PRESSURE SENSOR**
   1. With the scan tool look at Pressure Sensor Signal and the Brake Switch Signal.
   2. With the brakes not applied the Pressure Sensor should read ± 15 bar (218 psi).
   3. Apply the brakes hard, the Pressure Sensor should read above 15 bar (218 psi).

   Did Brake Pressure Sensor increase above 15 bar (218 psi)?

   Yes

   - Replace the Integrated Control Unit in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK FOR AIR IN BRAKE SYSTEM**

   NOTE: Before continuing the brake system must be bled to verify there is no air in the brake system.

   1. Turn ignition off.
   2. Bleed brake system.

   Was there any air in the brake system?

   Yes

   - Repair as needed.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Replace the Integrated Control Unit in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C1231-DRIVE TEST: STEERING ANGLE SENSOR

MODULE-
ANTI-LOCK

CLOCKSPRING C3
(SAS)

Fig. 190: Steering Angle Sensor Wiring Diagram

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

WHEN MONITORED:

During the Drive Test.

SET CONDITION:

If the Antilock Brakes System (ABS) Module detects implausible Steering Angle Sensor (SAS) data.

POSSIBLE CAUSES

Possible Causes
CLOCKSPRING INSTALLATION
CLOCKSPRING (SAS)
ANTILOCK BRAKES SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR A DTC C1231-DRIVE TEST: STEERING ANGLE SENSOR**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Ignition on, engine not running.
   2. Using the scan tool, read and record DTC's.
   3. Using the scan tool, read and record Freeze Frame information.
   4. Perform ECU initialization with drive test. Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.
   5. Start the engine.
   6. Using the scan tool, read and record DTC's.

   Does the scan tool display: C1231-DRIVE TEST: STEERING ANGLE SENSOR?

   Yes

   - Go To 2.

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS**
   1. Using the scan tool, select ECU View.
   2. Verify that the Steering Angle Sensor is active on the bus.

   Is the Steering Angle Sensor active on the bus?

   Yes

   - Go To 3.

   No

   - Refer to **NO RESPONSE FROM THE STEERING ANGLE SENSOR (SAS)** and perform the diagnostic procedure.

3. **CHECK STEERING ANGLE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool check steering angle.

   Is the Steering Angle reading within ±15 degrees?

   Yes

   - Go To 4.

   No

   - Go To 5.

4. **CHECK STEERING ANGLE CHANGE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool check steering angle.
   3. Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

   Did the steering angle change accordingly?

   Yes

   - Replace the Antilock Brake System (ABS) Module in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Replace the Clockspring (SAS) in accordance with the Service Information. Refer to **CLOCKSPRING, INSTALLATION** .

5. **CHECK STEERING ANGLE SENSOR INSTALLATION**

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Clockspring (SAS) installation is crucial for proper operation.

1. Turn ignition off to the lock position.
2. Verify that the Clockspring (SAS) is properly installed. Refer to **CLOCKSPRING, INSTALLATION** .

Is the Clockspring (SAS) properly installed?

Yes

- Replace the Antilock Brake System (ABS) Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C1232-DRIVE TEST: PRESSURE SENSOR

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED:

During the Drive Test.

SET CONDITION:

If the Pressure Sensor fails to activate.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC / BRAKE SYSTEM COMPONENT INSTALLATION
ELECTRONIC CONTROL UNIT (ECU)
PRESSURE SENSOR (HYDRAULIC CONTROL UNIT)

DIAGNOSTIC TEST

1. **CHECK FOR A DTC C1232-DRIVE TEST: PRESSURE SENSOR**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTC's.
   3. With the scan tool, read and record Freeze Frame information.
   4. Perform ECU initialization with drive test. Refer to ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.
   5. Start the engine.
   6. With the scan tool, read and record DTC's.

   Does the scan tool display: C1232-DRIVE TEST: PRESSURE SENSOR?

   Yes

   - Go To 2.

   No

   - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK HYDRAULIC SYSTEM AND BRAKE SYSTEM COMPONENT INSTALLATION AND FUNCTION**
   1. Verify that the Antilock Brakes Module and Hydraulic Control Unit are properly installed.
   2. Verify that the hydraulic system is properly filled and bled.
   3. Verify that the brake system components are installed and functioning properly.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Replace the ECU in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C1234-DRIVE TEST: SENSOR CLUSTER INSTALLATION

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article**

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

WHEN MONITORED:

During the Drive Test.

SET CONDITION:

If the Antilock Brake System (ABS) Module detects implausible Dynamics Sensor data.

POSSIBLE CAUSES

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR A DTC C1234-DRIVE TEST: SENSOR CLUSTER INSTALLATION**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTC's.
   3. With the scan tool, read and record Freeze Frame information.
   4. Perform ECU initialization with drive test. Refer to Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.
   5. Start the engine.
   6. With the scan tool, read and record DTC's.

   Does the scan tool display: C1234-DRIVE TEST: SENSOR CLUSTER INSTALLATION?

Yes

- Go To 2.

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK THE DYNAMICS SENSOR INSTALLATION**

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

1. Turn the ignition off.
2. Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.
3. Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 3.

3. **REPLACE DYNAMICS SENSOR AND VERIFY IF DTC IS STILL ACTIVE**

1. Replace the Dynamics Sensor in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. Refer to **ABS VERIFICATION TEST**.

WARNING: Make sure brake capability is available before road testing.

2. Park the vehicle.
3. With the scan tool, read ABS DTC's.

Does this DTC reset?

Yes

- Replace the Antilock Brakes Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Test complete.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C1235 DRIVE TEST: TEST ACTIVE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED:

With ignition on.

SET CONDITION:

Conditions for running drive test not met.

POSSIBLE CAUSES

Possible Causes
DRIVE TEST ACTIVATED BUT NOT RUN
ANTILOCK BRAKE MODULE

DIAGNOSTIC TEST

1. **CHECK FOR A DTC C1235-DRIVE TEST: TEST ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTC's.
   3. With the scan tool, read and record Freeze Frame information.
   4. Perform ECU initialization with drive test. Refer to Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      NOTE: Drive test must be performed correctly for ECU to initialize.

   5. With the scan tool, erase DTC's.
   6. Start the engine.
   7. With the scan tool, read and record DTC's.

   Does the scan tool display: C1235-DRIVE TEST: TEST ACTIVE?

   Yes

- Go To 2.

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **DRIVE TEST ACTIVATED BUT NOT RUN**
   1. With scan tool rerun drive test.

      WAS DRIVE TEST COMPLETED?

      Yes

      - Replace the Antilock Brake Module in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Rerun drive test.

C1238-DRIVE TEST: UNSUCCESSFUL

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

During the Drive Test.

SET CONDITION:

If the Antilock Brakes Module detects a fault with the Steering Angle Sensor, the Pressure Sensor, or the Dynamics Sensor.

POSSIBLE CAUSES

Possible Causes
STEERING ANGLE SENSOR
PRESSURE SENSOR
DYNAMICS SENSOR
ANTILOCK BRAKES MODULE

DIAGNOSTIC TEST

1. **DIAGNOSE AND REPAIR ALL DTC's**

   Repair

- Diagnose and repair all DTC's.

C1239-EMISSION ROLLS TEST ACTIVE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

WHEN MONITORED:

Continuously with the ignition on and no BUS communication failure DTC's present.

SET CONDITION:

If the Antilock Brake Module receives two messages in a row indicating that the extended diagnostic session is active. ABS is inhibited during the extended diagnostic session.

POSSIBLE CAUSES

Possible Causes
CAN COMMUNICATION DTC's PRESENT
TIPM ROLLS MODE COMMAND ACTIVE
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **DTC IS PRESENT**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool clear DTC's.
   3. Turn the ignition off.
   4. Turn the ignition on.
   5. Using the scan tool, read DTC's.

   Is the status Active for this DTC?

   Yes

   - Go To 2.

No

- Go To 3.

2. **ANTILOCK BRAKE MODULE**
   1. Turn the ignition on.
   2. Using the scan tool, select View DTC's in each module on the CAN B BUS and the CAN C BUS.

      Are there CAN BUS communication DTC's present in any other module?

      Yes

      - Perform the appropriate diagnostic procedure before continuing with this test. Refer to **TIPM - DIAGNOSIS AND TESTING** .
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Replace the Antilock Brake System (ABS) Module in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.
3. **INTERMITTENT COMMUNICATION DTC**
   1. The condition necessary to set this DTC is not present at this time.
   2. This DTC will set if the ABS Module receives two messages in a row from the TIPM indicating that the Emissions Rolls test is active.
   3. Using the scan tool, select View DTC's in each of the modules on the CAN B BUS and the CAN C BUS. If there are any communications DTC's present, perform the appropriate diagnostic procedure. Refer to **TIPM - DIAGNOSIS AND TESTING** .
   4. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C123A-ESP SYSTEM SENSORS CALIBRATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.**

WHEN MONITORED:

Once per ignition cycle.

SET CONDITION:

If the calculated checksum does not match the stored checksum.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **INITIALIZE ANTILOCK BRAKES MODULE**
    1. Initialize the ECU, Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

       Does this DTC reset?

       Yes

       - Replace the Antilock Brake System (ABS) Module in accordance with the Service Information.
       - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

C123B-ESP SYSTEM CONTROL TOO LONG

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.**

WHEN MONITORED:

With the ignition on.

SET CONDITION:

When the Antilock Brake System (ABS) Module indicates excessive valve control lasting longer the 15 seconds.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC/BRAKE ISSUE DYNAMICS SENSOR INTEGRATED CONTROL UNIT

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

NOTE: **If other DTC's are set they must be repaired before continuing. This DTC must be active for the results of this test to be valid and this DTC may set while driving under excessive driving conditions.**

1. Turn the ignition on.
2. Using the scan tool, read and record ABS DTC's.
3. Using the scan tool, read and record Environmental Data (EV Data).
4. Using the scan tool, erase ABS DTC's.
5. Cycle the ignition switch.

WARNING: **Make sure brake capability is available before road testing.**

6. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 m.p.h.).
7. Park the vehicle.
8. Using the scan tool, read ABS DTC's.

Does this DTC reset?

Yes

- Go To 2.

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK HYDRAULIC SYSTEM AND BRAKE SYSTEM COMPONENT INSTALLATION AND FUNCTION**
   1. Verify that the Antilock Brakes Module and Hydraulic Control Unit are properly installed.
   2. Verify that the hydraulic system is properly filled and bled.
   3. Verify that the brake system components are installed and functioning properly.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Replace the Dynamics Sensor in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C123F-STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With ignition on, but not if a checksum failure of the stored offset values is detected.

Or, a CAN time-out failure is detected.

Or, a failure is detected by the Steering Angle Sensor.

SET CONDITION:

If the Antilock Brakes System (ABS) Module detects that either the calculated steering wheel angle offset or the steering wheel angle signal measured output is out of range.

POSSIBLE CAUSES

Possible Causes
VEHICLE DAMAGE
STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE
STEERING WHEEL ALIGNMENT

STEERING ANGLE SENSOR (SAS) LOOSE
CLOCKSPRING (SAS) IMPROPERLY INSTALLED (WRONG MOUNTING POSITION)
CLOCKSPRING (SAS)
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **PERFORM TEST DRIVE AND VERIFY DTC IS STILL ACTIVE**

   NOTE: If present, diagnose and repair DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE, C121A-STEERING ANGLE SENSOR NOT INITIALIZED, or C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE before diagnosing this DTC.

   1. Ignition on, engine not running.
   2. With the scan tool, erase ABS DTC's.
   3. Cycle the ignition switch.

      WARNING: **To avoid possible serious or fatal injury, check brake capability is available before road testing.**

   4. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).
   5. Park the vehicle.
   6. With the scan tool, read ABS DTC's.

      Does this DTC reset?

      Yes

      - Go To 2.

      No

      - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK STEERING ANGLE SENSOR OUTPUT**
   1. Start the engine.
   2. Turn the steering wheel so wheels point in a straight ahead position.
   3. With the scan tool, read the Steering Angle Sensor position.

      Is the Steering Angle Sensor Position within ± 15° degrees?

Yes

- Go To 5.

No

- Go To 3.

3. **INSPECT VEHICLE, STEERING COLUMN, AND INTERMEDIATE SHAFT FOR DAMAGE**

NOTE: If possible, check vehicle repair history for collision damage.

1. Turn ignition off to the lock position.
2. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.
3. Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK CLOCKSPRING (SAS) INSTALLATION**

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Clockspring (SAS) installation is crucial for proper operation.

1. Verify that the Clockspring (SAS) is properly installed.

Is the Steering Angle Sensor properly installed?

Yes

- Go To 5.

No

- Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

5. **RE-INITIALIZE THE ESC MODULE**
   1. Perform ECU initialization with drive test to clear offsets. Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      Is DTC C123F-STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE still active?

      Yes

      - Go To 6.

      No

      - Sensor was probably loose or calibrated with wheels not centered to vehicle. Test complete.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

6. **CHECK STEERING ANGLE SENSOR OUTPUT WHILE ROTATING THE STEERING WHEEL**
   1. With the scan tool, read the Steering Angle Sensor position while rotating the steering wheel to the right and then to the left. The Steering Angle Sensor position should decrease when rotating the steering wheel to the right and increase when rotating the steering wheel to the left.

      Did the steering angle change accordingly?

      Yes

      - Replace the Antilock Brake System (ABS) Module in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Replace the Clockspring (SAS) in accordance with the Service Information. Refer to **CLOCKSPRING, INSTALLATION** .

C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration.**

Certain components may also reference ESP, ESC, or use the traction control symbol.

WHEN MONITORED:

With ignition on, but not if a CAN time out failure is detected.

Or, if a fault is detected by the Steering Angle Sensor (SAS).

SET CONDITION:

If the Antilock Brakes System (ABS) Module detects sensor overtravel over 720 degrees.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN IMPROPERLY INSTALLED
STEERING ANGLE SENSOR (SAS) LOOSE
CLOCKSPRING (SAS) / STEERING WHEEL IMPROPERLY INSTALLED
CLOCKSPRING (SAS)
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR A DTC C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Ignition on, engine not running.
   2. Using the scan tool, read and record DTC's.
   3. Using the scan tool, read and record Freeze Frame information.
   4. Using the scan tool, erase DTC's.
   5. Start the engine.
   6. Turn steering wheel from lock to lock.
   7. Using the scan tool, read and record DTC's.

   Does the scan tool display: C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE?

   Yes

   - Go To 2.

   No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS**
   1. Using the scan tool, select ECU View.
   2. Verify that the Steering Angle Sensor is active on the bus.

      Is the Steering Angle Sensor active on the bus?

      Yes

      - Go To 3.

      No

      - Refer to **NO RESPONSE FROM THE STEERING ANGLE SENSOR (SAS)** and perform the diagnostic procedure.

3. **CHECK STEERING ANGLE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool check steering angle.

      Is the Steering Angle reading within ±15 degrees?

      Yes

      - Go To 4.

      No

      - Go To 5.

4. **CHECK STEERING ANGLE CHANGE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool check steering angle if reading travels to 720 degrees whiling rotating wheel from lock to lock.

      NOTE: Sensor damage can occur if wheel is turned over 720 degrees.

   3. Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

      Did the steering angle change accordingly and display less the 720 degrees from lock to lock?

      Yes

      - Replace the Antilock Brake System (ABS) Module in accordance with the Service

Information.

- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Replace the Clockspring (SAS) in accordance with the Service Information. Refer to **CLOCKSPRING, INSTALLATION** .

5. **CHECK CLOCKSPRING (SAS) INSTALLATION**

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Clockspring (SAS) installation is crucial for proper operation.

1. Turn the ignition off.
2. Verify that the Clockspring (SAS) is properly installed. Refer to **CLOCKSPRING, INSTALLATION** .

Is the Clockspring (SAS) properly installed?

Yes

- Replace the Antilock Brake System (ABS) Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C1242-G SENSOR INPUT SIGNAL PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously, with ignition on, until vehicle speed exceeds 20 km/h (12.4 m.p.h.) for the first time, but not if

the sensor voltage is out of range,

Or, during diagnostic mode.

Or, if the monitoring was inhibited by a corresponding diagnostics command.

Or, if the vehicle speed has exceeded 20 km/h (12.4 m.p.h.) during the actual ignition cycle.

Or, if at least one over spinning wheel is detected.

Or, if one of the control functions is active.

SET CONDITION:

Potential issue with yaw/lat/long sensors (dynamics sensor).

POSSIBLE CAUSES

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR OR ANTILOCK BRAKE MODULE
ANTILOCK BRAKES MODULE

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read and record ABS DTC's.
    3. With the scan tool, read and record Environmental Data (EV Data).
    4. With the scan tool, erase ABS DTC's.
    5. Cycle the ignition switch.

    WARNING: **To avoid possible serious or fatal injury, check brake capability is available before road testing.**

    6. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 m.p.h.).
    7. Park the vehicle.
    8. With the scan tool, read ABS DTC's.

    Does this DTC reset?

    Yes

- Go To 2.

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK THE DYNAMICS SENSOR INSTALLATION**

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

1. Turn the ignition off.
2. Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.
3. Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

NOTE: Vehicles without a Dynamics Sensor replace Antilock Brake Module.

- Replace the Dynamics Sensor or Antilock Brake Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C1243-G SENSOR NOT INITIALIZED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Once after ignition on.

SET CONDITION:

If the stored zero point calibration value of the longitudinal acceleration sensor is invalid.

POSSIBLE CAUSES

Possible Causes
DYNAMICS SENSOR NOT CALIBRATED
DYNAMICS SENSOR
ANTILOCK BRAKES MODULE

DIAGNOSTIC TEST

1. **PERFORM ECU INITIALIZATION**
    1. Turn the ignition on.
    2. With the scan tool, erase ABS DTC's.
    3. Cycle the ignition switch.

    WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

    4. Perform ECU initialization with drive test refer to ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

    NOTE: The ECU Initialization process must include driving the vehicle into a 90° turn.

    5. Park the vehicle.
        - Go To 2.
2. **VERIFY IF DTC IS STILL ACTIVE**
    1. Cycle the ignition switch.

    WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

    2. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).
    3. Park the vehicle.
    4. With the scan tool, read ABS DTC's.

    Does this DTC reset?

    Yes

    - Replace the Dynamics Sensor or Antilock Brake Module in accordance with the Service Information.

    NOTE: Vehicles without a Dynamics Sensor replace Antilock Brake

Module.

- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on.

SET CONDITION:

If the sensed ignition voltage drops below 9.5 volts for 100 msec.

POSSIBLE CAUSES

Possible Causes
INTERMITTENT BATTERY VOLTAGE LOW DTC
(F941) IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN OR HIGH RESISTANCE
(Z905) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: Diagnose and repair any powertrain Charging system DTC's before continuing with this procedure.

   NOTE: Make sure the battery is fully charged.

   1. Ignition on, engine not running.
   2. With the scan tool, record and erase DTC's.
   3. Turn ignition off to the lock position.
   4. Start the engine.
   5. With the scan tool, read DTC's.

   Is the status Active for this DTC?

   Yes

   - Go To 2.

   No

   - Perform ABS INTERMITTENT TEST. Refer to **ABS INTERMITTENT CONDITION**.

2. **(F941) IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 192: Checking Dynamics Sensor Fused Ignition Switch Output (Run/Start) Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn ignition off to the lock position.
2. Disconnect the Antilock Brake Module harness connector.
3. Check connectors - Clean/repair as necessary.
4. Ignition on, engine not running.
5. Using a 12-volt test light connected to ground, check the (F941) Ignition Run/Start Control Output circuit.

NOTE: Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 3.

No

- Repair the (F941) Ignition Run/Start Control Output circuit for an open circuit or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

3. **(Z905) GROUND CIRCUITS OPEN OR HIGH RESISTANCE**

Fig. 193: Checking ABS Module Ground Circuits For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn ignition off to the lock position.
2. Using a 12-volt test light connected to B+, check the (Z905) Ground circuits.

NOTE: Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Antilock Brake System (ABS) Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Repair the (Z905) Ground circuit(s) for an open circuit or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C2101-BATTERY VOLTAGE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on and no system undervoltage DTC active.

SET CONDITION:

If the sensed ignition voltage is greater than 16.5 volts for 100 msec.

POSSIBLE CAUSES

Possible Causes
INTERMITTENT BATTERY VOLTAGE HIGH DTC
POWERTRAIN CONTROL MODULE (PCM) CHARGING SYSTEM DTCS PRESENT
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**
    1. Ignition on, engine not running.
    2. With the scan tool, read DTC's in the PCM.

    Are there any Charging System or related voltage DTC's present?

    Yes

    - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to **SPECIFICATIONS - CHARGING SYSTEM** .

    No

    - Go To 2.
2. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTC's.
    3. Turn ignition off to the lock position.
    4. Start the engine.
    5. With the scan tool, read DTC's.

    Is the status Active for this DTC?

    Yes

    - Replace the Antilock Brake System (ABS) Module in accordance with the Service

Information.

- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Perform ABS INTERMITTENT TEST. Refer to **ABS INTERMITTENT CONDITION**.

C2105-ABS VALVE SUPPLY VOLTAGE CIRCUIT LOW

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED:

Ignition on.

SET CONDITION:

The Antilock Brake Module has detected an internal error.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE MODULE

DIAGNOSTIC TEST

1. **ANTILOCK BRAKE MODULE INTERNAL CONDITION**
   1. The Antilock Brake Module is reporting internal errors.

      NOTE: Before continuing, check the Antilock Brake Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

   2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
   3. Perform any Technical Service Bulletins that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

- Replace the Antilock Brake Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C2200-ANTILOCK BRAKE MODULE INTERNAL

ANTILOCK BRAKE MODULE

DIAGNOSTIC TEST

1. **ANTILOCK BRAKE MODULE INTERNAL CONDITION**
   1. The Antilock Brake Module is reporting internal errors.

      NOTE: Before continuing, check the Antilock Brake Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

   2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
   3. Perform any Technical Service Bulletins that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Replace the Antilock Brake Module in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C2202-ORIGINAL VIN MISMATCH / MISSING

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED:

Ignition on.

SET CONDITION:

This DTC will set if the current VIN does not match the broadcast VIN.

POSSIBLE CAUSES

Possible Causes
COMMUNICATIONS DTC(S) PRESENT
POWERTRAIN CONTROL MODULE (PCM)
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, erase DTC's.
    3. Turn ignition off to the lock position.
    4. Ignition on, engine not running.
    5. Wait ten seconds.
    6. With the scan tool, read DTC's.

    Is the status Active for this DTC?

    Yes

    - Go To 2.

    No

    - Go To 3.
2. **WRONG VIN PROGRAMMED IN PCM**
    1. Ignition on, engine not running.
    2. With the scan tool, read the VIN in the PCM.
    3. Compare VIN in the PCM to the vehicle VIN.

    Is the correct VIN programmed in the PCM?

Yes

- Replace the Antilock Brake System (ABS) Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Replace the Powertrain Control Module (PCM) in accordance with the Service Information.
- Perform PCM VERIFICATION TEST. Refer to **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** .

3. **COMMUNICATION DTCS PRESENT**
   1. Turn ignition off to the lock position.
   2. With the scan tool, read DTC's in all other modules. If any communications DTC's are present, refer to the appropriate diagnostic procedure. Refer to **TIPM - DIAGNOSIS AND TESTING** .
   3. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Test Complete.

Or, if one of the control functions is active.

SET CONDITION:

Internal problem with Dynamics Sensor.

POSSIBLE CAUSES

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**
    1. Turn the ignition on.
    2. Using the scan tool, read and record ABS DTC's.
    3. Using the scan tool, read and record Environmental Data (EV Data).
    4. Using the scan tool, erase ABS DTC's.
    5. Cycle the ignition switch.

    WARNING: Make sure brake capability is available before road testing.

    6. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 mph).
    7. Park the vehicle.
    8. Using the scan tool, read ABS DTC's.

    Does this DTC reset?

    Yes

    - Go To 2.

    No

    - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS**

INTERMITTENT CONDITION.

2. **CHECK THE DYNAMICS SENSOR INSTALLATION**

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

1. Turn the ignition off.
2. Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.
3. Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C2205-STEERING ANGLE SENSOR INTERNAL

ANTI-LOCK

CLOCKSPRING C3
(SAS)

Fig. 195: Steering Angle Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

SET CONDITION:

When the Antilock Brake System (ABS) Module detects the Steering Angle Sensor (SAS) has sent the internal failure status.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(F943) FUSED B(+) CIRCUIT FOR AN OPEN
(G211) GROUND CIRCUIT FOR AN OPEN
CLOCKSPRING (SAS)

DIAGNOSTIC TEST

1. **CHECK FOR A DTC C2205-STEERING ANGLE SENSOR INTERNAL**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on, engine not running.
   2. With the scan tool, read and record DTC's.
   3. With the scan tool, read and record Freeze Frame information.
   4. With the scan tool, erase DTC's.
   5. Turn the steering wheel lock to lock.
   6. With the scan tool, read and record DTC's.

   Does the scan tool display: C2205-STEERING ANGLE SENSOR INTERNAL?

   Yes

   - Go To 2.

   No

   - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Clockspring (SAS) installation is crucial for proper operation.

1. Turn the ignition off to the lock position.
2. Check the Clockspring (SAS) installation.
3. Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.
4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE VOLTAGE ON THE (F943) STEERING ANGLE SENSOR SUPPLY CIRCUIT**

Fig. 196: Measuring Voltage On The Fused B(+) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Clockspring C3 (SAS) harness connector.
3. Turn the ignition on, engine not running.
4. Measure the voltage between ground and the (F943) Steering Angle Sensor Supply circuit at the Clockspring C3 (SAS) harness connector.

   Is the voltage above 10 volts?

Yes

- Go To 4.

No

- Repair the (F943) Steering Angle Sensor Supply circuit for an open.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

4. **CHECK THE RESISTANCE OF THE (G211) GROUND CIRCUIT**

Fig. 197: Measuring Resistance Of The Ground Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Turn ignition off to the lock position.
2. Measure the resistance between the (G211) Steering Angle Sensor Ground Circuit and Ground at the Clockspring C3 (SAS) harness connector.

   Is the resistance below 5.0 Ohm?

   Yes

   - Replace the Clockspring (SAS) in accordance with the Service Information. Refer to **CLOCKSPRING, INSTALLATION** .

   No

   - Repair the (G211) Steering Angle Sensor Ground circuit for an open.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

C2206-VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.**

SET CONDITION:

This DTC will set if the vehicle type is not identified or incorrectly identified.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE SYSTEM (ABS) MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **ANTILOCK BRAKE SYSTEM (ABS) MODULE**

   NOTE: **Diagnose and repair any Powertrain Control Module VIN or**

Communication DTC's before continuing with this test.

NOTE: **If C2202-Original VIN Mismatch / Missing is set along with this DTC, perform the diagnostic procedure for C2202 before continuing with this test.**

1. Ignition on, engine not running.
2. Using the scan tool, erase DTC's.
3. Turn ignition off to the lock position.
4. Ignition on, engine not running.
5. Using the scan tool, select View DTC's.

   Is the status Active for this DTC?

   Yes

   - Check vehicle configuration in TIPM. Refer to TIPM information for procedure. If configuration incorrect, fix and reinitialize ABS module. Refer to **TIPM - DIAGNOSIS AND TESTING** .
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Use the scan tool to read DTC's in all other modules. If any communication DTC's are present, perform the appropriate diagnostic procedure. Perform any Technical Service Bulletins that apply. If no problems are found, test is complete.

   Does this DTC reset?

   Yes

   - Go To 2.

   No

   - Perform the Stored Lost Communication test procedure. Refer to **STORED LOST COMMUNICATION DTCS** .
   - Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**

   1. With the scan tool, read all active DTC's from all CAN C Bus modules.

      NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

      Does the scan tool display any active DTC's related to the conditions listed above?

      Yes

      - Diagnose and repair the DTC's. Refer to appropriate Electrical Diagnostic Information.

      No

- Go To 3.

3. **VERIFY THAT THE TCM IS ACTIVE ON THE BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the TCM is active on the bus.

    Is the TCM active on the bus?

    Yes

    - Go To 4.

    No

    - Perform the Stored Lost Communication test procedure. Refer to **STORED LOST COMMUNICATION DTCS** .
    - Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
    1. With the scan tool, select Network View and select Advanced.

    Is there more than one module with active DTC's "Logged Against" the TCM?

    Yes

    - Replace/update the Transmission Control Module (TCM) in accordance with the service information.
    - Perform TCM VERIFICATION TEST. Refer to **AS68RC TRANSMISSION VERIFICATION TEST** .

    No

    - Replace the Antilock Brakes System (ABS) Module in accordance with the service information.
    - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: **If present, diagnose and repair DTC C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW or DTC C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH before proceeding.**

   1. Turn the ignition on.
   2. Using the scan tool, read and record ABS DTC's.
   3. Using the scan tool, read and record Environmental Data (EV Data).
   4. Using the scan tool, erase ABS DTC's.

5. Cycle the ignition switch.
6. Using the scan tool, read ABS DTC's.

   Does this DTC reset?

   Yes

   - Go To 2.

   No

   - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **INSPECT RELATED WIRING HARNESS, TERMINALS, AND CONNECTORS**

   WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

   NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

   1. Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.
   2. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 199: Checking Dynamics Sensor High Data Link Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Antilock Brakes Module harness connector.
2. Disconnect the Dynamics Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (D465) Dynamics Sensor High Data Link circuit.

   Is there any voltage present?

   Yes

- Repair the (D465) Dynamics Sensor High Data Link circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND**

Fig. 200: Checking Dynamics Sensor High Data Link Circuit For A Short To Ground

1. Turn the ignition off.
2. Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (D465) Dynamics Sensor High Data Link circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

   No

   - Go To 5.

5. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN**

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

1. Turn the ignition on.

2. With the scan tool, read active DTC's.

   Is this DTC active?

   Yes

   - **Refer to U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)** and perform the diagnostic procedure.

   No

   - **Refer to STORED LOST COMMUNICATION DTCS** and perform the diagnostic procedure.

U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED:

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.

SET CONDITION:

When the Antilock Brake Module detects an incorrect CAN message from the Engine Control Module (ECM).

POSSIBLE CAUSES

Possible Causes
ABM CAN BUS DTCS
ENGINE DTCS
ANTILOCK BRAKE MODULE

DIAGNOSTIC TEST

1. **CHECK FOR DTC U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTC's.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTC's.

Does the scan tool display: U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM?

Yes

- Go To 2.

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **ABS INTERMITTENT CONDITION**.

2. **CHECK IF TIPM CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read FCM DTC's.

      Are there any TIPM CAN BUS DTC's present?

      Yes

      - Perform the appropriate diagnostic procedures. Refer to **TIPM - DIAGNOSIS AND TESTING** .
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK IF ENGINE DTCS ARE PRESENT**
   1. With the scan tool, read Engine DTC's.

      Are there any Engine DTC's present?

      Yes

      - Perform the appropriate diagnostic procedures. Refer to **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** and/or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** .

      No

      - Using the schematics as a guide, check the Antilock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Antilock Brake Module per the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

STANDARD PROCEDURE

ABS VERIFICATION TEST

DIAGNOSTIC TEST

1. **ABS VERIFICATION TEST**

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

NOTE: If the Antilock Brake System (ABS) Module, Steering Angle Sensor (SAS), or the Dynamics Sensor was replaced, it must be initialized using the scan tool. If not initialized, the ABS indicator will flash continuously with no DTC's. To initialize the ABS Module and clear offsets have wheels pointing

straight ahead and follow the directions on the scan tool. The drive test requires a 90° turn. If the Dynamics Sensor was replaced, test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

1. Turn the ignition off.
2. Connect all previously disconnected components and connectors.
3. Verify all accessories are turned off and the battery is fully charged.
4. Verify that the ignition is on, with the scan tool, erase all Diagnostic Trouble Codes (DTC's) from All modules. Start the engine and allow it to run for two minutes and fully operate the system that was indicating the failure.
5. Turn the ignition off and wait five seconds. Turn the ignition on and using the scan tool, read DTC's from all modules.
6. If any Diagnostic Trouble Codes are present, Refer to **ABS - DIAGNOSIS AND TESTING** and perform the diagnostic procedure.
7. **NOTE: For Sensor Signal and Pump Motor faults, the ABS Module must sense all 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicator.**
8. If there are no DTC's present after turning ignition on, road test the vehicle for at least five minutes. Perform several antilock braking stops.
9. Again, with the scan tool read DTC's. If any DTC's are present, for the diagnostic procedure and troubleshoot the new or recurring DTC. Refer to **ABS - DIAGNOSIS AND TESTING**.
10. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete.

    Are any DTC's present or is the original concern still present?

    Yes

    - Repair is not complete, perform the appropriate diagnostic procedure. Refer to **ABS - DIAGNOSIS AND TESTING**.

    No

    - Repair is complete.

ABS INTERMITTENT CONDITION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **PERFORM ABS INTERMITTENT CONDITION TEST**

NOTE: **The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.**

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Refer to any Technical Service Bulletins (TSBs) that may apply.
2. Review the scan tool Environmental Data (EV Data). If possible, try to duplicate the conditions under which the DTC set.
3. Turn the ignition off.
4. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
5. Wiggle the wires while checking for shorts and open circuits.
6. Perform a voltage drop test on the related circuits between the suspected inoperative component and the Antilock Brake Module.
7. Inspect and clean all PCM, ABS, engine, and chassis grounds that are related to the most current DTC.
8. If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits
9. For any Relay DTC's, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.
10. Use the scan tool to perform a System Test if one applies to failing component.
11. A co-pilot, data recorder, or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes

- Perform the necessary repairs.
- Perform the ABS VERIFICATION TEST. Refer to **ABS VERIFICATION TEST**.

No

- Test Complete.

Antilock Brake System (ABS) - Service Information - Ram Pickup

DESCRIPTION

1500/2500/3500

The antilock brake system (ABS) is an electronically operated, four channel brake control system which is part of Electronic Stability Control (ESC). The vehicle also has Electronic Variable Brake Proportioning (EVBP) designed into the system which eliminates the combination/proportioning valve.

The system is designed to prevent wheel lockup and maintain steering control during braking. Preventing lockup is accomplished by modulating fluid pressure to the wheel brake units.

The hydraulic system is a four channel design. All wheel brakes are controlled individually. The ABS electrical system is separate from other electrical circuits in the vehicle. A specially programmed controller antilock brake unit operates the system components.

ABS system major components include:

- Antilock Brake Module (ABM)
- Hydraulic Control Unit (HCU)
- Wheel Speed Sensors (WSS)
- ABS Warning Light

CAB CHASSIS/4500/5500

The antilock brake system (ABS) is an electronically operated, three channel brake control system. The vehicle has Electronic Variable Brake Proportioning (EVBP) designed into the system which eliminates the combination/proportioning valve.

The system is designed to prevent wheel lockup and maintain steering control during braking. Preventing lockup is accomplished by modulating fluid pressure to the wheel brake units.

The hydraulic system is a three channel design. The front wheel brakes are controlled individually and the rear wheel brakes in tandem. The ABS electrical system is separate from other electrical circuits in the vehicle. A specially programmed controller antilock brake unit operates the system components.

ABS system major components include:

- Antilock Brake Module (ABM)
- Hydraulic Control Unit (HCU)
- Wheel Speed Sensors (WSS)
- ABS Warning Light

OPERATION

1500/2500/3500

Battery voltage is supplied to the ABM. The ABM performs a system initialization procedure at start up along with an ABS motor check. Initialization consists of a static and dynamic self check of system electrical components.

The static and dynamic checks occurs at ignition start up. During the dynamic check, the ABM briefly cycles solenoids to verify operation. An audible noise may be heard during this self check. This noise should be considered normal.

If an ABS component exhibits a fault during initialization, the ABM illuminates the amber warning light and registers a fault code in the microprocessor memory.

The ABM monitors wheel speed sensor inputs continuously while the vehicle is in motion. However, the ABM will not activate any ABS components as long as sensor inputs indicate normal braking.

During normal braking, the master cylinder, power booster and wheel brake units all function as they would in a vehicle without ABS. The HCU components are not activated.

The purpose of the antilock system is to prevent wheel lockup. Preventing lockup helps maintain vehicle braking action and steering control.

The antilock ABM activates the system whenever sensor signals indicate periods of wheel slip.

The antilock system prevents lockup during a wheel slip condition by modulating fluid apply pressure to the wheel brake units.

Brake fluid apply pressure is modulated according to wheel speed, degree of slip and rate of deceleration. Sensors at each wheel convert wheel speed into electrical signals. These signals are transmitted to the ABM for processing and determination of wheel slip and deceleration rate.

The ABS system has four fluid pressure control channels. Each wheel brakes are controlled separately. A speed sensor input signal indicating a wheel slip condition activates the ABM antilock program.

There are Two solenoid valves (Isolation and Dump valve) which are used in each antilock control channel. The valves are all located within the HCU valve body and work in pairs to either increase, hold, or decrease apply pressure as needed in the individual control channels.

During an ABS stop the ISO valve is energized which acts to prevent further pressure build-up to the calipers. Then the Dump valve dumps off pressure until the wheel unlocks. This will continue until the wheels quit slipping altogether.

STANDARD PROCEDURE

STANDARD PROCEDURE - ABS BRAKE BLEEDING

ABS system bleeding requires conventional bleeding methods plus use of a scan tool. The procedure involves performing a base brake bleeding, followed by use of the scan tool to cycle and bleed the HCU pump and solenoids. A second base brake bleeding procedure is then required to remove any air remaining in the system.

1. Perform base brake bleeding. Refer to **STANDARD PROCEDURE** . .
2. Connect scan tool to the Data Link Connector.
3. Select ANTILOCK BRAKES, followed by MISCELLANEOUS, then ABS BRAKES. Follow the instructions displayed. When scan tool displays TEST COMPLETE, disconnect scan tool and proceed.
4. Perform base brake bleeding a second time. Refer to **STANDARD PROCEDURE** . .
5. Top off master cylinder fluid level and verify proper brake operation before moving vehicle.

ELECTRICAL

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRICAL

Diagnosis of base brake conditions which are mechanical in nature should be performed first. This includes brake noise, lack of power assist, parking brake, or vehicle vibration during normal braking.

The antilock brake system performs several self-tests every time the ignition switch is turned on and the vehicle is driven. The Antilock Brake Module (ABM) monitors the system inputs and outputs circuits to verify the

system is operating properly. If the ABM senses a malfunction in the system it will set a DTC into memory and trigger the warning lamp.

NOTE: A scan tool must be used to diagnose the Antilock Brake system.

SENSOR, WHEEL SPEED, FRONT

DESCRIPTION

DESCRIPTION

1500/2500/3500

The ABS brake system uses four wheel speed sensors. A sensor is mounted to each hub/bearing.

CAB CHASSIS/4500/5500

The ABS brake system uses 3 wheel speed sensors. A sensor is mounted to each front hub/bearings. The third sensor is mounted on top of the rear axle differential housing.

OPERATION

OPERATION

The sensors convert wheel speed into an electrical signal. This signal and amperage is changed by magnetic induction when the toothed tone wheel passes the wheel speed sensor. This signal is sent to the ABM which measures the voltage and amperage of the digital signal for each wheel to determine wheel speed.

The signal strength is affected by the distance between the sensor and the tone ring. If the "Air Gap" between the sensor and the tone ring/wheel is too large, the signal can drop out at low speed, (below 40 mph) and can cause an ABS activation. No adjustment is available for the air gap.

HYDRAULIC/MECHANICAL

DESCRIPTION

DESCRIPTION

Vehicles equipped with ABS use electronic variable brake proportioning (EVBP) to balance front-to-rear braking. The EVBP is used in place of a rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the integrated control unit (ICU).

OPERATION

OPERATION

EVBP is able to decrease, hold and increase rear brake pressure without activating full ABS control. Upon entry into EVBP the inlet valve for the rear brake circuit is switched on so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the hydraulic control unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS

warning indicators are illuminated, the EVBP may not be functioning.

HYDRAULIC CONTROL UNIT (HCU)

DESCRIPTION

DESCRIPTION

Fig. 13: HCU/ABM & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

The HCU (3) consists of a valve body, pump motor, low pressure accumulators, inlet valves, outlet valves and noise attenuators.

OPERATION

OPERATION

Accumulators in the valve body store extra fluid released to the system for ABS mode operation. The pump provides the fluid volume needed and is operated by a DC type motor. The motor is controlled by the ABM.

The valves modulate brake pressure during antilock braking and are controlled by the ABM.

During antilock braking, the solenoid valves are opened and closed as needed.

During normal braking, the HCU solenoid valves and pump are not activated. The master cylinder and power booster operate the same as a vehicle without an ABS brake system.

NOTE: The three modes mentioned below do occur but not necessarily in the order listed every time.

During antilock braking, solenoid valve pressure modulation occurs in three stages, pressure increase, pressure hold, and pressure decrease. The valves are all contained in the valve body portion of the HCU.

PRESSURE DECREASE

The outlet valve is opened and the inlet valve is closed during the pressure decrease cycle.

A pressure decrease cycle is initiated when speed sensor signals indicate high wheel slip at one or more wheels. At this point, the ABM closes the inlet then opens the outlet valve, which also opens the return circuit to the accumulators. Fluid pressure is allowed to bleed off (decrease) as needed to prevent wheel lock.

Once the period of high wheel slip has ended, the ABM closes the outlet valve and begins a pressure increase or hold cycle as needed.

PRESSURE HOLD

Both solenoid valves are closed in the pressure hold cycle but only the inlet valve is energized. Fluid apply pressure in the control channel is maintained at a constant rate. The ABM maintains the hold cycle until sensor inputs indicate a pressure change is necessary.

PRESSURE INCREASE

The inlet valve is open and the outlet valve is closed during the pressure increase cycle. The pressure increase cycle is used to reapply the brakes. This cycle controls re-application of fluid apply pressure.

WARNING

WARNING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information. Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean the system components. These fluids damage rubber cups and seals. Use only fresh brake fluid or Mopar brake cleaner to clean or flush brake system components. These are the only cleaning materials recommended. If system contamination is suspected, check the fluid for dirt, discoloration, or separation into distinct layers. Also check the reservoir cap seal for distortion. Drain and flush the system with new brake fluid if contamination is suspected.

CAUTION: Use Mopar brake fluid, or an equivalent quality fluid meeting SAE/DOT standards J1703 and DOT 3. Brake fluid must be clean and free of contaminants. Use fresh fluid from sealed containers only to ensure proper antilock component operation.

CAUTION: Use Mopar multi-mileage or high temperature grease to lubricate caliper slide surfaces, drum brake pivot pins, and shoe contact points on the backing plates. Use multi-mileage grease or GE 661 or Dow 111 silicone grease on caliper slide pins to ensure proper operation.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BASE BRAKE SYSTEM

Base brake components consist of the brake pads, calipers, brake drum in hat rotor in the rear, rotors, brake lines, master cylinder, booster, and parking brake components.

Brake diagnosis involves determining if the problem is related to a mechanical, hydraulic, or vacuum operated component.

The first diagnosis step is the preliminary check.

PRELIMINARY BRAKE CHECK

1. Check condition of tires and wheels. Damaged wheels and worn, damaged, or underinflated tires can cause pull, shudder, vibration, and a condition similar to grab.
2. If complaint was based on noise when braking, check suspension components. Jounce front and rear of vehicle and listen for noise that might be caused by loose, worn or damaged suspension or steering components.
3. Inspect brake fluid level and condition. Note that the brake reservoir fluid level will decrease in proportion to normal lining wear. **Also note that brake fluid tends to darken over time. This is normal and should not be mistaken for contamination.**
    1. If fluid level is abnormally low, look for evidence of leaks at calipers, wheel cylinders, brake lines, and master cylinder.
    2. If fluid appears contaminated, drain out a sample to examine. System will have to be flushed if fluid is separated into layers, or contains a substance other than brake fluid. The system seals and cups will also have to be replaced after flushing. Use clean brake fluid to flush the system.
4. Check parking brake operation. Verify free movement and full release of cables and pedal. Also note if vehicle was being operated with parking brake partially applied.
5. Check brake pedal operation. Verify that pedal does not bind and has adequate free play. If pedal lacks free play, check pedal and power booster for being loose or for bind condition. Do not road test until condition is corrected.
6. Check booster vacuum check valve and hose.
7. If components checked appear OK, road test the vehicle.

ROAD TESTING

1. If complaint involved low brake pedal, pump pedal and note if it comes back up to normal height.
2. Check brake pedal response with transmission in Neutral and engine running. Pedal should remain firm under constant foot pressure.
3. During road test, make normal and firm brake stops in 25-40 mph range. Note faulty brake operation such as low pedal, hard pedal, fade, pedal pulsation, pull, grab, drag, noise, etc.
4. Attempt to stop the vehicle with the parking brake only and note grab, drag, noise, etc.

PEDAL FALLS AWAY

A brake pedal that falls away under steady foot pressure is generally the result of a system leak or fluid contamination. The leak point could be at a brake line, fitting, hose, or caliper/wheel cylinder. If leakage is severe, fluid will be evident at or around the leaking component.

Internal leakage (seal by-pass) in the master cylinder caused by worn or damaged piston cups, may also be the problem cause.

An internal leak in the ABS or RWAL system may also be the problem with no physical evidence.

LOW PEDAL

If a low pedal is experienced, pump the pedal several times. If the pedal comes back up worn linings, rotors, drums, or rear brakes out of adjustment are the most likely causes. The proper course of action is to inspect and replace all worn component and make the proper adjustments.

SPONGY PEDAL

A spongy pedal is most often caused by air in the system. However, thin brake drums or substandard brake lines and hoses can also cause a spongy pedal. The proper course of action is to bleed the system, and replace thin drums and substandard quality brake hoses if suspected.

HARD PEDAL OR HIGH PEDAL EFFORT

A hard pedal or high pedal effort may be due to lining that is water soaked, contaminated, glazed, or badly worn. The power booster or check valve or a vacuum hose could also be faulty.

PEDAL PULSATION

Pedal pulsation is caused by components that are loose, or beyond tolerance limits.

The primary cause of pulsation are disc brake rotors with excessive lateral runout or thickness variation, or out of round brake drums. Other causes are loose wheel bearings or calipers and worn, damaged tires.

NOTE: Some pedal pulsation may be felt during ABS activation.

BRAKE DRAG

Brake drag occurs when the lining is in constant contact with the rotor or drum. Drag can occur at one wheel, all wheels, fronts only, or rears only.

Drag is a product of incomplete brake shoe release. Drag can be minor or severe enough to overheat the linings, rotors and drums.

Minor drag will usually cause slight surface charring of the lining. It can also generate hard spots in rotors and drums from the overheat-cool down process. In most cases, the rotors, drums, wheels and tires are quite warm to the touch after the vehicle is stopped.

Severe drag can char the brake lining all the way through. It can also distort and score rotors and drums to the point of replacement. The wheels, tires and brake components will be extremely hot. In severe cases, the lining may generate smoke as it chars from overheating.

Common causes of brake drag are:

- Seized or improperly adjusted parking brake cables.
- Loose/worn wheel bearing.
- Seized caliper or wheel cylinder piston.
- Caliper binding on corroded bushings or rusted slide surfaces.
- Loose caliper mounting.

- Drum brake shoes binding on worn/damaged support plates.
- Mis-assembled components.
- Long booster output rod.

If brake drag occurs at all wheels, the problem may be related to a blocked master cylinder return port, or faulty power booster (binds-does not release).

BRAKE FADE

Brake fade is usually a product of overheating caused by brake drag. However, brake overheating and resulting fade can also be caused by riding the brake pedal, making repeated high deceleration stops in a short time span, or constant braking on steep mountain roads. Refer to **BRAKE DRAG**.

BRAKE PULL

Front brake pull condition could result from:

- Contaminated lining in one caliper
- Seized caliper piston
- Binding caliper
- Loose caliper
- Rusty caliper slide surfaces
- Improper brake pads
- Damaged rotor
- Front wheel alignment (caster, camber, and toe are possibly out of spec)

A worn, damaged wheel bearing or suspension component are further causes of pull. A damaged front tire (bruised, ply separation) can also cause pull.

A common and frequently misdiagnosed pull condition is where direction of pull changes after a few stops. The cause is a combination of brake drag followed by fade at one of the brake units.

As the dragging brake overheats, efficiency is so reduced that fade occurs. Since the opposite brake unit is still functioning normally, its braking effect is magnified. This causes pull to switch direction in favor of the normally functioning brake unit.

An additional point when diagnosing a change in pull condition concerns brake cool down. Remember that pull will return to the original direction, if the dragging brake unit is allowed to cool down (and is not seriously damaged).

REAR BRAKE GRAB OR PULL

Rear grab or pull is usually caused by improperly adjusted or seized parking brake cables, contaminated lining, bent or binding shoes and support plates, or improperly assembled components. This is particularly true when only one rear wheel is involved. However, when both rear wheels are affected, the master cylinder or

proportioning valve could be at fault.

BRAKES DO NOT HOLD AFTER DRIVING THROUGH DEEP WATER PUDDLES

This condition is generally caused by water soaked lining. If the lining is only wet, it can be dried by driving with the brakes very lightly applied for a mile or two. However, if the lining is both soaked and dirt contaminated, cleaning and/or replacement will be necessary.

BRAKE LINING CONTAMINATION

Brake lining contamination is mostly a product of leaking calipers or worn seals, driving through deep water puddles, or lining that has become covered with grease and grit during repair. Contaminated lining should be replaced to avoid further brake problems.

WHEEL AND TIRE PROBLEMS

Some conditions attributed to brake components may actually be caused by a wheel or tire problem.

A damaged wheel can cause shudder, vibration and pull. A worn or damaged tire can also cause pull.

Severely worn tires with very little tread left can produce a grab-like condition as the tire loses and recovers traction. Flat-spotted tires can cause vibration and generate shudder during brake operation. A tire with internal damage such as a severe bruise, cut, or ply separation can cause pull and vibration.

BRAKE NOISES

Some brake noise is common with rear drum brakes and on some disc brakes during the first few stops after a vehicle has been parked overnight or stored. This is primarily due to the formation of trace corrosion (light rust) on metal surfaces. This light corrosion is typically cleared from the metal surfaces after a few brake applications causing the noise to subside.

BRAKE SQUEAK/SQUEAL

Brake squeak or squeal may be due to linings that are wet or contaminated with brake fluid, grease, or oil. Glazed linings and rotors with hard spots can also contribute to squeak. Dirt and foreign material embedded in the brake lining will also cause squeak/squeal.

A very loud squeak or squeal is frequently a sign of severely worn brake lining. If the lining has worn through to the brake pads in spots, metal-to-metal contact occurs. If the condition is allowed to continue, rotors can become so scored that replacement is necessary.

BRAKE CHATTER

Brake chatter is usually caused by loose or worn components, or glazed/burnt lining. Rotors with hard spots can also contribute to chatter. Additional causes of chatter are out-of-tolerance rotors, brake lining not securely attached to the shoes, loose wheel bearings and contaminated brake lining.

THUMP/CLUNK NOISE

Thumping or clunk noises during braking are frequently **not** caused by brake components. In many cases, such noises are caused by loose or damaged steering, suspension, or engine components. However, calipers that bind on the slide surfaces can generate a thump or clunk noise.

STANDARD PROCEDURE

MANUAL BLEEDING

Fig. 1: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

1. Remove reservoir filler caps and fill reservoir.
2. If calipers were overhauled, open all caliper bleed screws. Then close each bleed screw as fluid starts to drip from it. Top off master cylinder reservoir once more before proceeding.
3. Attach one end of bleed hose (1) to bleed screw and insert opposite end in glass container (2) partially filled with brake fluid. Be sure end of bleed hose is immersed in fluid.

NOTE: Bleed procedure should be in this order (1) Right rear (2) Left rear (3) Right front (4) Left front.

4. Open up bleeder, then have a helper press down the brake pedal. Once the pedal is down, hold the pedal down while closing the bleeder. Repeat bleeding until fluid stream is clear and free of bubbles. Then move to the next wheel.
5. Before moving the vehicle verify the pedal is firm and not mushy.
6. Top off the brake fluid and install the reservoir cap.

PRESSURE BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use

fresh, clean fluid from a sealed container at all times.

Follow the manufacturers instructions carefully when using pressure equipment. Do not exceed the tank manufacturers pressure recommendations. Generally, a tank pressure of 15-20 psi is sufficient for bleeding.

Fill the bleeder tank with recommended fluid and purge air from the tank lines before bleeding.

Do not pressure bleed without a proper master cylinder adapter. The wrong adapter can lead to leakage, or drawing air back into the system.

DESCRIPTION

DESCRIPTION

Fig. 2: Adjustable Pedals System Components

The Adjustable Pedals System (APS) is designed to enable the fore and aft repositioning of the brake and accelerator pedals. This results in improved ergonomics in relation to the steering wheel for taller and shorter drivers. Being able to adjust the pedal positions also allows the driver to set steering wheel tilt and seat position to the most comfortable position. The position of the brake and accelerator pedals can be adjusted without compromising safety or comfort in actuating the pedals.

Change of pedal position is accomplished by means of a motor driven screw. Operating the adjustable pedal switch activates the pedal drive motor (5). The pedal drive motor turns a screw that changes the position of the brake and accelerator pedals (6). The pedals can be moved rearward (closer to the driver) or forward (away from driver). The brake pedal is moved on its drive screw to a position where the driver feels most comfortable.

The accelerator pedal (6) is moved at the same time and the same distance as the brake pedal.

Neither the pedal drive motor (5) nor drive mechanism (2) are subject to the mechanical stress of brake or accelerator application.

- SYSTEM FEATURES:
  a. Range of Adjustment: The pedals may be adjusted up to 3 in. (75 mm)
  b. Pedal Adjustment Speed: 0.5 in./sec (12.5 mm/sec)
  c. Pedal Adjustment Inhibitors: Pedal adjustment is inhibited when the vehicle is in reverse or when cruise control is activated.

REMOVAL

REMOVAL

NOTE: If equipped with adjustable pedals: When replacing the components both pedal assemblies must be in the fully down position toward the floor for proper

adjustment. Pedals can be moved manually by rotating the cable on the component not being replaced. New components come in the correct position until activated.

1. Remove the pedal assembly. Refer to **PEDAL(S), BRAKE AND/OR ACCELERATOR, REMOVAL**.

NOTE: The adjustable pedal motor has three locking tabs (3) that prevent easy twisting when removing drive cable from housing.

2. Disconnect the drive cable (2) from the adjustable pedal motor (5) by twisting clockwise and lifting from motor.

NOTE: Clean slide pin bores thoroughly to remove any old grease.

NOTE: Use grease packets included with kit or Dow Corning-807® grease.

1. Thoroughly coat the new slide pins (3) on all working surfaces.
2. Install the boot (2) onto the slide pin (3) and then insert into the adapter (1).
3. Push the pin (3) all the way into the adapter (1) and carefully expel the trapped air by gently pushing on the boot (2) near the slide pin head (3).

BOOSTER, POWER BRAKE

DESCRIPTION

DESCRIPTION

Fig. 24: Identifying Power Brake Booster Components
Courtesy of CHRYSLER GROUP, LLC

All models use a tandem diaphragm, power brake booster (3).

NOTE: **The power brake booster is not a repairable component. The booster must be replaced as an assembly if diagnosis indicates a malfunction has occurred.**

OPERATION

OPERATION

Fig. 25: Identifying Power Brake Booster Components
Courtesy of CHRYSLER GROUP, LLC

The booster unit consists of a single housing divided into two by a tandem diaphragm (3). The outer edge of the diaphragm is secured to the housing. A spacer block (2) is located in between the cowl and the booster housing. The booster push rod (1), connects the booster to the brake pedal and master cylinder (4), is attached to the center of the diaphragm. A check valve (5) is used in the booster outlet connected to the engine intake manifold. Power assist is generated by utilizing a combination of vacuum and atmospheric pressure to boost brake assist.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

1. Start the engine and check the booster vacuum hose connections. A hissing noise indicates a vacuum leak. Correct any vacuum leaks before proceeding.
2. Stop the engine and pump the brake pedal until all vacuum reserve in the booster is depleted.
3. Press and hold the brake pedal under light foot pressure. The pedal should hold firm. If the pedal falls away, there may be an external leak or the master cylinder is faulty (internal leakage).
4. Start the engine and note pedal action. It should fall away slightly under light foot pressure, then hold firm. If no pedal action is discernible, the power booster, vacuum supply or vacuum check valve is faulty, refer to **POWER BOOSTER VACUUM TEST**.
5. If the POWER BOOSTER VACUUM TEST passes, rebuild the booster vacuum reserve as follows: Release the brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off the ignition to stop the engine.

6. Wait a minimum of 90 seconds and try brake action again. The booster should provide two or more vacuum assisted pedal applications. If the vacuum assist is not provided, the booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect a vacuum gauge to the booster check valve with a short length of hose and T-fitting.
2. Start and run the engine at curb idle for one minute.
3. Observe the vacuum supply. If the vacuum supply is less that 12 inches HG (406 millibars), repair the vacuum supply.
4. Clamp the hose shut between the intake vacuum source and the check valve.
5. Stop the engine and observe the vacuum gauge.
6. If the vacuum drops more than one inch HG (33 millibars) within 15 seconds, the booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Remove the power booster check valve from the power booster.
2. Using a hand operated vacuum pump, apply 15-20 inches HG (508-677 millibars) vacuum at the booster side of the check valve.
3. The vacuum should hold steady. If the gauge on the pump indicates vacuum loss, the check valve is faulty and should be replaced.

REMOVAL

REMOVAL

1 - MOUNTING NUT
2 - POWER BRAKE BOOSTER

1. Remove the master cylinder. Refer to **MASTER CYLINDER, BRAKE, REMOVAL**.
2. Disconnect the vacuum line at the booster.
3. Remove the clip securing the booster push rod to the brake pedal.
4. Remove the brake lamp switch. Refer to **SWITCH, STOP LAMP, REMOVAL** .
5. Remove the nuts (1) from the booster mounting studs.
6. Remove the booster (2) and gasket from front cowl panel.

INSTALLATION

2 - POWER BRAKE BOOSTER

1. Guide the booster (2) studs into the cowl panel holes and seat the booster on the panel.
2. Install and tighten the new booster attaching nuts (1) to 28 N.m (250 in. lbs.).
3. Install the booster push rod on the brake pedal and install clip.
4. Install the brake lamp switch. Refer to **SWITCH, STOP LAMP, INSTALLATION** .
5. Install the booster check valve if removed and connect the vacuum hose to the check valve.
6. Install the master cylinder. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.
7. Fill and bleed the brake system. Refer to **STANDARD PROCEDURE**. .

BOOSTER, POWER BRAKE, HYDRO-BOOST

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HYDRAULIC BOOSTER

The hydraulic booster uses hydraulic pressure from the power steering pump. Before diagnosing a booster problem, first verify the power steering pump is operating properly. Perform the following checks.

- Check the power steering fluid level.
- Check the brake fluid level.
- Check all power steering hoses and lines for leaks and restrictions.
- Check power steering pump pressure.

HISSING

A hissing noise may be noticed when above normal brake pedal pressure is applied, 40 lbs. or above. The noise will be more noticeable if the vehicle is not moving. The noise will increase with the brake pedal pressure and an increase of system operating temperature.

CLUNK-CHATTER-CLICKING

A clunk-chatter-clicking may be noticed when the brake pedal is released quickly, after above normal brake pedal pressure is applied 50-100 lbs.

NOISES

The hydraulic booster unit will produce certain characteristic booster noises. The noises may occur when the brake pedal is used in a manner not associated with normal braking or driving habits.

BOOSTER FUNCTION TEST

With the engine off depress the brake pedal several times to discharge the accumulator. Then depress the brake pedal using 40 lbs. of force and start the engine. The brake pedal should fall and then push back against your foot. This indicates the booster is operating properly.

ACCUMULATOR LEAKDOWN

1. Start the engine, apply the brakes and turn the steering wheel from lock to lock. This will ensure the accumulator is charged. Turn off the engine and let the vehicle sit for one hour. After one hour there should be at least two power assisted brake application with the engine off. If the system does not retain a charge the booster must be replaced.
2. With the engine off depress the brake pedal several times to discharge the accumulator. Grasp the accumulator and see if it wobbles or turns. If it does the accumulator has lost a gas charge and the booster must be replaced.

SEAL LEAKAGE

Fig. 28: Hydraulic Booster Components
Courtesy of CHRYSLER GROUP, LLC

1 - PUMP
2 - GEAR
3 - INPUT SEAL
4 - HOUSING SEAL
5 - ACCUMULATOR SEAL
6 - PISTON SEAL
7 - SPOOL PLUG SEAL
8 - RETURN PORT FITTING SEAL

If the booster leaks from any of the seals the booster assembly must be replaced.

- **INPUT ROD SEAL (3):** Fluid leakage from rear end of the booster.
- **PISTON SEAL (6):** Fluid leakage from vent at front of booster.
- **HOUSING SEAL (4):** Fluid leakage between housing and housing cover.
- **SPOOL VALVE SEAL (7):** Fluid leakage near spool plug.
- **RETURN PORT FITTING SEAL (8):** Fluid leakage from port fitting.

HYDRAULIC BOOSTER DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
Slow Brake Pedal Return	1. Excessive seal friction in booster.	1. Replace booster.
	2. Faulty spool valve action.	2. Replace booster.
	3. Restriction in booster return hose.	3. Replace hose.
	4. Damaged input rod.	4. Replace booster.
Excessive Brake Pedal Effort.	1. Internal or external seal	1. Replace booster.

	leakage.	
	2. Faulty steering pump.	2. Replace pump.
Brakes Self Apply	1. Dump valve faulty.	1. Replace booster.
	2. Contamination in hydraulic system.	2. Flush hydraulic system and replace booster.
	3. Restriction in booster return hose.	3. Replace hose.
Booster Chatter, Pedal Vibration	1. Slipping pump belt.	1. Replace power steering belt.
	2. Low pump fluid level.	2. Fill pump and check for leaks.
Grabbing Brakes	1. Low pump flow.	1. Test and repair/replace pump.
	2. Faulty spool valve action.	2. Replace booster.

STANDARD PROCEDURE

STANDARD PROCEDURE - BLEEDING

The hydraulic booster is generally self-bleeding, this procedure will normally bleed the air from the booster. Normal driving and operation of the unit will remove any remaining trapped air.

1. Fill power steering pump reservoir.
2. Disconnect fuel shutdown relay and crank the engine for several seconds. Refer to appropriate electrical information for relay location and WARNING.
3. Check fluid level and add if necessary.
4. Connect fuel shutdown relay and start the engine.
5. Turn the steering wheel slowly from lock to lock twice.
6. Stop the engine and discharge the accumulator by depressing the brake pedal 5 times.

NOTE: If fluid foaming occurs, wait for foam to dissipate and repeat steps 7 and 8.

7. Start the engine and turn the steering wheel slowly from lock to lock twice.
8. Turn off the engine and check fluid level and add if necessary.

REMOVAL

REMOVAL

Fig. 29: Identifying Nut, Electrical Connector, Brake Lines & Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the booster is being replaced because the power steering fluid is contaminated, flush the power steering system before replacing the booster.

1. With engine off depress the brake pedal 5 times to discharge the accumulator.
2. Remove brake lines (5) from master cylinder (3).
3. Remove mounting nuts (4) from the master cylinder.
4. Remove the master cylinder (3).
5. Remove the return hose and the two pressure lines (2) from the hydraulic booster.
6. From inside the vehicle remove the booster push rod clip, washer and rod remove from the brake pedal.
7. Remove the brake lamp switch. Refer to **SWITCH, STOP LAMP, REMOVAL** .
8. Remove the mounting nuts from the hydraulic booster and remove the booster.

INSTALLATION

INSTALLATION

Fig. 30: Identifying Nut, Electrical Connector, Brake Lines & Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

1. Install the hydraulic booster and tighten the mounting nuts to 28 N.m (21 ft. lbs.).
2. Install the booster push rod, washer and clip onto the brake pedal.
3. Install the brake lamp switch. Refer to **SWITCH, STOP LAMP, INSTALLATION** .
4. Install the master cylinder on the mounting studs and tighten the mounting nuts (4) to 23 N.m (17 ft. lbs.).
5. Install the brake lines (5) to the master cylinder (3) and tighten to 19 N.m (170 in. lbs.).

NOTE: Inspect the o-rings on the pressure line fittings to insure they are in good condition before installation. Replace the o-rings if necessary.

6. Install the hydraulic booster pressure lines (2) to the booster and tighten to 41 N.m (30 ft. lbs.).
7. Install the return hose to the booster.
8. Bleed the base brake system. Refer to **STANDARD PROCEDURE**. .

CAUTION: MOPAR (MS-9602) ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

9. Fill the power steering pump with fluid. Refer to **PUMP, STANDARD PROCEDURE** .
10. Bleed the hydraulic booster. Refer to **BOOSTER, POWER BRAKE, HYDRO-BOOST, STANDARD PROCEDURE**.

DESCRIPTION

DESCRIPTION

NOTE: **Petroleum based grease should not be used on any of the rubber components of the caliper, Use only Non-Petroleum based grease.**

Fig. 33: Identifying Disc Brake Caliper Components

The calipers are a dual piston type. The calipers are free to slide laterally, this allows continuous compensation for lining wear.

OPERATION

OPERATION

Fig. 34: CutawayView of Disc Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

When the brakes are applied fluid pressure is exerted against the caliper piston (2). The fluid pressure is exerted equally and in all directions. This means pressure exerted against the caliper piston and within the caliper bore will be equal.

Fluid pressure applied to the piston is transmitted directly to the inboard brake pad (5). This forces the pad lining against the inner surface of the disc brake rotor. At the same time, fluid pressure within the piston bore forces the caliper to slide inward on the mounting bolts. This action brings the outboard brake pad lining (6) into contact with the outer surface of the disc brake rotor.

In summary, fluid pressure acting simultaneously on both piston and caliper, produces a strong clamping action. When sufficient force is applied, friction will attempt to stop the rotors from turning and bring the vehicle to a stop.

Application and release of the brake pedal generates only a very slight movement of the caliper and piston. Upon release of the pedal, the caliper and piston return to a rest position. The brake pads do not retract an appreciable distance from the rotor. In fact, clearance is usually at, or close to zero. The reasons for this are to keep road debris from getting between the rotor and lining and in wiping the rotor surface clear each revolution.

The caliper piston seal (4) controls the amount of piston (2) extension needed to compensate for normal lining wear.

Fig. 35: Caliper Operation
Courtesy of CHRYSLER GROUP, LLC

During brake application, the seal is deflected outward by fluid pressure and piston movement (6). When the brakes (and fluid pressure) are released, the seal relaxes and retracts the piston (3).

The amount of piston retraction is determined by the amount of seal deflection. Generally the amount is just enough to maintain contact between the piston and inboard brake pad.

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

1. Install prop rod on the brake pedal to keep pressure on the brake system, Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open. This will allow you to bleed out the area of repair instead of the entire system.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the tire and wheel assembly.
4. Compress the disc brake caliper (6).

FLUID

DESCRIPTION

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar brake fluid or an equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brakes hydraulic unit and all hydraulic fluid hoses.

JUNCTION BLOCK, BRAKE TUBE

REMOVAL

FRONT JUNCTION BLOCK

1. Install a prop rod on the brake pedal to keep pressure on the brake system. Holding pedal in this position will isolate the master cylinder from the hydraulic brake system and will not allow brake fluid to drain out of the brake fluid reservoir while the brake lines are open. This will allow you to bleed out the area of repair instead of the entire system.

2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the eight brake lines (1) from the junction block (2).
4. Remove the junction block mounting bolts (3) and remove the junction block (2) from the frame.

REAR JUNCTION BLOCK

1. Install prop rod on the brake pedal to keep pressure on the brake system. Holding pedal in this position will isolate the master cylinder from the hydraulic brake system and will not allow brake fluid to drain out of the brake fluid reservoir while the brake lines are open. This will allow you to bleed out the area of repair instead of the entire system.

MASTER CYLINDER, BRAKE

DESCRIPTION

DESCRIPTION

A two-piece master cylinder is used on all models. The cylinder body containing the primary and secondary pistons is made of aluminum. The removable fluid reservoir is made of nylon reinforced with glass fiber. The reservoir stores reserve brake fluid for the hydraulic brake circuits and has a switch for indicating low fluid levels. The reservoir is the only serviceable component.

The fluid compartments of the nylon reservoir are interconnected to permit fluid level equalization. However, the equalization feature does not affect circuit separation in the event of a front or rear brake malfunction. The reservoir compartments will retain enough fluid to operate the functioning hydraulic circuit.

Care must be exercised when removing/installing the master cylinder connecting lines. The threads in the

cylinder fluid ports can be damaged if care is not exercised. Start all brake line fittings by hand to avoid cross threading.

The cylinder reservoir can be replaced when necessary. However, the aluminum body section of the master cylinder is not a repairable component.

NOTE: **If diagnosis indicates that an internal malfunction has occurred, the aluminum body section must be replaced as an assembly.**

OPERATION

OPERATION

The master cylinder bore contains a primary and secondary piston. The primary piston supplies hydraulic pressure to the front brakes. The secondary piston supplies hydraulic pressure to the rear brakes.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

1. Start the engine and check the booster vacuum hose connections. A hissing noise indicates a vacuum leak. Correct any vacuum leaks before proceeding.
2. Stop the engine and pump the brake pedal until all vacuum reserve in the booster is depleted.
3. Press and hold the brake pedal under light foot pressure. The pedal should hold firm. If the pedal falls away, there may be an external leak or the master cylinder is faulty (internal leakage).
4. Start the engine and note pedal action. It should fall away slightly under light foot pressure, then hold firm. If no pedal action is discernible, the power booster, vacuum supply or vacuum check valve is faulty, refer to **POWER BOOSTER VACUUM TEST**.
5. If the POWER BOOSTER VACUUM TEST passes, rebuild the booster vacuum reserve as follows: Release the brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off the ignition to stop the engine.
6. Wait a minimum of 90 seconds and try brake action again. The booster should provide two or more vacuum assisted pedal applications. If the vacuum assist is not provided, the booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect a vacuum gauge to the booster check valve with a short length of hose and T-fitting.
2. Start and run the engine at curb idle for one minute.
3. Observe the vacuum supply. If the vacuum supply is less that 12 inches HG (406 millibars), repair the vacuum supply.
4. Clamp the hose shut between the intake vacuum source and the check valve.
5. Stop the engine and observe the vacuum gauge.
6. If the vacuum drops more than one inch HG (33 millibars) within 15 seconds, the booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Remove the power booster check valve from the power booster.
2. Using a hand operated vacuum pump, apply 15-20 inches HG (508-677 millibars) vacuum at the booster side of the check valve.
3. The vacuum should hold steady. If the gauge on the pump indicates vacuum loss, the check valve is faulty and should be replaced.

STANDARD PROCEDURE

STANDARD PROCEDURE - MASTER CYLINDER BLEEDING

Fig. 66: Bleeding Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

1 - BLEEDING TUBES
2 - RESERVOIR

A new master cylinder should be bled before installation on the vehicle. Required bleeding tools include bleed tubes and a wood dowel to stroke the pistons. Bleed tubes can be fabricated from brake line.

1. Mount master cylinder in vise.
2. Attach bleed tubes to cylinder outlet ports (1). Then position each tube end into reservoir (2).
3. Fill reservoir with fresh brake fluid.
4. Press cylinder pistons inward with wood dowel. Then release pistons and allow them to return under spring pressure. Continue bleeding operations until air bubbles are no longer visible in fluid.

1. Depress the brake pedal five times to deplete any vacuum that may remain in the booster unit.
2. Siphon and drain the fluid from the reservoir.
3. Disconnect the electrical connector for the low fluid level.
4. Place a towel or rag under the master cylinder outlet port area to protect the vehicle from brake fluid damage.
5. Remove the brake lines (3) from the master cylinder (4).
6. Remove the mounting nuts from the master cylinder (4).

NOTE: **Gently ease the master cylinder and reservoir assembly away from the booster, During removal the master cylinder should be kept as perpendicular to the front of the booster as possible to avoid excess interference with the booster output rod and in order not to dislodge the output rod from its seat inside the booster.**

7. Remove the master cylinder (4).

NOTE: **Using care remove the master cylinder directly forward in order not to dislodge the output rod from its seat inside the booster.**

6. Remove the master cylinder (4).

INSTALLATION

ALL EXCEPT HYDROBOOST

NOTE: **If master cylinder is replaced bleed cylinder before installation.**

NOTE: **Make sure the output rod of the brake booster is in position and retained by a output rod retaining ring, by looking into the boosters master cylinder mounting hole. This position will enable the output rod to enter inside of the master cylinder plunger sleeve during installation. Proper position is obtained when the output rod is centered perpendicular to the master cylinder mounting hole.**

NOTE: **Prior to installing the master cylinder assembly check that there is a vacuum seal present at the shoulder of the master cylinder flange and it's neck. A square seal must be present to ensure vacuum integrity with the booster.**

INSPECTION

INSPECTION

Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

Courtesy of CHRYSLER GROUP, LLC

1 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL THICKNESS IS TO BE MEASURED AT THE THINNEST POINT.
2 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL
3 - BRAKE SHOE ASSEMBLY BACKING PLATE

Measure brake pad minimum thickness (1). Brake pads must be replaced when usable material on a brake pad lining (2) measured at its **thinnest point** measures one millimeter (0.04 inches) or less.

If a brake pad fails inspection, replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.

If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original

position they were removed from.

NOTE: **It is important to inspect both front and rear brake pads during the same inspection.**

PEDAL(S), BRAKE AND/OR ACCELERATOR

DESCRIPTION

DESCRIPTION

Fig. 102: Identifying Pedal Components

Courtesy of CHRYSLER GROUP, LLC

A suspended-type brake pedal is used. The pedal is attached to the pedal support bracket (4) with a pivot shaft pin, bushings and 2 e-clips (1, 2). If the bushings become dry a spray lubricant can be used to eliminate noises. The booster push rod is attached to the pedal with e-clips. The pedal (3), bushings/pivot pin (1, 2) and support bracket (4) are serviceable separate from the assembly and the accelerator pedal. If equipped with adjustable pedals the brake pedal is serviced with the adjustable (drive) cable (from the adjustable pedal motor). For brake pedal replacement with or without adjustable pedals, the assembly must be removed from the vehicle. Adjustable pedal components can be serviced as follows:

- Adjustable pedal assembly (including bracket and all subcomponents)
- Brake pedal assembly (including adjustment cable)
- Accelerator pedal (Electronic Throttle Control [ETC])
- Accelerator subassembly (including adjustable pedal motor, ETC, ETC mounting plate and bracket).

OPERATION

OPERATION

The brake pedal is attached to the booster push rod. When the pedal is depressed, the primary booster push rod is depressed which moves the booster secondary rod. The booster secondary rod depress the master cylinder piston.

REMOVAL

BRAKE PEDAL

NOTE: The views in this procedure are with adjustable pedals. Without adjustable pedals are similar.

NOTE: If equipped with adjustable pedals: When replacing the components both pedal assemblies must be in the fully down position toward the floor for proper adjustment. Pedals can be moved manually by rotating the cable on the component not being replaced. New components come in the correct position until activated.

1. Remove the pedal assembly. Refer to **PEDAL(S), BRAKE AND/OR ACCELERATOR, REMOVAL**.

Fig. 103: Adjustable Pedals System Components

NOTE: **The adjustable pedal motor has three locking tabs (3) that prevent easy twisting when removing drive cable from housing.**

2. If equipped with adjustable pedals, disconnect the drive cable (2) from the adjustable pedal motor (5) by twisting clockwise and lifting from motor.

Fig. 104: Identifying Pedal Components

NOTE: **If equipped with adjustable pedals, note the spring and bushing positions during removal for proper installation.**

3. Remove the e-clip (1) from the brake pedal pivot shaft and slide shaft (2) from the pedal assembly (4).

4. Remove the brake pedal (3) from the pedal assembly (4).

PEDAL ASSEMBLY

NOTE: The brake pedal is serviced as a complete assembly including accelerator pedal and the bracket.

NOTE: The views in this procedure are with adjustable pedals. Without adjustable pedals are similar.

2. Remove the brake lamp switch. Refer to **SWITCH, STOP LAMP, REMOVAL** .
3. Remove the steering column. Refer to **COLUMN, REMOVAL** .
4. Disconnect the electrical connectors.
5. Remove the brake booster rod to brake pedal retainer clip and discard the clip.
6. Remove the four brake booster nuts.
7. If equipped with a manual transmission, remove the clutch master cylinder to clutch pedal clip and pin.

NOTE: If equipped with an automatic transmission a clutch master cylinder block out plate is used in place of the master cylinder and the retaining nuts will still be used.

8. Remove the two clutch master cylinder nuts.
9. Remove the three pedal assembly mounting bolts (to instrument panel) and remove the pedal assembly (4) from the vehicle.

NOTE: Ensure that the cables and wiring harness is not pinched.

1. Position the pedal assembly (4) and install the three mounting bolts (to instrument panel). Do not tighten at this time.
2. Install the four brake booster mounting nuts and tighten to 28 N.m (20.5 ft. lbs.).
3. Tighten the pedal assembly mounting bolts (to instrument panel) to 31 N.m (23 ft. lbs.).
4. Install the brake booster rod to the brake pedal and install a new retainer clip.
5. If equipped with a manual transmission, install the clutch master cylinder to clutch pedal clip and pin.

NOTE: If equipped with an automatic transmission a clutch master cylinder block out plate is used in place of the master cylinder and the retaining nuts will still be used.

6. Install the two clutch master cylinder nuts and tighten to 28 N.m (20.5 ft. lbs.).
7. Connect the electrical connectors.
8. Install the steering column. Refer to **COLUMN, INSTALLATION** .

9. Install the brake lamp switch. Refer to **SWITCH, STOP LAMP, INSTALLATION** .

ROTOR, BRAKE

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - DISC BRAKE ROTOR

The rotor braking surfaces should not be refinished unless necessary.

Light surface rust and scale can be removed with a lathe equipped with dual sanding discs. The rotor surfaces can be restored by machining with a disc brake lathe if surface scoring and wear are light.

Replace the rotor for the following conditions:

- Severely Scored
- Tapered
- Hard Spots
- Cracked
- Below Minimum Thickness

ROTOR MINIMUM THICKNESS

Measure rotor thickness at the center of the brake shoe contact surface. Replace the rotor if below minimum thickness, or if machining would reduce thickness below the allowable minimum.

Rotor minimum thickness is usually specified on the rotor hub. The specification is either stamped or cast into the hub surface.

ROTOR RUNOUT

Fig. 117: Checking Rotor Lateral Runout
Courtesy of CHRYSLER GROUP, LLC

1 - DIAL INDICATOR

Check rotor lateral runout with Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1). Excessive lateral runout will cause brake pedal pulsation and rapid, uneven wear of the brake shoes. Position the dial indicator plunger approximately 25.4 mm (1 in.) inward from the rotor edge.

NOTE: **Be sure wheel bearing has zero end play before checking rotor runout.**

Maximum allowable rotor runout is 0.050 mm (0.002 in.).

ROTOR THICKNESS VARIATION

Fig. 118: Measuring Rotor Thickness
Courtesy of CHRYSLER GROUP, LLC

1 - MICROMETER
2 - ROTOR

Variations in rotor thickness will cause pedal pulsation, noise and shudder.

Measure rotor thickness at 6 to 12 points around the rotor face.

Position the micrometer (1) approximately 25.4 mm (1 in.) from the rotor (2) outer circumference for each measurement.

Thickness should not **vary** by more than 0.015 mm (0.0059 in.) from point-to-point on the rotor. Machine or replace the rotor if necessary.

STANDARD PROCEDURE

STANDARD PROCEDURE - DISC BRAKE ROTOR MACHINING

NOTE: **A hub mounted on-vehicle lathe is highly recommended. This type of lathe trues the rotor to the vehicles hub/bearing.**

The disc brake rotor can be machined if scored or worn. The on-vehicle lathe must machine both sides of the rotor simultaneously with dual cutter heads. The rotor mounting surface must be clean before placing on the on-

vehicle lathe. Equipment capable of machining only one side at a time may produce a tapered rotor **This type of rotor machining is not recommended** .

NOTE: Proper wheel torque is also critical to help prevent any warping of the disc brake rotor.

CAUTION: Brake rotors that do not meet minimum thickness specifications before or after machining must be replaced.

TUBES AND HOSES, BRAKE

STANDARD PROCEDURE

DOUBLE INVERTED FLARING

A preformed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

Fig. 128: Flaring Brake Line (Double Inverted) & Cutting Line
Courtesy of CHRYSLER GROUP, LLC

1. Cut off damaged tube with Tubing Cutter.
2. Ream cut edges of tubing to ensure proper flare.
3. Install replacement tube nut on the tube.
4. Insert tube in flaring tool.
5. Place gauge form over the end of the tube.
6. Push tubing through flaring tool jaws until tube contacts recessed notch in gauge that matches tube diameter.
7. Tighten the tool bar on the tube
8. Insert plug on gauge in the tube. Then swing compression disc over gauge and center tapered flaring screw in recess of compression disc.
9. Tighten tool handle until plug gauge is squarely seated on jaws of flaring tool. This will start the inverted flare.
10. Remove the plug gauge and complete the inverted flare.

ISO FLARING

A preformed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

Fig. 129: ISO Flaring Using Tool Kit
Courtesy of CHRYSLER GROUP, LLC

To make a ISO flare use an ISO flaring tool kit.

1. Cut off damaged tube with Tubing Cutter.
2. Remove any burrs from the inside of the tube.
3. Install tube nut on the tube.
4. Position the tube in the flaring tool flush with the top of the tool bar (6). Then tighten the tool bar on the tube.
5. Install the correct size adaptor (1) on the flaring tool yoke screw.
6. Lubricate the adaptor (2).
7. Align the adaptor and yoke screw over the tube.
8. Turn the yoke screw in until the adaptor is squarely seated on the tool bar.

Courtesy of CHRYSLER GROUP, LLC

1 - MOUNTING BOLT
2 - BRAKE HOSE
3 - BANJO BOLT
4 - WHEEL SPEED SENSOR WIRE

1. Install prop rod on the brake pedal to keep pressure on the brake system, Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open. This will allow you to bleed out the area of repair instead of the entire system.
2. Raise and support vehicle.
3. Remove the tire and wheel assembly.
4. Remove the brake hose (2) from the brake line located at the frame. Refer to **Fig. 130**.
5. Remove the brake hose banjo bolt (3) at the caliper. Refer to **Fig. 130**.
6. Remove the mounting bolt securing the brake hose (2) to the frame and remove the wheel speed sensor wire (4) from the brake hose (2). Refer to **Fig. 130**.
7. Remove the hose.

Left and right side procedures are similar.

1. Install prop rod on the brake pedal to keep pressure on the brake system. Holding pedal in this position will isolate the master cylinder from the hydraulic brake system and will not allow brake fluid to drain out of the brake fluid reservoir while the brake lines are open. This will allow you to bleed out the area of repair instead of the entire system.

PARKING BRAKE

DESCRIPTION

DESCRIPTION

Fig. 144: Support Plate, Bolts & Parking Brake Shoes
Courtesy of CHRYSLER GROUP, LLC

The parking brakes are secured to a support plate (1) and operated by a system of cables and levers attached to a primary and secondary shoe (2) positioned within the drum section of the rotor.

The drum-in-hat design utilizes an independent set of shoes (2) to park the vehicle.

OPERATION

OPERATION

To apply the parking brake the pedal is depressed. This creates tension in the cable which pulls forward on the park brake lever. The lever pushes the park brake shoes outward and into contact with the drum section of the rotor. The contact of shoe to rotor parks the vehicle.

A torsion locking mechanism is used to hold the pedal in an applied position. Parking brake release is accomplished by the hand release.

A parking brake switch is mounted on the parking brake lever and is actuated by movement of the lever. The switch, which is in circuit with the red warning light in the dash, will illuminate the warning light whenever the parking brake is applied.

Parking brake adjustment is controlled by a cable tensioner mechanism. The cable tensioner, once adjusted at the factory, should not need further adjustment under normal circumstances. Adjustment may be required if a new tensioner, or cables are installed, or disconnected.

1. From inside the vehicle, insert the cable end fitting (2) into the hole in the pedal assembly (1).
2. Seat the cable retainer in the pedal assembly (1).
3. Engage the cable ball end in clevis on the pedal assembly.
4. Route the cable through the floorpan and install the body grommet.
5. Place the carpet down and install the left cowl trim and sill plate.
6. Raise and support the vehicle.
7. Route the cable through the underbody bracket and seat the cable end fitting in the bracket.
8. Connect the cable to the cable connector.
9. Perform the park brake adjustment procedure. Refer to **TENSIONER, PARKING BRAKE CABLE, ADJUSTMENTS**.
10. Lower the vehicle.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Reach under the driver side outboard end of the instrument panel to access and unsnap the plastic retainer clip that secures the park brake release linkage rod to the park brake mechanism on the left cowl side inner panel.
3. Disengage the park brake release linkage rod end from the park brake mechanism.
4. Lift the park brake release handle to access and unsnap the plastic retainer clip that secures the park brake release linkage rod to the lever on the back of the park brake release handle.
5. Lower the park brake release handle and reach under the driver side outboard end of the instrument panel to disengage the park brake release linkage rod end from the lever on the back of the park brake release handle.
6. Lift the park brake release handle to access the handle mounting bracket.

3. Install the park brake release rod.
4. Connect the front cable to the arm on the pedal assembly (1).
5. Install the front cable grommet into the floorpan and the cable retainer, roll the carpet back.
6. Connect the wires to the brake lamp switch.
7. Install the knee bolster. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
8. Raise the vehicle.
9. Adjust the parking brake cable tensioner. Refer to **TENSIONER, PARKING BRAKE CABLE, ADJUSTMENTS**.

SHOES, PARKING BRAKE

ADJUSTMENTS

PARKING BRAKE SHOES

Fig. 161: Using Brake Shoe Gauge To Measure Rotor Inside Diameter
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before adjusting the park brake shoes be sure that the park brake pedal is in the fully released position. If park brake pedal is not in the fully released position, the park brake shoes can not be accurately adjusted.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove tire and wheel.
3. Remove disc brake caliper from caliper adapter. Refer to **CALIPER, DISC BRAKE, REMOVAL**.
4. Remove rotor from the axle shaft. Refer to **ROTOR, BRAKE, REMOVAL**.

NOTE: When measuring the brake drum diameter, the diameter should be measured in the center of the area in which the park brake shoes contact the surface of the brake drum.

5. Using Brake Shoes Gauge (special tool #C-3919, Gauge, Brake Shoes) (1), or equivalent, **accurately** measure the inside diameter of the park brake drum portion (2) of the rotor.

Fig. 162: Using Ruler To Read Special Tool Measurement Of Inside Diameter Of Brake Drum
Courtesy of CHRYSLER GROUP, LLC

6. Using a ruler (2) that reads in 64th of an inch, accurately read the measurement of the inside diameter of the park brake drum from the special tool (2).

Fig. 163: Identifying Special Tool
Courtesy of CHRYSLER GROUP, LLC

7. Reduce the inside diameter measurement of the brake drum that was taken using Brake Shoes Gauge (special tool #C-3919, Gauge, Brake Shoes) (2) by 1/64 of an inch. Reset Brake Shoes Gauge (special tool #C-3919, Gauge, Brake Shoes) (2) or the equivalent used, so that the outside measurement jaws are set to the reduced measurement.
8. Place Brake Shoes Gauge (special tool #C-3919, Gauge, Brake Shoes), or equivalent over the park brake shoes. Brake Shoes Gauge (special tool #C-3919, Gauge, Brake Shoes) must be located diagonally across at the top of one shoe and bottom of opposite shoe (widest point) of the park brake shoes.
9. Using the star wheel adjuster, adjust the park brake shoes until the lining on the park brake shoes just touches the jaws on Brake Shoes Gauge (special tool #C-3919, Gauge, Brake Shoes).
10. Repeat step 8 above and measure shoes in both directions.

11. Install brake rotor on the axle shaft. Refer to **ROTOR, BRAKE, INSTALLATION**.
12. Rotate rotor to verify that the park brake shoes are not dragging on the brake drum. If park brake shoes are dragging, remove rotor and back off star wheel adjuster one notch and recheck for brake shoe drag against drum. Continue with the previous step until brake shoes are not dragging on brake drum.
13. Install disc brake caliper on caliper adapter. Refer to **CALIPER, DISC BRAKE, INSTALLATION**.
14. Install wheel and tire. Refer to **WHEELS, STANDARD PROCEDURE** .
15. Remove the support and lower the vehicle.
16. Apply and release the park brake pedal one time. This will seat and correctly adjust the park brake cables.

CAUTION: Before moving vehicle, pump brake pedal several times to ensure the vehicle has a firm enough pedal to stop the vehicle.

17. Road test the vehicle to ensure proper function of the vehicle's brake system.

WITH ADJUSTING TOOL

Fig. 164: Inserting Adjusting Tool Through Access Hole
Courtesy of CHRYSLER GROUP, LLC

Adjustment can be made with a standard brake gauge or with adjusting tool. Adjustment is performed with the complete brake assembly installed on the backing plate.

1. Be sure parking brake lever is fully released.
2. Raise vehicle so rear wheels can be rotated freely.
3. Remove plug from each access hole in brake support plates.
4. Loosen parking brake cable adjustment nut until there is slack in front cable.
5. Insert adjusting tool (4) through support plate access hole (1) and engage tool in teeth of adjusting screw star wheel (2).
6. Rotate adjuster screw star wheel (move tool handle upward) until slight drag can be felt when wheel is rotated.

7. Push and hold adjuster lever away from star wheel with thin screwdriver (3).
8. Back off adjuster screw star wheel until brake drag is eliminated.
9. Repeat adjustment at opposite wheel. Be sure adjustment is equal at both wheels.
10. Install support plate access hole plugs.
11. Adjust parking brake cable and lower vehicle.
12. Depress park brake pedal and make sure park brakes hold the vehicle stationary.
13. Release park brake pedal.

2. Remove the tire and wheel assembly.
3. Remove the disc brake caliper. Refer to **CALIPER, DISC BRAKE, REMOVAL**.
4. Remove the disc brake rotor. Refer to **ROTOR, BRAKE, REMOVAL**.
5. Lockout the parking brake cable (2).

8. Disassemble the rear park brake shoes (4).

CLEANING

CLEANING

Clean the individual brake components, including the support plate exterior, with a water dampened cloth or

with brake cleaner. Do not use any other cleaning agents. Remove light rust and scale from the brake shoe contact pads on the support plate with fine sandpaper.

INSPECTION

INSPECTION

Fig. 168: Locating Support Plate & Rear Brake Components
Courtesy of CHRYSLER GROUP, LLC

As a general rule, riveted brake shoes (2) should be replaced when worn to within 0.78 mm (1/32 in.) of the rivet heads. Bonded lining should be replaced when worn to a thickness of 1.6 mm (1/16 in.).

Examine the lining contact pattern to determine if the shoes are bent or the drum is tapered. The lining should exhibit contact across its entire width. Shoes (2) exhibiting contact only on one side should be replaced and the drum checked for runout or taper.

Inspect the adjuster screw assembly (5). Replace the assembly if the star wheel or threads are damaged, or the components are severely rusted or corroded.

Discard the brake springs (3) and retainer components (4) if worn, distorted or collapsed. Also replace the springs if a brake drag condition had occurred. Overheating will distort and weaken the springs.

Inspect the brake shoe contact pads on the support plate (1), replace the support plate if any of the pads are worn or rusted through. Also replace the plate (1) if it is bent or distorted.

INSTALLATION

INSTALLATION

NOTE: **On a new vehicle or after parking brake lining replacement, it is recommended that the parking brake system be conditioned prior to use. This is done by making one stop from 25 mph on dry pavement or concrete using light to moderate force on the parking brake foot pedal.**

4. Unlock the park brake cable.
5. Install the disc brake rotor. Refer to **ROTOR, BRAKE, INSTALLATION**.
6. Install the disc brake caliper. Refer to **CALIPER, DISC BRAKE, INSTALLATION**.
7. Adjust the rear brake shoes. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS**.
8. Install the tire and wheel assembly. Refer to **WHEELS, STANDARD PROCEDURE** .

NOTE: **Tensioner adjustment is only necessary when the tensioner, or a cable has been replaced or disconnected for service. When adjustment is necessary, perform adjustment only as described in the following procedure. This is necessary to avoid faulty park brake operation.**

1. Raise the vehicle.
2. Back off the cable tensioner adjusting nut (5) to create slack in the cables.
3. Remove the rear wheel/tire assemblies. Then remove the brake rotors. Refer to **ROTOR, BRAKE, REMOVAL**.
4. Verify the brakes are in good condition and operating properly.
5. Verify the park brake cables operate freely and are not binding, or seized.
6. Check the rear brake shoe adjustment with standard brake gauge. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS**.
7. Install the rotors and verify that the rotors rotate freely without drag. Refer to **ROTOR, BRAKE, INSTALLATION**.
8. Install the wheel/tire assemblies. Refer to **WHEELS, STANDARD PROCEDURE** .
9. Lower the vehicle enough for access to the park brake foot pedal. Then fully apply the park brakes.

NOTE: **Leave park brakes applied until adjustment is complete.**

12. Tighten the adjusting nut (5) on the tensioner rod until the mark is no longer visible.

CAUTION: Do not loosen, or tighten the tensioner adjusting nut for any reason after completing adjustment.

13. Lower the vehicle until the rear wheels are 15-20 cm (6-8 in.) off the shop floor.
14. Release the park brake foot pedal and verify that rear wheels rotate freely without drag. Then lower the vehicle.

ELECTRONIC TRAILER BRAKE CONTROL OUTPUT-SHORT TO GROUND

Fig. 1: Integrated Trailer Brake Module (ITBM) Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Integrated Trailer Brake Module (ITBM) communicates with the vehicle through the high speed CAN C

bus. The ITBM monitors the Brake Pedal Status, Vehicle Speed and ESP status via CAN message. It also outputs the Trailer Status, Gain Setting, and Trailer Brake Output Power to the vehicle. The ITBM connects to the electric trailer brakes through the 7-Way connector and controls the brake force through a Pulse Width Modulating (PWM) duty cycle.

NOTE: If there is no trailer connected there will be NO Pulse Width Modulating (PWM) signal.

The PWM is proportional to the rate of deceleration measured by the accelerometer inside the ITBM. The ITBM controls the PWM output to the trailer brakes in four ways. The first occurs while the brake pedal becomes active and vehicle speed is greater than 0 km/h (0 mph). The second is the manual lever on the ITBM that can be controlled by the driver. If both the manual lever and the brake pedal are active simultaneously, the greater of the two, in terms of PWM output, will prevail. The third is after the vehicle has stopped moving, after approximately three seconds of the brake pedal applied the trailer brakes will be applied too. This is to minimize hitch to trailer noise and vehicle roll back when taking off from a stop and on an incline. The fourth is that it will become active during an ESP trailer sway event.

WHEN MONITORED:

Continuous.

SET CONDITION:

If the Integrated Trailer Brake Module (ITBM) is configured incorrect or the (B40) Trailer Tow Brake (B+) circuit is shorted to ground, this code will set. Automatic braking and manual lever braking (squeeze switch) are disabled.

C10C7-00 ELECTRONIC TRAILER BRAKE CONTROL OUTPUT

Fig. 3: Integrated Trailer Brake Module (ITBM) Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Integrated Trailer Brake Module (ITBM) communicates with the vehicle through the high speed CAN C

bus. The ITBM monitors the Brake Pedal Status, Vehicle Speed and ESP status via CAN message. It also outputs the Trailer Status, Gain Setting, and Trailer Brake Output Power to the vehicle. The ITBM connects to the electric trailer brakes through the 7-Way connector and controls the brake force through a Pulse Width Modulating (PWM) duty cycle.

NOTE: If there is no trailer connected there will be NO Pulse Width Modulating (PWM) signal.

The PWM is proportional to the rate of deceleration measured by the accelerometer inside the ITBM. The ITBM controls the PWM output to the trailer brakes in four ways. The first occurs while the brake pedal becomes active and vehicle speed is greater than 0 km/h (0 mph). The second is the manual lever on the ITBM that can be controlled by the driver. If both the manual lever and the brake pedal are active simultaneously, the greater of the two, in terms of PWM output, will prevail. The third is after the vehicle has stopped moving, after approximately three seconds of the brake pedal applied the trailer brakes will be applied too. This is to minimize hitch to trailer noise and vehicle roll back when taking off from a stop and on an incline. The fourth is that it will become active during an ESP trailer sway event.

WHEN MONITORED:

Continuous.

SET CONDITION:

If the Integrated Trailer Brake Module (ITBM) is configured incorrect or the ignition voltage is below 9v or greater than 16v, this code will set. Automatic braking and manual lever braking (squeeze switch) are disabled.

C10CA-2A ITBM ADJUSTMENT SWITCH STUCK

Fig. 13: Integrated Trailer Brake Module (ITBM) Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Integrated Trailer Brake Module (ITBM) communicates with the vehicle through the high speed CAN C

bus. The ITBM monitors the Brake Pedal Status, Vehicle Speed and ESP status via CAN message. It also outputs the Trailer Status, Gain Setting, and Trailer Brake Output Power to the vehicle. The ITBM connects to the electric trailer brakes through the 7-Way connector and controls the brake force through a Pulse Width Modulating (PWM) duty cycle.

NOTE: If there is no trailer connected there will be NO Pulse Width Modulating (PWM) signal.

The PWM is proportional to the rate of deceleration measured by the accelerometer inside the ITBM. The ITBM controls the PWM output to the trailer brakes in four ways. The first occurs while the brake pedal becomes active and vehicle speed is greater than 0 km/h (0 mph). The second is the manual lever on the ITBM that can be controlled by the driver. If both the manual lever and the brake pedal are active simultaneously, the greater of the two, in terms of PWM output, will prevail. The third is after the vehicle has stopped moving, after approximately three seconds of the brake pedal applied the trailer brakes will be applied too. This is to minimize hitch to trailer noise and vehicle roll back when taking off from a stop and on an incline. The fourth is that it will become active during an ESP trailer sway event.

WHEN MONITORED:

Continuous.

SET CONDITION:

If the Integrated Trailer Brake Module (ITBM) is configured incorrect or the manual lever (squeeze switch) is stuck, this code will set. Automatic braking and manual lever braking are disabled.

No CAN bus circuit error conditions present.

No lost communication with Totally Integrated Power Module (TIPM) conditions present.

No system undervoltage or overvoltage condition present.

SET CONDITION:

The Integrated Trailer Brake Module (ITBM) is receiving implausible data from the TIPM.

POSSIBLE CAUSES

Possible Causes
CAN BUS OPEN OR SHORTED CONDITION TOTALLY INTEGRATED POWER MODULE (TIPM) DTCS PRESENT INTEGRATED TRAILER BRAKE MODULE (ITBM)

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: Diagnose all CAN C and CAN Interior bus communication DTCs before continuing.

NOTE: This DTC must be active for the results of this test to be valid.

1. Ignition on, engine not running.
2. With the scan tool, record and erase DTCs.
3. Cycle the ignition switch from off to on.
4. With the scan tool, read DTCs.

Is the status Active for this DTC?

Yes

- Go To 2.

No

- Go To 3.

2. **CHECK FOR TOTALLY INTEGRATED POWER MODULE (TIPM) DTCS**
   1. With the scan tool, read DTCs in the TIPM.

      Are there any TIPM DTCs present?

      Yes

      - Refer to **TIPM - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Replace the Integrated Trailer Brake Module (ITBM) in accordance with the Service Information.
      - Perform the ITBM VERIFICATION TEST. Refer to **STANDARD PROCEDURE - ITBM VERIFICATION TEST**.
3. **INTERMITTENT WIRING HARNESS AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   4. Look for the data to change or for the DTC to reset during the wiggle test.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ITBM VERIFICATION TEST. Refer to **STANDARD PROCEDURE - ITBM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

U1601-00-ECU APPLICATION SOFTWARE CODE 1 MISSING OR CORRUPTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Integrated Trailer Brake Module (ITBM) requires communication over the CAN C bus to function properly.

WHEN MONITORED:

Continuously, with the ignition on.

SET CONDITION:

When the Integrated Trailer Brake Module (ITBM) detects that its software has been corrupted or is missing.

POSSIBLE CAUSES

Possible Causes
INTEGRATED TRAILER BRAKE MODULE (ITBM)

DIAGNOSTIC TEST

1. **CHECK FOR DTC U1601-00-ECU APPLICATION SOFTWARE CODE 1 MISSING OR CORRUPTED**

   NOTE: This DTC must be active for the results of this test to be valid. Check for a loose scan tool connection. Verify battery charger is installed and charge rate provides approximately 13.5 volts.

   1. Ignition on, engine off.
   2. With the scan tool, read the DTCs.
   3. With the scan tool, follow the reprogramming procedure and reflash the Integrated Trailer Brake Module (ITBM) while maintaining voltage as noted above.
   4. With the scan tool, read the DTCs.

   Does the scan tool display: U1601-ECU APPLICATION SOFTWARE CODE 1 MISSING OR CORRUPTED?

   Yes

   - Replace the Integrated Trailer Brake Module (ITBM) in accordance with the Service Information.
   - Perform the ITBM VERIFICATION TEST. Refer to **STANDARD PROCEDURE - ITBM VERIFICATION TEST**.

   No

   - The condition or conditions that originally set this DTC are not present at this time. Using the

wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the ITBM VERIFICATION TEST. Refer to **STANDARD PROCEDURE - ITBM VERIFICATION TEST**.

STANDARD PROCEDURE

STANDARD PROCEDURE - ITBM VERIFICATION TEST

DIAGNOSTIC TEST

1. **PERFORM ITBM VERIFICATION TEST**

NOTE: If the Powertrain Control Module (PCM) or Totally Integrated Power Module (TIPM) was replaced, refer to the Service Information for proper programming procedures.

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. Make sure all accessories are turned off.
3. Make sure the battery is fully charged.
4. With the scan tool, record and erase all DTC(s) from the ITBM.
5. Start the engine and allow it to idle for two minutes while operating all functions of the system that caused the original concern.
6. Turn the ignition off, wait five seconds, then turn the ignition on. Using the scan tool, read DTC(s) from the ITBM.

   Are any ITBM DTC(s) present or is the original condition still present?

   Yes

   - The repair is not complete. Perform the appropriate diagnostic procedure for the DTC or symptom that is still present.

   No

   - The repair is complete.

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Disconnecting Stabilizer Bar Switch in the FR/RR position.

SET CONDITION:

The FDCM detects the Front Locker Source circuit is shorted low.

POSSIBLE CAUSES

Possible Causes
FRONT LOCKER SOLENOID
(T520) FRONT LOCKER SOURCE CIRCUIT FOR A SHORT TO GROUND
(T520) FRONT LOCKER SOURCE CIRCUIT FOR A SHORT TO FRONT LOCKER RETURN CIRCUIT
FDCM

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   CAUTION: Before removing the FDCM harness connector, clean the connector and locking cam area of dirt and debris. Failure to do so can result in the connector being jammed or damage to the locking cams on the harness connector or module. Do not force the assist arm when releasing or installing the harness connector.

   1. Ignition on, engine not running.
   2. With the scan tool, read DTC's.

      Is the DTC active at this time?

      Yes

      - Go To 2.

      No

      - Go To 6.
2. **FRONT LOCKER SOLENOID OPERATION**

   NOTE: Before continuing with the below diagnostic test, ensure the FDCM harness connector seal is installed correctly. Inspect the terminals on both harness connector and the module for damage. Failure to do so can result in misdiagnoses of the system.

   1. Turn the ignition off.

2. Disconnect the Front Locker Solenoid harness connector.
3. Ignition on, engine not running.
4. Using a 12-volt test light, jump across from the (T520) Front Locker Source circuit and the (T524) Front Locker Return circuit in the Front Locker harness connector.
5. With the scan tool, actuate the Front Locker Solenoid.

   Does the test light illuminate and flash on and off?

   Yes

   - Inspect the Front Locker Solenoid terminals and connectors for corrosion and/or dirt that may compromise the connection. If OK, replace the Front Locker Solenoid.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **(T520) FRONT LOCKER SOURCE CIRCUIT FOR A SHORT TO GROUND**

Fig. 2: Checking Front Locker Source Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the FDCM harness connector.
3. Measure the resistance of the (T520) Front Locker Source circuit at the FDCM harness connector to ground.

   Is the resistance below 100 ohms?

   Yes

- Repair the short to ground in the (T520) Front Locker Source circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Go To 4.

4. **(T520) CHECK FRONT LOCKER SOURCE CIRCUIT FOR A SHORT TO (T524) FRONT LOCKER RETURN CIRCUIT**

Fig. 3: Checking Front Locker Source Circuit For A Short To Front Locker Return Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (T520) Front Locker Source circuit and the (T524) Front Locker Return circuit in the FDCM harness connector.

   Is the resistance below 100 ohms?

   Yes

   - Repair the short between (T520) Front Locker Source circuit and the (T524) Front Locker Return circuit.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Go To 5.

5. **FDCM**

   NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

   1. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

      No

      - Replace and program the Final Drive Control Module in accordance with Service Information.
      - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

6. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
   4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

      Were there any problems found?

Yes

- Repair as necessary.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Test Complete.

1. Measure the resistance of the (T524) Front Locker Return circuit from the Front Locker Solenoid harness connector and the FDCM harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To 5.

No

- Repair the open in the (T524) Front Locker Return circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **FDCM**

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

1. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   CAUTION: Before removing the FDCM harness connector, clean the connector and locking cam area of dirt and debris. Failure to do so can result in the connector being jammed or damage to the locking cams on the harness connector or module. Do not force the assist arm when releasing or installing the harness connector.

   1. Ignition on, engine not running.
   2. With the scan tool, read DTC's.

      Is the DTC active at this time?

      Yes

      - Go To 2.

      No

      - Go To 5.
2. **REAR LOCKER SOLENOID OPERATION**

   NOTE: Before continuing with the below diagnostic test, ensure the FDCM harness connector seal is installed correctly. Inspect the terminals on both harness connector and the module for damage. Failure to do so can result in misdiagnoses of the system.

   1. Turn the ignition off.
   2. Disconnect the Rear Locker Solenoid harness connector.
   3. Ignition on, engine not running.

4. Using a 12-volt test light, jump across from the (T526) Rear Locker Source circuit and the (T528) Rear Locker Return circuit in the Rear Locker harness connector.
5. With a scan tool, actuate the Rear Locker Solenoid.

   Does the test light flash on and off?

   Yes

   - Inspect the Rear Locker Solenoid terminals and connectors for corrosion and/or dirt that may compromise the connection. If OK, replace the Rear Locker Solenoid.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **(T526) REAR LOCKER SOURCE CIRCUIT FOR AN OPEN**

Fig. 16: Checking Rear Locker Source Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the FDCM harness connector.
3. Turn the ignition on.
4. Measure the resistance of the (T526) Rear Locker Source circuit from the FDCM harness connector and the Rear Locker Solenoid harness connector.

   Is the resistance below 5.0 ohms?

Yes

- Go To 4.

No

- Repair the open in the (T526) Rear Locker Source circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

4. **FDCM**

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

1. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Replace and program the Final Drive Control Module in accordance with Service Information.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
   4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

- Test Complete.

DIAGNOSTIC TEST

1. **DTC ACTIVE**

   CAUTION: Before removing the FDCM harness connector, clean the connector and locking cam area of dirt and debris. Failure to do so can result in the connector being jammed or damage to the locking cams on the harness connector or module. Do not force the assist arm when releasing or installing the harness connector.

   1. Turn the ignition on, engine not running
   2. With the scan tool, read FDCM DTC(s).

      Is the DTC active at this time?

      Yes

      - Go To 2.

      No

      - Go To 5.
2. **DISCONNECTING STABILIZER BAR SWITCH OPERATION**

   NOTE: Before continuing with the below diagnostic test, ensure the FDCM

harness connector seal is installed correctly. Inspect the terminals on both harness connector and the module for damage. Failure to do so can result in misdiagnoses of the system.

1. Turn the ignition off.
2. Disconnect the Disconnecting Stabilizer Bar Switch harness connector.
3. Remove the Disconnecting Stabilizer Bar Switch.
4. Measure the resistance on the Disconnecting Stabilizer Bar Switch between the Locker Switch Supply terminal and the Locker Switch Sense terminal.
5. The resistance must read as follows for each position of the switch.
   - **UNLOCK: 5454 ohms +/- 5%**
   - **RR: 1940 ohms +/- 5%**
   - **FR/RR: 1075 ohms +/- 5%**

   Does the ohmmeter read correctly for each position of the Disconnecting Stabilizer Bar Switch

   Yes

   - Go To 3.

   No

   - Replace the Disconnecting Stabilizer Bar Switch.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

3. **(T535) LOCKER SWITCH SENSE CIRCUIT FOR AN OPEN**

Fig. 18: Checking Locker Switch Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the FDCM harness connector.
2. Measure the resistance of the (T535) Locker Switch Sense circuit between the Disconnecting Stabilizer Bar Switch and the FDCM harness connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Go To 4.

No

- Repair the open or high resistance in the (T535) Locker Switch Sense circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

4. **(T537) LOCKER SWITCH SUPPLY CIRCUIT FOR AN OPEN**

Fig. 19: Checking Locker Switch Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T537) Locker Switch Supply circuit between the Disconnecting Stabilizer Bar Switch and the FDCM harness connector.

Is the resistance below 5.0 ohms?

Yes

- Replace the FDCM in accordance with the Service Information
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Repair the open or high resistance in the (T537) Locker Switch Supply circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
    4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.
    5. While monitoring the TRAC State on the scan tool, move the switch to each position. The scan tool display must match the position on the actual switch.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

    No

    - Test Complete.

1. Measure the resistance between (T536) Switch Supply circuit and the (T531) Stabilizer Bar Switch Sense circuit in the Disconnecting Stabilizer Bar Switch harness connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the short between (T536) Switch Supply circuit and the (T531) Stabilizer Bar Switch Sense circuit.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Go To 5.

1. Measure the resistance of the (T531) Stabilizer Bar Switch Sense circuit between the Disconnecting Stabilizer Bar Switch and the FDCM harness connectors.

   Is the resistance below 5.0 ohms?

   Yes

- Replace the FDCM in accordance with the Service Information.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Repair the open in the (T531) Stabilizer Bar Switch Sense circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

6. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
    4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.
    5. While monitoring the Stabilizer Bar State on the scan tool, move the switch to each position. The scan tool display must match the position on the actual switch.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

    No

    - Test Complete.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

CAUTION: Before removing the FDCM harness connector, clean the connector and locking cam area of dirt and debris. Failure to do so can result in the connector being jammed or damage to the locking cams on the harness connector or module. Do not force the assist arm when releasing or installing the harness connector.

1. Ignition on, engine not running.
2. With the scan tool, read DTC's.

   Is the DTC active at this time?

   Yes

   - Go To 2.

   No

   - Go To 5.

2. **FRONT LOCKER SOLENOID OPERATION**

NOTE: Before continuing with the below diagnostic test, ensure the FDCM harness connector seal is installed correctly. Inspect the terminals on both harness connector and the module for damage. Failure to do so can result in misdiagnoses of the system.

1. Turn the ignition off.
2. Disconnect the Front Locker Solenoid harness connector.
3. Ignition on, engine not running.

4. Using a 12-volt test light, jump across from the (T520) Front Locker Source circuit and the (T524) Front Locker Return circuit in the Front Locker harness connector.
5. With a scan tool, actuate the Front Locker Solenoid.

   Does the test light flash on and off?

   Yes

   - Inspect the Front Locker Solenoid terminals and connectors for corrosion and/or dirt that may compromise the connection. If OK, replace the Front Locker Solenoid.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **(T524) FRONT LOCKER RETURN CIRCUIT FOR A SHORT TO GROUND**

Fig. 38: Checking Front Locker Return Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the FDCM harness connector.
3. Measure the resistance of the (T524) Front Locker Return circuit in the FDCM harness connector to ground.

   Is the resistance below 100 ohms?

Yes

- Repair the short to ground in (T524) Front Locker Return circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Go To 4.

4. **FDCM**

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

1. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Replace and program the Final Drive Control Module in accordance with Service Information.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **INTERMITTENT WIRING AND CONNECTORS**

1. The conditions necessary to set this DTC are not present at this time.
2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

- Test Complete.

      - Go To 2.

      No

      - Go To 6.
2. **FRONT DIFFERENTIAL POSITION SENSOR WIRING**

   NOTE: Before continuing with the below diagnostic test, ensure the FDCM harness connector seal is installed correctly. Inspect the terminals on both harness connector and the module for damage. Failure to do so can result in misdiagnoses of the system.

   1. Using the scan tool, actuate the Front Locker Solenoid.

2. Monitor the Front Differential Position Sensor State.
3. Wiggle the related wiring harness from the FDCM to the Front Locker Solenoid connector at the axle.
4. With a scan tool, actuate the Front Locker Solenoid.

   Does the state on the scan tool change while wiggling the wiring harness?

   Yes

   - Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Check the Locker Solenoid terminals and connectors for corrosion and/or dirt that may compromise the connection. Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

3. Disconnect the FDCM harness connector.

4. Turn the ignition on.
5. Measure the voltage on the (T522) Front Locker Sensor Sense circuit in the FDCM harness connector.

   Does the voltmeter indicate voltage present?

   Yes

   - Repair the short to voltage in the (T522) Front Locker Sensor Sense circuit.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **FRONT DIFFERENTIAL POSITION SENSOR OPERATION**
   1. Turn the ignition off.
   2. Connect the FDCM harness connector.
   3. Ignition on, engine not running.
   4. Using a jumper wire, jumper across from the (T522) Front Locker Sensor Sense circuit and the (T521) Locker Sensor Supply circuit in the Front Locker Solenoid harness connector.
   5. While monitoring the sensor state on the scan tool, tap the jumper wire on and off the (T522) Front Locker Sensor Sense circuit terminal. Hold the jumper wire on and off the terminal for a minimum of 3 seconds.

      Does the state change on the scan tool while tapping the terminal?

      Yes

      - Replace the Front Locker Solenoid.
      - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **(T522) FRONT LOCKER SENSOR SENSE CIRCUIT FOR AN OPEN**

1. Turn the ignition off.
2. Disconnect the FDCM harness connector.
3. Measure the resistance of the (T522) Front Locker Sensor Sense circuit between the Front Locker Solenoid harness connector and the FDCM harness connector.

   Is the resistance below 5.0 ohms?

Yes

- Go To 5.

No

- Repair the open in the (T522) Front Locker Sensor Sense circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **(T522) FRONT LOCKER SENSOR SENSE CIRCUIT FOR A SHORT TO (T521) LOCKER SENSOR 1 SUPPLY**

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (T522) Front Locker Sensor Sense circuit and the (T521) Locker Sensor 1 Supply circuit in the FDCM harness connector.

   Is the resistance below 5.0 ohms?

   Yes

- Repair the short between the (T522) Front Locker Sensor Sense circuit and the (T521) Locker Sensor 1 Supply circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Go To 6.

6. **FDCM**

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

1. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Replace and program the Final Drive Control Module in accordance with Service Information.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

7. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
   4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Test Complete.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

CAUTION: Before removing the FDCM harness connector, clean the connector and locking cam area of dirt and debris. Failure to do so can result in the connector being jammed or damage to the locking cams on the harness connector or module. Do not force the assist arm when releasing or installing the harness connector.

1. Ignition on, engine not running.
2. With the scan tool, read DTC's.

Is the DTC active at this time?

Yes

- Go To 2.

No

- Go To 6.

2. **REAR DIFFERENTIAL POSITION SENSOR WIRING**

NOTE: Before continuing with the below diagnostic test, ensure the FDCM harness connector seal is installed correctly. Inspect the terminals on both harness connector and the module for damage. Failure to do so can result in misdiagnoses of the system.

1. Using the scan tool, actuate the Rear Locker Solenoid.
2. Monitor the Rear Differential Position Sensor State.
3. Wiggle the related wiring harness from the FDCM to the Rear Locker Solenoid connector at the axle.
4. With a scan tool, actuate the Rear Locker Solenoid.

   Does the state on the scan tool change while wiggling the wiring harness?

   Yes

   - Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Check the Locker Solenoid terminals and connectors for corrosion and/or dirt that may compromise the connection. Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **REAR DIFFERENTIAL POSITION SENSOR OPERATION**
   1. Turn the ignition off.
   2. Disconnect the Rear Locker Solenoid harness connector.
   3. Ignition on, engine not running.
   4. Using a jumper wire, jumper across from the (T527) Rear Locker Sensor Sense circuit and the (T521) Locker Sensor Supply circuit in the Rear Locker Solenoid harness connector.
   5. While monitoring the sensor state on the scan tool, tap the jumper wire on and off the (T527) Rear Locker Sensor Sense circuit terminal. Hold the jumper wire on and off the terminal for a minimum of 3 seconds.

      Does the state change on the scan tool while tapping the terminal?

      Yes

      - Replace the Rear Locker Solenoid.
      - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **(T527) REAR LOCKER SENSOR SENSE CIRCUIT FOR AN OPEN**

Fig. 56: Checking Rear Locker Sensor Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the FDCM harness connector.
3. Measure the resistance of the (T527) Rear Locker Sensor Sense circuit between the Rear Locker Solenoid harness connector and the FDCM harness connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Go To 5.

   No

   - Repair the open in the (T527) Rear Locker Sensor Sense circuit.

- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **FDCM**

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

1. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Replace and program the Final Drive Control Module in accordance with Service Information.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

6. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
   4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

2. Disconnect the FDCM harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (T521) Locker Sensor 1 Supply circuit at the FDCM harness connector.

   Does the voltmeter indicate voltage present?

   Yes

- Repair the short to voltage in the (T521) Locker Sensor 1 Supply circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Go To 4.

4. **FDCM**

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

1. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Replace and program the Final Drive Control Module in accordance with Service Information.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **INTERMITTENT WIRING AND CONNECTORS**

1. The conditions necessary to set this DTC are not present at this time.
2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Test Complete.

DIAGNOSTIC TEST

1. **DTC ACTIVE**

CAUTION: Before removing the FDCM harness connector, clean the connector and locking cam area of dirt and debris. Failure to do so can result in the connector being jammed or damage to the locking cams on the harness connector or module. Do not force the assist arm when releasing or installing the harness connector.

NOTE: If set along with this DTC, diagnostic any Locker/Differential Indicator Control Circuit DTC(s) first before continuing.

1. Turn the ignition on, engine not running
2. With the scan tool, read FDCM DTC(s).

   Is the DTC active at this time?

   Yes

   - Go To 2.

No

- Go To 11.

2. **(T530) STABILIZER BAR DISENGAGE ILLUMINATION SENSE OPERATION**

Fig. 74: Checking Stabilizer Bar Disengage Illumination Sense Operation
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before continuing with the below diagnostic test, ensure the FDCM harness connector seal is installed correctly. Inspect the terminals on both harness connector and the module for damage. Failure to do so can result in misdiagnoses of the system.**

1. Turn the ignition off.
2. Disconnect the Disconnecting Stabilizer Bar Switch harness connector.
3. Using a 12-volt test light connected to battery voltage, probe the (T530) Stabilizer Bar Disengage Illumination Sense circuit.
4. Turn the ignition on.
5. With the scan tool, actuate the Stabilizer Bar Disengage Illumination Sense circuit.

   Does the test light illuminate and flash on and off?

   Yes

   - Go to 3.

   No

   - Go To 4.

3. **(T529) STABILIZER BAR ENGAGE ILLUMINATION SENSE OPERATION**

Fig. 75: Checking Stabilizer Bar Engage Illumination Sense Operation
Courtesy of CHRYSLER GROUP, LLC

1. Probe the Stabilizer Bar Disengage Illumination Sense circuit with the test light.
2. With the scan tool, actuate the (T529) Stabilizer Bar Engage Illumination Sense circuit.

   Does the test light illuminate and flash on and off?

   Yes

   - Replace the Disconnecting Stabilizer Bar Switch.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Go to 7.

4. **(T530) STABILIZER BAR DISENGAGE ILLUMINATION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 76: Checking Stabilizer Bar Disengage Illumination Sense Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the FDCM harness connector.
3. Turn the ignition on.

4. Measure the voltage on the (T530) Stabilizer Bar Disengage Illumination Sense circuit in the FDCM harness connector.

   Does the voltmeter indicate voltage present?

   Yes

   - Repair the short to voltage in the (T530) Stabilizer Bar Disengage Illumination Sense circuit.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Go To 5.

5. **(T530) STABILIZER BAR DISENGAGE ILLUMINATION SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 77: Checking Stabilizer Bar Disengage Illumination Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance of the (T530) Stabilizer Bar Disengage Illumination Sense circuit between ground and the FDCM harness connector.

   Is the resistance below 100 ohms?

   Yes

   - Repair the short to ground in the (T530) Stabilizer Bar Disengage Illumination Sense circuit.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

- Go To 6.

6. **(T530) STABILIZER BAR DISENGAGE ILLUMINATION SENSE CIRCUIT FOR AN OPEN**

Fig. 78: Checking Stabilizer Bar Disengage Illumination Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T530) Stabilizer Bar Disengage Illumination Sense circuit between the Disconnecting Stabilizer Bar Switch harness connector and the FDCM harness connector.

   Is the resistance below 5.0 ohms?

Yes

- Go To 10.

No

- Repair the open in the (T530) Stabilizer Bar Disengage Illumination Sense circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

7. **(T529) STABILIZER BAR ENGAGE ILLUMINATION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the FDCM harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (T529) Stabilizer Bar Engage Illumination Sense circuit in the FDCM harness connector.

   Does the voltmeter indicate voltage present?

   Yes

   - Repair the short to voltage in the (T529) Stabilizer Bar Engage Illumination Sense circuit.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Go To 8.

8. **(T529) STABILIZER BAR ENGAGE ILLUMINATION SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 80: Checking Stabilizer Bar Engage Illumination Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance of the (T529) Stabilizer Bar Engage Illumination Sense circuit between ground and the FDCM harness connector.

   Is the resistance below 100 ohms?

   Yes

   - Repair the short to ground in the (T529) Stabilizer Bar Engage Illumination Sense circuit.

- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Go To 9.

9. **(T529) STABILIZER BAR ENGAGE ILLUMINATION SENSE CIRCUIT FOR AN OPEN**

Fig. 81: Checking Stabilizer Bar Engage Illumination Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (T529) Stabilizer Bar Engage Illumination Sense circuit between the Disconnecting Stabilizer Bar Switch harness connector and the FDCM harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To 10.

No

- Repair the open in the (T529) Stabilizer Bar Engage Illumination Sense circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

10. **FDCM**

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

1. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Replace and program the Final Drive Control Module in accordance with Service Information.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

11. **INTERMITTENT WIRING AND CONNECTORS**

1. The conditions necessary to set this DTC are not present at this time.
2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

NOTE: **If set along with this DTC, diagnose any Stabilizer Select Switch DTC(s) first before continuing.**

1. Turn the ignition off.

2. Disconnect the Disconnecting Stabilizer Switch harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (T536) Switch Supply circuit in the Disconnecting Stabilizer Switch harness connector.

   Is the voltage 12 volts?

   Yes

   - Go To 3.

   No

   - Check the (T536) Switch Supply circuit for an open or short to ground condition. If OK, replace the FDCM in accordance with the Service Information.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

3. **DISCONNECTING STABILIZER SWITCH**

   - (T532) Locker Open Illumination Sense circuit
   - (T533) Locker Rear Illumination Sense circuit
   - (T534) Locker FR/RR Illumination Sense circuit

   Does the ohmmeter indicate each measurement below 5.0 ohms?

   Yes

- Replace the FDCM in accordance with the Service Information.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Repair the open or high resistance in the Illumination Sense circuit that indicated the incorrect resistance reading.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

1. Disconnect the Disconnecting Stabilizer Switch harness connector.
2. Measure the resistance between the FDCM harness connector and ground for each of the following circuits:
   - (T532) Locker Open Illumination Sense circuit.
   - (T533) Locker Rear Illumination Sense circuit.
   - (T533) Locker Rear Illumination Sense circuit.

   Does the ohmmeter read below 100 ohms for any of the above circuit checks?

Yes

- Repair the short to ground in the Illumination Sense circuit that indicated the resistance reading below 100 ohms.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Replace the Final Drive Control Module (FDCM) in accordance with the Service Information.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

5. Measure the voltage on the (T536) Switch Supply circuit in the Disconnecting Stabilizer Switch harness connector.

   Does the voltmeter indicate voltage present?

Yes

- Replace the Disconnecting Stabilizer Bar Switch.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Go To 4.

4. **(T536) SWITCH SUPPLY CIRCUIT FOR AN OPEN**

Fig. 99: Checking Switch Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance of the (T536) Switch Supply circuit between the Disconnecting Stabilizer Switch harness connector and the FDCM harness connector.

   Is the resistance below 5.0 ohms?

Yes

- Replace the FDCM in accordance with the Service Information.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Repair the open in the Switch Supply circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **(T532, T533 or T534) LOCKER ILLUMINATION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 100: Checking Locker Illumination Sense Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Disconnecting Stabilizer Switch harness connector.
2. Measure the voltage at each of the following circuit at the FDCM harness connector.
   - (T532) Locker Open Illumination Sense circuit
   - (T533) Locker Rear Illumination Sense circuit
   - (T534) Locker FR/RR Illumination Sense circuit

   Does the voltmeter indicate voltage present for any of the above circuit?

   Yes

   - Repair the Locker Illumination Sense circuit that indicated a short to voltage.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Go To 6.

6. **(T532, T533 or T534) LOCKER ILLUMINATION SENSE CIRCUIT FOR AN OPEN**

Fig. 101: Checking Locker Illumination Sense Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of each of the following circuits between the FDCM harness connector and the Disconnecting Stabilizer Switch harness connector.
   - (T532) Locker Open Illumination Sense circuit
   - (T533) Locker Rear Illumination Sense circuit
   - (T534) Locker FR/RR Illumination Sense circuit

   Does the ohmmeter indicate each measurement below 5.0 ohms?

   Yes

- Replace the FDCM in accordance with the Service Information.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Repair the Locker Illumination Sense circuit that indicated an open circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

7. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
    4. Using the scan tool monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

    No

    - Test Complete.

DIAGNOSTIC TEST

1. **DTC ACTIVE**

CAUTION: Before removing the FDCM harness connector, clean the connector and locking cam area of dirt and debris. Failure to do so can result in the connector being jammed or damage to the locking cams on the harness connector or module. Do not force the assist arm when releasing or installing the harness connector.

NOTE: If set along with this DTC, diagnose any Stabilizer Select Switch DTC(s) first before continuing.

1. Turn the ignition on, engine not running
2. With the scan tool read FDCM DTC(s).

   Is the DTC active at this time?

   Yes

   - Go To 2.

   No

   - Go To 8.

2. **DISCONNECTING STABILIZER BAR SWITCH**

NOTE: Before continuing with the below diagnostic test, ensure the FDCM harness connector seal is installed correctly. Inspect the terminals on both harness connector and the module for damage. Failure to do so can result in misdiagnoses of the system.

1. Turn the ignition off.

2. Disconnect the Disconnecting Stabilizer Bar Switch harness connector.
3. Turn the ignition on.
4. Using a test light connected to battery voltage, probe the (T529) Stabilizer Bar Engage Illumination Sense circuit in the Disconnecting Stabilizer Bar Switch harness connector.
5. With the scan tool, select System Test and actuate the Stabilizer Bar Engage Illumination LED. Select the blinking option.

NOTE: Repeat the above test for the Stabilizer Bar Disengage Illumination Sense circuit.

Does the test light illuminate and flash on and off at each circuit?

Yes

Go To 3.

No

- Go To 5.

3. **(T536) SWITCH SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 103: Checking Disconnecting Stabilizer Switch Operation
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Disconnecting Stabilizer Bar Switch harness connector
3. Disconnect the FDCM harness connector.
4. Turn the ignition on.
5. Measure the voltage on the (T536) Switch Supply circuit in the Disconnecting Stabilizer Switch harness connector.

   Does the voltmeter indicate voltage present?

Yes

- Replace the Disconnecting Stabilizer Bar Switch.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Go To 4.

4. **(T536) SWITCH SUPPLY CIRCUIT FOR AN OPEN**

Fig. 104: Checking Switch Supply Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance of the (T536) Switch Supply circuit between the Disconnecting Stabilizer Switch harness connector and the FDCM harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Replace the FDCM in accordance with the Service Information.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Repair the open in the (T536) Switch Supply circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **(T529 or T530) STABILIZER BAR ILLUMINATION SENSE CIRCUIT(S) SHORTED TO VOLTAGE**

Fig. 105: Checking Stabilizer Bar Illumination Sense Circuit(s) For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Disconnecting Stabilizer Switch harness connector.
2. Disconnect the FDCM harness connector.
3. Measure the voltage at each of the following circuit at the FDCM harness connector.
   - (T529) Stabilizer Bar Engage Illumination Sense circuit.
   - (T530) Stabilizer Bar Disengage Illumination Sense circuit.

   Does the voltmeter indicate voltage present for any of the above circuit?

   Yes

   - Repair the Stabilizer Bar Illumination Sense circuit(s) that indicated a short to voltage.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Go To 6.

6. **(T529 or T530) STABILIZER BAR ILLUMINATION SENSE CIRCUIT(S) SHORTED TO GROUND**

Fig. 106: Checking Stabilizer Bar Illumination Sense Circuit(s) For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of each of the following circuit at the FDCM harness connector to ground.
   - (T529) Stabilizer Bar Engage Illumination Sense circuit.
   - (T530) Stabilizer Bar Disengage Illumination Sense circuit.

   Does the Ohmmeter read below 100 Ohms for any of the above circuit checks?

   Yes

   - Repair the short to ground in the Illumination Sense circuit that indicated the resistance reading below 100 Ohms.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Go To 7.

7. **(T529 or T530) STABILIZER BAR ILLUMINATION SENSE CIRCUIT(S) OPEN**

Fig. 107: Checking Stabilizer Bar Illumination Sense Circuit(s) For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of each of the following circuits between the FDCM harness connector and

the Disconnecting Stabilizer Switch harness connector.

- (T529) Stabilizer Bar Engage Illumination Sense circuit
- (T530) Stabilizer Bar Disengage Illumination Sense circuit

Does the Ohmmeter indicate each measurement below 5.0 Ohms?

Yes

- Replace the FDCM in accordance with the Service Information.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

No

- Repair the Stabilizer Bar Illumination Sense circuit(s) that indicated an open circuit.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

8. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
   4. Using the scan tool monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Test Complete.

U0100-LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on

Battery voltage between 10 and 16 volts

IOD fuse installed

TIPM is configured correctly

SET CONDITION:

Bus messages not received from the ECM/PCM for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE (TIPM) NOT CONFIGURED CORRECTLY

MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. Ignition on, engine not running.
   2. With the scan tool, read DTC's.

      Is this DTC active?

      Yes

      - Go To 2.

      No

      - Go To 5.
2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC's**
   1. With the scan tool, read all active DTC's from all modules.
   2. Check for:
      - TIPM configuration.
      - CAN B or C hardware electrical.
      - VIN Missing/Mismatch.
      - Battery or ignition related DTC's.

      Does the scan tool display any active DTC's to the conditions listed above?

Yes

- Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic test procedure.

No

- Go To 3.

3. **VERIFY THAT THE ECM/PCM IS ACTIVE ON THE BUS**
   1. Ignition on, engine not running.
   2. With the scan tool, select Network Diagnostics.
   3. Verify that the PCM is active on the bus.

   Is the PCM active on the bus?

   Yes

   - Go To 4.

   No

   - Perform the appropriate diagnostic procedure. Refer to **TIPM - DIAGNOSIS AND TESTING** .

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC's**
   1. With the scan tool, select Network Diagnostics.

   Is there more than one module with active DTC's "Logged Against" the PCM?

   Yes

   - Replace the Powertrain Control Module (PCM) in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **1500 & 2500 - 3.7L, 4.7L & 5.7L - POWERTRAIN VERIFICATION TEST** or **2500 & 3500 - POWERTRAIN VERIFICATION TEST - 6.7L** or **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** .

   No

   - Replace the module that set this DTC in accordance with the service information.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.

2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Test complete.

U0155-NO CLUSTER BUS MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Ignition on, engine not running.

2. With the scan tool, erase DTC's.
3. Cycle the ignition key on and off several times.
4. With the scan tool, read DTC's.

   Does the DTC reset?

   Yes

   - Go To 2.

   No

   - Go To 4.

2. **COMMUNICATE WITH CLUSTER**
   1. With the scan tool, attempt to communicate with the Instrument Cluster.

      Can communication be established with the Instrument Cluster?

      Yes

      - Go To 3.

      No

      - Refer to **TIPM - DIAGNOSIS AND TESTING** and perform the U0155-Lost Communication with Cluster/CCN diagnostic procedure.

3. **INSTRUMENT CLUSTER OPERATION**
   1. Start the engine
   2. Allow the engine to idle.

      Is the correct engine speed display in the instrument cluster (Tach)?

      Yes

      - Replace and program the Powertrain Control Module in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **1500 & 2500 - 3.7L, 4.7L & 5.7L - POWERTRAIN VERIFICATION TEST** or **2500 & 3500 - POWERTRAIN VERIFICATION TEST - 6.7L** or **3500 CAB & CHASSIS - POWERTRAIN VERIFICATION TEST** or **3500 CAB & CHASSIS, 4500 & 5500 - POWERTRAIN VERIFICATION TEST - 6.7L** .

      No

      - Refer to **CCN - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic

procedure.

4. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
    4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

    No

    - Test complete.

U0401-IMPLAUSIBLE DATA RECEIVED FROM PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.

SET CONDITION:

When the Final Drive Control Module detects an incorrect CAN message from the Power Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
TOTALLY INTEGRATED POWER MODULE (TIPM) NOT CONFIGURED CORRECTLY
ACTIVE POWERTRAIN CONTROL MODULE DTC's
FINAL DRIVE CONTROL MODULE (FDCM)

DIAGNOSTIC TEST

1. **CHECK FOR DTC U0401-IMPLAUSIBLE DATA RECEIVED FROM PCM**

    NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, record and erase DTC's.
3. Cycle the ignition switch from off to on.
4. With the scan tool, read DTC's.

   Does the scan tool display: U0401-IMPLAUSIBLE DATA RECEIVED FROM PCM?

   Yes

   - Go To 2.

   No

   - Go To 4.

2. **CHECK IF TIPM CAN BUS DTC's ARE PRESENT**
   1. With the scan tool, read TIPM DTC's.

      Are there any TIPM CAN BUS DTC's present?

      Yes

      - Refer to **TIPM - DIAGNOSIS AND TESTING** and perform the appropriate CAN Bus diagnostic procedure.

      No

      - Go To 3.

3. **PCM DTC's ARE PRESENT**
   1. With the scan tool, read Powertrain Control Module DTC's.

      Are there any PCM DTC's present?

      Yes

      - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic test procedure.

      No

      - Replace the Final Drive Control Module (FDCM) in accordance with the Service Information.
      - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

4. **INTERMITTENT WIRING AND CONNECTORS**

1. The conditions necessary to set this DTC are not present at this time.
2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

   No

   - Test complete.

U0431-IMPLAUSIBLE DATA RECEIVED FROM FCM (TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on for Four seconds, no CAN BUS circuit error condition present, no lost communication with Totally Integrated Power Module (TIPM) condition present, and no system undervoltage or overvoltage condition present.

SET CONDITION:

The Final Drive Control Module (FDCM) is receiving no message or implausible data for Ambient Temperature from the TIPM.

POSSIBLE CAUSES

Possible Causes
TOTALLY INTEGRATED POWER MODULE (TIPM) DTC's PRESENT FINAL DRIVE CONTROL MODULE (FDCM)

DIAGNOSTIC TEST

1. **TOTALLY INTEGRATED POWER MODULE (TIPM) DTC's PRESENT**
   1. Ignition on, engine not running.
   2. With the scan tool, read DTC's.

      Are there any DTC's present?

Yes

- Perform the appropriate diagnostic procedure. Refer to **TIPM - DIAGNOSIS AND TESTING** .

No

- Replace the Final Drive Control Module (FDCM) in accordance with the Service Information.
- Perform FDCM VERIFICATION TEST. Refer to **FDCM VERIFICATION TEST**.

STANDARD PROCEDURE

TRANSFER CASE VERIFICATION TEST

DIAGNOSTIC TEST

1.
    1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
    2. With the scan tool, select clear Stored DTC's.
    3. Make sure that all accessories are turned off and that the battery is fully charged.
    4. Test drive the vehicle in each Transfer Case range and verify proper operation in each range.
        - To select or deselect 2WD, AWD or 4HI mode (if equipped), vehicle speed must be below 88 Kmh (55 mph) with all wheels at vehicle speed.
        - Shifts will not take place with a wheel speed difference of greater than 21 Kmh (13 mph) between the front and rear wheels.
        - To select or deselect 4LO (if equipped), vehicle speed must be below 5 Kmh (3 mph) with the ignition on, engine not running and the transmission in neutral (automatic transmission) or the clutch pedal pressed (manual transmission).
        - To select or deselect Transfer Case Neutral (if equipped), vehicle speed must be 0 Kmh (0 mph) with the ignition on, engine not running, the brake pedal applied, and the transmission in neutral (automatic transmission) or the clutch pedal pressed (manual transmission). Press the Neutral button (if equipped) on the Transfer Case Selector Switch until the Neutral Indicator is illuminated.

        WARNING: **Apply the parking brake. The vehicle may roll with the Transfer Case in neutral.**

        -
        - To verify that the Transfer Case is in Neutral, shift the automatic transmission into reverse and release the brake pedal for three seconds or shift the manual transmission into gear and slowly release the clutch pedal. There should be no vehicle movement if the Transfer Case is in Neutral.
    5. With the scan tool, read DTC's in the Totally Integrated Power Module (TIPM) and in the

Instrument Cluster (CCN).

Are there any DTC's present in the TIPM or in the CCN?

Yes

- Perform the appropriate diagnostic procedure. Refer to **TIPM - DIAGNOSIS AND TESTING** or, Refer to **CCN - DIAGNOSIS AND TESTING** .

No

- Test complete.

FDCM VERIFICATION TEST

DIAGNOSTIC TEST

1. **PERFORM FDCM VERIFICATION TEST**

CAUTION: Before removing the FDCM harness connector, clean the connector and locking cam area of dirt and debris. Failure to do so can result in the connector being jammed or damage to the locking cams on the harness connector or module. Do not force the assist arm when releasing or installing the harness connector.

NOTE: If the SKIM, PCM or FCM was replaced, refer to the service information for proper programming procedures.

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. Ensure that all accessories are turned off.
3. Ensure that the battery is fully charged.
4. With the scan tool, record and erase all DTC(s) from the FDCM
5. Start and run the engine for 2 minutes while operating all functions of the system that caused the original concern.

NOTE: When a Stabilizer System DTC diagnostic is complete and all repairs have been made, running the Stabilizer Motor System Test and/or LED System Test can also provide verification that the DTC has been repaired and the system is operating normally.

6.
7. Turn the ignition off, wait 5 seconds, then turn the ignition on. Using the scan tool, read DTC(s) from the FDCM.

Are any FDCM DTC(s) present or is the original condition still present?

Yes

- The repair is not complete. Refer to the appropriate Electrical Diagnostic Information for the DTC or symptom that is still present.

No

- The repair is complete.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - NOISE

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, tooth contact, worn/damaged gears or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. The side gears are loaded during turns. They usually do not cause noise during straight-ahead driving when the gears are unloaded. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 m.p.h.

LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joint(s).
- Worn side-gear thrust washers.
- Worn pinion shaft bore.

VIBRATION

Vibration at the front/rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out of balance wheels.
- Loose wheel lug nuts.
- Worn U-joint(s).
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion flange run out.
- Bent axle shaft(s).

Check for loose or damaged front end components or engine/transmission mounts. These components can contribute to what appears to be a vibration. Do not overlook engine accessories, brackets and drive belts.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged) can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints.
- Loose spring mounts.
- Loose pinion gear nut and flange.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear and listen for the noise. A mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction

Wheel Noise	1. Wheel loose.	1. Tighten loose nuts.
	2. Worn wheel bearing.	2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube.	1. Inspect axle tube alignment. Correct as necessary.
	2. Bent or sprung axle shaft.	2. Inspect and correct as necessary.
	3. End-play in pinion bearings.	3. Refer to pinion pre-load information and correct as necessary.
	4. Excessive gear backlash between the ring gear and pinion.	4. Check adjustment of the ring gear and pinion backlash. Correct as necessary.
	5. Improper adjustment of pinion gear bearings.	5. Adjust the pinion bearings pre-load.
	6. Loose pinion flange nut.	6. Tighten the pinion flange nut.
	7. Scuffed gear tooth contact surfaces.	7. Inspect and replace as necessary.
Axle Shaft Broke	1. Misaligned axle tube.	1. Replace the broken shaft after correcting tube mis-alignment.
	2 Vehicle overloaded.	2. Replace broken shaft and avoid excessive weight on vehicle.
	3. Erratic clutch operation.	3. Replace broken shaft and avoid or correct erratic clutch operation.
	4. Grabbing clutch.	4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper adjustment of the differential bearings.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
	4. Erratic clutch operation.	4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the correct fluid type and quantity.

	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked differential housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored flange.	5. Replace flange and seal.
	6. Axle cover not properly sealed.	6. Remove, clean and seal cover.
Axle Overheating	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing pre-loads too high.	3. Adjust bearing pre-loads.
	4. Insufficient ring gear backlash.	4. Adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Erratic clutch operation.	2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation.
	3. Ice-spotted pavement.	3. Replace gears and examine remaining parts for damage.
	4. Improper adjustments.	4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant.	1. Fill differential with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Check ring gear and pinion contact pattern.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring gear and pinion.	4. Replace ring gear and pinion.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing pre-load.
	7. Ring gear run-out.	7. Measure ring gear run-out. Replace components as necessary.
	8. Loose differential bearing cap bolts.	8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification.

	9. Housing not machined properly.	9. Replace housing.

ADJUSTMENTS

ADJUSTMENTS

Fig. 1: Identifying Shim Locations
Courtesy of CHRYSLER GROUP, LLC

Ring gear and pinion are supplied as a matched sets. Identifying numbers marked on the ring and pinion gears for production date, part number and matching number. A plus (+) number, minus (-) number or zero (0) will be marked on the pinion gear for depth variance. This first number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion marked with a (0).

Pinion depth is adjusted with a select shim (1) located under the rear pinion bearing cup. Pinion bearing preload/torque to rotate is adjusted with a select shim (2) on the pinion shaft. Differential bearing preload and backlash is adjusted with select shims (3) located between the differential bearing cups and the housing.

PINION GEAR DEPTH

Measurement is taken with Height Block (special tool #6739, Block, Height) (1), Pinion Block (special tool #10091, Block, Gauge) (2), Screw (special tool #6741, Screw) (3), Nut (special tool #10121, Cone) (4), Arbor Discs (special tool #10094, Set, Arbor Disc) (5) and Arbor (special tool #D-115-3, Arbor) (6). With pinion bearing cups and pinion bearings installed in the housing, take measurements with Dial Indicator (special tool #C-3339A, Set, Dial Indicator) and Scooter Block (special tool #D-115-2A, Block, Scooter).

7. Assemble Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1) into Scooter Block (special tool #D-115-2A, Block, Scooter) (2) and secure set screw.
8. Position Scooter Block (1) flush on the pinion height block. Hold scooter block and zero the dial indicator (2).
9. Slowly slide the scooter block (1) across the pinion height block over to the arbor (3). Move scooter block till dial indicator (2) crests the arbor (3), then record the highest reading.

NOTE: If depth variance is -2, add 0.002 in. to the dial indicator reading. If the depth variance is +2, subtract 0.002 in. from the dial indicator reading.

PINION TORQUE TO ROTATE

Fig. 13: Select Shim & Spacer
Courtesy of CHRYSLER GROUP, LLC

Pinion torque to rotate/pinion bearing preload is achieved using a select shim (1). The shim is located on the pinion shaft on top of the spacer (2). Pinion preload shims thickness will change with pinion depth shim change.

NOTE: Pinion torque to rotate (PTTR) is measured without the pinion seal.

1. Install pinion into the housing with the original shims plus/minus the pinion depth shim change. If pinion depth shim thickness was increased by 0.002 in. from the original shim thickness, increase preload shim thickness by 0.002 in. If pinion depth shim thickness was decreased by 0.002 in. from the original shim thickness, decrease preload shim thickness by 0.002 in.
2. Install pinion front bearing.
3. Install pinion flange and tighten the nut to 500 N.m (369 ft. lbs.)

Fig. 14: Measuring Pinion Torque To Rotate
Courtesy of CHRYSLER GROUP, LLC

4. Measure pinion torque to rotate (1) with and inch pound torque wrench (2). Pinion torque to rotate is: 5 - 8 N.m (44 - 70 in. lbs.).

NOTE: **To increase PTTR install a thinner shim. To decreases PTTR install thicker shim. A shim thickness change of 0.025 mm (0.001 in.) will change PTTR approximately 0.9 N.m (8 in. lbs.).**

DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH

Before measuring differential bearing preload and gear backlash, pinion gear depth must be established and the pinion gear ready for installation. Pinion gear depth is essential to establishing gear backlash and tooth contact patterns.

Differential bearing preload and gear backlash is achieved with selective shims located between the differential bearing cups and differential housing. Shim thickness is determined using Dummy Bearings (special tool #10120, Bearings, Dummy) in place of the differential side bearings and preload shims.

NOTE: **The large dummy bearings has 7 mm (0.275 in.) added to the thickness. This was done to eliminate the use of a dummy shim and differential spacer. The small dummy bearing has 3 mm (0.118) added to the thickness. This was done to eliminate the use of a dummy shim.**

7. Tighten larger bearing cap to 160 N.m (118 ft. lbs.) and small bearing to 100 N.m (74 ft. lbs.).

Fig. 19: Checking End Play

8. Attach Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1) to the housing and position dial indicator plunger on a flat surface on the ring gear (2).
9. Push and hold differential case (3) to pinion gear side of the housing and zero dial indicator.
10. Push and hold differential case (3) to the ring gear (2) side and record differential dial indicator (1) reading. Add 6 mm (0.236 in.) to the dial indicator reading for dummy bearings thickness. Then add 0.2 mm (0.008 in) for bearing preload. This is the total shim thickness needed to preload the differential bearings.

    Example: Differential Dial Indicator Reading + Dummy Bearings 6 mm (0.236 in.) + Differential Bearing Preload 0.2 mm (0.008 in) = Total Differential Shim

11. Rotate dial indicator out of the way.
12. Remove differential case with dummy bearings from the housing.

19. Attach Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1) to the housing and position dial indicator plunger on a flat surface on the ring gear (2).

20. Push and hold differential case (3) to pinion gear side of the housing and zero dial indicator.
21. Push and hold differential case (3) to the ring gear (2) side and record ring gear side dial indicator (1) reading. Add 3 mm (0.118 in.) to the record dial indicator reading to compensate for dummy bearing thickness. Then subtract 0.15 mm (0.006 in.) to compensate for ring gear backlash. The remainder is the total shim thickness needed on the ring gear side of the differential.

    Example: Ring Gear Side Dial Indicator Reading + One Dummy Bearing 3 mm (0.118 in.) - Ring Gear Backlash 0.15 mm (0.006 in.) = Ring Gear Side Shim

22. Subtract ring gear side shim from total differential shim, the remainder is the shim thickness needed on the pinion side of the housing.

    Example: Total Differential Shim - Ring Gear Side Shim = Pinion Gear Side Shim

23. Remove differential case with dummy bearings from the housing.
24. Install new side bearing cones and cups on differential case.
25. Mount Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1) to the housing (2) with indicator plunger against the opposite side of the housing. Zero the indicator.
26. Spread housing, while measuring the distance with the dial indicator.

CAUTION: Never spread housing over 0.38 mm (0.015 in.). Failure to follow these instruction will damage the housing.

27. Remove dial indicator.

31. Install differential (1) bearing caps and bolts (2).
32. Tighten larger bearing cap to 160 N.m (118 ft. lbs.) and small bearing to 100 N.m (74 ft. lbs.).

GEAR BACKLASH

Fig. 30: Backlash Measurement
Courtesy of CHRYSLER GROUP, LLC

1. Position the dial indicator (1) plunger against a ring gear tooth (2).
2. Push and hold ring gear upward while not allowing the pinion gear to rotate.
3. Zero dial indicator face to pointer.
4. Push and hold ring gear downward while not allowing the pinion gear to rotate. Dial indicator reading should be between 0.1 - 0.15 mm (0.004 - 0.006 in.). If backlash is not within specifications transfer the necessary amount of shim thickness from one side of the differential housing to the other.
5. Verify differential case and ring gear runout by measuring ring to pinion gear backlash at eight locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in.). If readings vary more than specified, the ring gear or the differential case is defective.

Fig. 31: Adjusting Backlash Shims
Courtesy of CHRYSLER GROUP, LLC

6. If backlash is not within specifications adjust shims equally on both sides to obtain backlash specification.

After the proper backlash is achieved, perform the Gear Contact Pattern procedure.

Pinion gear is set too high. Decrease pinion depth, by decreasing the pinion depth shim thickness.

DIFFERENTIAL BEARING PRELOAD CHECK

The final check on the differential assembly before installing the axles is torque to rotate pinion and differential combined. This will verify the correct differential bearing preload.

Total Torque To Rotate (TTTR) the differential is: Pinion Torque To Rotate plus 1.5 N.m ± 0.5 N.m (13 in. lbs. ± 4.4 in. lbs.).

NOTE: **If TTTR is too high, decrease shim thickness equally from both sides of the differential and check TTTR again. If TTTR is too low, increase shim thickness equally to both sides of the differential and check TTTR again.**

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - NOISE

FLUID CHECK

Filling an axle to the bottom of the fill hole may result in an over fill condition. This can cause fluid foaming which will result in inadequate lubrication to the axle components. To check axle fluid, park vehicle on a level surface. Take a piece of wire and make a 90 degree bend two inches from the end of the wire. Insert the wire into the fill plug hole and use it like a dipstick. Remove the wire and measure from the 90 degree bend to the oil level. For the correct measurement, refer to **SPECIFICATIONS**.

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, tooth contact, worn/damaged gears or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. The side gears are loaded during turns. They usually do not cause noise during straight-ahead driving when the gears are unloaded. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing

noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 m.p.h.

LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joint(s).
- Worn side-gear thrust washers.
- Worn pinion shaft bore.

VIBRATION

Vibration at the front/rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out of balance wheels.
- Loose wheel lug nuts.
- Worn U-joint(s).
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front end components or engine/transmission mounts. These components can contribute to what appears to be a vibration. Do not overlook engine accessories, brackets and drive belts.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged) can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints.
- Loose spring mounts.
- Loose pinion gear nut and yoke.

- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear and listen for the noise. A mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	1. Wheel loose.	1. Tighten loose nuts.
	2. Worn wheel bearing.	2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube.	1. Inspect axle tube alignment. Correct as necessary.
	2. Bent or sprung axle shaft.	2. Inspect and correct as necessary.
	3. End-play in pinion bearings.	3. Refer to **ADJUSTMENTS** and correct as necessary.
	4. Excessive gear backlash between the ring gear and pinion.	4. Check adjustment of the ring gear and pinion backlash. Correct as necessary.
	5. Improper adjustment of pinion gear bearings.	5. Adjust the pinion bearings pre-load.
	6. Loose pinion yoke nut.	6. Tighten the pinion yoke nut.
	7. Scuffed gear tooth contact surfaces.	7. Inspect and replace as necessary.
Axle Shaft Broke	1. Misaligned axle tube.	1. Replace the broken shaft after correcting tube mis-alignment.
	2 Vehicle overloaded.	2. Replace broken shaft and avoid excessive weight on vehicle.
	3. Erratic clutch operation.	3. Replace broken shaft and avoid or correct erratic clutch operation.
	4. Grabbing clutch.	4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper adjustment of the differential bearings.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.

	4. Erratic clutch operation.	4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the correct fluid type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked differential housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored yoke.	5. Replace yoke and seal.
	6. Axle cover not properly sealed.	6. Remove, clean and seal cover.
Axle Overheating	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing pre-loads too high.	3. Adjust bearing pre-loads.
	4. Insufficient ring gear backlash.	4. Adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Erratic clutch operation.	2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation.
	3. Ice-spotted pavement.	3. Replace gears and examine remaining parts for damage.
	4. Improper adjustments.	4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant.	1. Fill differential with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Check ring gear and pinion contact pattern.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring gear and pinion.	4. Replace ring gear and pinion.

	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing pre-load.
	7. Ring gear run-out.	7. Measure ring gear run-out. Replace components as necessary.
	8. Loose differential bearing cap bolts.	8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification.
	9. Housing not machined properly.	9. Replace housing.

PINION DEPTH MEASUREMENT

Fig. 1: Pinion Gear Depth Gauge Tools
Courtesy of CHRYSLER GROUP, LLC

Ring and pinion gears are supplied as matched sets. Compensation for pinion depth variance is achieved with a select shim. located between the rear pinion bearing and pinion gear head.

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator (special tool #C-3339A, Set, Dial Indicator).

1. Assemble Pinion Height Block (special tool #6739, Block, Height) (3), Pinion Block (special tool #8878,

Gauge, Pinion Height) (6) and rear pinion bearing onto Screw (special tool #6741, Screw) (5).

Fig. 2: Identifying Pinion Height Block
Courtesy of CHRYSLER GROUP, LLC

2. Insert assembled pinion height block (1), pinion block (2), rear bearing and screw into the housing through pinion bearing cups.
3. Install front pinion bearing and Cone-Nut (special tool #6740, Cone) onto the screw. Tighten cone-nut until Torque To Rotate the screw is 1.7 - 2.26 N.m (15 - 20 in. lbs.).

Fig. 3: Gauge Tools In Housing
Courtesy of CHRYSLER GROUP, LLC

4. Place Arbor Disc (special tool #8289, Set, Arbor Disc) (4) on Arbor (special tool #D-115-3, Arbor) (3) in position in the housing side bearing cradles.
5. Install differential bearing caps on arbor discs and snug the bearing cap bolts. Then cross tighten cap bolts to 85 N.m (63 ft. lbs.).

NOTE: Arbor (3) should rotate freely in the arbor disc (4).

Fig. 4: Pinion Depth Measurement
Courtesy of CHRYSLER GROUP, LLC

6. Assemble Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1) into Scooter Block (special tool #D-115-2A, Block, Scooter) (3) and secure set screw.
7. Position Scooter Block/Dial Indicator flush on the pinion height block. Hold scooter block and zero the dial indicator (1).
8. Slowly slide the scooter block across the pinion height block over to the arbor. Move scooter block till dial indicator crests the arbor (2), then record the highest reading.
9. Select a shim equal to the dial indicator reading.

Fig. 5: Measuring Pinion Torque To Rotate

10. Install select shim between rear pinion bearing and the pinion gear head.
11. Install pinion gear and establish Pinion Torque To Rotate (PTTR) with and inch pound torque wrench (2).

DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH

Fig. 6: Adjuster Locks & Bolts
Courtesy of CHRYSLER GROUP, LLC

Backlash is adjusted by moving the adjusters in and out or both. By moving the adjusters the case/ring gear will move closer or further away from the pinion. In most cases this adjustment can be used to achieve the correct gear tooth pattern and set the case bearing preload.

1. Remove adjuster lock bolts (3) and adjuster locks (2).
2. **Loosen** the differential bearing caps.
3. Slide differential case (1) toward the pinion gear until the gears make contact/zero backlash. If zero backlash cannot be obtained, turn the pinion side adjuster until zero backlash is obtained.
4. Holding the differential case toward the pinion gear, turn bearing adjusters with Wrench (special tool #8883A, Wrench, Differential Adjusting) until they make contact with the differential bearings/cups.
5. Back off the ring gear side adjuster 4 holes, to obtain initial ring gear backlash.
6. Install ring gear side adjuster lock and bolt. **Do not tighten** adjuster lock bolt at this time.
7. Tighten pinion gear side adjuster firmly against the differential case bearing cup.
8. Rotate the pinion several times to seat the differential bearings.
9. Loosen pinion gear side adjuster until it is no longer in contact with the bearing cup, then tighten it until it makes contact.
10. Tighten pinion gear side adjuster an additional:
    - **New Bearings:** 6 Adjuster Holes
    - **Original Bearings:** 4 Adjuster Holes
11. Install pinion gear side adjuster lock and bolt.
12. Tighten bearing cap bolts to 85 N.m (63 ft. lbs.).
13. Tighten adjuster lock bolts to 25 N.m (18 ft. lbs.).

Fig. 7: Measuring Ring Gear Backlash
Courtesy of CHRYSLER GROUP, LLC

14. Measure ring gear backlash with a Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1) and Dial

Indicator Stud (special tool #L-4438, Dial Indicator Post) at eight points around the drive side of the ring gear (2). The backlash should be 0.08 - 0.25 mm (0.003 - 0.010 in) with a preferred backlash of 0.13 - 0.18 mm (0.005 - 0.007 in).

NOTE: **Backlash measurement should not vary more than 0.05 mm (0.002 in) between measuring points. If measurement does vary inspect the gears for burrs, the differential case flange and ring gear mounting.**

GEAR TOOTH CONTACT PATTERN

Fig. 8: Correct Contact Pattern
Courtesy of CHRYSLER GROUP, LLC

1. Wipe clean each tooth of the ring gear.
2. Apply gear marking compound to all of the ring gear teeth.
3. Verify bearing cap bolts are torque to specification.
4. Apply the brakes lightly to create a 14 N.m (10 ft. lbs.) pinion rotating torque.
5. Rotate the pinion/pinion yoke 4 full revolutions in each directions.
6. Read gear tooth contact pattern.

Gear contact pattern is correct. Backlash and pinion depth is correct.

CAUTION: Suspension components with rubber bushings should be tightened with the weight of the vehicle on the suspension. Failure to follow these instructions will result in damage.

1. Support the axle on a suitable lifting device.
2. Secure axle to lifting device.
3. Position the axle under the vehicle.
4. Install springs (3), retainer clip and bolts.
5. Raise axle and align it with the spring pads.
6. Position upper (4) and lower control arms (5) in the axle brackets. Install bolts, nuts and align the suspension alignment cams to the reference marks. Do not tighten at this time.
7. Connect track bar (6) to the axle bracket and install the bolt. Do not tighten at this time.
8. Install shock absorber (2) and stabilizer bar (1)
9. Install drag link and tie rod to the steering knuckles.
10. Install ABS wheel speed sensors.
11. Install rotors and brake calipers.
12. Connect the axle vent hose.
13. Install front propeller shaft.
14. With vehicle on the ground, tighten upper control arm nuts at axle to 149 N.m (110 ft. lbs.). Tighten upper control arm nuts at frame to 149 N.m (110 ft. lbs.).
15. With vehicle on the ground, tighten lower control arm nuts at axle to 190 N.m (140 ft. lbs.). Tighten the lower control arm nuts at frame to 190 N.m (140 ft. lbs.).
16. Tighten track bar bolt at the axle bracket to 176 N.m (130 ft. lbs.).
17. Check front wheel alignment.

DESCRIPTION

DESCRIPTION

Fig. 35: Magnetic Target Sensor & Wire Tie Strap
Courtesy of CHRYSLER GROUP, LLC

The electric locker differential has an 12 volt electromagnetic coil on the ring gear side of the differential. When the coil is energized a dog clutch is engaged in the differential case which locks both axles. A 5 volt magnetic target sensor (1) mounted on the bearing cap is used to indicate the system has been activated.

NOTE: System will time out within 2 minutes, when the key is in the on position and the engine is not running.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - DIFFERENTIAL-ELECTRIC LOCKER

1. Position vehicle on host with wheels of the ground.
2. Turn key to the on position.

NOTE: System will time out within 2 minutes, when the key is in the on position and the engine is not running.

3. Place vehicle in drive/first gear and transfer case in LOW LOCK.
4. Activate locker switch and lock rear axle.
5. Activate locker switch for front axle.
6. Hold one wheel and rotate the other wheel which should lock once the dog clutch is aligned.
7. Turn off locker switch.
8. Hold one wheel and rotate the other wheel which should turn.

NOTE: **Only the locker actuator with sensor is serviced. Internal differential components are serviced as a differential case assembly.**

3. Install differential case with bearings cups into the housing.
4. Slide electric locker connector through differential housing.
5. Install O-ring on electric locker connector.
6. Install electric locker connector (1) with retainer (2) in differential housing.
7. Install connector retainer and bolt.

NOTE: Do not torque bearing cap and bolts at this time.

8. Install bearing caps (2) and tighten bearing cap bolts finger-tight.
9. Slide differential case toward the pinion gear until the gears make contact/zero backlash. If zero backlash cannot be obtained, turn the pinion side adjuster until zero backlash is obtained.
10. Holding the differential case toward the pinion gear, turn bearing adjusters with Wrench (special tool #8883A, Wrench, Differential Adjusting) until they make contact with the differential bearings/cups.
11. Back off the ring gear side adjuster 4 holes, to obtain initial ring gear backlash.
12. Install ring gear side adjuster lock and bolt. Do not tighten adjuster lock bolt at this time.
13. Tighten pinion gear side adjuster firmly against the differential case bearing cup.
14. Rotate the pinion several times to seat the differential bearings.
15. Loosen pinion gear side adjuster until it is no longer in contact with the bearing cup.
16. Tighten pinion gear side adjuster until it just makes contact with the bearing cup.
17. Tighten pinion gear side adjuster an additional:
    - **New Bearings:** 6 Adjuster Holes
    - **Original Bearings:** 4 Adjuster Holes

20. Install axle shafts and hub bearings.
21. Install sensor target magnet (1) on bearing cap.
22. Energize locker and rotate axle shaft. Verify dog clutch is engaged by rotating one axle while holding the other. If engaged axle will not rotate.
23. De-energize locker and rotate left axle 15 to 40 degrees so dog clutch gears will not engage.

NOTE: System will time out within 2 minutes when the key is in the on position and the engine is not running.

NOTE: If the axle is locking and the indicator light continues to flash, the sensor gap is too small. If the axle is disengaged and the indicator light stays on, the sensor gap is to large. Gap adjustment must be within spec.

24. Energize locker and set sensor air gap (2) to 5.05 mm ± 0.25 mm (0.20 in. ± 0.01 in.).
25. Tighten sensor target magnet bolt (3) to 7 N.m (62 in. lbs.).

NOTE: The next step will verify the sensor air gap was adjusted with the dog clutch gears ear to ear.

26. Hold right axle and rotate left axle until dog clutch engages with an audible click nose.
27. Install sensor wire tie strap (4) in the original location or at white dot on wiring harness to the top leg of adjuster lock and de-energize coil.
28. Measure ring gear backlash and check gear tooth contact pattern. For procedure, refer to **ADJUSTMENTS**.
29. Install differential housing gasket and cover. Tighten cover bolts to 40 N.m (30 ft. lbs.).
30. Fill differential with lubricant.
31. Install fill plug and tighten to 32 N.m (24 ft. lbs.).

NOTE: **The ring and pinion gears are service in a matched set. Never replace the ring gear/pinion gear without replacing the other matching gear.**

1. Mark pinion flange and propeller shaft for installation alignment.
2. Disconnect propeller shaft from pinion flange and remove propeller shaft.
3. Remove axle shafts.
4. Remove differential from housing.
5. Place differential case in a vise with soft metal jaw protectors
6. Remove bolts holding ring gear to differential case.
7. Drive ring gear (2) from differential case (1) with a soft hammer (3).

10. Remove pinion gear (1) from housing with Pinion Driver (special tool #8976, Pinion Driver) (2) and a hammer.

NOTE: Thread drive on shaft until it bottoms out.

11. Remove pinion seal with a slide hammer or pry bar.

12. Remove and discard front pinion bearing.
13. Remove collapsible spacer from the pinion shaft.

14. Remove rear pinion bearing with Puller (special tool #C-293-PA, Puller, Press) (1) and Adapters (special tool #8879, Adapters, Puller) (4).
15. Remove pinion depth shim from the pinion gear shaft and record thickness of the shims.
16. Remove front pinion bearing cup from the housing with a punch and hammer and discard cup.
17. Remove rear pinion bearing cup from the housing with a punch and hammer, if bearing is replaced.

8. Install **new** pinion seal with Installer (special tool #8882, Installer, Pinion Seal) (2) and Handle (special tool #C-4171, Driver Handle, Universal) (1).
9. Apply a light coat of teflon sealant to the pinion flange splines.
10. Hold pinion and lightly tap the pinion flange onto the pinion shaft, until a few threads are showing.
11. Install pinion flange washer and **new** pinion nut.
12. Hold pinion flange with Flange Wrench (special tool #8979, Wrench, Pinion Flange) and tighten pinion nut until end play is eliminated.

Fig. 61: Measuring Pinion Torque To Rotate

13. Rotate pinion several times to seat pinion bearings.
14. Measure Pinion Torque To Rotate (1) with an inch pound torque wrench (2). Tighten pinion nut in 6.8 N.m (5 ft. lbs.) increments until pinion torque to rotate is reached.

Pinion Torque To Rotate is:

- **New Pinion Bearings:** 1.7 - 2.8 N.m (15 - 25 in. lbs.)
- **Original Pinion Bearings:** 1.1 - 2.2 N.m (10 - 20 in. lbs.)

15. Rotate pinion several times then verify pinion torque to rotate again.
16. Position ring gear on differential case and start two **new** ring gear bolts.
17. Install remaining **new** ring gear bolts and tighten them alternately to seat the ring gear. Torque ring gear bolts to 140 N.m (103 ft. lbs.).
18. Install differential in housing.
19. Measure Total Torque to Rotate (TTTR) with an inch pound torque wrench.

    Total Torque to Rotate is:

    - **New Bearings:** 3.4 - 5.6 N.m (30 - 50 in. lbs.)
    - **Original Bearings:** 2.8 - 5.1 N.m (25 - 45 in. lbs.)

    NOTE: **If TTTR is to high, back off adjusters evenly on both sides slightly and check TTTR again. If TTTR is to low, tighten adjusters evenly on both sides slightly and check TTTR again.**

20. Verify ring gear backlash and gear contact pattern.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PROPELLER SHAFT

PROPELLER SHAFT VIBRATION

Out-of-round tires or wheels that are out of balance, will cause a low frequency vibration.

Driveline vibration can also be caused by loose or damaged engine mounts.

Propeller shaft vibration increases with vehicle speed. A vibration that occurs at a specific speed range, is not usually caused by an out of balance propeller shaft. Defective universal joints or an incorrect propeller shaft angle are usually the cause of such a vibration.

DRIVELINE VIBRATION

CONDITION	POSSIBLE CAUSE	CORRECTION
Propeller Shaft Noise	1) Undercoating or other foreign material on shaft.	1) Clean exterior of shaft and wash with solvent.
	2) Loose companion flange bolts.	2) Install new bolts and tighten to proper torque.
	3) Loose or bent U-joint yoke or excessive runout.	3) Install new yoke.
	4) Incorrect driveline angularity.	4) Measure and correct driveline angles.
	5) Rear spring center bolt not in seat.	5) Loosen spring U-bolts and seat center bolt.
	6) Worn U-joint bearings.	6) Install new U-joint.
	7) Propeller shaft damaged or out of balance.	7) Install new propeller shaft.
	8) Broken rear spring.	8) Install new rear spring.
	9) Excessive runout or unbalanced condition.	9) Re-index propeller shaft, test, and evaluate.
	10) Excessive drive pinion gear shaft runout.	10) Re-index propeller shaft and evaluate.
	11) Excessive axle yoke deflection.	11) Inspect and replace yoke if necessary.
	12) Excessive transfer case runout.	12) Inspect and repair as necessary.
Universal Joint Noise	1) Loose companion flange bolts.	1) Install new bolts and tighten to proper torque.
	2) Lack of lubrication.	2) Replace U-joints as necessary.

PROPELLER SHAFT BALANCE

Fig. 1: Screw Clamp & Propeller Shaft
Courtesy of CHRYSLER GROUP, LLC

If propeller shaft is suspected of being out of balance, use the following procedure.

NOTE: Indexing propeller shaft 180 degrees relative to the yoke may eliminate some vibrations.

1. Raise and support vehicle.
2. Clean all foreign material from the propeller shaft and universal joints.
3. Inspect propeller shaft for missing balance weights, broken welds and bent areas. **If propeller shaft is bent, it must be replaced.**
4. Inspect universal joints for wear and properly installed.
5. Check propeller shaft bolt torques.
6. Remove wheels and install lug nuts to retain brake rotors.
7. Mark and number the shaft six inches from the pinion yoke end at four positions 90 degrees apart.
8. Run and accelerate vehicle until vibration occurs. Note the intensity and speed the vibration occurred. Stop the engine.
9. Install a screw clamp at position (1).

Fig. 2: Separating Clamps
Courtesy of CHRYSLER GROUP, LLC

10. Start engine and check vibration. If there is little or no change move the clamp to the next positions. Repeat the vibration test.

NOTE: **If there is no difference in vibration at this positions, the vibration may not be the propeller shaft.**

11. If vibration decreased, install a second clamp (1) and repeat the test.

Fig. 3: Stagger Clamps
Courtesy of CHRYSLER GROUP, LLC

12. If additional clamp causes an additional vibration, separate the clamps 1/2 inch (1) above and below the mark. Repeat the vibration test.
13. Increase distance between the clamp screws (1) (2) and repeat test, until the least amount of vibration is noticed. Bend the slack end of the clamps so screws will not loosen.
14. If vibration remains unacceptable, repeat the procedure to the front end of the propeller shaft.
15. Install wheels and lower vehicle.

STANDARD PROCEDURE

PROPELLER SHAFT ANGLE

ONE PIECE PROPELLER SHAFT

Fig. 4: Identifying Output Angle (A)
Courtesy of CHRYSLER GROUP, LLC

This procedure applies to front and rear propeller shafts.

NOTE: To obtain output angle (A) on the front propeller shaft equipped with a C/V joint, place inclinometer on machined surface of the C/V joint.

1. Raise vehicle and support the axles as level as possible, allowing the wheels and propeller shaft to turn.
2. Remove universal joint snap rings if equipped, so inclinometer base sits flat.
3. Rotate shaft until transmission/transfer case output yoke bearing is facing downward.

NOTE: **Always take measurements from front to rear and on the same side of the vehicle.**

4. Place Inclinometer (special tool #7663, Inclinometer) on yoke bearing cap or pinion flange ring parallel to the shaft. Center bubble in sight glass and record measurement (A).

   This measurement will give you the transmission yoke Output Angle (A).

Fig. 5: Propeller Shaft Angle (C)
Courtesy of CHRYSLER GROUP, LLC

5. Rotate propeller shaft 90 degrees and place Inclinometer on yoke bearing parallel to the shaft. Center bubble in sight glass and record measurement. This measurement can also be taken at the rear end of the shaft.

   This measurement will give you the Propeller Shaft Angle (C).

Fig. 6: Companion Flange Input Angle (B)
Courtesy of CHRYSLER GROUP, LLC

6. Rotate propeller shaft 90 degrees and place inclinometer on companion flange yoke bearing parallel to the shaft. Center bubble in sight glass and record measurement.

   This measurement will give you the pinion Companion Flange Input Angle (B).

7. Subtract smaller figure from larger (C minus A) to obtain Transmission/Transfer Case **Output Operating Angle** .
8. Subtract smaller figure from larger (C minus B) to obtain axle **Input Operating Angle** .

Fig. 7: Universal Joint Angle Example
Courtesy of CHRYSLER GROUP, LLC

Refer to rules below for additional information (example shown in illustration).

RULES

- Good cancellation of U-joint operating angles should be within 1 degree.
- Operating angles should be less than 3 degrees.
- Operating angles less than 10 degrees for double cardan U-joint.
- At least 1/2 of one degree continuous operating propeller shaft angle.

TWO PIECE PROPELLER SHAFT

Fig. 8: Two Piece Propeller Shaft Universal Joint Angle

Two piece propeller shaft angles measurement is the same as a one-piece propeller shaft.

LUBRICATION

ADJUSTMENTS

ADJUSTMENTS

Launch shudder is a vibration that occurs at first acceleration from a stop. Shudder vibration usually peaks at the engines highest torque output. Shudder is a symptom associated with vehicles using a two-piece propeller shaft. To decrease shudder, lower the center bearing in 3.0 mm (0.125 in.) increments. Use shim stock or fabricated plates. **Do not use washers.** Replace the original bolts with the appropriate increased length bolts.

4. Press bearing cap into the yoke bore enough to clear snap ring groove.
5. Repeat to install the opposite bearing cap. Refer to 3 and 4.

NOTE: If joint is stiff or binding, strike the yoke with a soft hammer to seat the needle bearings.

6. Add grease to lube fitting, if equipped.
7. Install propeller shaft.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REAR AXLE - 10 1/2 AA

FLUID CHECK

Filling an axle to the bottom of the fill hole may result in an over fill condition. This can cause fluid foaming which will result in inadequate lubrication to the axle components. To check axle fluid, park vehicle on a level surface. Take a piece of wire and make a 90 degree bend two inches from the end of the wire. Insert the wire into the fill plug hole and use it like a dipstick. Remove the wire and measure from the 90 degree bend to the oil level. Refer to **SPECIFICATIONS**.

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. The side gears are loaded during turns. They usually do not cause noise during straight-ahead driving when the gears are unloaded. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing

noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 m.p.h.

LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joint(s).
- Worn side-gear thrust washers.
- Worn pinion shaft bore.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joint(s).
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

NOTE: All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged), can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints.

- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear and listen for the noise. A mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	1. Wheel loose.	1. Tighten loose nuts.
	2. Worn wheel bearing.	2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube.	1. Inspect axle tube alignment. Correct as necessary.
	2. Bent or sprung axle shaft.	2. Inspect and correct as necessary.
Axle Shaft Broke	1. Misaligned axle tube.	1. Replace the broken shaft after correcting tube mis-alignment.
	2 Vehicle overloaded.	2. Replace broken shaft and avoid excessive weight on vehicle.
	3. Erratic clutch operation.	3. Replace broken shaft and avoid or correct erratic clutch operation.
	4. Grabbing clutch.	4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper adjustment of the differential bearings.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
	4. Erratic clutch operation.	4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the correct fluid

		type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked differential housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored yoke.	5. Replace yoke and seal.
	6. Axle cover not properly sealed.	6. Remove, clean and seal cover.
Axle Overheating	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing pre-loads too high.	3. Adjust bearing pre-loads.
	4. Insufficient ring gear backlash.	4. Adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Erratic clutch operation.	2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation.
	3. Ice-spotted pavement.	3. Replace gears and examine remaining parts for damage.
	4. Improper adjustments.	4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant.	1. Fill differential with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring gear and pinion.	4. Replace ring gear and pinion.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing pre-load.
	7. Ring gear run-out.	7. Measure ring gear run-out. Replace components as necessary.
	8. Loose differential bearing cap bolts.	8. Inspect differential components and replace as necessary. Ensure

		that the bearing caps are torqued tot he proper specification.
	9. Housing not machined properly.	9. Replace housing.

ADJUSTMENTS

ADJUSTMENTS

PINION DEPTH MEASUREMENT

Fig. 1: Pinion Gear Depth Gauge Tools
Courtesy of CHRYSLER GROUP, LLC

Ring and pinion gears are supplied as matched sets. Compensation for pinion depth variance is achieved with a select shim. The shim is located between the rear pinion bearing and the pinion gear head.

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator (special tool #C-3339A, Set, Dial Indicator).

1. Assemble Pinion Height Block (special tool #6739, Block, Height) (3), Pinion Block (special tool #8899, Gauge, Pinion Height) (6) and rear pinion bearing onto Screw (special tool #6741, Screw) (5).

Fig. 2: Pinion Height Block
Courtesy of CHRYSLER GROUP, LLC

2. Insert pinion block (1), pinion height block (2), rear bearing and screw into the housing through pinion bearing cups.
3. Install front pinion bearing and Cone-nut (special tool #6740, Cone) onto the screw. Tighten cone-nut until Torque To Rotate the screw is 1.7-2.26 N.m (15-20 in. lbs.).

Fig. 3: Gauge Tools In Housing
Courtesy of CHRYSLER GROUP, LLC

4. Place Arbor Discs (special tool #6732, Set, Arbor Disc) (1) on Arbor (special tool #D-115-3, Arbor) (3) in position in the housing side bearing cradles.
5. Install differential bearing caps on arbor discs (1) and snug the bearing cap bolts. Then cross tighten cap bolts to 165 N.m (122 ft. lbs.).

NOTE: Arbor should rotate freely in the arbor discs.

6. Assemble Dial Indicator (special tool #C-3339A, Set, Dial Indicator) into Scooter Block (special tool #D-115-2A, Block, Scooter) and secure set screw.

Fig. 4: Measuring Pinion Gear Depth
Courtesy of CHRYSLER GROUP, LLC

7. Position scooter block (2) with dial indicator (3) flush on the pinion height block. Hold scooter block and zero the dial indicator.
8. Slowly slide the scooter block (2) across the pinion height block over to the arbor (1). Move the scooter block till dial indicator crests the arbor, then record the highest reading.
9. Select a shim equal to the dial indicator reading.

Fig. 5: Measuring Pinion Rotating Torque
Courtesy of CHRYSLER GROUP, LLC

10. Install select shim between rear pinion bearing and the pinion gear head.
11. Install pinion gear and establish Pinion Torque To Rotate (PTTR) with an inch pound torque wrench (2).

DIFFERENTIAL CASE BEARING PRELOAD AND GEAR BACKLASH

Fig. 6: Adjuster Locks & Bolts
Courtesy of CHRYSLER GROUP, LLC

Backlash is adjusted by moving the adjusters in and out or both. By moving the adjusters the case/ring gear will move closer or further away from the pinion. In most cases this adjustment can be used to achieve the correct gear tooth pattern and set the case bearing preload.

1. Remove adjuster lock bolts (3) and adjuster locks (2).
2. **Loosen** the differential bearing cap bolts (4).
3. Slide differential case (1) toward the pinion gear until the gears make contact/zero backlash. If zero backlash cannot be obtained, turn the pinion side adjuster until zero backlash is obtained.

Fig. 7: Turning Bearing Adjusters
Courtesy of CHRYSLER GROUP, LLC

4. Holding the differential case (2) toward the pinion gear, turn bearing adjusters with Adjuster Wrench (special tool #8883A, Wrench, Differential Adjusting) (1) until they make contact with the differential bearings/cups.
5. Back off the ring gear side adjuster 4 holes, to obtain initial ring gear backlash.
6. Install ring gear side adjuster lock and bolt. **Do not tighten** adjuster lock bolt at this time.
7. Tighten pinion gear side adjuster firmly against the differential case bearing cup.
8. Rotate the pinion several times to seat the deferential bearings.
9. Loosen pinion gear side adjuster until it is no longer in contact with the bearing cup, then tighten it until it makes contact.
10. Tighten pinion gear side adjuster an additional:
    - **New Bearings:** 6 Adjuster Holes
    - **Original Bearings:** 4 Adjuster Holes
11. Install pinion gear side adjuster lock and bolt.
12. Tighten bearing cap bolts to 165 N.m (122 ft. lbs.).
13. Tighten adjuster lock bolts to 25 N.m (18 ft. lbs.).

14. Measure ring gear (2) backlash with a Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1) and Pilot Stud (special tool #L-4438, Dial Indicator Post) at eight points around the drive side of the ring gear. The backlash should be 0.08-0.25 mm (0.003-0.010 in) with a preferred backlash of 0.13-0.18 mm (0.005-0.007 in).

NOTE: **Backlash measurement should not vary more than 0.05 mm (0.002 in) between measuring points. If measurement does vary inspect the gears for burrs, the differential case flange and ring gear mounting.**

GEAR TOOTH CONTACT PATTERN

Fig. 9: Correct Contact Pattern

1. Wipe clean each tooth of the ring gear.
2. Apply gear marking compound to all of the ring gear teeth.

3. Verify bearing cap bolts are torqued to specification.
4. Apply parking brakes lightly to create at 14 N.m (10 ft. lbs.) pinion rotating torque.
5. Rotate the pinion/pinion yoke 4 full revolutions in each directions.
6. Read gear tooth contact pattern.

Gear contact pattern correct. Backlash and pinion depth is correct.

CASE ASSEMBLY, DIFFERENTIAL, ELECTRIC LOCKER

DESCRIPTION

DESCRIPTION

Fig. 42: Sensor Target Magnet & Tie Strap
Courtesy of CHRYSLER GROUP, LLC

The electric locker differential has a 12 volt electromagnet coil on the ring gear side of the differential. When the coil is energized a dog clutch is engaged in the differential case which locks both axles. A 5 volt magnetic target sensor (1) mounted on the bearing cap is used to indicate the system has been activated.

NOTE: System will time out within 2 minutes, when the key is in the on position and the engine is not running.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRIC LOCKER DIFFERENTIAL

1. Position vehicle on host with wheels of the ground.
2. Turn key to the on position.

NOTE: System will time out within 2 minutes, when the key is in the on position and the engine is not running.

3. Place vehicle in drive/first gear and transfer case in LOW LOCK.
4. Activate locker switch.
5. Hold one wheel and rotate the other wheel which should lock once the dog clutch is aligned.
6. Turn off locker switch.
7. Hold one wheel and rotate the other wheel which should turn.

NOTE: **Only the locker actuator with sensor are serviced. Internal differential components are serviced as a differential case assembly.**

21. Measure ring gear backlash and check gear tooth contact pattern. Refer to **ADJUSTMENTS**.
22. Install axle shafts.
23. Install sensor target magnet (1) on bearing cap.
24. Energize locker and rotate axle shaft. Verify dog clutch is engaged by rotating one axle while holding the other. If engaged axle will not rotate.
25. De-energize locker and rotate left axle 15 to 40 degrees so dog clutch gears will not engage.

NOTE: System will time out within 2 minutes when the key is in the on position and the engine is not running.

NOTE: If the axle is locking and the indicator light continues to flash, the sensor gap is too small. If the axle is disengaged and the indicator light stays on, the sensor gap is to large. Gap adjustment must be within spec.

26. Energize locker and set sensor air gap (2) to 5.5 mm ± 0.25 mm (0.21 in. ± 0.01 in.).
27. Tighten sensor target magnet bolt (3) to 7 N.m (62 in. lbs.).

NOTE: The next step will verify the sensor air gap was adjusted with the dog clutch gears ear to ear.

28. Hold right axle and rotate left axle until dog clutch engages with an audible click nose.
29. Install sensor wire tie strap (4) in the original location or at white dot on wiring harness to the top leg of adjuster lock and de-energize coil.
30. Install differential housing gasket and cover. Tighten cover bolts to 40 N.m (30 ft. lbs.).
31. Fill differential with lubricant to specifications.
32. Install fill plug and tighten to 32 N.m (24 ft. lbs.).

CASE ASSEMBLY, DIFFERENTIAL, TRAC-RITE

DESCRIPTION

DESCRIPTION

Fig. 57: Side Gears, Thrust Washers & Spacer
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The differential is serviced as an assembly only do not attempt to disassemble. Failure to follow these instructions will result in damage to the differential.

The Trac-Rite™ differential is a helical gear differential. The differential has two side gears (3), two thrust washers (1) and one spacer (2).

Fig. 58: Pinion Gear, Shaft & Brake Shoe
Courtesy of CHRYSLER GROUP, LLC

It also has six pinion brake shoes (1) which pivot on the six pinion gear (2) shafts (3).

OPERATION

OPERATION

Fig. 59: Pinion Gears & Brake Shoes
Courtesy of CHRYSLER GROUP, LLC

> **CAUTION: The differential is serviced as an assembly only do not attempt to disassemble. Failure to follow these instructions will result in damage to the differential.**

When one wheel begins to spin the pinion gears (2) on that side, are forced toward the pinion brake shoes (1). The pinion brake shoes then cause frictional drag on the opposite pinion gears and the side gear. These friction forces transfer the power to the opposite wheel. Once the frictional forces are overcome, differentiation will occur. The torque will be continually biased by the frictional forces to the high traction wheel.

CLEANING

CLEANING

> **CAUTION: The differential is serviced as an assembly only do not attempt to disassemble. Failure to follow these instructions will result in damage to the differential.**

Flush the differential case and gears through openings in the case with light oil.

NOTE: The ring and pinion gears are service in a matched set. Never replace the ring gear/pinion gear without replacing the other matching gear.

1. Mark pinion flange and propeller shaft for installation alignment.
2. Disconnect propeller shaft from pinion flange and remove propeller shaft.
3. Remove differential from axle housing.
4. Place differential on Plug (special tool #8888, Plug, Differential Bearing) and drive exciter ring (4) off the differential case (1) with a hammer and punch (3).

NOTE: Do not remove the exciter ring if it is not being replaced.

13. Rotate pinion several times to seat pinion bearings.
14. Measure Pinion Torque To Rotate (1) with an inch pound torque wrench (2). Tighten pinion nut in 6.8 N.m (5 ft. lbs.) increments until pinion torque to rotate is achieved.

    Pinion Torque To Rotate is:

    - **New Pinion Bearings:** 1.7 - 2.8 N.m (15 - 25 in. lbs.)
    - **Original Pinion Bearings:** 1.1 - 2.2 N.m (10 - 20 in. lbs.)
15. Rotate pinion several times then verify pinion torque to rotate again.

19. If exciter ring was removed, position differential assembly on differential Plug (special tool #8888, Plug, Differential Bearing) and place exciter ring on the differential case.
20. Install exciter ring (1) on the differential case evenly with a hammer and brass punch (2). Drive the ring down until it is seated against the ring gear (3).

CAUTION: Do not damage exciter ring teeth during installation.

21. Install differential into the housing.
22. Measure Total Torque to Rotate (TTTR) with an inch pound torque wrench.

Total Torque To Rotate is:

- **New Bearings:** 3.4 - 5.6 N.m (30 - 50 in. lbs.)
- **Original Bearings:** 2.8 - 5.1 N.m (25 - 45 in. lbs.)

NOTE: **If TTTR is to high back off adjusters evenly on both sides slightly and check TTTR again. If TTTR is to low tighten adjusters evenly on both**

sides slightly and check TTTR again.

23. Verify ring gear backlash and gear contact pattern.

1. Install sensor target magnet (1) on bearing cap.
2. Energize locker and rotate axle shaft. Verify dog clutch is engaged by rotating one axle while holding the other. If engaged axle will not rotate.
3. De-energize locker and rotate left axle 15 to 40 degrees so dog clutch gears will not engage.
4. Energize locker and set sensor air gap (2) to 5.5 mm ± 0.25 mm (0.21 in. ± 0.01 in.).

NOTE: System will time out within 2 minutes, when the key is in the on position and the engine is not running.

5. Tighten sensor target magnet bolt (3) to 7 N.m (62 in. lbs.).
6. Hold right axle and rotate left axle until dog clutch engages with an audible click nose.

NOTE: This will verify the sensor air gap was adjusted with the dog clutch gears ear to ear.

7. Install sensor wire tie strap (4) in the original location or at white dot on wiring harness to the top leg of adjuster lock and de-energize coil.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REAR AXLE - 11 1/2 AA

FLUID CHECK

Filling an axle to the bottom of the fill hole may result in an over fill condition. This can cause fluid foaming which will result in inadequate lubrication to the axle components. To check axle fluid, park vehicle on a level surface. Take a piece of wire and make a 90 degree bend two inches from the end of the wire. Insert the wire into the fill plug hole and use it like a dipstick. Remove the wire and measure from the 90 degree bend to the oil level. For the correct measurement, refer to **SPECIFICATIONS**.

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. The side gears are loaded during turns. They usually do not cause noise during straight-ahead driving when the gears are unloaded. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing

noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joint(s).
- Worn side gear thrust washers.
- Worn pinion shaft bore.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joint(s).
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

NOTE: All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged), can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints.

- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear and listen for the noise. A mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	1. Wheel loose.	1. Tighten loose nuts.
	2. Worn wheel bearing.	2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube.	1. Inspect axle tube alignment. Correct as necessary.
	2. Bent or sprung axle shaft.	2. Inspect and correct as necessary.
Axle Shaft Broke	1. Misaligned axle tube.	1. Replace the broken shaft after correcting tube mis-alignment.
	2 Vehicle overloaded.	2. Replace broken shaft and avoid excessive weight on vehicle.
	3. Erratic clutch operation.	3. Replace broken shaft and avoid or correct erratic clutch operation.
	4. Grabbing clutch.	4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper adjustment of the differential bearings.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
	4. Erratic clutch operation.	4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the correct fluid

		type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked differential housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored yoke.	5. Replace yoke and seal.
	6. Axle cover not properly sealed.	6. Remove, clean and seal cover.
Axle Overheating	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing pre-loads too high.	3. Adjust bearing pre-loads.
	4. Insufficient ring gear backlash.	4. Adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Erratic clutch operation.	2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation.
	3. Ice-spotted pavement.	3. Replace gears and examine remaining parts for damage.
	4. Improper adjustments.	4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant.	1. Fill differential with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring gear and pinion.	4. Replace ring gear and pinion.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing pre-load.
	7. Ring gear run out.	7. Measure ring gear run-out. Replace components as necessary.
	8. Loose differential bearing cap bolts.	8. Inspect differential components and replace as necessary. Ensure

		that the bearing caps are torqued to the proper specification.
	9. Housing not machined properly.	9. Replace housing.

ADJUSTMENTS

PINION DEPTH MEASUREMENT

Fig. 1: Pinion Gear Depth Gauge Tools
Courtesy of CHRYSLER GROUP, LLC

Ring and pinion gears are supplied as matched sets. Compensation for pinion depth variance is achieved with a select shim, located between the rear pinion bearing and pinion gear head.

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1).

1. Assemble Pinion Height Block (special tool #6739, Block, Height) (3), Pinion Block (special tool #8897, Gauge, Pinion Height) (6) and rear pinion bearing onto Screw (special tool #6741, Screw) (5).

Fig. 2: Pinion Height Block
Courtesy of CHRYSLER GROUP, LLC

2. Insert assembled pinion block (1), pinion height block (2), rear bearing and screw into the housing through pinion bearing cups.
3. Install front pinion bearing and Cone-nut (special tool #6740, Cone) onto the screw. Tighten cone-nut until Torque To Rotate the screw is 1.7-2.26 N.m (15-20 in. lbs.).

Fig. 3: Gauge Tools In Housing
Courtesy of CHRYSLER GROUP, LLC

4. Place Arbor Discs (special tool #8289, Set, Arbor Disc) (1) on Arbor (special tool #D-115-3, Arbor) (3) in position in the housing side bearing cradles.
5. Install differential bearing caps on arbor discs and snug the bearing cap bolts. Then cross tighten cap bolts to 281 N.m (207 ft. lbs.).

NOTE: Arbor should rotate freely in the arbor discs.

Fig. 4: Pinion Gear Depth Measurement
Courtesy of CHRYSLER GROUP, LLC

6. Assemble Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (3) into Scooter Block (special tool #D-115-2A, Block, Scooter) (2) and secure set screw.
7. Position Scooter Block/Dial Indicator flush on the pinion height block. Hold scooter block and zero the dial indicator.
8. Slowly slide the scooter block across the pinion height block over to the arbor. Move the scooter block till dial indicator crests the arbor (1), then record the highest reading.
9. Select a shim equal to the dial indicator reading.

Fig. 5: Measuring Pinion Rotating Torque
Courtesy of CHRYSLER GROUP, LLC

10. Install select shim between rear pinion bearing and the pinion gear head.

11. Install pinion gear and establish Pinion Torque To Rotate (PTTR) with an inch pound torque wrench (2).

DIFFERENTIAL CASE BEARING PRELOAD AND GEAR BACKLASH

Fig. 6: Adjuster Locks & Bolts
Courtesy of CHRYSLER GROUP, LLC

Backlash is adjusted by moving the adjusters in and out or both. By moving the adjusters the case/ring gear will move closer or further away from the pinion. In most cases this adjustment can be used to achieve the correct gear tooth pattern and set the case bearing preload.

1. Remove adjuster lock bolts (3) and adjuster locks (2).
2. **Loosen** the differential bearing caps (4).
3. Slide differential case toward the pinion gear until the gears make contact/zero backlash. If zero backlash cannot be obtained, turn the pinion side adjuster until zero backlash is obtained.

Fig. 7: Turning Bearing Adjusters
Courtesy of CHRYSLER GROUP, LLC

4. Holding the differential case (2) toward the pinion gear, turn bearing adjusters with Adjuster Wrench (special tool #8883A, Wrench, Differential Adjusting) (1) until adjuster makes contact with the differential bearings/cups.
5. Back off the ring gear side adjuster 4 holes, to obtain initial ring gear backlash.
6. Install ring gear side adjuster lock and bolt. **Do not tighten** adjuster lock bolt at this time.
7. Tighten pinion gear side adjuster firmly against the differential case bearing cup.
8. Rotate the pinion several times to seat the deferential bearings.
9. Loosen pinion gear side adjuster until it is no longer in contact with the bearing cup, then tighten it until it makes contact.
10. Tighten pinion gear side adjuster an additional:
    - **New Bearings:** 6 Adjuster Holes
    - **Original Bearings:** 4 Adjuster Holes
11. Install pinion gear side adjuster lock and bolt.
12. Tighten bearing cap bolts to 281 N.m (207 ft. lbs.).
13. Tighten adjuster lock bolts to 25 N.m (18 ft. lbs.).

Fig. 8: Measuring Ring Gear Backlash
Courtesy of CHRYSLER GROUP, LLC

14. Measure ring gear backlash with a Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1) and Pilot Stud (special tool #L-4438, Dial Indicator Post) at eight points around the drive side of the ring gear (2). The backlash should be 0.08-0.25 mm (0.003-0.010 in) with a preferred backlash of 0.13-0.18 mm (0.005-0.007 in).

NOTE: **Backlash measurement should not vary more than 0.05 mm (0.002 in) between measuring points. If measurement does vary inspect the gears for burrs, the differential case flange and ring gear mounting.**

GEAR TOOTH CONTACT PATTERN

Fig. 9: Correct Contact Pattern
Courtesy of CHRYSLER GROUP, LLC

1. Wipe clean each tooth of the ring gear.
2. Apply gear marking compound to all of the ring gear teeth.

3. Verify bearing cap bolts are torque specification.
4. Apply parking brakes lightly to create at 14 N.m (10 ft. lbs.) pinion rotating torque.
5. Rotate the pinion/pinion yoke 4 full revolutions in each directions.
6. Read gear tooth contact pattern.

Gear contact pattern correct. Backlash and pinion depth is correct.

WARNING: Use welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: A bearing heater (2) is used to install Trac-Rite™ differential case bearings (1). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 177 Celsius (212° - 350° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for and extended amount of time. If component is discolored after heating the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

1. Heat Trac-Rite™ differential case bearings (1) with bearing heater (2).
2. With welding gloves or tongs install bearings on differential case.

DESCRIPTION

DESCRIPTION

Fig. 39: Identifying Side Gears, Thrust Washers & Spacer
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The differential is serviced as an assembly only do not attempt to disassemble. Failure to follow these instructions will result in damage to the differential.

The Trac-Rite™ differential is a helical gear differential. The differential has two side gears (3), two thrust washers (1) and one spacer (2).

Fig. 40: Identifying Pinion Gear, Shaft & Brake Shoe
Courtesy of CHRYSLER GROUP, LLC

It also has six pinion brake shoes (1) which pivot on the six pinion gear (2) shafts (3).

OPERATION

OPERATION

Fig. 41: Pinion Gears & Brake Shoes
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The differential is serviced as an assembly only do not attempt to disassemble. Failure to follow these instructions will result in damage to the differential.

When one wheel begins to spin the pinion gears (2) on that side, are forced toward the pinion brake shoes (1). The pinion brake shoes then cause frictional drag on the opposite pinion gears and the side gear. These friction forces transfer the power to the opposite wheel. Once the frictional forces are overcome, differentiation will occur. The torque will be continually biased by the frictional forces to the high traction wheel.

CLEANING

CLEANING

CAUTION: The differential is serviced as an assembly only do not attempt to disassemble. Failure to follow these instructions will result in damage to the differential.

Flush the differential case and gears through openings in the case with light oil.

NOTE: The ring and pinion gears are service in a matched set. Never replace the ring gear/pinion gear without replacing the other matching gear.

1. Mark pinion flange and propeller shaft for installation alignment.
2. Remove propeller shaft.
3. Remove differential from the housing.
4. Place differential case (1) on Plug (special tool #8964, Plug, Differential Bearing). Drive exciter ring (4) off the differential case with a hammer and punch (3).

NOTE: Do not remove the exciter ring if it is not being replaced.

5. Place differential case in a vise with soft metal jaw protectors.

12. Remove front pinion bearing and discard bearing.

NOTE: Do not reuse front pinion bearing/cup.

13. Remove collapsible spacer from the pinion shaft.
14. Remove rear pinion bearing (1) with Bearing Splitter (special tool #1130, Splitter, Bearing/Gear) (2) and a press.
15. Remove pinion depth shim from the pinion gear shaft and record thickness of the shims.
16. Remove front pinion bearing cup from the housing with a punch and hammer, and discard cup.

NOTE: Do not reuse front pinion bearing/cup.

17. Remove rear pinion bearing cup from the housing with a punch and hammer, if bearing is going to be replaced.

13. Rotate pinion several times to seat pinion bearings.
14. Measure Pinion Torque To Rotate (1) with an inch pound torque wrench (2). Tighten pinion nut in 6.8 N.m (5 ft. lbs.) increments until pinion torque to rotate is achieved.

    Pinion Torque To Rotate is:

    - **New Pinion Bearings:** 1.7 - 2.8 N.m (15 - 25 in. lbs.)
    - **Original Pinion Bearings:** 1.1 - 2.2 N.m (10 - 20 in. lbs.)
15. Rotate pinion several times then verify pinion rotating torque again.

19. If exciter ring was removed, position differential assembly on differential Plug (special tool #8965, Installer, Differential Bearing) and place exciter ring (1) on the differential case.
20. Install the exciter ring on the differential case evenly with a hammer and brass punch (2). Drive the ring down until it is seated against the ring gear (2).
21. Install differential in housing.
22. Measure Total Torque To Rotate (TTTR) with an inch pound torque wrench.

    Total Torque To Rotate is:

    - **New Bearings:** 3.4 - 5.6 N.m (30 - 50 in. lbs.)
    - **Original Bearings:** 2.8 - 5.1 N.m (25 - 45 in. lbs.)

    NOTE: **If TTTR is to high, back off adjusters evenly on both sides slightly and check TTTR again. If TTTR is to low, tighten adjusters evenly on both sides slightly and check TTTR again.**

23. Verify ring gear backlash and gear contact pattern.

2. Install new axle shaft gasket.
3. Slide axle shaft into the axle tube.
4. Install axle shaft flange (1) bolts (2) and tighten to 129 N.m (95 ft. lbs.).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - NOISE

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or growling sound.

Pinion bearings have a constant-pitch noise. This noise changes with vehicle speed. Pinion bearing noise will be high pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If bearing noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle turning the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joint(s).
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

NOTE: All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged), can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction

Wheel Noise	1. Wheel loose.	1. Tighten loose nuts.
	2. Worn wheel bearing.	2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube.	1. Inspect axle tube alignment. Correct as necessary.
	2. Bent or sprung axle shaft.	2. Inspect and correct as necessary.
Axle Shaft Broke	1. Misaligned axle tube.	1. Replace the broken shaft after correcting tube mis-alignment.
	2 Vehicle overloaded.	2. Replace broken shaft and avoid excessive weight on vehicle.
	3. Erratic clutch operation.	3. Replace broken shaft and avoid or correct erratic clutch operation.
	4. Grabbing clutch.	4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper adjustment of the differential bearings.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
	4. Erratic clutch operation.	4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the correct fluid type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked differential housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored yoke.	5. Replace yoke and seal.
	6. Axle cover not properly sealed.	6. Remove, clean and seal cover.

Axle Overheating	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing pre-loads too high.	3. Adjust bearing pre-loads.
	4. Insufficient ring gear backlash.	4. Adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Erratic clutch operation.	2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation.
	3. Ice-spotted pavement.	3. Replace gears and examine remaining parts for damage.
	4. Improper adjustments.	4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant.	1. Fill differential with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring gear and pinion.	4. Replace ring gear and pinion.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing pre-load.
	7. Ring gear runt-out.	7. Measure ring gear run-out. Replace components as necessary.
	8. Loose differential bearing cap bolts.	8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification.
	9. Housing not machined properly.	9. Replace housing.

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacturer's instructions. Heat components to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

1. Heat differential case bearings to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit) and install on differential with tongs or welding gloves.

CASE ASSEMBLY, DIFFERENTIAL

DESCRIPTION

DESCRIPTION

DIFFERENTIAL-OPEN

Fig. 60: Exploded View Of Differential Case
Courtesy of CHRYSLER GROUP, LLC

The differential case (1) is a two-piece design with two pinion gears (2). The differential pinion mate shaft is retained with a pin (3). Differential bearing preload and ring gear backlash are set using threaded adjusters (4).

DIFFERENTIAL-TRUETRAC®

Fig. 61: Differential & Pinion Gears

Courtesy of CHRYSLER GROUP, LLC

The Truetrac® limited slip differential (1) performs like a conventional open differential under normal conditions. When traction control is needed, gear forces from the planetary pinion gears (2) automatically apply resistance to the wheel with less traction and torque to the opposite wheel.

OPERATION

OPERATION

DIFFERENTIAL-OPEN

Fig. 62: Differential-Straight Ahead Driving
Courtesy of CHRYSLER GROUP, LLC

During straight-ahead driving (1), the differential pinion gears (2) do not rotate on the pinion mate shaft. This occurs because input torque applied to the gears is divided and distributed equally between the two side gears (3). As a result, the pinion gears revolve with the pinion mate shaft but do not rotate around it.

Fig. 63: Differential-On Turns
Courtesy of CHRYSLER GROUP, LLC

When turning corners, the outside wheel must travel a greater distance than the inside wheel to complete a turn. To accomplish this, the differential allows the axle shafts to turn at unequal speeds. In this instance, the input torque applied to the pinion gears is not divided equally. The pinion gears (1) now rotate around the pinion mate shaft in opposite directions. This allows the side gear and axle shaft attached to the outside wheel to rotate at a faster speed.

DIFFERENTIAL-TRUETRAC®

Fig. 64: Normal Torque Flow
Courtesy of CHRYSLER GROUP, LLC

When the vehicle is on a surface with equal traction to both wheels, the Truetrac® differential will supply torque flow (1) evenly to both axle.

Fig. 65: Identifying Limited Slip Torque Flow
Courtesy of CHRYSLER GROUP, LLC

When the vehicle experiences a loss of traction to either axle, the Truetrac® differential mating pinions push off each other and wedge themselves into the differential case pockets. This provides a friction force, which is applied to the axle with the loss of traction to prevent it from spinning. The majority of torque flow (1) is then transferred to the axle with traction.

ADJUSTMENTS

ADJUSTMENTS

GEAR IDENTIFICATION

Fig. 66: Gear Identification
Courtesy of CHRYSLER GROUP, LLC

Ring and pinion gears are matched parts and must be replaced as a set. Gear identification numbers are stamped on to both gears.

- Matched Gear Set Number - (1)
- Part Number - (2)
- Ring Gear Teeth - (3)
- Pinion Teeth - (4)
- Manufacturing Number - (5)

PINION BEARING PRELOAD

Fig. 67: Preload Spacer & Pinion Bearings
Courtesy of CHRYSLER GROUP, LLC

Pinon bearing preload is set using a select preload spacer (1) located between the pinion bearings (2).

Fig. 68: Measuring Pinion Torque To Rotate
Courtesy of CHRYSLER GROUP, LLC

Measure Pinion Torque To Rotate (1) (PTTR) with an inch pound torque wrench (2). Pinion torque to rotate is 2.3 - 4.5 N.m (20 - 40 in. lbs.). Pinion torque to rotate (PTTR) is measured without the pinion seal.

Spacers are available in sizes from 27.23 - 28.1 mm (1.07 - 1.10 in.). A 0.025 mm (0.001 in.) change in spacer thickness will change pinion torque to rotate approximately 3.38 mm (30 in. lbs.).

NOTE: To increase PTTR install a thinner spacer. To decreases PTTR install thicker spacer.

8. Install Adjuster (special tool #10066, Bearing Adjuster) (1) into pinion gear side differential bearing adjuster with indicator marks showing.
9. Mark first indicator mark on the bearing cap (2). Rotate adjuster clockwise until the third indicator mark is aligned with the bearing cap mark (2).

Fig. 73: Measuring Ring Gear Backlash
Courtesy of CHRYSLER GROUP, LLC

10. With Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1) measure ring gear (2) backlash. Backlash is 0.15 - 0.46 mm (0.006 - 0.018 in.). If backlash is not within specification move adjusters equally one indicator mark and check backlash again.

NOTE: **One indicator mark on Adjuster (special tool #10066, Bearing Adjuster) equals about 0.08 mm (0.003 in.) of backlash.**

11. Tighten bearing cap bolts to 190 N.m (140 ft. lbs.).
12. Recheck ring gear backlash.
13. Measure ring gear runout.

RING GEAR RUNOUT

Fig. 74: Measuring Radial Runout
Courtesy of CHRYSLER GROUP, LLC

1. Measure radial runout with dial indicator (1) plunger on top of the ring gear (2). Rotate ring gear and record the highest reading. Radial runout should not exceed 0.25 mm (0.01 in.).

Fig. 75: Measuring Lateral Runout
Courtesy of CHRYSLER GROUP, LLC

2. Measure lateral runout with dial indicator (1) plunger on the side of the ring gear (2). Rotate ring gear and record the highest reading. Lateral runout should not exceed 0.25 mm (0.01 in.).
3. Check gear contact pattern.

GEAR TOOTH CONTACT PATTERN

Fig. 76: Gear Tooth Contact Pattern
Courtesy of CHRYSLER GROUP, LLC

The gear and pinion gear tooth contact patterns will show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

Ring and pinion gear tooth description:

- Toe - (1)
- Land - (2)
- Drive Side - (3)
- Root - (4)
- Heel - (5)
- Coast Side - (6)

Paint six ring gear teeth 180 degrees apart with marking compound. Turn the gear to obtain a contact pattern.

NEW GEAR PATTERN

Fig. 77: Identifying New Gear Pattern
Courtesy of CHRYSLER GROUP, LLC

A new gear pattern should be slightly below center on the ring gear tooth with lengthwise contact up off the toe (1). Length of the pattern in an unloaded condition is approximately one-half to two-thirds of the ring gear tooth. Pattern can very in length but should cover one-half or more of the tooth face. Pattern should be evenly centered between the tooth land.

USED GEAR PATTERN

Fig. 78: Identifying Old Gear Pattern

Courtesy of CHRYSLER GROUP, LLC

A used gear pattern will normally have a pocket at the heal (1) end of ring gear. The more the gear is used the more dominate this pattern. The pattern should be evenly centered between the tooth land and root off the toe. Length and shape of the pattern are highly variable but considered acceptable as long as it does not run off the tooth. Adjust used gear sets to this same pattern or to pattern observed before disassembly.

RING GEAR ADJUSTMENT

Fig. 79: Contact Pattern Too Close To Ring Gear Toe
Courtesy of CHRYSLER GROUP, LLC

Contact pattern is too close to ring gear toe (1). Move ring gear away from pinion gear to increase backlash.

Fig. 80: Contact Pattern Too Close To Ring Gear Heel
Courtesy of CHRYSLER GROUP, LLC

Contact pattern is too close to ring gear heel (1). Move ring gear towards pinion gear to decrease backlash.

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Pinion bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service information to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any inoperative system it detects. For the proper charging system on-board diagnostic test procedures, refer to **DIAGNOSIS AND TESTING** .

MICRO 420 BATTERY TESTER

The Micro 420 automotive battery system tester is designed to help diagnose the cause of a defective battery. For directions on using the Micro 420 battery tester. Refer to **BATTERY, STANDARD PROCEDURE**.

SPECIFICATIONS

SPECIFICATIONS

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for thirty seconds at -18° C (0° F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7° C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.
- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.
- **Load Test Amperage** - The Load Test Amperage rating specifies the current (in amperes) that a battery should be tested at with the battery load test equipment. This value should always be 50 percent of the CCA. For example: if the CCA for this battery is 600 amps, the Load Test Amperage is 50 percent of that or 300 amps.

CLEANING

CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

Fig. 1: Cleaning Battery Cable Terminal Clamps
Courtesy of CHRYSLER GROUP, LLC

1. Clean the battery cable terminal clamps (2) of all corrosion. Remove any corrosion using a wire brush or a post and terminal cleaning tool (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.
2. Clean the battery tray and battery hold-down hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution. Paint any exposed bare metal.

Fig. 2: Cleaning Outside Of Battery Case

3. If the removed battery is to be reinstalled, clean the outside of the battery case (3) and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution (2) using a stiff bristle parts cleaning brush (1) to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, for the factory-installed battery specifications, refer to **SPECIFICATIONS**. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.
4. Clean the battery thermal guard with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film.

5. Clean any corrosion from the battery terminal posts with a wire brush or a post and terminal cleaner (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.

INSPECTION

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** . It is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

1. Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.
2. Inspect the battery tray and battery hold down hardware for damage. Replace any damaged parts.
3. Slide the thermal guard off of the battery case (if equipped). Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.

4. Inspect the battery thermal guard (if equipped) for tears, cracks, deformation or other damage. Replace any battery thermal guard that has been damaged.
5. If the battery is discharged, charge as required. For the proper battery charging procedures, refer to **BATTERY, STANDARD PROCEDURE**.

BATTERY

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BATTERY

MIDTRONICS GR8 BATTERY TESTER

The Midtronics GR8 battery tester is designed to help diagnose the cause of an inoperative battery. For instructions on the use of the Midtronics GR8 battery tester, refer to **BATTERY, STANDARD PROCEDURE**.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

A battery that will not accept a charge is inoperative, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is inoperative and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge. For the proper battery charging procedures, refer to STANDARD PROCEDURE.

STANDARD PROCEDURE

BATTERY CHARGING

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Midtronics (special tool #GR8-1220KIT-CHRY, AGM Battery Tester/Charger Station) tester indicates battery is OK.
- All of the battery cells are gassing freely during battery charging.
- Open-circuit voltage of the battery is 12.65 volts or above.

WARNING: Never exceed twenty amperes when charging a cold (-1° C [30° F] or lower) battery. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: If the battery shows signs of freezing, leaking, loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and/or vehicle damage may result.

WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.

WARNING: If the battery is equipped with removable cell caps, be certain that each of the cell caps is in place and tight before the battery is returned to service. Personal injury and possible vehicle damage may result from loose or missing cell caps.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to 12.65 volts or greater, perform a load test to determine the battery cranking capacity. For the proper battery load test procedures, refer to **BATTERY, STANDARD PROCEDURE**. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is inoperative and must be replaced.

Clean and inspect the battery hold-down, tray, terminals, posts, and top before completing battery service. For the proper battery system cleaning and inspection procedures, refer to **CLEANING** and **INSPECTION**.

CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the Midtronics (special tool #GR8-1220KIT-CHRY, AGM Battery Tester/Charger Station).

NOTE: **Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.**

3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is inoperative and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CHARGE RATE TABLE	
Voltage	**Hours**
16.0 volts maximum	up to 4 hours
14.0 to 15.9 volts	up to 8 hours
13.9 volts or less	up to 16 hours

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.

- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME TABLE			
Charging Amperage	**5 Amps**	**10 Amps**	**20 Amps**
Open Circuit Voltage	**Hours Charging @ 21° C (70° F)**		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

GR8 BATTERY TESTER / CHARGER

Always use the Midtronics GR8 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

WARNING: **Always wear appropriate eye protection and use extreme caution when working with batteries.**

BATTERY TESTING

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. Refer to **CLEANING**. If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.
2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. Connect the Midtronics GR8 directly to the battery posts.

NOTE: **Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.**

3. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.

4. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the test result table noted below.
5. While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

NOTE: The SERVICE CODE is required on every warranty claim submitted for battery replacement.

QUICK REFERENCE GUIDE

Inspect the battery for damages and check the electrolyte level. Always use the necessary safety precautions when working with batteries to prevent severe injury or death. Follow all manufacturers' instructions and BCI (Battery Council International) safety recommendations, which include the following precautions:

OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery. This test can be used in place of the hydrometer test when a hydrometer is not available, or for maintenance-free batteries with non-removable cell caps.

Before proceeding with this test, completely charge the battery. Refer to **BATTERY, STANDARD PROCEDURE**.

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.
2. Disconnect and isolate both battery cables, negative cable first.
3. Using a voltmeter connected to the battery posts measure the open-circuit voltage.

Refer to the Open-Circuit Voltage Table below. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater,

it may be load tested to reveal its cranking capacity. Refer to **BATTERY, STANDARD PROCEDURE**.

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	**Charge Percentage**
11.7 volts or less	0%
12.0 volts	25%
12.2 volts	50%
12.4 volts	75%
12.6 volts or more	100%

IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Totally Integrated Power Module (TIPM). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Inoperative or improperly adjusted switches.
- Inoperative or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to ten minutes. Refer to the Electronic Module Ignition-Off Draw Table for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW (IOD) TABLE			
	Time Out? (If Yes,		**IOD**

Module	Interval And Wake-Up Input)	IOD	After Time Out
Radio	No	1 to 3 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliampere	N/A
Powertrain Control Module (PCM)	No	0.95 milliampere	N/A
Cab Compartment Node (CCN)	No	0.44 milliampere	N/A

2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.
3. Turn off all electrical accessories.
4. Disconnect the battery negative cable.

WARNING: Do not open any doors, or turn on any electrical accessories. Failure to do so can result in possible serious or fatal injury.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.

5. Connect a 10 amp fused jumper wire between the negative battery cable and the negative battery post.
6. Turn the ignition key ON and then OFF and wait 10 minutes for all systems to enter sleep mode.

NOTE: Do not break the connection between the 10 amp fused jumper wire and the battery. If the connection between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.

7. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter to the battery negative cable terminal clamp and the battery negative terminal post, but not on the jumper connection.
8. Remove the 10 amp jumper wire without breaking the digital multi-meter connection.
9. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post, but not the 10 amp jumper wire.
10. The high-amperage IOD reading on the multi-meter should be very low or nonexistent, depending upon

the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the TIPM, one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information for complete TIPM, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, diagnose and repair the Charging System as necessary. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.

11. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in. Refer to 10. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or an inoperative component is the cause.

WARNING: Wear a suitable pair of rubber gloves (not the household type) when removing a battery by hand. Safety glasses should also be worn. If the battery is cracked or leaking, the electrolyte can burn the skin and eyes.

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Disconnect the battery negative cable from the battery.
3. Disconnect the battery positive cable from the battery.

4. Remove the battery thermal cover (1).
5. Remove the battery hold down retaining bolt (2) and battery hold down (3).
6. Remove the battery (4) from the battery tray.

1. Clean and inspect the battery (2). For the proper procedures, refer to **CLEANING** and **INSPECTION**.

CAUTION: Be certain that the battery cable terminal clamps are connected to the correct battery terminal posts. Reversed battery polarity may damage electrical components of the vehicle.

2. Position the battery into the battery tray. Ensure that the battery positive and negative terminal posts are correctly positioned. The battery cable terminal clamps must reach the correct battery terminal post without stretching the cables.
3. Position the battery hold down (3) and install the retaining bolt (2).
4. Clean the battery cable terminal clamps and the battery terminal posts. For the proper procedures, refer to **CLEANING**.
5. Connect the battery positive cable to the battery. Tighten to 4 N.m (35 in. lbs.).
6. Connect the battery negative cable to the battery. Tighten to 4 N.m (35 in. lbs.).
7. Apply a thin coating of petroleum jelly or chassis grease to the exposed surfaces of the battery cable terminal clamps and the battery terminal posts.
8. Obtain an appropriate scan tool and check the PCM for any stored battery disconnect trouble codes. Clear codes if required.

CABLES, BATTERY

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cables. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

TESTING

VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged and tested. Refer to **BATTERY, STANDARD PROCEDURE**.
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.

1. Connect the positive lead of the voltmeter (1) to the battery negative terminal post. Connect the negative lead of the voltmeter to the battery negative cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

NOTE: **If the vehicle is equipped with two 12v batteries, step #1 must be performed twice, once for each battery.**

DESCRIPTION

DESCRIPTION

The charging system consists of:

- Generator
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM).
- Ignition switch
- Battery. For information, refer to **BATTERY** .
- Battery temperature sensor
- Check Gauges Lamp (if equipped)
- Voltmeter. For information, refer to appropriate Electrical Diagnostic article.
- Wiring harness and connections. For information, refer to appropriate wiring information.

OPERATION

OPERATION

Fig. 1: Identifying Charging System Components
Courtesy of CHRYSLER GROUP, LLC

1 - PCM
2 - TIPM
3 - Battery

4 - Generator
5 - Feed Back Circuit B+
6 - Control Circuit
7 - Battery Sense

The charging system is turned on and off with the Powertrain Control Module (PCM) and ignition switch with engine running. The field circuit will not be energized until engine is running and ignition switch on. This voltage is connected through the PCM and supplied to one of the generator field terminals (Gen. Source B+) at the back of the generator. The generator is internally grounded. The generator regulates the field using pin-1 of the field connector (high side driver).

The generator is driven by the engine through a serpentine belt and pulley, or a decoupler pulley arrangement.

The PCM receives a voltage input from the generator (5) and also a battery voltage input (7) from the Totally Integrated Power Module (TIPM), it then compares the voltages to the desired voltage programed in the Electronic Voltage Regulator (EVR) software, and, if there is a difference it sends a signal to the generator EVR circuit to increase or decrease output. It uses a Pulse Width Modulation (PWM) to send signals to the generator circuitry to control the amount of output from the generator. The amount of DC current produced by the generator is controlled by the EVR circuitry contained within the generator.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects.

The Check Gauges Lamp (if equipped) monitors: **charging system voltage,** engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. This is done as reminder to check the three gauges. The lamp is located on the instrument panel.

Voltage is monitored at the B+ terminal stud to insure it is connected. If the B+ cable is loose, the PCM will shut down generator field. Because of this new feature, pin-2 of the field connector is internally connected to the B+ terminal.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CHARGING SYSTEM

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp (if equipped) is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on for Ignition-Off Draw Test. Refer to

IGNITION-OFF DRAW TEST .

INSPECTION

The PCM (Powertrain Control Module) monitors the critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

For Diagnostic Trouble Codes, refer to appropriate diagnostic information.

To perform a complete test of the charging system, use a diagnostic scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to **INSPECTION** .
2. Inspect the condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relays. They should be clean and tight. Repair as required.
3. Inspect all the fuses in the Totally Integrated Power Module (TIPM) for tightness in there receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect the generator mounting bolts for tightness. Replace or tighten the bolts if required. For torque specifications, refer to **SPECIFICATIONS**.
5. Inspect the generator drive belt condition and tension. Tighten or replace the belt as required. Refer to **BELT, SERPENTINE** .
6. Inspect the automatic belt tensioner (when equipped).
7. Inspect the generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check the generator ground wire connection at the engine (if equipped). They should all be clean and tight. Repair as required.

GENERATOR

DESCRIPTION

DESCRIPTION

The generator is belt-driven by the engine using a serpentine type drive belt. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced.

OPERATION

OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil. Once the generator begins producing sufficient current, it also provides the current needed to energize the rotor.

The stator winding connections deliver the induced alternating current to 3 or 6 positive and 3 or 6 negative diodes for rectification. From the diodes, rectified direct current is delivered to the vehicle electrical system through the generator battery terminal.

Although the generators appear the same externally, different generators with different output ratings are used on this vehicle. Be certain that the replacement generator has the same output rating and part number as the original unit. For amperage ratings, refer to **GENERATOR RATINGS**.

Noise emitting from the generator may be caused by: worn, loose or defective bearings; a loose or defective drive pulley; incorrect, worn, damaged or misadjusted fan drive belt; loose mounting bolts; a misaligned drive pulley or a defective stator or diode.

6. Unsnap plastic insulator cap (1) from B+ output terminal.
7. Remove B+ terminal mounting nut at rear of generator. Disconnect terminal from generator.
8. Disconnect field wire connector (3) at rear of generator by pushing on connector tab.

INSTALLATION

3.7L / 4.7L

1. Position the generator to the engine and install the two horizontal bolts and the one vertical bolt. Tighten all three bolts to 55 N.m (40 ft. lbs.).
2. Snap the field wire connector into the rear of the generator.
3. Install the B+ terminal eyelet to the generator output stud. Tighten to 12 N.m (8.8 ft. lbs.).

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt must be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to INSTALLATION .

4. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
5. Connect the negative battery cable.

5.7L

1. Position the generator to the engine and install the two mounting bolts. Tighten to 41 N.m (30 ft. lbs.).
2. Position the support bracket to the front of the generator and install the bolt and nuts. Tighten to 41 N.m (30 ft. lbs.).
3. Snap the field wire connector into the rear of the generator.
4. Install the B+ terminal eyelet to the generator output stud. Tighten mounting nut to 12 N.m (8.8 ft. lbs.).

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt must be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to BELT, SERPENTINE, INSTALLATION .

5. Install the generator drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
6. Connect the negative battery cable.

DIESEL

1. Position generator to upper and lower mounting brackets and install upper bolt and lower bolt / nut.
2. Tighten all bolts/nut to 30 ft. lbs. (41 N.m).
3. Snap field wire connector into rear of generator.
4. Install B+ terminal eyelet to generator output stud. Tighten mounting nut. Refer to **TORQUE SPECIFICATIONS - GENERATOR / CHARGING SYSTEM**.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt must be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to BELT, SERPENTINE, INSTALLATION .

5. Install generator drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
6. Install both negative battery cables to both batteries.

REGULATOR, VOLTAGE

DESCRIPTION

DESCRIPTION

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the PCM (Powertrain Control Module). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

OPERATION

OPERATION

The amount of direct current produced by the generator is controlled by EVR circuitry contained within the PCM. This circuitry is connected in series with the generators second rotor field terminal and its ground.

Voltage is regulated by cycling the battery positive path to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage (B+) and battery temperature (refer to appropriate Electrical Diagnostic article). It then determines a target charging voltage. If sensed battery voltage is 0.5 volts or lower than the target voltage, the PCM grounds the field winding until sensed battery voltage is 0.5 volts above target voltage. A circuit in the PCM cycles the battery positive (high side) of the generator field up to 400 times per second (400Hz), but has the capability to ground the field control wire 100% of the time (full field) to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 25% is used by the PCM in order to have some generator output. For additional information, refer to **OPERATION**.

DESCRIPTION

DESCRIPTION

The power distribution system for this vehicle consists of the following components:

- Totally Integrated Power Module (TIPM)
- Cigar Lighter Outlets

The power distribution system also incorporates various types of circuit control and protection devices, including:

- Automatic resetting circuit breakers
- Blade-type fuses
- Cartridge fuses
- Relays

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

For specific fuse location and types, refer to **FUSE LOCATIONS AND TYPES, SPECIFICATIONS** .

FUSE, IOD

DESCRIPTION

DESCRIPTION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is disconnected within the Totally Integrated Power Module (TIPM) when the vehicle is shipped from the factory. Dealer personnel are to reconnect the IOD fuse in the TIPM as part of the new vehicle preparation procedures and then disconnect it again until new vehicle delivery to the customer.

A laser printed fuse layout map is integral to the TIPM cover to ensure proper fuse identification. The IOD fuse is a 60 amp cartridge fuses - FMX series fuse. The fuse is secured within a white molded plastic fuse holder and puller unit that serves both as a tool for disconnecting and reconnecting the fuse in the TIPM cavity, and as a fuse holder that conveniently stores the fuse in the same cavity after it has been disconnected.

CIRCUITS INCLUDED WITH IOD FUSE

- A/C and Heater Control
- Amplifier
- Cluster (CCN)
- Compass
- Hands Free Module (HFM)
- Multifunction Switch
- Radio
- Satellite Video Module
- Underhood Lamp
- Video Screen Module

OPERATION

OPERATION

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position. The only reason the IOD fuse is disconnected is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is disconnected from Totally Integrated Power Module (TIPM) fuse cavity # J15 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that disconnecting the IOD fuse will not eliminate IOD, but only reduce this normal condition. If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged.

MODULE, POWER INVERTER

DESCRIPTION

DESCRIPTION

The inverter module is located under the front passenger seat it provides a total of 400 watts of power. The A/C outlet is mounted in the right hand side of the instrument panel center and in the back of the center floor console. The inverter module provides A/C power for user accessories. The inverter converts the 12 Volt DC

from the battery system to a 115 Volt AC output.

OPERATION

OPERATION

The AC power outlet receives 12 volts from the Totally Integrated Power Module (TIPM) and passes it as an enable signal to the inverter module. The inverter module also receives 12 volts via the TIPM and inverts this to a 115 volt AC output. The enable signal received from the power outlet enables the inverter to convert the received voltage and pass it to the power outlet to power external devices.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INVERTER MODULE

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

MODULE, TOTALLY INTEGRATED POWER (TIPM)

DESCRIPTION

DESCRIPTION

The Totally Integrated Power Module (TIPM) is a combination unit that performs the functions of the Power Distribution Center (PDC) and the Front Control Module. The TIPM is a printed circuit board based module that contains fuses, internal relays and a microprocessor that performs the functions previously executed by the FCM. The TIPM is located in the engine compartment, next to the battery and connects directly to the B+ cable via a stud located on top of the unit. The ground connection is via electrical connectors. The TIPM provides the primary means of voltage distribution and protection for the entire vehicle.

The molded plastic TIPM housing includes a base and cover. The TIPM cover is easily opened or removed for service and has a fuse and relay layout map integral to the inside surface of the cover. The TIPM housing base and cover are secured in place via mounting tabs. The mounting tabs secure the TIPM to the TIPM mounting bracket.

OPERATION

OPERATION

All of the current from the battery and the generator output enters the Totally Integrated Power Module (TIPM) via a stud on the top of the module. The TIPM cover is removed to access the fuses or relays. Internal connections of all of the power distribution center circuits are accomplished by a combination of bus bars and a printed circuit board.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices, and grounds.

OUTLET, POWER, 12 V

DESCRIPTION

DESCRIPTION

A cigar lighter outlet is installed to the left of the center stack area in the lower instrument panel. The cigar lighter outlet is secured by a snap fit within the bezel.

The cigar lighter outlet, plastic cap and the knob and heating element unit are available for service replacement. These components cannot be repaired and, if inoperative or damaged, they must be replaced.

OPERATION

OPERATION

The cigar lighter consists of two major components: a knob and heating element unit, and the cigar lighter base or outlet shell. The receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The cigar lighter receives battery voltage from a fuse in the Integrated Power Module (IPM) when the ignition switch is in the Accessory or Run positions.

The cigar lighter knob and heating element are encased within a spring-loaded housing, which also features a sliding protective heat shield. When the knob and heating element are inserted in the outlet shell, the heating element resistor coil is grounded through its housing to the outlet shell. If the cigar lighter knob is pushed inward, the heat shield slides up toward the knob exposing the heating element, and the heating element extends from the housing toward the insulated contact in the bottom of the outlet shell.

Two small spring-clip retainers are located on either side of the insulated contact inside the bottom of the outlet shell. These clips engage and hold the heating element against the insulated contact long enough for the resistor coil to heat up. When the heating element is engaged with the contact, battery current can flow through the resistor coil to ground, causing the resistor coil to heat.

When the resistor coil becomes sufficiently heated, excess heat radiates from the heating element causing the spring-clips to expand. Once the spring-clips expand far enough to release the heating element, the spring-loaded housing forces the knob and heating element to pop back outward to their relaxed position. When the cigar lighter knob and element are pulled out of the outlet shell, the protective heat shield slides downward on the housing so that the heating element is recessed and shielded around its circumference for safety.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CIGAR LIGHTER OUTLET

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Check the fused B(+) fuse in the Integrated Power Module (IPM). If OK, go to 2. If not OK, repair the

shorted circuit or component as required and replace the inoperative fuse.

2. Turn the ignition switch to the Run position. Check for battery voltage at the fused B(+) fuse in the IPM. If OK, go to 3. If not OK, repair the open or short as required.
3. Remove the cigar lighter knob and element from the cigar lighter outlet shell. Check for continuity between the inside circumference of the cigar lighter outlet shell and a good ground. there should be continuity. If OK, go to 4. If not OK, go to 5.
4. Turn the ignition switch to the Run position. Check for battery voltage at the insulated contact located at the back of the cigar lighter outlet shell. If OK, replace the inoperative cigar lighter knob and element. If not OK, go to 5.
5. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the cigar lighter wire harness connector and a good ground. There should be continuity. If OK, go to 6. If not OK, repair the open ground circuit to ground as required.
6. Connect the battery negative cable. Turn the ignition switch to the Accessory or Run positions. Check for battery voltage at the fused B(+) circuit cavity of the cigar lighter wire harness connector. If OK, replace the inoperative cigar lighter outlet. If not OK, repair the open fused B(+) circuit to the IPM fuse as required.

OUTLET, POWER, 115 V

DESCRIPTION

DESCRIPTION

Fig. 19: View Of Center Floor Console Rear Trim Panel
Courtesy of CHRYSLER GROUP, LLC

The 115 Volt AC outlet (3) is mounted in the rear of the center floor console (2). The vehicle is able to supply 115 Volt AC power through the use of a inverter module. The inverter module is located under the right rear seat cushion. The inverter converts the 12 Volt DC from the vehicle battery system to a 115 Volt AC output.

Fig. 20: Instrument Panel Switch Pods
Courtesy of CHRYSLER GROUP, LLC

The inverter module provides A/C power for user accessories when the 115 Volt AC outlet switch (4) in the instrument panel center stack is in the "ON" position. The outlet switch is part of the instrument panel upper switch pod assembly and is not available for service as an individual part. If the switch is damaged or inoperative the complete upper switch pod assembly must be replaced. For the appropriate procedure, refer to **POD, SWITCH, REMOVAL** .

OPERATION

OPERATION

The 115 volt AC power outlet switch receives 12 volts from the Totally Integrated Power Module (TIPM) and passes it as an enable signal to the inverter module. The inverter module also receives 12 volts via the TIPM and inverts this to a 115 volt AC output. The enable signal received from the power outlet switch enables the inverter to convert the received voltage and pass it to the power outlet to power external devices.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - 115 V POWER OUTLET

WARNING: **Be sure to utilize the proper safety gloves rated at least at a 00 rating when working on any high voltage system. Failure to do so may result in serious or fatal injury.**

Proper use and care of rubber insulating gloves and sleeves are essential to user safety. Do not wear rings, watches, jewelry and sharp objects on your hands or arms, they will cause damage to the rubber gloves and sleeves.

NOTE: **Before attempting any repair on a inverter circuits, check for Diagnostic Trouble Codes with the scan tool.**

NOTE: **B (+) range must be with 11.5 V DC to 16 V DC for inverter operation.**

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Check the fused B (+) fuse in the Integrated Power Module (TIPM). If OK, go to 2. If not OK, repair the shorted circuit or component as required and replace the inoperative fuse.
2. Remove the instrument panel center bezel, disconnect the connector from the back of the 115 V power outlet. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL** . Turn the ignition switch to the RUN position and press the inverter ON switch. Switch the multi-meter from D/C to A/C and check for 115 V at pin 1 and pin 4 in the harness connector. If OK, go to 3. If not OK, repair the open or short as required.
3. Replace the 115 V power outlet. Refer to **OUTLET, POWER, 115 V, REMOVAL**.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL** .
3. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, release the 115 V power outlet from the retaining clips and remove from the instrument panel center bezel.

INSTALLATION

INSTALLATION

1. Install the 115 V power outlet into the instrument panel center bezel.
2. Install the instrument panel center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, INSTALLATION** .
3. Connect the battery negative cable.

OUTLET, POWER, CONSOLE

DESCRIPTION

DESCRIPTION

Two power outlets are utilized on this model. One in the instrument panel center lower bezel and the other in

the center console. The power outlet bases are secured by a snap fit within the instrument panel or trim panel. A plastic protective cap snaps into the power outlet base when the power outlet is not being used, and hangs from the power outlet base mount by an integral bail strap while the power outlet is in use.

The power outlet receptacle unit and the accessory power outlet protective cap are available for service. The power outlet receptacle cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION

OPERATION

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the integrated power module at all times.

While the power outlet is very similar to a cigar lighter base unit, it does not include the two small spring-clip retainers inside the bottom of the receptacle shell that are used to secure the cigar lighter heating element to the insulated contact.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER OUTLET

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Check the fused B(+) fuse in the Integrated Power Module (IPM). If OK, go to 2. If not OK, repair the shorted circuit or component as required and replace the inoperative fuse.
2. Turn the ignition switch to the Run position. Check for battery voltage at the fused B(+) fuse in the IPM. If OK, go to 3. If not OK, repair the open or short as required.
3. Remove the cigar lighter knob and element from the cigar lighter outlet shell. Check for continuity between the inside circumference of the cigar lighter outlet shell and a good ground. there should be continuity. If OK, go to 4. If not OK, go to 5.
4. Turn the ignition switch to the Run position. Check for battery voltage at the insulated contact located at the back of the cigar lighter outlet shell. If OK, replace the inoperative cigar lighter knob and element. If not OK, go to 5.
5. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the cigar lighter wire harness connector and a good ground. There should be continuity. If OK, go to 6. If not OK, repair the open ground circuit to ground as required.
6. Connect the battery negative cable. Turn the ignition switch to the Accessory or Run positions. Check for battery voltage at the fused B(+) circuit cavity of the cigar lighter wire harness connector. If OK, replace the inoperative cigar lighter outlet. If not OK, repair the open fused B(+) circuit to the IPM fuse as required.

OPERATION

OPERATION

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

The cooling system also provides a source of hot coolant for heating the passenger compartment and cooling the automatic transmission fluid (if equipped). The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

- When engine is cold the thermostat is closed. The cooling system has no flow through the radiator. The coolant flows through the engine, water pump, and heater.
- When engine is warm the thermostat is full open. One the gas engine coolant flows through the engine, radiator, heater, and water pump.

All engines utilize an ambient overflow bottle for coolant recovery/reserve.

An optional factory installed maximum duty cooling package is available on most models. This package will provide additional cooling capacity for vehicles used under extreme conditions such as trailer towing in high ambient temperatures.

DIAGNOSIS AND TESTING

PRELIMINARY CHECKS

ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- Prolonged idle
- Very high ambient temperature

- Overloaded Truck
- Slow traffic
- Traffic jams
- High speed or steep grades
- Snow Plow restricting airflow through cooling module
- Debris on front of the grill or the cooling module that is restricting airflow

Driving techniques that avoid overheating are:

- Idle with A/C off when temperature gauge is at end of normal range.
- Increasing engine speed up to 2000 rpm with transmission in park or neutral for more airflow is recommended.
- If equipped with a snow plow. Activate the **snow plow** mode.

TRAILER TOWING:

Consult Trailer Towing section of the owners manual. Do not exceed the limits.

RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may affect the cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt(s)
- Brakes (possibly dragging)
- Changed parts. Incorrect water pump or pump rotating in wrong direction due to belt not correctly routed
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).
- Service to electrically controlled viscous fan clutch

NOTE: **If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to COOLING SYSTEM DIAGNOSIS CHART.**

These charts are to be used as a quick-reference only.

HEAT ODOR	1. Damaged or missing exhaust system heat shields.	1. Repair or replace damaged or missing exhaust system heat shields. Refer to **SHIELD, HEAT, DESCRIPTION** .
	2. Electronically controlled viscous fan drive//mechanical viscous fan damaged.	2. Check viscous fan drive.

LEAK TESTING

ULTRAVIOLET LIGHT METHOD

Fig. 4: Identifying Ultraviolet Light Method
Courtesy of CHRYSLER GROUP, LLC

1 - TYPICAL BLACK LIGHT TOOL

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light) (1). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate the engine until the radiator upper hose is warm to the touch. Aim the commercially available black light tool at the components to be checked. If leaks are present, the black light will cause the additive to glow a bright green color.

The black light can be used in conjunction with a pressure tester to determine if any external leaks exist.

PRESSURE TESTER METHOD

The engine should be at normal operating temperature. Recheck the system cold if the cause of coolant loss is not located during the warm engine examination.

> WARNING: **Hot, pressurized coolant can cause injury by scalding.**

Carefully remove the radiator pressure cap from the filler neck and check the coolant level. Push down on the cap to disengage it from the stop tabs. Wipe the inside of the filler neck and examine the lower inside sealing seat for nicks, cracks, paint, dirt and solder residue. Inspect the radiator-to- reserve/overflow tank hose for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect the cams on the outside of the filler neck. If the cams are damaged, seating of the pressure cap valve and tester seal will be affected.

Attach pressure tester ((special tool #7700, Tester, Cooling System) or an equivalent) to radiator filler neck.

Operate the tester pump to apply 103.4 kPa (15 psi) pressure to the system. If the hoses enlarge excessively or bulges while testing, replace as necessary. Observe the gauge pointer and determine the condition of the cooling system according to following criteria:

Holds Steady: If the pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform Internal Leakage Test. Refer to **INTERNAL LEAKAGE INSPECTION**.

Drops Slowly: Indicates a small leak or seepage is occurring. Examine all of the connections for seepage or slight leakage with a flashlight. Inspect the radiator, hoses, gasket edges and heater. Seal the small leak holes with a Sealer Lubricant (or equivalent). Repair the leak holes and inspect the system again with pressure applied.

Drops Quickly: Indicates that serious leakage is occurring. Examine the system for external leakage. Block side panels are embossed to highlight core plugs. Remove embossed noise panels to inspect and or repair core plugs. If leaks are not visible, inspect for internal leakage.

INTERNAL LEAKAGE INSPECTION

Remove the engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil. An alternative method is to operate engine for a short period to churn the oil. After this is done, remove the engine dipstick and inspect for water globules. Also inspect the transmission dipstick for water globules and transmission fluid cooler for leakage.

> WARNING: **With radiator pressure tester tool installed on radiator, do not allow pressure to exceed 145 kpa (21 psi). Pressure will build up quickly if a combustion leak is present. To release pressure, rock tester from side to side. When removing tester, do not turn tester more than 1/2 turn if**

system is under pressure.

Operate the engine without the pressure cap on the radiator until the thermostat opens. Attach a Pressure Tester to the filler neck. If pressure builds up quickly it indicates a combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.

If there is not an immediate pressure increase, pump the Pressure Tester. Do this until indicated pressure is within system range of 110 kPa (16 psi). Fluctuation of the gauge pointer indicates compression or combustion leakage into cooling system.

Because the vehicle is equipped with a catalytic converter, **do not** short out cylinders to isolate compression leak.

If the needle on dial of the pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.

COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

WARNING: **Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.**

Drain sufficient coolant to allow thermostat removal. Refer to **THERMOSTAT, REMOVAL**. Remove accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.

Add coolant to radiator to bring level to within 6.3 mm (1/4 in) of the top of the thermostat housing.

CAUTION: **Avoid overheating. Do not operate engine for an excessive period of time. Open draincock immediately after test to eliminate boil over.**

Start engine and accelerate rapidly three times, to approximately 3000 rpm while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

STANDARD PROCEDURE

CLEANING/REVERSE FLUSHING

CLEANING

Drain the cooling system and refill with water. Run the engine with the radiator cap installed until the upper radiator hose is hot. Stop the engine and drain the water from system. If the water is dirty, fill the system with water, run the engine and drain the system. Repeat this procedure until the water drains clean.

REVERSE FLUSHING

Reverse flushing of the cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

REVERSE FLUSHING RADIATOR

Disconnect the radiator hoses from the radiator inlet and outlet. Attach a section of the radiator hose to the radiator bottom outlet fitting and insert the flushing gun. Connect a water supply hose and air supply hose to the flushing gun.

CAUTION: Internal radiator pressure must not exceed 138 kPa (20 psi) as damage to radiator may result.

Allow the radiator to fill with water. When the radiator is filled, apply air in short blasts. Allow the radiator to refill between blasts. Continue this reverse flushing until clean water flows out through the rear of the radiator cooling tube passages.

REVERSE FLUSHING ENGINE

Drain the cooling system. Remove the thermostat housing and thermostat. Install the thermostat housing. Disconnect the radiator upper hose from the radiator and attach the flushing gun to the hose. Disconnect the radiator lower hose from the water pump and attach a lead-away hose to the water pump inlet fitting.

CAUTION: On vehicles equipped with a heater water control valve, be sure the heater control valve is closed (heat off). This will prevent coolant flow with scale and other deposits from entering the heater core.

Connect the water supply hose and air supply hose to flushing gun. Allow the engine to fill with water. When the engine is filled, apply air in short blasts, allowing the system to fill between air blasts. Continue until clean water flows through the lead away hose.

Remove the lead away hose, flushing gun, water supply hose and air supply hose. Remove the thermostat housing and install the thermostat. Install the thermostat housing with a replacement gasket. Refer to **INSTALLATION**. Connect the radiator hoses. Refill the cooling system with the correct antifreeze/water mixture. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** .

CHEMICAL CLEANING

In some instances, use a radiator cleaner (Mopar® Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid flushing operation.

CAUTION: Follow manufacturers instructions when using these products.

DRAINING

Fig. 5: Identifying Cylinder Block Drain Plugs
Courtesy of CHRYSLER GROUP, LLC

1 - CYLINDER BLOCK DRAIN PLUG
2 - EXHAUST MANIFOLD AND HEAT SHIELD

WARNING: **Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.**

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Attach one end of a hose to the draincock. Put the other end into a clean container.
2. **DO NOT REMOVE THE RADIATOR CAP** when draining the coolant from the reservoir/overflow tank. Open radiator draincock and when the tank is empty, remove the radiator cap and continue draining the cooling system.
3. If draining the entire engine, remove the cylinder block drain plugs (1).

STANDARD PROCEDURE - COOLANT AIR EVACUATION

Fig. 6: Pressurized Air Operated Vacuum Generator
Courtesy of CHRYSLER GROUP, LLC

Evacuating or purging air from the cooling system involves the use of a pressurized air operated vacuum generator. The vacuum created allows for a quick and complete coolant refilling while removing any airlocks present in the system components.

NOTE: **To avoid damage to the cooling system, ensure that no component would be susceptible to damage when a vacuum is drawn on the system.**

WARNING: **ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE; PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED; PERSONAL INJURY CAN RESULT.**

WARNING: **WEAR APPROPRIATE EYE AND HAND PROTECTION WHEN PERFORMING THIS PROCEDURE.**

NOTE: **The service area where this procedure is performed should have a minimum shop air requirement of 80 PSI (5.5 bar) and should be equipped with an air**

dryer system.

NOTE: **For best results, the radiator should be empty. The vehicle's heater control should be set to the heat position (ignition may need to be turned to the on position but do not start the motor).**

1. Refer to the Chrysler Pentastar Service Equipment (Chrysler PSE) Coolant Refiller #85-15-0650 or equivalent tool's operating manual for specific assembly steps.
2. Choose an appropriate adapter cone that will fit the vehicle's radiator filler neck or reservoir tank.
3. Attach the adapter cone (2) to the vacuum gauge (1).

Fig. 7: Vacuum Generator/Venturi Ball Valve
Courtesy of CHRYSLER GROUP, LLC

4. Make sure the vacuum generator/venturi ball valve (3) is closed and attach an airline hose (2) (minimum shop air requirement of 80 PSI/5.5 bar) to the vacuum generator/venturi (1).
5. Position the adaptor cone/vacuum gauge assembly into the radiator filler neck or reservoir tank. Ensure that the adapter cone is sealed properly.

Fig. 8: Vacuum Generator/Venturi
Courtesy of CHRYSLER GROUP, LLC

6. Connect the vacuum generator/venturi (2) to the positioned adaptor cone/vacuum gauge assembly (1).
7. Open the vacuum generator/venturi ball valve.

NOTE: **Do not bump or move the assembly as it may result in loss of vacuum. Some radiator overflow hoses may need to be clamped off to obtain vacuum.**

8. Let the system run until the vacuum gauge shows a good vacuum through the cooling system. Refer to the tool's operating manual for appropriate pressure readings.

NOTE: **If a strong vacuum is being created in the system, it is normal to see the radiator hoses to collapse.**

9. Close the vacuum generator/venturi ball valve.

Fig. 9: Vacuum Generator/Venturi & Air Line
Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the vacuum generator/venturi and airline from the adaptor cone/vacuum gauge assembly.
11. Wait approximately 20 seconds, if the pressure readings do not move, the system has no leaks. If the pressure readings move, a leak could be present in the system and the cooling system should be checked for leaks and the procedure should be repeated.
12. Place the tool's suction hose into the coolant's container.

NOTE: **Ensure there is a sufficient amount of coolant, mixed to the required strength/protection level available for use. For best results and to assist the refilling procedure, place the coolant container at the same height as the radiator filler neck. Always draw more coolant than required. If the coolant level is too low, it will pull air into the cooling system which could result in airlocks in the system.**

13. Connect the tool's suction hose (1) to the adaptor cone/vacuum gauge assembly (2).

Fig. 10: Refilling Cooling System
Courtesy of CHRYSLER GROUP, LLC

14. Open the suction hose's ball valve to begin refilling the cooling system.
15. When the vacuum gauge reads zero, the system is filled.

NOTE: On some remote pressurized tanks, it is recommended to stop filling when the proper level is reached.

16. Close the suction hose's ball valve and remove the suction hose from the adaptor cone/vacuum gauge assembly.
17. Remove the adaptor cone/vacuum gauge assembly from the radiator filler neck or reservoir tank.
18. With heater control unit in the HEAT position, operate engine with container cap in place.
19. After engine has reached normal operating temperature, shut engine off and allow it to cool. When engine is cooling down, coolant will be drawn into the radiator from the pressure container.
20. Add coolant to the recovery bottle/container as necessary. **Only add coolant to the container when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.** Add necessary coolant to raise container level to the COLD MINIMUM mark after each cool down period.
21. Once the appropriate coolant level is achieved, attach the radiator cap or reservoir tank cap.

DRAINING - DIESEL ENGINE

WARNING: Do not remove the cylinder block drain plugs or loosen the radiator drain plug with system hot and under pressure. Serious burns from coolant can occur.

DO NOT WASTE reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

1. Start the engine and place the heater control temperature selector in the Full-On position.

2. Turn the ignition off.
3. Do not remove radiator cap when draining coolant from coolant recovery container. Open radiator drain plug and when coolant recovery container is empty, remove radiator cap. If the coolant recovery container does not drain. Refer to **DIAGNOSIS AND TESTING**.
4. Remove radiator pressure cap.

STANDARD PROCEDURE - FILLING

WARNING: ANTIFREEZE COOLANT IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE; PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN AND OTHER MOVING COMPONENTS WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED; PERSONAL INJURY CAN RESULT.

WARNING: WEAR APPROPRIATE EYE AND HAND PROTECTION WHEN PERFORMING THIS PROCEDURE.

CAUTION: Do not use well water or suspect water supply in cooling system. A 50/50 mixture of the recommended antifreeze coolant and distilled water is recommended.

NOTE: Cooling system fill procedure is critical to overall cooling system performance.

NOTE: Make sure all hoses are connected and radiator draincock is closed. Draincock should be hand tightened only.

6.7L

CAUTION: All air must be purged from the 6.7L engine when refilling the cooling system. Failure to do so can cause EGR Cooler cracking which can lead to catastrophic engine and exhaust system damage.

Fig. 11: Vent Fitting
Courtesy of CHRYSLER GROUP, LLC

1. Close radiator drain plug.
2. Remove the vent fitting (1) located near the EGR cooler (2).
3. If using funnel 8195:
    1. Remove cooling system pressure cap. Attach Filling Aid Funnel (special tool #8195, Funnel), to coolant pressure container filler neck.
    2. Use the supplied clip to pinch overflow hose.
    3. Pour coolant into the larger section of Filling Aid Funnel (the smaller section of funnel is to allow air to escape).
    4. Continue filling until a steady stream of coolant flows from the vent hole.
    5. Install vent fitting when coolant is free of bubbles.
    6. Tighten the bleed plug to 6 N.m (55 in. lbs.).
    7. Remove clip from overflow hose.
    8. Allow coolant in Filling Aid Funnel to drain into overflow chamber of pressure container.
    9. Remove Filling Aid Funnel. (special tool #8195, Funnel)
    10. Install the pressure cap.

NOTE: **The diesel engine is equipped with two one-way check valves (jiggle pins). The check valves are used as a servicing feature and will vent air when the system is being filled. Water pressure (or flow) will hold the valves closed.**

Fig. 12: Locating Funnel, Locking Ring, Fitting Extension & Stopper
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The 8195A does not require pinching off the overflow hose. The adapter seal prevents liquid from entering the overflow during coolant fill.**

4. If using Special Tool 8195A:
    1. Select the appropriate fitting extension (3) and locking ring (2) and attach to the fill neck of the cooling system.
    2. Make sure the adapter seal fits firmly against the inside of the fill neck base to ensure a good seal. After the extension and locking ring are installed, make sure the extension can not be moved. This will confirm a good seal.
    3. Attach the funnel (1) to the extension (1) and fill with coolant.
    4. Add coolant to the funnel. Continue to add coolant until a steady stream of coolant flows from the vent hole.
    5. Install the vent fitting when coolant is free of bubbles.
    6. Tighten the vent fitting to 6 N.m (55 in. lbs.).
    7. Install the stopper (4) into the funnel base. The stopper will prevent the fluid that is left in the

funnel from spilling out when separated from the extension.

8. Remove the funnel, extension and locking ring and install the cap.

5. Start and operated the engine. Take the vehicle on a test drive till operating temperature is reached. Shut the engine down and wait till engine is cool.
6. Slowly loosen vent fitting (1) to purge any trapped air. If air is still present. Repeat step 3 - 5.
7. Check coolant level in coolant recovery container. Fill to FULL line.
8. The volume of coolant added to the engine must be within 1.5 quarts of the volume drained. If this requirement has not been met, repeat steps 2 - 9.
9. Remove Tool. Install radiator cap.

5.9L

NOTE: **The diesel engine is equipped with two one-way check valves (jiggle pins). The check valves are used as a servicing feature and will vent air when the system is being filled. Water pressure (or flow) will hold the valves closed.**

Clean cooling system prior to refilling. Refer to **STANDARD PROCEDURE**.

1. Close radiator drain plug.

2. If using funnel 8195:
    1. Remove cooling system pressure cap. Attach Filling Aid Funnel (special tool #8195, Funnel), to coolant pressure container filler neck.
    2. Use the supplied clip to pinch overflow hose.
    3. Pour coolant into the larger section of Filling Aid Funnel (the smaller section of funnel is to allow air to escape).
    4. Add coolant until some coolant remains in the funnel and no more air bubbles appear in the fluid.
    5. Remove clip from overflow hose.
    6. Allow coolant in Filling Aid Funnel to drain into overflow chamber of pressure container.
    7. Remove Filling Aid Funnel. (special tool #8195, Funnel)
    8. Install the pressure cap.

Fig. 14: Locating Funnel, Locking Ring, Fitting Extension & Stopper

NOTE: **The 8195A does not require pinching off the overflow hose. The adapter seal prevents liquid from entering the overflow during coolant fill.**

3. If using Special Tool 8195A:
    1. Select the appropriate fitting extension (3) and locking ring (2) and attach to the fill neck of the cooling system.
    2. Make sure the adapter seal fits firmly against the inside of the fill neck base to ensure a good seal. After the extension and locking ring are installed, make sure the extension can not be moved. This will confirm a good seal.
    3. Attach the funnel (1) to the extension (3) and fill with coolant.
    4. Add coolant to the funnel.

       Continue to add coolant until it is free of bubbles.

    5. Install the stopper (4) into the funnel base. The stopper will prevent the fluid that is left in the funnel from spilling out when separated from the extension.
    6. Remove the funnel, extension and locking ring and install the cap.
4. Fill coolant recovery container to the FULL mark.
5. Start and operate engine until thermostat opens. Upper radiator hose should be warm to touch.
6. Accelerate engine from idle to 2500 RPM five times.
7. Shut off engine. Allowing cooling system to settle. Fill coolant recovery container to FULL line.
8. Start and operate engine. Take vehicle for a test drive till operating temperature is reached.
9. Shut off engine. Allow engine to cool. Fill coolant recovery container to FULL line.
10. The volume of coolant added to the engine must be within 1.5 quarts of the volume drained. If this requirement has not been met, repeat steps 1 - 13.
11. Install radiator cap.

ACCESSORY DRIVE

BELT, SERPENTINE

DESCRIPTION

DESCRIPTION

The accessory drive belt is a serpentine type belt. Satisfactory performance of these belts depends on belt condition and proper belt tension.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SERPENTINE BELT

VISUAL DIAGNOSIS

When diagnosing serpentine accessory drive belts, small cracks that run across the ribbed surface of the belt from rib to rib, are considered normal. These are not a reason to replace the belt. However, cracks running along

a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace the belt if it has excessive wear, frayed cords or severe glazing.

for further belt diagnosis. Refer to **ACCESSORY DRIVE BELT DIAGNOSIS CHART**.

NOISE DIAGNOSIS

Fig. 15: Belt Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

1 - NORMAL CRACKS BELT OK
2 - NOT NORMAL CRACKS REPLACE BELT

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to resolve a noise condition, inspect all of the accessory drive pulleys for alignment, glazing, or excessive end play.

ACCESSORY DRIVE BELT DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
RIB CHUNKING (One or more ribs has separated from belt body)	1. Foreign objects imbedded in pulley grooves.	1. Remove foreign objects from pulley grooves. Replace belt.
	2. Installation damage.	2. Replace belt.
RIB OR BELT WEAR	1. Pulley misaligned.	1. Align pulley(s).
	2. Abrasive environment.	2. Clean pulley(s). Replace belt if necessary.
	3. Rusted pulley(s).	3. Clean rust from pulley(s).
	4. Sharp or jagged pulley groove tips.	4. Replace pulley. Inspect belt.

	5. Belt rubber deteriorated.	5. Replace belt.
BELT SLIPS	1. Belt slipping because of insufficient tension.	1. Inspect/Replace tensioner if necessary.
	2. Belt or pulley exposed to substance that has reduced friction (belt dressing, oil, ethylene glycol).	2. Replace belt and clean pulleys.
	3. Driven component bearing failure (seizure).	3. Replace faulty component or bearing.
	4. Belt glazed or hardened from heat and excessive slippage.	4. Replace belt.
LONGITUDAL BELT CRACKING	1. Belt has mistracked from pulley groove.	1. Replace belt.
	2. Pulley groove tip has worn away rubber to tensile member.	2. Replace belt.
"GROOVE JUMPING" (Belt does not maintain correct position on pulley)	1. Incorrect belt tension.	1. Inspect/Replace tensioner if necessary.
	2. Pulley(s) not within design tolerance.	2. Replace pulley(s).
	3. Foreign object(s) in grooves.	3. Remove foreign objects from grooves.
	4. Pulley misalignment.	4. Align component.
	5. Belt cordline is broken.	5. Replace belt.
BELT BROKEN (Note: Identify and correct problem before new belt is installed)	1. Incorrect belt tension.	1. Replace Inspect/Replace tensioner if necessary.
	2. Tensile member damaged during belt installation.	2. Replace belt.
	3. Severe misalignment.	3. Align pulley(s).
	4. Bracket, pulley, or bearing failure.	4. Replace defective component and belt.
NOISE (Objectionable squeal, squeak, or rumble is heard or felt while drive belt is in operation)	1. Incorrect belt tension.	1. Inspect/Replace tensioner if necessary.
	2. Bearing noise.	2. Locate and repair.
	3. Belt misalignment.	3. Align belt/pulley(s).
	4. Belt to pulley mismatch.	4. Install correct belt.
	5. Driven component induced vibration.	5. Locate defective driven component and repair.
TENSION SHEETING FABRIC FAILURE (Woven fabric on outside, circumference of belt has cracked or separated from body of belt)	1. Tension sheeting contacting stationary object.	1. Correct rubbing condition.
	2. Excessive heat causing woven fabric to age.	2. Replace belt
	3. Tension sheeting splice has fractured.	3. Replace belt.
CORD EDGE FAILURE	1. Incorrect belt tension.	1. Inspect/Replace tensioner if

(Tensile member exposed at edges of belt or separated from belt body)		necessary.
	2. Belt contacting stationary object.	2. Replace belt.
	3. Pulley(s) out of tolerance.	3. Replace pulley.
	4. Insufficient adhesion between tensile member and rubber matrix.	4. Replace belt.

1. Insert a suitable square drive ratchet into the square hole on belt tensioner arm (7).
2. Release the belt tension by rotating the tensioner (7)**clockwise** . Rotate the belt tensioner (7) until the accessory belt (4) can be removed from pulleys (1, 2, 3, 5, 6, 8).

CAUTION: Do not let the tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

3. Remove the accessory belt (4).
4. Gently release the tensioner (7).

1. Check condition of all pulleys.

CAUTION: When installing the serpentine accessory drive belt, the belt MUST be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

NOTE: When installing accessory drive belt onto pulleys, make sure that belt is properly routed and all V-grooves make proper contact with pulleys.

2. Position accessory drive belt around all pulleys except the idler pulley.
3. Rotate the tensioner arm until it contacts it's stop position. Route the belt around the idler and slowly release tensioner rotate into accessory drive belt. Make sure the belt is seated onto all pulleys.

TENSIONER, BELT

DESCRIPTION

DESCRIPTION

Fig. 27: Identifying Automatic Belt Tensioner

1 - AUTOMATIC TENSIONER ASSEMBLY

Correct drive belt tension is required to ensure optimum performance of the belt driven engine accessories. If specified tension is not maintained, belt slippage may cause; engine overheating, lack of power steering assist, loss of air conditioning capacity, reduced generator output rate, and greatly reduced belt life.

It is not necessary to adjust belt tension. All engines are equipped with an automatic belt tensioner. The tensioner maintains correct accessory drive belt tension at all times.

On 3.7L and 4.7L engines, the accessory drive belt tensioner is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new accessory drive belt is being installed, tang must be within approximately 24 mm (.94 inches) of indexing stop. Belt is considered new if it has been used 15 minutes or less.

1. Remove accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.

WARNING: Because of high spring pressure, do not attempt to disassemble automatic tensioner. Unit is serviced as an assembly.

2. Remove tensioner (3) assembly from timing chain cover.

BOTTLE, COOLANT RECOVERY

DESCRIPTION

DESCRIPTION

Fig. 34: Coolant Recovery/Overflow Bottle

The coolant recovery/overflow bottle (2) is mounted on the front of the radiator support and behind the grille. The coolant recovery/overflow bottle (2) is made of high temperature plastic.

OPERATION

OPERATION

Fig. 35: Coolant Recovery/Overflow Bottle
Courtesy of CHRYSLER GROUP, LLC

The coolant recovery/overflow bottle (2) works in conjunction with the radiator pressure cap. It utilizes thermal expansion and contraction of coolant to keep coolant free of trapped air. It provides a volume for expansion and contraction of coolant. It also provides a convenient and safe method for checking coolant level and adjusting level at atmospheric pressure. This is done without removing the radiator pressure cap. The system also

provides some reserve coolant to the radiator to cover minor leaks and evaporation or boiling losses.

As the engine cools, a vacuum is formed in the cooling system of both the radiator and engine. Coolant will then be drawn from the coolant recovery/overflow bottle (2) and returned to a proper level in the radiator.

REMOVAL

3.7L/4.7L/5.7L ENGINE

1. Remove the exterior grille. Refer to **GRILLE, REMOVAL** .
2. Partially drain the cooling system using the draincock only. Refer to **STANDARD PROCEDURE**.

NOTE: DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

3. Drain system below the level of the coolant recovery pressure container.
4. Remove the recovery hose (1) from the radiator.
5. Remove the coolant recovery bottle (2) to radiator support mounting bolts.
6. Disengage the coolant recovery bottle (2) mounting pins located on the radiator support side by pulling the assembly straight up.
7. Remove the coolant recovery bottle (1).

CAP, RADIATOR

DESCRIPTION

DESCRIPTION

Fig. 40: Radiator Cap
Courtesy of CHRYSLER GROUP, LLC

1 - FILLER NECK SEAL
2 - VACUUM VENT VALVE
3 - PRESSURE RATING
4 - PRESSURE VALVE

All cooling systems are equipped with a pressure cap. For all engines, the pressure cap is located on top of the radiator outlet tank. The cap releases pressure at some point within a range of 97-to-124 kPa (14-to-18 psi). The pressure relief point (in pounds) is engraved on top of the cap

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap contains a spring-loaded pressure relief valve. This valve opens when system pressure reaches the release range of 97-to-124 kPa (14-to-18 psi).

A rubber gasket seals the radiator filler neck. This is done to maintain vacuum during coolant cool-down and to prevent leakage when system is under pressure.

DIAGNOSIS AND TESTING

RADIATOR CAP-TO-FILLER NECK SEAL

The pressure cap upper gasket (seal) pressure relief can be tested by removing overflow hose from the radiator filler neck tube. Attach the hose of the pressure tester tool (special tool #7700, Tester, Cooling System) (or equivalent) to the tube. It will be necessary to disconnect hose from its adapter for the filler neck. Pump air into radiator. The pressure cap upper gasket should relieve at 69 to 124kPa (10 to 18 psi) and hold pressure at a minimum of 55 kPa (8 psi).

> WARNING: **The warning words, "DO NOT OPEN HOT", on radiator pressure cap, are a safety precaution. When hot, pressure builds up in cooling system. To prevent scalding or injury, radiator cap should not be removed while system is hot and/or under pressure.**

Do not remove the radiator cap at any time **except** for the following purposes:

- Check and adjust antifreeze freeze point.
- Refill the system with new antifreeze.
- Conducting service procedures.
- Checking for vacuum leaks.

> WARNING: **If vehicle has been run recently, wait at least 15 minutes before removing radiator cap. With a rag, squeeze radiator upper hose to check if system is under pressure. Place a rag over cap and without pushing cap down, rotate it counter-clockwise to first stop. Allow fluid to escape through the coolant reserve/overflow hose into reserve/overflow tank. Squeeze radiator upper hose to determine when pressure has been released. When coolant and steam stop being pushed into tank and system pressure drops, remove radiator cap completely.**

RADIATOR CAP

Fig. 41: Pressure Testing Radiator Cap
Courtesy of CHRYSLER GROUP, LLC

1 - PRESSURE CAP
2 - TYPICAL COOLING SYSTEM PRESSURE TESTER

Remove the cap from the radiator. Be sure that the sealing surfaces are clean. Moisten the rubber gasket with water and install the cap on the pressure tester (special tool #7700, Tester, Cooling System) or an equivalent. Refer to **Fig. 41**.

Operate the tester pump to bring the pressure to 104 kPa (15 psi) on the gauge. If the pressure cap fails to hold pressure of at least 97 kPa (14 psi) replace the cap. Refer to the following **CAUTION** .

The pressure cap may test properly while positioned on tool (special tool #7700, Tester, Cooling System) (or equivalent). It may not hold pressure or vacuum when installed on the radiator. If so, inspect the radiator filler neck and radiator cap's top gasket for damage. Also inspect for dirt or distortion that may prevent the cap from sealing properly.

CAUTION: Radiator pressure testing tools are very sensitive to small air leaks which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.

INSPECTION

INSPECTION

1 - STAINLESS-STEEL SWIVEL TOP
2 - RUBBER SEALS
3 - VENT VALVE
4 - RADIATOR TANK
5 - FILLER NECK
6 - OVERFLOW NIPPLE
7 - MAIN SPRING
8 - GASKET RETAINER

Hold cap at eye level, right side up. The vent valve at bottom of cap should closed. Refer to **Fig. 42**. A slight downward pull on the vent valve should open it. If the rubber gasket has swollen and prevents vent valve from opening, replace cap.

Hold cap at eye level, upside down. If any light can be seen between vent valve and rubber gasket, replace cap. A replacement cap must be the type designed for a coolant reserve/overflow system with a completely sealed diaphragm spring and a rubber gasket. This gasket is used to seal to radiator filler neck top surface. Use of proper cap will allow coolant return to radiator.

COOLANT

DESCRIPTION

DESCRIPTION

WARNING: **Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol based coolant properly, contact your dealer or government agency for location of collection center in your**

area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Use of Propylene-Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps require special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100, 000 Mile Formula (MS-9769), or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100, 000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT) may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.

COOLANT PERFORMANCE

The required ethylene-glycol and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water- Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol - The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic. The increased temperature can result in severe engine damage. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water - Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90° F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field

equipment and can cause problems associated with 100 percent ethylene-glycol.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLANT CONCENTRATION TESTING

Check coolant concentration when any additional coolant is added to the system, or after a coolant drain, flush and refill. Use of a hydrometer or Refractometer Tool (special tool #8286, Refractometer), refractometer can be used to test coolant concentration.

A hydrometer tests the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and the higher the freeze protection (up to a maximum of 60% by volume glycol).

A Refractometer Tool (special tool #8286, Refractometer) tests the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufacturers use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and are not recommended.

CAUTION: Do not mix types of coolant - corrosion protection will be severely reduced.

COOLER, EGR

DESCRIPTION

DESCRIPTION

The Exhaust Gas Recirculation cooler is located above the exhaust manifold on the right side of the engine. Using engine coolant, the EGR cooler reduces the temperature of the exhaust gas that is recirculated to the air intake.

OPERATION

OPERATION

Exhaust gas enter the rear portion of the EGR Cooler from the exhaust manifold. The gas is cooled as it passes through the EGR Cooler and then enters the EGR crossover tube and is routed to the EGR valve.

Coolant enters the rear of the EGR Cooler and flow the same direction as the exhaust gases.

1. Remove EGR Cooler. Refer to **COOLER, EGR, REMOVAL**.
2. Spray the internal cavity of EGR Cooler (2) with hot tap water for 10 minutes.

3. Plug the EGR Cooler inlet (1) with a locally obtained rubber expansion plug to make a watertight seal.
4. Following instruction on the container, mix MOPAR® EGR System Cleaner and hot tap water with a ratio of one part EGR Cleaner, four parts water.
5. Position the EGR Cooler with the outlet (3) facing up. Fill EGR Cooler with hot tap water and MOPAR® EGR System Cleaner until cooler is completely full. Soak for one hour.
6. Remove the plug from EGR Cooler inlet (1). Drain cleaning solution from cooler. Discard according to local governmental regulations.
7. Rinse the EGR Cooler (2) using hot tap water until all cleaning solution has been rinsed clean. Dry completely.
8. Install EGR Cooler. Refer to **COOLER, EGR, INSTALLATION**.

DESCRIPTION

DESCRIPTION

Fig. 75: Viscous Fan Drive & Blade
Courtesy of CHRYSLER GROUP, LLC

1 -VISCOUS FAN DRIVE
2 - FAN BLADE ASSEMBLY
3 - WATER PUMP AND PULLEY
4 - BOLT (4)

A thermostatic bi-metallic spring coil is located on the front face of the viscous fan drive unit. This spring coil reacts to the temperature of the radiator discharge air. It engages the viscous fan drive for higher fan speed if the air temperature from the radiator rises above a certain point. Until additional engine cooling is necessary, the fan will remain at a reduced rpm regardless of engine speed.

Only when sufficient heat is present, will the viscous fan drive engage. This is when the air flowing through the radiator core causes a reaction to the bi-metallic coil. It then increases fan speed to provide the necessary additional engine cooling.

Once the engine has cooled, the radiator discharge temperature will drop. The bi-metallic coil again reacts and the fan speed is reduced to the previous disengaged speed.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - RADIATOR VISCOUS FAN

NOISE

NOTE: It is normal for fan noise to be louder (roaring) when:

- The underhood temperature is above the engagement point for the viscous drive coupling. This may occur when ambient (outside air temperature) is very high.
- Engine loads and temperatures are high such as when towing a trailer.

- Cool silicone fluid within the fan drive unit is being redistributed back to its normal disengaged (warm) position. This can occur during the first 15 seconds to one minute after engine start-up on a cold engine.

LEAKS

Viscous fan drive operation is not affected by small oil stains near the drive bearing. If leakage appears excessive, replace the fan drive unit.

VISCOUS DRIVE

For the following test, the cooling system must be in good condition. It also will ensure against excessively high coolant temperature.

WARNING: Be sure that there is adequate fan blade clearance before drilling.

1. Drill a 3.18-mm (1/8-in) diameter hole in the top center of the fan shroud.
2. Obtain a dial thermometer with an 8 inch stem (or equivalent). It should have a range of -18°-to-105°C (0°-to-220° F). Insert thermometer through the hole in the shroud. Be sure that there is adequate clearance from the fan blades.
3. Connect a tachometer and an engine ignition timing light. The timing light is to be used as a strobe light.
4. Block the air flow through the radiator. Secure a sheet of plastic in front of the radiator. Use tape at the top to secure the plastic and be sure that the air flow is blocked.
5. Be sure that the air conditioner (if equipped) and blower fan is turned off.

WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing.

6. Start the engine and operate at 2400 rpm. Within ten minutes the air temperature (indicated on the dial thermometer) should be up to 88° C (190° F). Fan drive **engagement** should start to occur at/between:
   - 3.7L Automatic - 93° C - 99°C (200° F - 210° F)
   - 3.7L Manual/4.7L Automatic - 85° - 91° C (185° - 195° F)
   - 4.7L Manual - 74° - 79° C (165° - 175° F)
   - 5.7L Automatic Standard Cool - 94° C - 99°C (201° F - 211° F)
   - 5.7L Manual - 93° C - 100°C (199° F - 212° F)
   - 5.7L Heavy Duty Snowplow - 76° C - 83°C (169° F - 181° F)
   - Engagement is distinguishable by a definite **increase** in fan flow noise (roaring). The timing light also will indicate an increase in the speed of the fan.
7. When viscous drive engagement is verified, remove the plastic sheet. Fan drive **disengagement** should start to occur at or between:
   - 3.7L Automatic - 76°C - 81°C (168° F - 178° F)
   - 3.7L Manual/4.7L Auto - 67°C - 73°C (153° F - 163° F)

- 4.7L Manual - 56°C - 62°C (133° F - 143° F)
- 5.7L Automatic Standard Cool - 69° C - 74°C (156° F - 166° F)
- 5.7L Manual - 71° C - 76°C (160° F - 170° F)
- 5.7L Heavy Duty Snowplow - 55° C - 60°C (168° F - 178° F)

A definite **decrease** of fan flow noise (roaring) should be noticed. If not, replace the defective viscous fan drive unit.

CAUTION: Some engines equipped with serpentine drive belts have reverse rotating fans and viscous fan drives. Installation of the wrong fan or viscous fan drive can result in engine overheating.

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

DIESEL

NOISE

NOTE: It is normal for fan noise to be louder (roaring) when:

- Fan duty cycle high. This may occur when ambient (outside air temperature) is very high.
- Engine loads and temperatures are high such as when towing a trailer.
- Operating conditions where transmission temperatures may be high
- Cool silicone fluid within the fan drive unit is being redistributed back to its normal disengaged (warm) position. This can occur during the first 15 seconds to one minute after engine start-up on a cold engine.

LEAKS

Viscous fan drive operation is not affected by small oil stains near the drive bearing. If leakage appears excessive, replace the fan drive unit.

ELECTRONICALLY CONTROLLED VISCOUS DRIVE - DIESEL

Courtesy of CHRYSLER GROUP, LLC

If the fan assembly does not free-wheel and a metallic grinding sound exists, replace the electronically controlled fan drive. Refer to **FAN, COOLING, VISCOUS, REMOVAL**.

NOTE: The following test may take up to 15 minutes to perform.

The engine should be at normal operating temperature.

1. Set the parking brake and verify the transmission is in park or neutral.
2. Set air conditioner (if equipped) and blower fan to OFF.
3. Start and allow engine to reach normal operating temperatures.
4. Stop engine, connect the scan tool and select appropriate model year and engine option.
5. Check for and correct existing DTC's
6. Locate the electronically controlled viscous fan drive connector on the fan shroud.

WARNING: A spark may occur when the connection to battery is made. Be sure there are no combustible materials near the area where this procedure is being performed.

7. Using a jumper wire, backprobe pin 6 of the viscous fan drive connector to battery positive.

NOTE: The fan drive control coil is energized to 12 volts at this time.

8. Using the scan tool, confirm that DTC 0480 is set to verify a good connection at the cooling fan harness connector.
9. Start the engine.
10. Actuate engine speed to 2000 RPM.
11. Go to the SENSOR screen and observe the fan speed.
12. Run the engine at 2000 RPM until the fan speed increases to 1850 RPM or more for 30 seconds.

NOTE: Fan RPM may ramp up slowly.

NOTE: It may take 15 minutes before fan speed increases.

13. The fan speed should be in accordance to the table below.
14. If fan speed does not increase, make sure that the jumper wire has a good connection. If so replace the electronically control viscous fan drive.
15. If the fan speed does increase and there is still a concern, refer to the appropriate Electrical Diagnostic article to diagnosis the electronically controlled viscous fan drive control circuit.

1. **Do Not** attempt to remove the fan/viscous fan drive assembly (2) from the vehicle at this time.

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

2. Disconnect negative battery cable from battery.
3. The thermal viscous fan drive/fan blade assembly (2) is attached (threaded) to the water pump hub shaft.

Remove the fan blade/viscous fan drive assembly from the water pump by turning the mounting nut clockwise as viewed from the front. Threads on the viscous fan drive are **LEFT-HAND.** A 36 MM Fan Wrench (1) should be used to prevent pulley from rotating.

4. **Do Not** unbolt the fan blade assembly from viscous fan drive at this time.
5. Remove the fan shroud-to-radiator mounting bolts.
6. Pull the lower shroud mounts out of the radiator tank clips.
7. Remove the fan shroud, electric cooling fan, and fan blade/viscous fan drive assembly (2) as a complete unit from vehicle. Refer to **FAN, COOLING, ELECTRIC, REMOVAL** and **FAN, COOLING, VISCOUS, REMOVAL**.
8. After removing the fan blade/viscous fan drive assembly (2), **do not** place the viscous fan drive in a horizontal position. If stored horizontally, silicone fluid in the viscous fan drive could drain into its bearing assembly and contaminate lubricant.

CAUTION: Do not remove water pump pulley-to-water pump bolts. This pulley is under spring tension.

9. Remove four bolts securing fan blade assembly to viscous fan drive.

CAUTION: Some engines equipped with serpentine drive belts have reverse rotating fans and viscous fan drives. They are marked with the word REVERSE to designate their usage. Installation of the wrong fan or viscous fan drive can result in engine overheating.

CAUTION: If the electronically controlled viscous fan drive is replaced because of

mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, or chipped blades that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect wiring harness and connectors for damage.

1. Remove the upper radiator shroud (1).
2. Disconnect and isolate the battery negative cable.
3. If equipped, disconnect and isolate the negative battery cable from the auxiliary battery.

CAUTION: Do not remove the fan pulley bolts. This pulley is under spring tension.

9. The electronically controlled viscous fan drive/fan blade assembly is attached (threaded) to the fan pulley shaft. Remove the fan blade/fan drive assembly from fan pulley by turning the mounting nut counterclockwise (as viewed from front). Threads on the viscous fan drive are **RIGHT-HAND.** A 36

MM Fan Wrench can be used. Place a bar or screwdriver between the fan pulley bolts to prevent pulley from rotating.

10. Disengage the fan shroud lower retaining clips.
11. Collapse fan shroud toward front of vehicle and remove fan drive/fan blade and fan shroud as an assembly.
12. Remove the electrical connector bracket (2) by disengaging the retainer clip and sliding the connector bracket (2) out of the fan shroud (1).

Fig. 82: Fan Blade Mounting Bolts

CAUTION: The electronically controlled viscous fan drive is vibration and impact sensitive, especially at the electrical connectors. Do not drop the unit.

13. Remove the four fan blade mounting bolts (2) from the viscous fan drive (3).
14. Inspect the fan for cracked, chipped or damaged fan blades (1).

CLEANING

CLEANING

Clean the fan blades using a mild soap and water. Do not use an abrasive to clean the blades.

INSPECTION

INSPECTION

WARNING: Do not attempt to bend or straighten fan blades if fan is not within specifications.

CAUTION: If fan blade assembly is replaced because of mechanical damage, water pump and viscous fan drive should also be inspected. These components could have been damaged due to excessive vibration.

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

NOTE: Viscous Fan Drive Fluid Pump Out Requirement: After installing a new viscous fan drive, bring the engine speed up to approximately 2000 rpm and hold for approximately two minutes. This will ensure proper fluid distribution within the drive.

1. Install fan blade assembly (2) to the viscous fan drive. Tighten the bolts to 24 N.m (18 ft. lbs.) torque.

2. Position the fan shroud, electric cooling fan and the fan blade/viscous fan drive assembly (2) to the vehicle as a complete unit. Refer to **FAN, COOLING, ELECTRIC, INSTALLATION** and **FAN, COOLING, VISCOUS, INSTALLATION**.
3. Install the fan shroud.
4. The thermal viscous fan drive/fan blade assembly is attached (threaded) to the water pump hub shaft. Install the fan blade/viscous fan drive assembly to the water pump by turning the mounting nut counterclockwise as viewed from the front. 15. Start the vehicle and check for proper clearance between the fan blade assembly and the fan shroud.

HEATER, ENGINE BLOCK

DESCRIPTION

DESCRIPTION

Fig. 89: Engine Block Heater - 3.7L/4.7L
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE BLOCK HEATER

WARNING: **Do not operate engine unless block heater cord has been disconnected from power source and secured in place. The power cord must be secured in its retaining clips and routed away from exhaust manifolds and moving parts.**

An optional engine block heater is available with all models. The heater is equipped with a power cord. The cord is attached to an engine compartment component with tie-straps. The heater warms the engine providing easier engine starting and faster warm-up in low temperatures. The heater is mounted in a core hole of the engine cylinder block in place of a freeze plug with the heating element immersed in engine coolant. The 3.7L/4.7L gas powered engines have the block heater located to the rear on the right side of the engine.

Fig. 90: 5.7L Engine Block Heater
Courtesy of CHRYSLER GROUP, LLC

1 - BLOCK HEATER

The 5.7L engine has the block heater (1) located on the left side of the engine below the exhaust manifold in the rear of the engine and is not immersed in engine coolant but makes direct contact with the block.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE BLOCK HEATER

If the unit does not operate, possible causes can be either the power cord or the heater element. Test the power cord for continuity with a 110-volt voltmeter or 110-volt test light. Test heater element continuity with an ohmmeter or a 12-volt test light.

CAUTION: To prevent damage, the power cord must be secured in its retainer clips and away from any components that may cause abrasion or damage, such as linkages, exhaust components, etc.

REMOVAL

3.7L/4.7L ENGINE

Fig. 91: Engine Block Heater - 3.7L/4.7L

1. Disconnect the battery negative cable.
2. Drain the coolant. Refer to **STANDARD PROCEDURE**.
3. Remove the power cord from the heater by unplugging.
4. Loosen (but do not completely remove) the screw at center of block heater.
5. Remove the block heater (1) by carefully prying from side-to-side. Note the direction of the heating element coil (up or down). The element coil must be installed correctly to prevent damage.

1. Clean and inspect the block heater hole.
2. Install the new O-ring seal(s) to heater.
3. Insert the block heater (1) into cylinder block and position the element properly.
4. With the heater fully seated, tighten center screw to 2 N.m (17 in. lbs.).
5. Fill the cooling system with the recommended coolant. Refer to **CAPACITIES AND RECOMMENDED FLUIDS** .
6. Start and warm the engine.
7. Check the block heater for leaks.

1. Clean and inspect the threads in the cylinder block and heater element.
2. Coat heater element threads with Mopar® Thread Sealer with Teflon.
3. Screw block heater (1) into cylinder block and tighten to 75 N.m (55 ft. lbs.).
4. Connect block heater cord and tighten retaining cap.
5. Fill cooling system with recommended coolant. Refer to **CAPACITIES AND RECOMMENDED FLUIDS** .
6. Start and warm the engine.
7. Check block heater for leaks.

5 - WATER PUMP

A centrifugal water pump circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core. The pump is driven from the engine crankshaft by a single serpentine drive belt.

The water pump impeller is pressed onto the rear of a shaft that rotates in bearings pressed into the housing. The housing has two small holes to allow seepage to escape. The water pump seals are lubricated by the antifreeze in the coolant mixture. No additional lubrication is necessary.

4- THERMOSTAT

The 3.7L and 4.7L engine uses an internal water/coolant bypass system. The design uses galleries in the timing chain cover to circulate coolant during engine warm-up preventing the coolant from flowing through the radiator. Refer to **Fig. 98**.

OPERATION

WATER PUMP

A centrifugal water pump circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core, this coolant absorbs the heat generated when the engine is running. The pump is driven by the engine crankshaft via a drive belt.

WATER PUMP BYPASS - 3.7L/4.7L

When the thermostat is in the closed position the bypass gallery is not obstructed allowing 100% flow. When the thermostat is in the open position the pill partially covers the bypass hole, reducing the amount of bypass flow. This design allows the coolant to reach operating temperature quickly when cold, while adding extra cooling during normal temperature operation.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WATER PUMP

A quick test to determine if pump is working is to check if heater warms properly. A defective water pump will not be able to circulate heated coolant through the long heater hose to the heater core.

STANDARD PROCEDURE

STANDARD PROCEDURE - COOLANT AIR EVACUATION

Fig. 99: Pressurized Air Operated Vacuum Generator
Courtesy of CHRYSLER GROUP, LLC

Evacuating or purging air from the cooling system involves the use of a pressurized air operated vacuum generator. The vacuum created allows for a quick and complete coolant refilling while removing any airlocks present in the system components.

NOTE: **To avoid damage to the cooling system, ensure that no component would be susceptible to damage when a vacuum is drawn on the system.**

WARNING: **ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH**

ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE; PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED; PERSONAL INJURY CAN RESULT.

WARNING: **WEAR APPROPRIATE EYE AND HAND PROTECTION WHEN PERFORMING THIS PROCEDURE.**

NOTE: **The service area where this procedure is performed should have a minimum shop air requirement of 80 PSI (5.5 bar) and should be equipped with an air dryer system.**

NOTE: **For best results, the radiator should be empty. The vehicle's heater control should be set to the heat position (ignition may need to be turned to the on position but do not start the motor).**

1. Refer to the Chrysler Pentastar Service Equipment (Chrysler PSE) Coolant Refiller #85-15-0650 or equivalent tool's operating manual for specific assembly steps.
2. Choose an appropriate adapter cone that will fit the vehicle's radiator filler neck or reservoir tank.
3. Attach the adapter cone (2) to the vacuum gauge (1).

Fig. 100: Vacuum Generator/Venturi Ball Valve
Courtesy of CHRYSLER GROUP, LLC

4. Make sure the vacuum generator/venturi ball valve (3) is closed and attach an airline hose (2) (minimum shop air requirement of 80 PSI/5.5 bar) to the vacuum generator/venturi (1).

5. Position the adaptor cone/vacuum gauge assembly into the radiator filler neck or reservoir tank. Ensure that the adapter cone is sealed properly.

Fig. 101: Vacuum Generator/Venturi
Courtesy of CHRYSLER GROUP, LLC

6. Connect the vacuum generator/venturi (2) to the positioned adaptor cone/vacuum gauge assembly (1).
7. Open the vacuum generator/venturi ball valve.

NOTE: **Do not bump or move the assembly as it may result in loss of vacuum. Some radiator overflow hoses may need to be clamped off to obtain vacuum.**

8. Let the system run until the vacuum gauge shows a good vacuum through the cooling system. Refer to the tool's operating manual for appropriate pressure readings.

NOTE: **If a strong vacuum is being created in the system, it is normal to see the radiator hoses to collapse.**

9. Close the vacuum generator/venturi ball valve.

Fig. 102: Vacuum Generator/Venturi & Air Line
Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the vacuum generator/venturi and airline from the adaptor cone/vacuum gauge assembly.
11. Wait approximately 20 seconds, if the pressure readings do not move, the system has no leaks. If the pressure readings move, a leak could be present in the system and the cooling system should be checked for leaks and the procedure should be repeated.
12. Place the tool's suction hose into the coolant's container.

NOTE: **Ensure there is a sufficient amount of coolant, mixed to the required strength/protection level available for use. For best results and to assist the refilling procedure, place the coolant container at the same height as the radiator filler neck. Always draw more coolant than required. If the coolant level is too low, it will pull air into the cooling system which could result in airlocks in the system.**

13. Connect the tool's suction hose (1) to the adaptor cone/vacuum gauge assembly (2).

Fig. 103: Refilling Cooling System
Courtesy of CHRYSLER GROUP, LLC

14. Open the suction hose's ball valve to begin refilling the cooling system.
15. When the vacuum gauge reads zero, the system is filled.

NOTE: **On some remote pressurized tanks, it is recommended to stop filling when the proper level is reached.**

16. Close the suction hose's ball valve and remove the suction hose from the adaptor cone/vacuum gauge assembly.
17. Remove the adaptor cone/vacuum gauge assembly from the radiator filler neck or reservoir tank.
18. With heater control unit in the HEAT position, operate engine with container cap in place.
19. After engine has reached normal operating temperature, shut engine off and allow it to cool. When engine is cooling down, coolant will be drawn into the radiator from the pressure container.
20. Add coolant to the recovery bottle/container as necessary. **Only add coolant to the container when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.** Add necessary coolant to raise container level to the COLD MINIMUM mark after each cool down period.
21. Once the appropriate coolant level is achieved, attach the radiator cap or reservoir tank cap.

REMOVAL

3.7L/4.7L

The water pump on 3.7L/4.7L engines is bolted directly to the engine timing chain case cover.

1. Disconnect the negative battery cable.
2. Drain cooling system. Refer to **STANDARD PROCEDURE**.
3. Remove fan/viscous fan drive assembly from water pump. Refer to **FAN, COOLING, VISCOUS, REMOVAL**. Do not attempt to remove fan/viscous fan drive assembly from vehicle at this time.

4. If the water pump is being replaced, do not unbolt the fan blade assembly from the thermal viscous fan drive.

7. Remove water pump mounting bolts (1).
8. Remove O-ring from water pump (2).
9. Remove water pump (2). Clean water pump sealing surface on cylinder block.

CLEANING

CLEANING

Clean the gasket mating surface. Use caution not to damage the gasket sealing surface.

To ensure proper gasket sealing, surface preparation must be performed, especially with the use of aluminum engine components.

Never use the following to clean gasket surfaces:

- Metal scraper.

- Abrasive pad or paper to clean cylinder block and head.
- High speed power tool with an abrasive pad or a wire brush).
- High speed power tool with 3M Roloc™ Bristle Disc (white or yellow).

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper.

INSPECTION

INSPECTION

Inspect the water pump assembly for cracks in the housing, water leaks from the shaft seal, worn bearing or the impeller rubbing either the pump body or the timing chain case/cover.

RADIATOR, ENGINE COOLING

DESCRIPTION

DESCRIPTION

Fig. 111: Radiator
Courtesy of CHRYSLER GROUP, LLC

The radiator (1) is a aluminum cross-flow design with horizontal tubes through the radiator core and vertical plastic side tanks.

This radiator (1) does not contain an internal transmission oil cooler.

OPERATION

OPERATION

The radiator supplies sufficient heat transfer using the cooling fins interlaced between the horizontal tubes in the radiator core to cool the engine.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - RADIATOR COOLANT FLOW

Use the following procedure to determine if coolant is flowing through the cooling system.

1. Idle engine until operating temperature is reached. If the upper radiator hose is warm to the touch, the thermostat is opening and coolant is flowing to the radiator.

   WARNING: Hot, pressurized coolant can cause injury by scalding. Using a rag to cover the radiator pressure cap, open radiator cap slowly to the first stop. This will allow any built-up pressure to vent to the reserve/overflow tank. After pressure build-up has been released, remove cap from filler neck.

2. Drain a small amount of coolant from the radiator until the ends of the radiator tubes are visible through the filler neck. Idle the engine at normal operating temperature. If coolant is flowing past the exposed tubes, the coolant is circulating.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Raise and secure the vehicle.

WARNING: **Do not remove the cylinder block drain plugs or loosen the radiator draincock with the system hot and under pressure. Serious burns from coolant can occur.**

4. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
5. Disconnect the ambient air temperature sensor electrical connector and mass airflow sensor electrical connector (If equipped).
6. Remove air box and turbocharger inlet tube. Refer to **BODY, AIR CLEANER, REMOVAL, 6.7L** .
7. Remove coolant tank hose from the fastening clips located on top of the radiator.
8. Remove the viscous fan and fan shroud. Refer to **FAN, COOLING, VISCOUS, REMOVAL**.
9. Remove the hose clamps and hoses from radiator.
10. Disconnect the transmission cooler lines at the transmission cooler. The transmission cooler will remain on the radiator and can be removed as an assembly. Refer to **TUBES AND HOSES, TRANSMISSION OIL COOLER, STANDARD PROCEDURE**.
11. Remove the two radiator upper mounting bolts.
12. Lift and support the vehicle.
13. Remove the power steering cooler mounting bolts and position the power steering cooler out of the way.
14. Lower the vehicle.
15. Tilt the radiator towards the rear of the vehicle and lift it out of the engine compartment. The bottom of the radiator is equipped with two alignment dowels that fit into holes in the lower radiator support panel. Rubber biscuits (insulators) are installed to these dowels. Take care not to damage cooling fins or tubes on the radiator and air conditioning condenser or the electronic viscous fan connector when removing.

INSPECTION

INSPECTION

Inspect the radiator side tanks for cracks, and broken or missing fittings. Inspect the joint where the tanks seam up to the radiator core for signs of leakage and/or deteriorating seals.

Inspect radiator core for corroded, bent or missing cooling fins. Inspect the core for bent or damaged cooling tubes.

INSTALLATION

18. Operate the engine until it reaches normal operating temperature. Check the cooling system and automatic transmission (if equipped) for leaks.

SENSOR, COOLANT TEMPERATURE

DESCRIPTION

DESCRIPTION

Fig. 132: Upper Radiator Hose, Thermostat Housing & Engine Coolant Temperature (ECT) Sensor
Courtesy of CHRYSLER GROUP, LLC

The Engine Coolant Temperature (ECT) sensor (2) is used to sense engine coolant temperature. The ECT sensor protrudes into an engine water jacket.

The ECT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as engine coolant temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION

OPERATION

At key-on, the Powertrain Control Module (PCM) sends out a regulated 5 volt signal to the ECT sensor. The PCM then monitors the signal as it passes through the ECT sensor to the sensor ground (sensor return).

When the engine is cold, the PCM will operate in Open Loop cycle. It will demand slightly richer air-fuel mixtures and higher idle speeds. This is done until normal operating temperatures are reached.

The PCM uses inputs from the ECT sensor for the following calculations:

- for engine coolant temperature gauge operation through CAN Bus communications
- Injector pulse-width
- Spark-advance curves
- ASD relay shut-down times

- Idle Air Control (IAC) motor key-on steps
- Pulse-width prime-shot during cranking
- O2 sensor closed loop times
- Purge solenoid on/off times
- Cooling fan control
- Temperature gauge operation
- A/C cutoff at high coolant temperatures
- EGR solenoid on/off times (if equipped)
- Evaporation System Integrity Monitor (ESIM) operation (if equipped)
- Radiator fan relay on/off times (if equipped)
- Target idle speed

5 - MACHINED GROOVE

CAUTION: Do not operate the engine without a thermostat, except for servicing or

testing.

The 3.7L/4.7L/5.7L engines use a pellet-type thermostat that controls the operating temperature of the engine by controlling the amount of coolant flow to the radiator. On all engines the thermostat is closed below 195°F (90° C). Above this temperature, coolant is allowed to flow to the radiator. This provides quick engine warm up and overall temperature control.

Coolant leakage into the pellet container will cause the thermostat to fail in the open position. Thermostats very rarely stick. Do not attempt to free a thermostat with a prying device.

Fig. 142: Cutaway View Of Thermostat & Bypass
Courtesy of CHRYSLER GROUP, LLC

1 - FROM HEATER AND DEGAS CONTAINER
2 - FROM RADIATOR
3 - TO WATER PUMP
4- THERMOSTAT

On the 3.7L/4.7L engine the thermostat is designed to block the flow of the coolant bypass journal by 50% instead of completely blocking the flow. This design controls coolant temperature more accurately. Refer to **Fig. 142**.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes other problems. These are: longer engine warm-up time, unreliable warm-up performance, increased exhaust emissions and crankcase condensation. This condensation can result in sludge formation.

OPERATION

OPERATION

The wax pellet is located in a sealed container at the spring end of the thermostat. When heated, the pellet expands, overcoming closing spring tension and water pump pressure to force the valve to open.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ON-BOARD DIAGNOSTICS

All models are equipped with On-Board Diagnostics for certain cooling system components. Refer to appropriate Electrical Diagnostic article. If the powertrain control module (PCM) detects low engine coolant temperature, it will record a Diagnostic Trouble Code (DTC) in the PCM memory. Do not change a thermostat for lack of heat as indicated by the instrument panel gauge or by poor heater performance unless a DTC is present. For other probable causes, refer to the appropriate diagnostic information.

WARNING: **Do not loosen the radiator draincock with the system hot and pressurized. Serious burns from the coolant can occur.**

1. Disconnect the battery negative cables.
2. Remove the vent plug near EGR cooler.
3. Drain the cooling system until the coolant level is below the thermostat. Refer to **STANDARD PROCEDURE**.
4. Disconnect the exhaust gas pressure sensor electrical connector (3).
5. Remove the exhaust pressure tube (4) from the thermostat housing.
6. Remove the EGR cooler cross over tube (1).
7. Remove the radiator hose clamp and hose from the thermostat housing (1).
8. Remove the heat shield.

9. Remove the three water outlet-to-cylinder head bolts (5) and remove the water outlet connector.
10. Clean the mating surfaces of the thermostat housing (1) and clean the thermostat seat groove at the top of the thermostat housing (1).

1. Clean the mating areas of the timing chain cover (4) and the thermostat housing (1).
2. Install the thermostat (3) (spring side down) into the recessed machined groove on the timing chain cover (4).

CAUTION: The housing must be tightened evenly and the thermostat must be centered into the recessed groove in the timing chain cover. If not, it may result in a cracked housing, damaged timing chain cover threads or coolant leaks.

3. Position the thermostat housing (1) on the timing chain cover (4).

4. Install the housing-to-timing chain cover bolts. Tighten the bolts to 13 N.m (112 in. lbs.).
5. Install the lower radiator hose on the thermostat housing (1).
6. Install the splash shield.
7. Lower the vehicle.
8. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
9. Connect negative battery cable.
10. Start and warm the engine. Check for leaks.

COOLER, TRANSMISSION OIL

DESCRIPTION

GAS ENGINES

EXTERNAL TRANS COOLER

An air-to-oil transmission oil cooler is standard on all engine packages. The transmission oil cooler is mounted to the front of the radiator above the power steering cooler.

A/C CONDENSER/TRANSMISSION COOLER COMBINATION

Fig. 150: A/C Condenser/Transmission Cooler
Courtesy of CHRYSLER GROUP, LLC

The automatic transmission cooler assembly is integrated in with the A/C condenser and behind the grille. The transmission cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins. The transmission oil cooler assembly is equipped with quick connect fitting for the transmission oil. The transmission oil cooler is serviced as an assembly with the A/C condenser.

To service the A/C condenser/Transmission cooler, refer to **CONDENSER, A/C, REMOVAL** and **CONDENSER, A/C, INSTALLATION** .

DIESEL ENGINES

1 - TRANSMISSION WATER-TO-OIL COOLER

All diesel models equipped with an automatic transmission are equipped with both a main water-to-oil cooler and a separate air-to-oil cooler. Both coolers are supplied as standard equipment on diesel engine powered models when equipped with an automatic transmission.

The main water-to-oil transmission oil cooler is mounted to a bracket on the intake side of the engine. Refer to **Fig. 151**.

5 - TRANSMISSION OIL COOLER

The air-to-oil cooler is located in front of the radiator. Refer to **Fig. 152**.

OPERATION

OPERATION

On all models equipped with an automatic transmission, the transmission oil is routed through the air-to-oil transmission oil cooler where heat is removed from the transmission oil before returning to the transmission. The air-to-oil cooler has an internal thermostat that controls oil flow through the cooler. When the transmission oil is cold (less then operating temperature), the oil is routed through the cooler bypass. When the transmission oil reaches operating temperatures and above, the thermostat closes off the bypass allowing the oil to flow through the cooler. The thermostat is serviceable.

On heavy duty diesel engine models, the transmission oil is routed through an oil-to water transmission oil cooler first, then to the air-to-oil transmission oil cooler.

1. Place a drain pan under the oil cooler lines.
2. Disconnect the transmission oil cooler line quick-connect fitting at the cooler outlet. Refer to **TUBES AND HOSES, TRANSMISSION OIL COOLER, STANDARD PROCEDURE**. Plug the cooler lines to prevent oil leakage.
3. Unsnap the transmission cooler tubes from the radiator tank clips.
4. Remove the bolt attaching the transmission cooler to the radiator.
5. Remove oil cooler from the vehicle. Take care not to damage the radiator core or transmission cooler tubes.

2. Place a drain pan under the oil cooler.
3. Raise the vehicle.
4. Disconnect the oil cooler quick-connect fittings from the transmission lines. Refer to **TUBES AND HOSES, TRANSMISSION OIL COOLER, STANDARD PROCEDURE**.
5. Remove the charge air cooler-to-oil cooler bolt. Refer to **Fig. 155**.
6. Remove two mounting nuts.
7. Remove the oil cooler and line assembly towards the front of vehicle. Cooler must be rotated and tilted into position while removing.

WATER TO OIL COOLER

Fig. 156: Water To Oil Cooler, Lines, Bolts & Nuts

CAUTION: If a leak should occur in the water-to-oil cooler mounted to the side of the engine block, engine coolant may become mixed with transmission fluid. Transmission fluid may also enter engine cooling system. Both cooling system and transmission should be drained and inspected in case of oil cooler leakage.

1. Disconnect both battery negative cables.
2. Remove starter. Refer to **STARTER, REMOVAL** .
3. Drain cooling system. Refer to **STANDARD PROCEDURE**.
4. Disconnect coolant lines from cooler.

NOTE: **Use a back-up wrench on the transmission cooler fittings to prevent damage to the cooler.**

5. Disconnect transmission oil lines from cooler. Plug cooler lines to prevent oil leakage.
6. Remove cooler bracket to transmission adapter bolt.
7. Remove the nut (6) secures the ground cable to the mounting stud then remove the nut.
8. Remove the upper nut (2).
9. Remove cooler bracket to block bolts (1).
10. Remove cooler assembly from vehicle.

1. Position the transmission cooler tubes to the front of the radiator by sliding brackets into slots on radiator inlet tank.
2. Snap the transmission cooler tubes into the clips on the side of the radiator tank.
3. Install the transmission cooler attaching bolt. Tighten the bolt to 16 N.m (140 in. lbs.).
4. Inspect the quick connect fittings for debris and install the quick connect fitting on the cooler tube until an audible "click" is heard. Pull on the connection to verify proper installation and install the secondary latches. Refer to **TUBES AND HOSES, TRANSMISSION OIL COOLER, STANDARD PROCEDURE**.
5. Start the engine and check all fittings for leaks.
6. Check the fluid level in the automatic transmission.

1. Guide the oil cooler onto the studs located on the cylinder block.
2. Install the upper (2) and lower nuts to cylinder block finger tight.
3. Install and tighten mounting bolt (1) to cooler at cylinder block to 24 N.m (18 ft. lbs).
4. Torque the nuts to 24 N.m (18 ft. lbs.)
5. Install the ground cable. Install the retaining nut (6).
6. Tighten lower mounting bolt to cooler at the cylinder block. Tighten to 77 N.m (57 ft. lbs.).

NOTE: Use a back-up wrench on the transmission cooler fittings to prevent damage to the cooler.

7. Tighten upper mounting bolt to cooler at cylinder block to 24 N.m (18 ft. lbs).
8. Install wire harness push in clip at bottom of cooler bracket.
9. Install starter motor. Refer to **STARTER, INSTALLATION** .
10. Connect battery negative cables.
11. Fill cooling system. Refer to **STANDARD PROCEDURE**.
12. Check transmission oil level and fill as necessary.

1. Remove dust cap by pulling it straight back off of quick connect fitting
2. Place disconnect Special Tool (special tool #8875A, Disconnect, Transmission Cooler Line) onto a ? inch transmission cooler lines or Special Tool (special tool #9546, Disconnect Tool) onto a 1/2 inch transmission cooler lines with the fingers of the tool facing the quick connect fitting.
3. Slide disconnect tool down the transmission line and engage the fingers of the tool into the retaining clip.

When properly engaged in the clip, the tool will fit flush against the quick connect fitting.

4. Rotate the disconnect tool 60° to expand the retaining clip.
5. While holding the disconnect tool against the quick connect fitting, pull back on the transmission cooler line to remove.

2. Push in on transmission cooler line until a "click" is heard or felt.
3. Slide dust cap down the transmission cooler line and snap it over the quick connect fitting until it is fully

seated and rotates freely. Dust cap will only snap over quick connect fitting when the transmission cooler line is properly installed.

NOTE: If dust cap will not snap into place, repeat assembly step 2.

DESCRIPTION

DESCRIPTION

The 5.7L engine (348 CID) eight-cylinder engine is a 90° V-Type lightweight, deep skirt cast iron block, aluminum heads, single cam, overhead valve engine with hydraulic roller tappets. The heads incorporate splayed valves with a hemispherical style combustion chamber and dual spark plugs. The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2.

DIAGNOSIS AND TESTING

INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

Refer to **PERFORMANCE** and **MECHANICAL** for possible causes and corrections of malfunctions.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**.
- Cylinder Combustion Pressure Leakage Test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.
- Engine Cylinder Head Gasket Failure Diagnosis. Refer to **DIAGNOSIS AND TESTING - CYLINDER HEAD GASKET FAILURE**.
- Intake Manifold Leakage Diagnosis. Refer to **DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKAGE**.

	3. Faulty starter.	3. Refer to **DIAGNOSIS AND TESTING** .	
	4. Incorrect spark plug gap.	4. Refer to **SPECIFICATIONS** .	
	5. Dirt or water in fuel system.	5. Clean system and replace fuel filter.	
	6. Faulty fuel pump, relay or wiring.	6. Refer to **FUEL SYSTEM** article.	
ENGINE STALLS OR ROUGH IDLE	1. Idle speed set to low.	1. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**.	
	2. Vacuum leak.	2. Inspect intake manifold and vacuum hoses, repair or replace as necessary.	
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped spark plugs.	1. Replace spark plugs.	
	2. Dirt or water in fuel system.	2. Clean system and replace fuel filter.	
	3. Blown cylinder head gasket.	3. Replace cylinder head gasket.	
	4. Low compression.	4. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**.	
	5. Burned, warped or pitted valves.	5. Replace as necessary.	
	6. Plugged or restricted exhaust system.	6. Inspect and replace as necessary.	

CYLINDER COMPRESSION PRESSURE LEAKAGE

NOTE: **The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.**

NOTE: **Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.**

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs and record the cylinder number of each spark plug for future reference.
3. Inspect the spark plug electrodes for abnormal firing indicators such as fouled, hot, oily, etc.
4. Disable the fuel system and perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
5. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
6. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

NOTE: **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

7. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
8. If one or more cylinders have abnormally low compression pressures, repeat the compression test.

NOTE: **If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question.**

9. If one or more cylinders continue to have abnormally low compression pressures, perform the cylinder combustion pressure leakage test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

1. Check the coolant level and fill as required. DO NOT install the radiator cap.
2. Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.
3. Remove the spark plugs.
4. Remove the oil filler cap.

5. Remove the air cleaner hose.
6. Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1, 379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.
7. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression, While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART**.

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.

OIL CONSUMPTION TEST AND DIAGNOSIS

Diagnostic Procedure

The following diagnostic procedures are used to determine the source of excessive internal oil Consumption, these procedures and tests apply to vehicles with 50, 000 miles or less.

NOTE: Engine oil consumption may be greater than normal during engine break-in. Repairs should be delayed until vehicle has been driven at least 7, 500 miles.

Severe service (high ambient temperature, short trips, heavy loading, trailer towing, taxi, off-road, or law enforcement use) may result in greater oil consumption than normal.

Sustained high speed driving and high engine RPM operation may result in increased oil consumption.

Failure to comply with the recommended oil type and viscosity rating, as outlined in the owner's manual, may impact oil economy as well as fuel economy.

Oil consumption may increase with vehicle age and mileage due to normal engine wear.

NOTE: **Because a few drops of external oil leakage per mile can quickly account for the loss of one quart of oil in a few hundred miles, ensure no external engine oil leaks are present.**

- **Oil leakage is not the same as oil consumption and all external leakage must be eliminated before any action can be taken to verify and/or correct oil consumption complaints.**
- **Verify that the engine has the correct oil level dipstick and dipstick tube installed.**
- **Verify that the engine is not being run in an overfilled condition. Check the oil level 15 minutes after a hot shutdown with the vehicle parked on a level surface. In no case should the level be above MAX or the FULL mark on the dipstick.**

OIL CONSUMPTION TEST

1. Check the oil level at least 15 minutes after a hot shutdown.
2. If the oil level is low, top off with the proper viscosity and API service level engine oil. Add one bottle of MOPAR® 4-In-1 Leak Detection Dye into the engine oil.
3. Tamper proof the oil pan drain plug, oil filter, dipstick and oil fill cap.
4. Record the vehicle mileage.
5. Instruct the customer to drive the vehicle as usual.
6. Ask the customer to return to the servicing dealer after accumulating 500 miles, Check the oil level at least 15 minutes after a hot shutdown. If the oil level is half way between the "FULL" and "ADD" mark continue with the next step.
7. Using a black light, re-check for any external engine oil leaks, repair as necessary, if no external engine oil leaks are present, continue with oil consumption diagnosis.

OIL CONSUMPTION DIAGNOSIS

1. Check the Positive Crankcase Ventilation (PCV) system. Make sure the system is not restricted and the PCV valve has the correct part number and correct vacuum source (18-20 in. Hg at idle below 3000 ft. above sea level is considered normal).
2. Perform a **CYLINDER COMPRESSION PRESSURE LEAKAGE** test and **CYLINDER-TO-CYLINDER LEAKAGE TEST** using the standard leak down gauge following manufacturers suggested best practices.

   NOTE: **Verify the spark plugs are not oil saturated. If the spark plugs are oil saturated and compression is good it can be assumed the valve seals or valve guides are at fault.**

3. If one or more cylinders have more than 15% leak down further engine tear down and inspection will be required.

TOP 19 REASONS THAT MAY LEAD TO ENGINE OIL CONSUMPTION

1. **Tapered and Out-of-Round Cylinders**

   The increased piston clearances permit the pistons to rock in the worn cylinders. While tilted momentarily, an abnormally large volume of oil is permitted to enter on one side of the piston. The rings, also tilted in the cylinder, permit oil to enter on one side. Upon reversal of the piston on each stroke, some of this oil is passed into the combustion chamber.

2. **Distorted Cylinders**

   This may be caused by unequal heat distribution or unequal tightening of cylinder head bolts. This condition presents a surface which the rings may not be able to follow completely. In this case, there may be areas where the rings will not remove all of the excess oil. When combustion takes place, this oil will be burned and cause high oil consumption.

3. **Improper operation of "PCV "system**

   The main purpose of the Positive Crankcase Ventilation (PCV) valve is to recirculate blow-by gases back from the crankcase area through the engine to consume unburned hydrocarbons. The PCV system usually has a one way check valve and a make up air source. The system uses rubber hoses that route crankcase blow by gases to the intake manifold. Vacuum within the engine intake manifold pulls the blow by gases out of the crankcase into the combustion chamber along with the regular intake air and fuel mixture.

   The PCV system can become clogged with sludge and varnish deposits and trap blow by gases in the crankcase. This degrades the oil, promoting additional formation of deposit material. If left uncorrected, the result is plugged oil rings, oil consumption, rapid ring wear due to sludge buildup, ruptured gaskets and seals due to crankcase pressurization.

4. **Worn Piston Ring Grooves**

   For piston rings to form a good seal, the sides of the ring grooves must be true and flat - not flared or shouldered. Piston rings in tapered or irregular grooves will not seal properly and, consequently, oil will pass around behind the rings into the combustion chamber.

5. **Worn, Broken or Stuck Piston Rings**

   When piston rings are broken, worn or stuck to such an extent that the correct tension and clearances are not maintained, this will allow oil to be drawn into the combustion chamber on the intake stroke and hot gases of combustion to be blown down the cylinder past the piston on the power stroke. All of these conditions will result in burning and carbon build up of the oil on the cylinders, pistons and rings.

6. **Cracked or Broken Ring Lands**

   Cracked or broken ring lands prevent the rings from seating completely on their sides and cause oil pumping. This condition will lead to serious damage to the cylinders as well as complete destruction of the pistons and rings. Cracked or broken ring lands cannot be corrected by any means other than piston replacement.

7. **Worn Valve Stems and Guides**

   When wear has taken place on valve stems and valve guides, the vacuum in the intake manifold will draw oil and oil vapor between the intake valve stems and guides into the intake manifold and then into the cylinder where it will be burned.

8. **Bent or Misaligned Connecting Rods**

   Bent or misaligned connecting rods will not allow the pistons to ride straight in the cylinders. This will prevent the pistons and rings from forming a proper seal with the cylinder walls and promote oil consumption. In addition, it is possible that a bearing in a bent connect rod will not have uniform clearance on the connecting rod wrist pin. Under these conditions, the bearing will wear rapidly and throw off an excessive amount of oil into the cylinder.

9. **Fuel Dilution**

   If raw fuel is allowed to enter the lubrication system, the oil will become thinner and more volatile and will result in higher oil consumption. The following conditions will lead to higher oil consumption;

   - Excess fuel can enter and mix with the oil via a leaking fuel injector
   - Gasoline contaminated with diesel fuel
   - Restricted air intake
   - Excessive idling

10. **Contaminated Cooling Systems**

    Corrosion, rust, scale, sediment or other formations in the water jacket and radiator will prevent a cooling system from extracting heat efficiently. This is likely to cause cylinder distortion thus leading to higher oil consumption.

11. **Oil Viscosity**

    The use of oil with a viscosity that is too light may result in high oil consumption. Refer to the vehicle owner's manual for the proper oil viscosity to be used under specific driving conditions and/or ambient temperatures.

12. **Dirty Engine Oil**

    Failure to change the oil and filter at proper intervals may cause the oil to be so dirty that it will promote accumulation of sludge and varnish and restrict oil passages in the piston rings and pistons. This will increase oil consumption; dirty oil by nature is also consumed at a higher rate than clean oil.

13. **Crankcase Overfull**

    Due to an error in inserting the oil dip stick so that it does not come to a seat on its shoulder, a low reading may be obtained. Additional oil may be added to make the reading appear normal with the stick in this incorrect position which will actually make the oil level too high. If the oil level is so high that the

lower ends of the connecting rods touch the oil in the oil pan excessive quantities of oil will be thrown on the cylinder walls and some of it will work its way up into the combustion chamber.

14. **Excessively High Oil Pressure**

    A faulty oil pressure relief valve may cause the oil pressure to be too high. The result will be that the engine will be flooded with an abnormally large amount of oil in a manner similar to that which occurs with worn bearings. This condition may also cause the oil filter to burst.

15. **Aftermarket Performance Chips and Modification**

    Increasing performance through the use of performance/power enhancement products to a stock or factory engine will increase the chance of excessive oil consumption.

16. **Lugging Engine**

    Lugging is running the engine at a lower RPM in a condition where a higher RPM (more power/torque) should be implemented. Especially susceptible on vehicles equipped with a manual transmission. This driving habit causes more stress loading on the piston and can lead to increases in engine oil consumption.

17. **Turbocharged Engines**

    There is a possibility for PCV "push-over" due to higher crankcase pressure (as compared to naturally aspirated engines) which is normal for turbocharged engines. This condition causes varying amounts of engine oil to enter the intake manifold, charge air cooler and associated plumbing to and from the charge air cooler, also a leaking turbocharger seal will draw oil into the combustion chamber where it will burn (blue smoke from tail pipe may be present) and form carbon deposits which contribute to further oil consumption as they interfere with proper engine function.

18. **Restricted Air Intake**

    Excessive restriction in the air intake system will increase engine vacuum and can increase oil consumption, an extremely dirty air filter would be one example of this situation.

19. **Intake Manifold port seals**

    Engines that have a "V" configuration and a "wet valley" could draw oil into the intake ports due to improper sealing between the intake manifold ports and cylinder head. Causes may include improper torque of intake manifold bolts, corrosion (aluminum intake manifold) and or warped sealing surface.

STANDARD PROCEDURE

DUST COVERS AND CAPS

Fig. 1: Covers/Caps
Courtesy of CHRYSLER GROUP, LLC

Due to the high amounts of failures cased by dust, dirt, moisture and other foreign debris being introduced to the engine during service. Covers or caps are needed to reduce the possible damage that can be caused or created.

Fig. 2: Opening Cover
Courtesy of CHRYSLER GROUP, LLC

Covers over openings will reduce any possibilities for foreign materials to enter the engine systems. Using miller tool (special tool #10368, Set, Universal Protective Cap), Select the appropriated cover needed to the procedure.

REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

HYDROSTATIC LOCK

CAUTION: Do not attempt to run engine. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

1. Perform the Fuel Pressure Release Procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect the negative battery cable(s) from the battery.
3. Inspect air cleaner, induction system, and intake manifold to make sure the system is dry and clear of foreign material.
4. Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.
5. With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.
6. Identify the fluid in the cylinders (coolant, fuel, oil).
7. Make sure all fluid has been removed from the cylinders.
8. Repair engine or components as necessary to prevent this problem from occurring again.
9. Squirt a small amount of engine oil into the cylinders to lubricate the walls. This prevents damage on restart.
10. Install new spark plugs. Tighten the spark plugs to 41 N.m (30 ft. lbs.).
11. Drain engine oil. Remove and discard the oil filter.
12. Install the drain plug. Tighten the plug to 34 N.m (25 ft. lbs.).
13. Install a new oil filter.
14. Fill the engine crankcase with the specified amount and grade of oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
15. Connect the negative battery cable(s).
16. Start the engine and check for any leaks.

FORM-IN-PLACE GASKETS AND SEALERS

NOTE: All sealants mentioned below are not used on every engine, they are listed as general reference guide. See service information for specific sealer usage.

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results.**Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin of a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket. All sealing surfaces that use form-in-place gaskets and sealers must be free of grease or oil. Clean surfaces with Mopar® brake parts cleaner prior to sealer application. After the sealer is applied, assemble the parts within 10 minutes.

Numerous types of form-in-place gasket materials are used in the engine area. Mopar® Sealant RTV Silicone Rubber Adhesive, MOPAR® Silicone Rubber RTV, Mopar® ATF-RTV and Mopar® Gasket Maker gasket materials, each have different properties and cannot be used in place of the other.

MOPAR® SEALANT RTV SILICONE RUBBER ADHESIVE is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® SILICONE RUBBER RTV is used to seal components exposed to engine oil, gear lubricant, and coolant. This material is a specially designed gray silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil, gear lubricant and coolant. Excellent adhesion even on oily surfaces, withstands temperatures to 330° C (626° F). Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF-RTV is a specially designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. It can be used on threaded and machined parts under all temperatures. This material also prevents corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or in a 4 oz. or 6 oz. can with applicator.

SEALER APPLICATION

Apply 1 mm (0.040 in.) diameter or less of Mopar® Gasket Maker material to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Tighten the components in place within 15 minutes. Use a locating dowel during assembly to prevent smearing material off the location.

Apply Mopar® RTV or ATF-RTV gasket material in a continuous bead approximately 3 mm (0.120 in.) in diameter. For corner sealing and "T-Joint" locations and waffle pad area, a 0.635 mm (0.025 in.) drop is placed in the center of the gasket contact area. Remove uncured sealant with a shop towel. Tighten the components in

place while the sealant is still wet to the touch (within 10 minutes). Use a locating dowel during assembly to prevent smearing material off the location.

1. Remove the Hood. Refer to **HOOD, REMOVAL** .
2. Disconnect the intake air temperature (IAT) sensor electrical connector (3).
3. Remove the clean air hose (2).
4. Remove the engine cover (1). Refer to **COVER, ENGINE, REMOVAL, 5.7L**.
5. Remove the air cleaner housing (4)
6. Perform the Fuel System Pressure Release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .

CAUTION: Do not let the tensioner arm snap back to the free arm position, severe damage may occur to the tensioner.

9. Insert a suitable square drive ratchet into the square hole on the belt tensioner arm (7).
10. Release the belt tension by rotating the tensioner (7) clockwise until the accessory drive belt (4) can be removed from the generator pulley only.

CAUTION: Do not place the viscous fan drive in horizontal position. If stored horizontally, silicone fluid in the viscous fan drive could drain into its bearing assembly and contaminate lubricant.

11. Remove the viscous fan drive assembly. Refer to **FAN, COOLING, ELECTRIC, REMOVAL** or **FAN, COOLING, VISCOUS, REMOVAL** .
12. Recover the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE** .

MDS SYSTEM

DESCRIPTION

DESCRIPTION

Fig. 50: MDS Lifter
Courtesy of CHRYSLER GROUP, LLC

The Multiple Displacement System (MDS) selectively deactivates cylinders 1, 4, 6 and 7 during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy.

The MDS can provide a 5 to 20% fuel economy benefit when operating in four-cylinder mode. Depending on driving habits and vehicle usage. For EPA rating purposes the fuel economy is 8 to 15% higher than if the engine was operating on eight-cylinders at all times.

The MDS deactivating lifter (1) can be distinguished from the non-MDS lifter (2) by the disconnecting pin (3) on the side of the MDS lifter.

MDS is integrated into the basic engine architecture requiring these additional components:

- Unique MDS camshaft
- 8 deactivating roller lifters
- 4 MDS control valve solenoids
- MDS control valve solenoid wiring harness
- Oil temperature sensor

OPERATION

OPERATION

Fig. 51: MDS Lifter Cross Section
Courtesy of CHRYSLER GROUP, LLC

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy. Both four and eight cylinder configurations have even firing intervals to provide smooth operation. The MDS selectively deactivates cylinders 1, 4, 6, and 7, to improve fuel economy. All deactivated cylinders have unique hydraulic lifters that collapse when deactivated to prevent the valves from opening. Engine oil pressure is used to activate and deactivate the valves. Oil is delivered through special oil passages drilled into the cylinder block. The MDS solenoid valves control the flow. When activated, pressurized oil pushes a latching pin on each MDS lifter which becomes a lost motion link. The base of the MDS lifter follows the camshaft while the top remains stationary. The MDS lifter is held in place against the pushrod by light spring pressure but unable to move because of the much higher force of the valve spring.

NOTE: It is critical to use the recommended oil viscosity in engines that use MDS.

Deactivation occurs during the compression stroke of each cylinder, after air and fuel enter the cylinder. Ignition occurs, but the combustion products remain trapped in the cylinder under high pressure, because the valves no longer open. No fuel/air enters or leaves during subsequent piston strokes, this high pressure gas is repeatedly compressed and expanded like an air spring.

CYLINDER HEAD

OPERATION

OPERATION

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to either allow clean air into the combustion chamber or to allow the exhaust gases out, depending on the stroke of the engine.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

- Possible indications of the cylinder head gasket leaking between adjacent cylinders are:
  - Loss of engine power
  - Engine misfiring
  - Poor fuel economy
- Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:
  - Engine overheating
  - Loss of coolant
  - Excessive steam (white smoke) emitting from exhaust
  - Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in the **CYLINDER COMPRESSION PRESSURE LEAKAGE** Test in this information. An engine cylinder head gasket leaking between adjacent cylinders will results in approximately a 50 - 70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: Use extreme care when the engine is operating with the coolant pressure cap removed. Failure to follow these instructions may result in possible

serious or fatal injury.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

CAUTION: With the cooling system tester in place, pressure builds up fast. Excessive pressure built up by continuous engine operation must be released to a safe pressure point. Never permit pressure to exceed 138 Kpa (20 psi).

Install the Cooling System Tester (special tool #7700, Tester, Cooling System) or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If the gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using the Bloc-Chek Kit (special tool #C-3685-A, Bloc-Chek Kit) or equivalent. Perform the test following the procedures supplied with the tool kit.

CLEANING

CLEANING

Clean all of the sealing surfaces of cylinder block and cylinder heads Mopar® Brake Parts Cleaner (or equivalent).

INSPECTION

INSPECTION

1. Inspect the cylinder head for out-of-flatness using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.
2. Inspect the valve seats for damage. Service the valve seats as necessary.
3. Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.
4. Inspect the pushrods. Replace worn or bent pushrods.

INSTALLATION

INSTALLATION

VALVES, INTAKE AND EXHAUST

DESCRIPTION

VALVE GUIDES

The valve guides are made of powdered metal and pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

VALVES

Both the intake and the exhaust valves are made of steel. The intake valve is 50.93 mm (2.00 inches) in diameter and the exhaust valve is 39.53 mm (1.55 inches) in diameter. All valves use three-bead lock keepers to retain the springs and promote valve rotation.

STANDARD PROCEDURE

STANDARD PROCEDURE - REFACING

VALVE FACE AND VALVE SEAT ANGLE CHART

DESCRIPTION	SPECIFICATION	
	Metric	Standard
Seat Width		
Intake	1.18 - 1.62 mm	0.0464 - 0.0637 in.
Exhaust	1.48 - 1.92 mm	0.058 - 0.075 in.
Face Angle	45° - 45 1/2 °	
Seat Angle	44 1/2 ° - 45°	

NOTE: **Valve seats that are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.**

NOTE: **When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.**

1. Using a suitable dial indicator, measure the center of the valve seat. Total run out must not exceed 0.051 mm (0.002 in).
2. Apply a small amount of Prussian Blue to the valve seat. Insert the valve into the cylinder head. Rotate valve while applying light pressure on the valve seat. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.
3. When the seat is properly positioned the width of the intake seat must be 1.18 - 1.62 mm (0.0464 - 0.0637 in.) and the exhaust seat must be 1.48 - 1.92 mm (0.058 - 0.075 in.).
4. Check the valve spring installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 46.0 mm (1.81 in.).
5. The valve seat must maintain a seat angle of 44 1/2 ° - 45°.
6. The valve face must maintain a face angle of 45° - 45 1/2 °.

REMOVAL

REMOVAL

1. Remove the cylinder head. Refer to **CYLINDER HEAD, REMOVAL, 5.7L**.
2. Compress valve springs using Valve Spring Compressor Tool (special tool #C-3422-D, Compressor, Valve Spring) and Adapter (special tool #8464, Adapter, Valve Spring).
3. Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.
4. Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

INSTALLATION

INSTALLATION

1. Clean valves thoroughly. Discard burned, warped and cracked valves.
2. Remove the carbon and varnish deposits from the inside of the valve guides with a reliable guide cleaner.
3. Measure the valve stems for wear. If the wear exceeds 0.051 mm (0.002 inch), replace the valve.
4. Coat the valve stems with clean engine oil and insert them into the cylinder head.
5. If the valves or seats are ground, check the valve stem height. If the valve stem is too long, replace the cylinder head.
6. Install new seals on all valve guides. Install the valve springs and valve retainers.
7. Compress the valve springs with the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) and Valve Spring Adapter (special tool #8464, Adapter, Valve Spring). Install the locks and release the tool. If the valves and/or seats are ground, measure the installed height of the springs. Make sure the measurement is taken from the bottom of the spring seat in the cylinder head to the bottom surface of the spring retainer.
8. Install the cylinder head. Refer to **CYLINDER HEAD, INSTALLATION, 5.7L**.

ENGINE BLOCK

CLEANING

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean:

- Gallery at the oil filter adaptor hole
- Front and rear oil gallery holes
- Multiple Displacement System (MDS) oil gallery holes in the valley
- Oil feed holes for the crankshaft main bearings

Drilled and tapped holes should be free of debris upon assembly.

Once the block has been completely cleaned, apply Loctite® PST pipe sealant with Teflon 592 to the threads of the front and rear oil gallery plugs and coolant drain plugs. Tighten the oil gallery 1/4 inch x 18 NPT plugs to 20 N.m (15 ft. lbs.). Tighten the coolant drain 1/4 inch x 18 NPT plugs to 34 N.m (25 ft. lbs.). Tighten the 3/8 inch x 18 NPT plugs to 27 N.m (20 ft. lbs.).

INSPECTION

INSPECTION

Fig. 122: Main Bearing Inserts
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the main bearing inserts (1, 2) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing.
6. Replace any bearing that shows abnormal wear.
7. Inspect the main bearing bores for signs of scoring, nicks and burrs.
8. If the cylinder block main bearing bores show damage, replace the engine block.

Fig. 123: Measuring Cylinder Bore Diameter
Courtesy of CHRYSLER GROUP, LLC

9. Use Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to correctly measure the inside diameter of the cylinder bore (3). A cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) Increments is required. If a bore gauge is not available, do not use an inside micrometer.
10. Measure the inside diameter of the cylinder bore at three levels below the top of the bore (4). Start at the top of the bore, perpendicular (across or at 90°) to the axis of the crankshaft at point A (1).
11. Repeat the measurement near the middle of the bore then repeat the measurement near the bottom of the bore.
12. Determine the taper by subtracting the smaller diameter from the larger diameter.
13. Rotate the measuring device 90° to point B (1) and repeat the three measurements. Verify that the maximum taper is within specifications.
14. Determine out-of-roundness by comparing the difference between each measurement.
15. If the cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.015 mm (0.0006 inch) then the cylinder bore can be honed. If the cylinder bore taper or out- of-round condition exceeds the maximum limits, replace the cylinder block.

NOTE: **A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.**

ASSEMBLY, VARIABLE VALVE TIMING, 5.7L

DESCRIPTION

DESCRIPTION

Fig. 124: Variable Cam Timing (VCT) Assembly
Courtesy of CHRYSLER GROUP, LLC

The 5.7L Eagle engine is equipped with Variable Cam Timing (VCT). This system advances and/or retards the camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The VCT assembly is sometimes referred to as a camshaft phaser.

CAUTION: Never attempt to disassemble the camshaft phaser, severe engine damage could result.

The VCT assembly consists of the camshaft sprocket and a timing phaser. The VCT phaser assembly bolts to the camshaft and is serviced as an assembly.

OPERATION

OPERATION

The Variable Cam Timing (VCT) assembly is actuated with engine oil pressure. The oil flow to the VCT assemblies are controlled by an Oil Control Valve (OCV). The OCV consist of a Pulse Width Modulated (PWM) solenoid and a spool valve. The PCM actuates the OCV to control oil flow through the spool valve into the VCT assemblies. The VCT assembly consists of a rotor, stator, and sprocket. The stator is connected to the timing chain through the sprocket. The rotor is connected to the camshaft. Oil flow in to the VCT assembly rotates the rotor with respect to the stator, thus rotating the exhaust camshaft with respect to the timing chain and intake camshaft. An infinitely variable cam timing position can be achieved within the limits of the hardware. The CMP monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

CAUTION: Never attempt to disassemble the camshaft phaser, severe engine damage could result.

REMOVAL

REMOVAL

2. Position the phaser (2) in place and install phaser retaining bolt (1) and tighten to 122 N.m (90 ft. lbs.).
3. Install the timing chain and sprockets. Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION, 5.7L**.

BEARING(S), CRANKSHAFT, MAIN

STANDARD PROCEDURE

STANDARD PROCEDURE - CRANKSHAFT MAIN BEARING - FITTING

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Fig. 128: Measuring Main Bearing Journal Diameter
Courtesy of CHRYSLER GROUP, LLC

With the crankshaft removed from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008 mm (0.0004 inch.) and maximum out of round is 0.005 mm (0.0002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select the inserts required to obtain the specified bearing-to-journal clearance.

CRANKSHAFT MAIN BEARING SELECTION

Fig. 129: Crankshaft Counterweight Stamped Grade Identification Marks
Courtesy of CHRYSLER GROUP, LLC

The main bearings are "select fit" to achieve proper oil clearances. For main bearing selection, the crankshaft counterweight has grade identification marks stamped into it. These marks are read from left to right. The left letter (1) refers to the number one main journal and the right letter (2) refers to the number 5 journal.

NOTE: **Service main bearings are coded. These codes identify what size or grade of the bearing.**

MAIN BEARING SELECTION CHART - 5.7L

GRADE MARKING	BEARING SIZE		FOR USE WITH JOURNAL SIZE	
	METRIC	STANDARD	METRIC	STANDARD
A	0.008 mm U/S	0.0004 in. U/S	64.988 - 64.995 mm	2.5585 - 2.5588 in.
B	NOMINAL		64.996 - 65.004 mm	2.5588 - 2.5592 in.
C	0.008 mm O/S	0.0004 in. O/S	65.005 - 65.012 mm	2.5592 - 2.5595 in.

INSPECTION

INSPECTION

Fig. 130: Main Bearing Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated.

NOTE: **If any crankshaft journals are scored, the crankshaft must be repaired or replaced.**

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

CAMSHAFT, ENGINE

REMOVAL

CAMSHAFT CORE HOLE PLUG

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Remove the engine from the vehicle. Refer to **REMOVAL, 5.7L**.
3. Remove the flexplate. Refer to **FLEXPLATE, REMOVAL, 5.7L**.

CAUTION: Do not damage the rear surface of the camshaft or the core plug sealing surface, when removing the core plug.

4. Using a suitable sharp punch, punch a small hole in the camshaft core hole plug (1).
5. Insert a short sheet metal screw into the small hole in the camshaft core hole plug.
6. Using a suitable slide hammer puller, remove the rear camshaft core hole plug.

NOTE: Slowly rotate the camshaft while pulling camshaft out.

14. Install a long bolt (2) into front of camshaft (1) to aid in removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

INSPECTION

INSPECTION

The cam bearings are not serviceable. Do not attempt to replace cam bearings for any reason. If the cam bearings are damaged, the cylinder block must be replaced.

INSTALLATION

CAMSHAFT CORE HOLE PLUG

Fig. 139: Camshaft Core Hole Plug

1. Clean the core hole in the cylinder block.

NOTE: **Do not apply adhesive to the new camshaft core hole plug. A new plug has adhesive pre-applied.**

2. Install a new camshaft core hole plug (1) located at the rear of cylinder block, using a suitable flat faced tool. The plug must be fully seated on the cylinder block shoulder.
3. Install the flexplate. Refer to **FLEXPLATE, INSTALLATION, 5.7L**.
4. Install the engine. Refer to **INSTALLATION, 5.7L**.

CAMSHAFT

NOTE: **Ensure that the plate is installed on the correct side. The fasteners are flat head fasteners so the top of the head of the fastener should not stick above the front face of the plate after they are torqued. The plate has chamfered fastener holes and the chamfered side should be facing forward to ensure the fasteners are flush or below the front surface.**

2. Install the camshaft thrust plate (1).

3. Using the sequence shown in illustration, tighten the bolts to 12 N.m (9 ft. lbs.).

NOTE: The camshaft phaser must be installed before the camshaft end play can be measured.

4. Measure camshaft end play. Refer to **Engine - Specifications**.
5. If not within limits, disassemble, clean, and inspect for burrs or debris. Reassemble and measure end play again. If the end play is still out, then install a new thrust plate.

LIFTER(S), HYDRAULIC, ROLLER

DESCRIPTION

DESCRIPTION

Fig. 184: MDS Lifter
Courtesy of CHRYSLER GROUP, LLC

The Multiple Displacement System (MDS) selectively deactivates cylinders 1, 4, 6 and 7 during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy.

The MDS can provide a 5 to 20% fuel economy benefit when operating in four-cylinder mode. Depending on driving habits and vehicle usage. For EPA rating purposes the fuel economy is 8 to 15% higher than if the engine was operating on eight-cylinders at all times.

The MDS deactivating lifter (1) can be distinguished from the non-MDS lifter (2) by the disconnecting pin (3) on the side of the MDS lifter.

MDS is integrated into the basic engine architecture requiring these additional components:

- Unique MDS camshaft
- 8 deactivating roller lifters
- 4 MDS control valve solenoids
- MDS control valve solenoid wiring harness
- Oil temperature sensor

OPERATION

OPERATION

Fig. 185: MDS Lifter Cross Section
Courtesy of CHRYSLER GROUP, LLC

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy. Both four and eight cylinder configurations have even firing intervals to provide smooth operation. The MDS selectively deactivates cylinders 1, 4, 6, and 7, to improve fuel economy. All deactivated cylinders have unique hydraulic lifters that collapse when deactivated to prevent the valves from opening. Engine oil pressure is used to activate and deactivate the valves. Oil is delivered through special oil passages drilled into the cylinder block. The MDS solenoid valves control the flow. When activated, pressurized oil pushes a latching pin on each MDS lifter which becomes a lost motion link. The base of the MDS lifter follows the camshaft while the top remains stationary. The MDS lifter is held in place against the pushrod by light spring pressure but unable to move because of the much higher force of the valve spring.

NOTE: It is critical to use the recommended oil viscosity in engines that use MDS.

Deactivation occurs during the compression stroke of each cylinder, after air and fuel enter the cylinder. Ignition occurs, but the combustion products remain trapped in the cylinder under high pressure, because the valves no longer open. No fuel/air enters or leaves during subsequent piston strokes, this high pressure gas is repeatedly compressed and expanded like an air spring.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HYDRAULIC TAPPETS

Check the oil pressure before disassembling any part of the engine to correct tappet noise. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-80 psi) at 3, 000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow five minutes for the oil level

to stabilize before checking the oil level. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on the dipstick. Either of these two conditions could be responsible for noisy tappets.

HIGH

If the oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in the oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow the valves to seat noisily.

LOW

Low oil level may allow the oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on the intake side of the oil pump through which air can be drawn creates the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When the oil level and leaks have been corrected, operate the engine at fast idle. Run the engine for a sufficient amount of time to allow all of the air inside the tappets to be bleed out.

TAPPET NOISE DIAGNOSIS

1. To determine the source of tappet noise, crank the engine over with the cylinder head covers removed.
2. Feel each valve spring or rocker arm to detect the noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

NOTE: **Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm pushrod sockets and pushrod ends for wear.**

3. Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.
4. The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. If more than one tappet seems to be noisy, it's probably not the tappets.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the cylinder head. Refer to **CYLINDER HEAD, REMOVAL, 5.7L**.

CAUTION: The lifter and retainer assembly must be installed as a unit.

CAUTION: If the lifter and retainer assembly are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

4. Remove the tappet guide holder (1) and tappets (2) as an assembly.
5. Check the camshaft lobes for abnormal wear.

INSTALLATION

INSTALLATION

Fig. 188: MDS Lifter

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy.

CAUTION: Engines equipped with MDS use both standard roller lifters (2) and deactivating roller lifters (1). The deactivating roller lifters must be used in cylinders 1, 4, 6, 7. The deactivating lifters can be identified by the two holes in the side of the lifter body (3), for the latching pins.

CAUTION: The lifter and retainer assembly must be installed as a unit.

CAUTION: If the lifters and guide holder assembly are to be reused, they must me installed in their original location.

2. Install the tappet guide holder (2) and tappets.
3. Tighten the tappet retainer bolt (1) to 12 N.m (9 ft. lbs.).
4. Install the cylinder head. Refer to **CYLINDER HEAD, INSTALLATION, 5.7L**.
5. Connect the negative battery cable.

CAUTION: To prevent damage to valve assemblies, do not run the engine above fast idle until all hydraulic lifters have filled with oil and have become quiet.

6. Start the engine and check for leaks.
7. Road test the vehicle.

RETAINER, CRANKSHAFT REAR OIL SEAL

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REAR SEAL AREA LEAKS

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and cannot be serviced separately.

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Raise and support the vehicle.
2. Remove the transmission inspection/torque converter access cover.
3. Inspect the rear of the cylinder block for evidence of oil leakage, note the following:
   - Circular spray pattern generally indicates seal leakage or crankshaft damage.
   - Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces. See appropriate Engine information, for proper repair procedures of these items.
4. If no leaks are detected, pressurize the crankcase as outlined in **OIL CONSUMPTION TEST AND DIAGNOSIS**.

   CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out using an emery cloth.

   CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done. Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, REMOVAL, 5.7L**.

REMOVAL

REMOVAL

NOTE: **The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.**

NOTE: **The crankshaft rear oil seal retainer can not be reused after removal.**

NOTE: **This procedure can be performed in vehicle.**

1. Disconnect the negative battery cable.
2. Remove the transmission. Refer to appropriate Transmission and Transfer Case articles.
3. Remove the flexplate. Refer to **FLEXPLATE, REMOVAL, 5.7L**.
4. Remove the oil pan. Refer to **PAN, OIL, REMOVAL, 5.7L**.
5. Using the sequence shown in illustration, remove the rear oil seal retainer mounting bolts.
6. Carefully remove the retainer from the engine block.

INSTALLATION

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

1. Thoroughly clean all gasket residue from the engine block.
2. Position the gasket onto the new crankshaft rear oil seal retainer.
3. Position the crankshaft rear oil seal retainer onto the engine block.
4. Using the sequence shown in illustration, install the crankshaft rear oil seal retainer mounting bolts and tighten to 15 N.m (11 ft. lbs.).
5. Install the oil pan. Refer to **PAN, OIL, INSTALLATION, 5.7L**.
6. Install the flexplate. Refer to **FLEXPLATE, INSTALLATION, 5.7L**.
7. Install the transmission. Refer to appropriate Transmission and Transfer Case articles.
8. Fill the engine with oil.
9. Start the engine and check for leaks.

RING(S), PISTON

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON RING FITTING

PISTON RING END GAP

Fig. 193: Checking Piston Ring End Gap Using Feeler Gauge
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before reinstalling used rings or installing new rings, the ring clearances must be checked.

1. Wipe the cylinder bore clean.
2. Insert the ring in the cylinder bore.

NOTE: The ring gap measurement must be made with the ring positioned at least 12 mm (0.50 inch.) from bottom of cylinder bore.

3. Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder.
4. Using a feeler gauge check the ring end gap. Replace any rings not within specification.

PISTON RING SIDE CLEARANCE

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

PISTON RING INSTALLATION

Fig. 195: Installing Piston Ring Side Rail
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (Dot) facing up, towards top of the piston.**

NOTE: **Piston rings are installed in the following order:**

- **Oil ring expander.**
- **Lower oil ring side rail.**
- **Upper oil ring side rail.**
- **No. 2 Intermediate piston ring.**
- **No. 1 Upper piston ring.**

1. Install the oil ring expander.
2. Install upper side rail by placing one end between the piston ring groove and the expander ring. Hold end firmly and press down the portion to be installed until side rail is in position. Repeat this step for the lower side rail.

Fig. 196: Installing Upper & Intermediate Rings

3. Install No. 2 intermediate piston ring using a piston ring installer.
4. Install No. 1 upper piston ring using a piston ring installer.

Fig. 197: Piston Ring End Gap Position
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Install the piston rings so the gaps positioned as indicated with the piston viewed from the top.**

NOTE: **Staggering ring gap is important for oil control.**

5. Install the oil expander so the ring gap is located in the (1) position.
6. Install the oil ring rails so the ring gap is located in the (2, 4) position.
7. Install the second compression ring so the ring gap is located in the (3) position.
8. Install the top compression so the ring gap is located in the (1) position.

ROD, PISTON AND CONNECTING

DESCRIPTION

DESCRIPTION

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are made of a high strength aluminum alloy. Piston skirts are coated with a solid lubricant (Molykote®) to reduce friction and provide scuff resistance. The piston top ring groove and land is anodized. The connecting rods are made of forged powdered metal, with a fractured cap design.

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON FITTING

Fig. 198: Measuring Cylinder Bore Diameter
Courtesy of CHRYSLER GROUP, LLC

1. To correctly select the proper size piston, use Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to measure the inside diameter of the cylinder bore (3). A cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) Increments is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at a point 38.0 mm (1.5 inches) below the top of bore (4). Start perpendicular (across or at 90°) to the axis of the crankshaft at point A (1) and then take an additional bore reading 90° at point B (1).
3. The coated pistons will be serviced with the piston pin and connecting rod pre-assembled. The piston-rod assembly is specific for the left cylinder bank (odd numbered) and the right cylinder bank (even

numbered) and must not be interchanged.

4. Measure the piston diameter with a micrometer at points (1, 2).

REMOVAL

REMOVAL

Fig. 200: Battery System Components & PDC Cover

4. Loosen clamp and disconnect the air duct at throttle body.
5. Disconnect the intake air temperature sensor (4) electrical connector.
6. Remove the makeup air hose (1).

7. Remove the air cleaner housing retaining bolt (3) and remove the air cleaner housing (2).
8. Remove the cylinder head(s). Refer to **CYLINDER HEAD, REMOVAL, 5.7L**.
9. Raise and support the vehicle.

NOTE: Do not use air tools to install engine lift fixture.

14. Install the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3).
15. Raise the engine to provide clearance to remove the oil pan.
16. Raise and support the vehicle.
17. Remove the oil pan. Refer to **PAN, OIL, REMOVAL, 5.7L**.
18. Lower the vehicle.
19. Remove the timing chain cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL, 5.7L**.
20. If necessary, remove the ridge on top of the cylinder bores with a reliable ridge reamer before removing the pistons from the cylinder block. **Be sure to keep the tops of the pistons covered during this operation.**

Fig. 206: Mark On Connecting Rod & Bearing Cap
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur.

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removal to ensure correct reassembly.

21. Raise and support the vehicle.
22. Mark the connecting rod and bearing cap positions using a permanent ink marker or scribe tool.

Fig. 207: Connecting Rod Guides
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

NOTE: Pistons and connecting rods assemblies must be removed from the top of cylinder block. When removing the piston and connecting rod assemblies from the engine, rotate the crankshaft so each connecting rod is centered in the cylinder bore.

23. Remove the connecting rod cap, install the Connecting Rod Guides (special tool #8507, Guides, Connecting Rod) (1) and carefully remove the piston from the cylinder bore, repeat this procedure for each piston being removed.

24. Immediately after removing the piston and connecting rod, install the bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.
25. Carefully remove the piston rings from the piston(s), starting from the top ring down.

CLEANING

CLEANING

CAUTION: Do not use a wire wheel or other abrasive cleaning devise to clean the pistons or connecting rods. The pistons have a moly coating, this coating must not be damaged.

1. Using a suitable cleaning solvent, clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

CAUTION: Do not remove the piston pin from the piston and connecting rod assembly.

INSPECTION

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring. Refer to **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore. Refer to **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.

Check the piston for scoring or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

INSTALLATION

Fig. 208: Rod Bearing

NOTE: Before reinstalling used rings or installing new rings, the ring clearances must be checked.

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

1. Check piston ring clearance. Refer to **Engine/Engine Block/RING(S), Piston - Standard Procedure**.
2. Before installing piston and connecting rod assemblies into the bore, install the piston rings. Refer to **Engine/Engine Block/RING(S), Piston - Standard Procedure**.
3. Immerse the piston head and rings in clean engine oil and position a ring compressor over the piston and rings and tighten the ring compressor. **Ensure the position of rings do not change during this operation.**
4. Position the rod bearing (1) onto the connecting rod and lubricate bearing surface with clean engine oil.

5. Install Connecting Rod Guides (special tool #8507, Guides, Connecting Rod) (1) into the connecting rod bolt threads.

Fig. 210: Piston Direction Arrow
Courtesy of CHRYSLER GROUP, LLC

6. The pistons are marked on the piston pin bore surface with an raised "F" or arrow on top of piston indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks.

7. Wipe cylinder bore clean and lubricate with clean engine oil.
8. Rotate the crankshaft until the connecting rod journal is centered with the cylinder bore.
9. Insert the piston and rod assembly into the cylinder bore and carefully position the connecting rod over the crankshaft journal.
10. Tap the piston down into the cylinder bore using a hammer handle while guiding the connecting rod into position on the rod journal.

Fig. 211: Connecting Rod Cap & Bearing
Courtesy of CHRYSLER GROUP, LLC

11. Remove the Connecting Rod Guides (special tool #8507, Guides, Connecting Rod).
12. Wipe the connecting rod cap (1) clean and lubricate with clean engine oil and install the bearing (3).

NOTE: **The connecting rods and bearing caps are not interchangeable, line up the previously marked bearing caps and connecting rods to ensure assembly to their original location.**

13. Lubricate the bearing surfaces with clean engine oil and position the rod cap in place.

Fig. 212: Identifying Connecting Rod Proper Installation

CAUTION: Always replace the connecting rod bolts whenever they are loosened or removed.

14. Lubricate the new rod cap bolts with clean engine oil, install and tighten to 21 N.m (15 ft. lbs.) plus 90°.
15. Install the timing chain cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION, 5.7L**.
16. Install the new oil pan gasket/windage tray and oil pan. Refer to **PAN, OIL, INSTALLATION, 5.7L**.
17. Install the engine oil dipstick tube and dipstick.
18. Lower the vehicle.
19. Using the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3) lower the engine into position and remove.
20. Raise and support the vehicle.

25. Position the air cleaner housing (2), install the air cleaner housing retaining bolt (3) and securely tighten.
26. Connect the makeup air hose (1).
27. Connect the intake air temperature sensor (4) electrical connector.
28. Connect the air duct to the throttle body and tighten clamp to 3 N.m (30 in. lbs.).

29. Fill the engine with oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.

1. Disconnect negative cable from battery.
2. Remove accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
3. Drain cooling system. Refer to **STANDARD PROCEDURE** .
4. Remove upper radiator hose.
5. Remove radiator shroud attaching fasteners.
6. Remove radiator cooling fan and shroud. Refer to **FAN, COOLING, ELECTRIC, REMOVAL** or **FAN, COOLING, VISCOUS, REMOVAL** .
7. Remove crankshaft damper bolt.
8. Remove damper using Crankshaft Insert (special tool #8513A, Insert, Crankshaft) (2) and Three Jaw Puller (special tool #1023, Puller) (1). Refer to **DAMPER, VIBRATION, REMOVAL, 5.7L**.

CAUTION: The front crankshaft seal must be installed dry. Do not apply lubricant to the sealing lip or the outer edge.

1. Using Crankshaft Front Oil Seal Installer (special tool #9072, Installer, Seal) (2) and Damper Installer (special tool #8512A, Installer, Damper) (1), install crankshaft front seal.

CAUTION: To prevent severe damage to the crankshaft or damper, thoroughly clean the damper bore and the crankshaft nose before installing damper.

2. Install vibration damper. Refer to **DAMPER, VIBRATION, INSTALLATION, 5.7L**.
3. Install radiator cooling fan and shroud. Refer to **FAN, COOLING, ELECTRIC, INSTALLATION** or **FAN, COOLING, VISCOUS, INSTALLATION** .
4. Install upper radiator hose.
5. Install accessory drive belt refer. Refer to **BELT, SERPENTINE, INSTALLATION** .
6. Refill cooling system. Refer to **STANDARD PROCEDURE** .
7. Connect negative cable to battery.

SEAL, CRANKSHAFT OIL, REAR

DESCRIPTION

DESCRIPTION

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer, for more information. Refer to the following;

- **Diagnosis and Testing** . Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, DIAGNOSIS AND TESTING, 5.7L**.
- **Removal** . Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, REMOVAL, 5.7L**.
- **Installation** . Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, INSTALLATION, 5.7L**.

SOLENOID, MULTIPLE DISPLACEMENT

DESCRIPTION

DESCRIPTION

The Multi Displacement System selectively deactivates cylinders 1, 4, 6, and 7, to improve fuel economy. It has two modes of operation:

- 8 cylinders for acceleration and heavy loads.
- 4 cylinders for cruising and city traffic.

The main components of the Multi Displacement System are:

- Unique MDS camshaft.
- Deactivating roller tappets.
- 4 control valves/solenoids.
- control valve/solenoid wiring harness.
- oil temp sensor.

OPERATION

OPERATION

Cylinder Deactivation

- Trap an exhaust charge from a normal combustion event
- Normal combustion event
- Don't open the exhaust valve
- Don't open the intake valve
- Piston is an air spring
- Cylinders deactivated in firing sequence

Cylinder Reactivation

- Open the exhaust valve
- Empty the cylinder
- Open the intake valve
- Normal combustion event
- Cylinders reactivated in firing sequence

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MDS SOLENOID

The Multi-Displacement System (MDS) has the following detectable issues:

- solenoid circuit
- fail to deactivate a cylinder(s)
- fail to reactivate a cylinder(s)
- low oil pressure

CONDITION	POSSIBLE CAUSES	CORRECTION
MDS does not activate	1. Low oil pressure.	1. Check for proper oil pressure.
	2. Bad oil temperature sensor.	2. Replace the oil temperature sensor.

	3. Malfunctioning MDS solenoid.	3. Replace the solenoid.
	4. Malfunctioning MDS tappet.	4. Replace tappet (s).
