4. Measure the resistance of the (R64) Passenger Squib circuit between the Passenger Airbag Squib 2 harness connector cavity 2 and ground.
5. Measure the resistance of the (R62) Passenger Squib 2 Line 2 circuit between the Passenger Airbag Squib 2 harness connector cavity 1 and ground.

   Is the resistance below 10K Ohms on either measurement?

   Yes

   - Repair the (R62, R64) Passenger Squib 2 circuits for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the ORC in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B0011-12-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT SHORT TO BATTERY

Fig. 49: Passenger Squib Control Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (SRS) Load Tool Kit (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool Adapter provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is on.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to voltage on the squib circuit for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to voltage for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT SHORTED TO VOLTAGE
(R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT SHORTED TO VOLTAGE
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B0011-12-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT SHORT TO BATTERY DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK PASSENGER AIRBAG SQUIB FOR SHORT TO VOLTAGE**

Fig. 50: Checking Passenger Airbag Squib For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and SRS Load Tool Jumper (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the ORC DTCs.

Does the scan tool display active B0011-12-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT SHORT TO BATTERY DTC?

Yes

- Go To 3.

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Passenger Airbag in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R62, R64) PASSENGER SQUIB 2 CIRCUITS FOR A SHORT TO VOLTAGE**

Fig. 51: Checking Passenger Squib 2 Circuits For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and Jumper from the Passenger Airbag Squib harness connectors.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C2 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R64) Passenger Squib 2 Line 1 circuit between the Passenger Airbag Squib 2 harness connector cavity 2 and ground.
5. Measure the voltage of the (R62) Passenger Squib 2 Line 2 circuit between the Passenger Airbag Squib 2 harness connector cavity 1 and ground.

Is there any voltage present for either measurement?

Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Repair the (R62, R64) Passenger Squib 2 circuits for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

-
-
- Replace the ORC in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B0011-13-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT OPEN

Fig. 52: Passenger Squib Control Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (SRS) Load Tool in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool Adapter provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is on.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects an open or high resistance on the squib circuit for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from an open condition for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT OPEN
(R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT OPEN
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B0011-13-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT OPEN DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK PASSENGER AIRBAG SQUIB OPEN CIRCUITS**

Fig. 53: Checking Passenger Airbag Squib Circuits For Open
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Airbag Squib harness connectors.

   WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

   NOTE: Check connectors - Clean and repair as necessary

   Connect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and SRS Load Tool Jumper (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib harness connectors.

   WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, read the ORC DTCs.

   Does the scan tool display active B0011-13-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT OPEN DTC ?

   Yes

   - Go To 3.

   No

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   - Replace the Passenger Airbag in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R62, R64) PASSENGER SQUIB 2 CIRCUITS FOR AN OPEN**

Fig. 54: Checking Passenger Squib 2 Circuits For Open
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and Jumper from the Passenger Airbag Squib harness connectors.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C2 harness connector.
4. Measure the resistance of the (R64) Passenger Squib 2 Line 1 circuit between the Passenger Airbag Squib 2 harness connector cavity 2 and the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 28.
5. Measure the resistance of the (R62) Passenger Squib 2 Line 2 circuit between the Passenger Airbag Squib 2 harness connector cavity 1 and the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 27.

Is the resistance below 1.0 Ohms on both circuits?

Yes

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

-
- Replace the ORC in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Repair the (R62, R64) Passenger Squib 2 circuits for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B0011-2B-PASSENGER FRONTAL SQUIB 2 CONTROL - WIRES SHORTED TOGETHER

Fig. 55: Passenger Squib Control Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (SRS) Load Tool Kit (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool Adapter provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 100 ms thereafter while the ignition is on.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects both circuits of the same squib are shorted together for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a shorted together condition for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT SHORTED TO THE (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT
PASSENGER AIRBAG SQUIB
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B0011-2B-PASSENGER FRONTAL SQUIB 2 CONTROL - WIRES SHORTED TOGETHER DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK PASSENGER AIRBAG SQUIB FOR CIRCUITS SHORT TOGETHER**

Fig. 56: Checking Passenger Airbag Squib Circuits For Short
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors. Clean and repair as necessary.

2. Connect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and SRS Load Tool Jumper (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With using a scan tool, read the ORC DTCs.

Does the scan tool display active B0011-2B-PASSENGER FRONTAL SQUIB 2 CONTROL - WIRES SHORTED TOGETHER DTC?

Yes

- Go To 3.

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Passenger Airbag in according to the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT FOR A SHORT TO (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT**

Fig. 57: Checking Passenger Squib Line Circuits
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and Jumper from the Passenger Airbag Squib harness connectors.
2. Disconnect the ORC harness connectors.

NOTE: **Check connectors - Clean and repair as necessary.**

3. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C2 harness connector.
4. Measure the resistance between the (R64) Passenger Squib 2 Line 1 circuit cavity 2 and the (R62) Passenger Squib 2 Line 2 circuit cavity 1 at the Passenger Airbag Squib 2 harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (R64) Passenger Squib 2 Line 1 circuit for a short to the (R62) Passenger Squib 2 Line 2 circuit.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the ORC in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (SRS) Load Tool Kit (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool Adapter provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is on. With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Left Side Curtain Squib 1 circuits.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the squib circuit for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground condition for greater than 2.5 seconds. The ORC has detected low resistance of the Left Side Curtain Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R3) LEFT SIDE CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
(R1) LEFT SIDE CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND
LEFT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Left Side Curtain Airbag harness connector.

WARNING: **Do not place an intact non-deployed airbag face down on a**

hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and SRS Load Tool Jumper (special tool #8443-1, Jumpers, 2 Pin) to the Left Side Curtain Airbag harness connector.

   WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

3. With the scan tool, read the ORC DTCs.

   Does the scan tool display active B0021-11-LEFT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO GROUND DTC?

   Yes

   - Go To 3.

   No

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the Left Side Curtain Airbag in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R1, R3) LEFT CURTAIN SQUIB 1 CIRCUITS FOR A SHORT TO GROUND**

Fig. 60: Checking Left Curtain Squib 1 Circuits
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and Jumper from the Left Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
4. Measure the resistance of the (R3) Left Curtain Squib 1 Line 1 circuit between the Left Side Curtain Airbag harness connector cavity 2 and ground.
5. Measure the resistance of the (R1) Left Curtain Squib 1 Line 2 circuit between the Left Side Curtain Airbag harness connector cavity 1 and ground.

   Is the resistance below 10K Ohms on either circuit?

   Yes

   - Repair the Left Curtain Squib 1 circuits for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the ORC in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is on.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to voltage on the left side squib circuit for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to voltage for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R3) LEFT CURTAIN SQUIB LINE 1 CIRCUIT SHORTED TO VOLTAGE
(R1) LEFT CURTAIN SQUIB LINE 2 CIRCUIT SHORTED TO VOLTAGE
LEFT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B0021-12-LEFT CURTAIN DEPLOYMENT SQUIB 1 -

CIRCUIT SHORT TO BATTERY DTC?

Yes

- Go To 2.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK LEFT SIDE CURTAIN AIRBAG FOR SHORT TO VOLTAGE**

Fig. 62: Checking Left Side Curtain Airbag Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Left Side Curtain Airbag harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and SRS Load Tool Jumper (special tool #8443-1, Jumpers, 2 Pin) to the Left Side Curtain Airbag harness connector.

   WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the ORC DTCs.

   Does the scan tool display active B0021-12-LEFT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO BATTERY DTC ?

   Yes

   - Go To 3.

   No

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   - Replace the Left Side Curtain Airbag in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R1, R3) LEFT CURTAIN SQUIB 1 CIRCUITS FOR A SHORT TO VOLTAGE**

Fig. 63: Checking Left Curtain Squib 1 Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and Jumper from the Left Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: **Check connectors - Clean and repair as necessary.**

3. Connect the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

4. Measure the voltage of the (R3) Left Curtain Squib 1 Line 1 circuit between the Left Side Curtain Airbag harness connector cavity 2 and ground.
5. Measure the voltage of the (R1) Left Curtain Squib 1 Line 2 circuit between the Left Side Curtain Airbag harness connector cavity 1 and ground.

Is there any voltage present for either measurement?

Yes

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

-
- Repair the Left Side Curtain Squib 1 circuits for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

-
-
- Replace the ORC in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (SRS) Load Tool Kit (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool Adapter provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is on.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects an open or high resistance on the left squib circuit for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from an open condition for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R3) LEFT CURTAIN SQUIB LINE 1 CIRCUIT OPEN
(R1) LEFT CURTAIN SQUIB LINE 2 CIRCUIT OPEN
LEFT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B0021-13-LEFT CURTAIN DEPLOYMENT SQUIB 1 -

CIRCUIT OPEN DTC?

Yes

- Go To 2.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK LEFT SIDE CURTAIN AIRBAG FOR OPEN CIRCUITS**

Fig. 65: Checking Left Side Curtain Airbag Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Left Side Curtain Airbag harness connector.

WARNING: **To avoid serious or fatal injury, do not place an intact**

undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and SRS Load Tool Jumper (special tool #8443-1, Jumpers, 2 Pin) to the Left Side Curtain Airbag harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the ORC DTCs.

   Does the scan tool display active B0021-13-LEFT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT OPEN DTC?

   Yes

   - Go To 3.

   No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Left Side Curtain Airbag in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R1, R3) LEFT CURTAIN SQUIB 1 CIRCUITS FOR AN OPEN**

Fig. 66: Checking Left Curtain Squib 1 Circuits For Open
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and Jumper from the Left Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: **Check connectors - Clean and repair as necessary.**

3. Connect the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
4. Measure the resistance of the (R3) Left Curtain Squib 1 Line 1 circuit between the Left Side Curtain Airbag harness connector cavity 2 and the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) cavity 25.
5. Measure the resistance of the (R1) Left Curtain Squib 1 Line 2 circuit between the Left Side Curtain Airbag harness connector cavity 1 and the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) cavity 26.

Is the resistance below 1.0 Ohms on both circuits?

Yes

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

-
- Replace the ORC in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Repair the (R1, R3) Left Curtain Squib 1 circuits for an open.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (SRS) Load Tool Kit (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool Adapter provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects both circuits of the same squib are shorted together for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a shorted together condition for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R3) LEFT CURTAIN SQUIB LINE 1 CIRCUIT SHORTED TO THE (R1) LEFT CURTAIN SQUIB LINE 2 CIRCUIT
LEFT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read the ORC DTCs.

      Does the scan tool display active B0021-2B-LEFT CURTAIN DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER DTC?

Yes

- Go To 2.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK LEFT SIDE CURTAIN AIRBAG FOR SHORT CIRCUITS**

Fig. 68: Checking Left Side Curtain Airbag Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Left Side Curtain Airbag harness connector.

WARNING: **Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Check connectors - Clean and repair as necessary.**

2. Connect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and SRS Load Tool Jumper (special tool #8443-1, Jumpers, 2 Pin) to the Left Side Curtain Airbag harness connector.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

3. With the scan tool, read the ORC DTCs.

Does the scan tool display active B0021-2B-LEFT CURTAIN DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER DTC?

Yes

- Go To 3.

No

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

-
- Replace the Left Side Curtain Airbag in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT**

Fig. 69: Checking Left Curtain Squib 1 Line 1 Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and Jumper from the Left Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.

4. Measure the resistance between the (R3) Left Curtain Squib 1 Line 1 circuit cavity 2 and the (R1) Left Curtain Squib 1 Line 2 circuit cavity 1 at the Left Side Curtain Airbag harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (R3) Left Curtain Squib 1 Line 1 circuit for a short to the (R1) Left Curtain Squib 1 Line 2 circuit.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the ORC in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (SRS) Load Tool Kit (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool Adapter provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on. With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Right Side Curtain Squib 1 circuits.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the right squib circuit for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground condition for greater than 2.5 seconds. The ORC has detected low resistance of the Right Side Curtain Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R4) RIGHT CURTAIN SQUIB LINE 1 CIRCUIT SHORTED TO GROUND
(R2) RIGHT CURTAIN SQUIB LINE 2 CIRCUIT SHORTED TO GROUND
RIGHT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

NOTE: Make sure the battery is fully charged.

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

Does the scan tool display active B0029-11-RIGHT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO GROUND DTC?

Yes

- Go To 2.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK RIGHT SIDE CURTAIN AIRBAG FOR SHORT CIRCUITS**

Fig. 71: Checking Right Side Curtain Airbag Squib Circuit

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Right Side Curtain Airbag harness connector.

WARNING: **Do not place an intact non-deployed airbag face down on a**

hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and SRS Load Tool Jumper (special tool #8443-1, Jumpers, 2 Pin) to the Right Side Curtain Airbag harness connector.

   WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

3. With the scan tool, read the ORC DTCs.

   Does the scan tool display active B0029-11-RIGHT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO GROUND DTC?

   Yes

   - Go To 3.

   No

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the Right Side Curtain Airbag in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R2, R4) RIGHT CURTAIN SQUIB 1 CIRCUITS FOR A SHORT TO GROUND**

Fig. 72: Checking Right Curtain Squib 1 Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and Jumper from the Right Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
4. Measure the resistance of the (R4) Right Curtain Squib 1 Line 1 circuit between the Right Side Curtain Airbag harness connector cavity 1 and ground.
5. Measure the resistance of the (R2) Right Curtain Squib 1 Line 2 circuit between the Right Side Curtain Airbag harness connector cavity 2.

   Is the resistance below 10K Ohms on either circuit?

   Yes

   - Repair the Right Curtain Squib 1 circuits for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the ORC in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Right Side Curtain Airbag harness connector.

   WARNING: **Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.**

   NOTE: Check connectors - Clean and repair as necessary.

2. Connect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and SRS Load Tool Jumper (special tool #8443-1, Jumpers, 2 Pin) to the Right Side Curtain Airbag harness connector.

   WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

3. With the scan tool, read the ORC DTCs.

   Does the scan tool display active B0029-2B-RIGHT CURTAIN DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER DTC?

   Yes

   - Go To 3.

   No

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the Right Side Curtain Airbag in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT**

Fig. 81: Checking Right Curtain Squib 1 Line 1 Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and Jumper from the Right Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
4. Measure the resistance between the (R4) Right Curtain Squib 1 Line 1 circuit cavity 1 and the (R2) Right Curtain Squib 1 Line 2 circuit cavity 2 at the Right Side Curtain Airbag harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (R4) Right Curtain Squib 1 Line 1 circuit for a short to the (R2) Right Curtain Squib 1 Line 2 circuit.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the ORC in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B0050-11-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO GROUND

Fig. 82: Driver Seatbelt Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current across the Driver Seat Belt Switch circuits every 60 ms to verify the integrity of the switch and wiring. The DTC will set if the circuits are shorted together or to ground for 2.5 seconds and the code will transitions from active to stored when the current return to normal range for five seconds.

WHEN MONITORED:

While the ignition on and the Occupant Restraint Controller (ORC) is configured for a Driver Seat Belt Switch, the ORC checks the switch input current ranges.

SET CONDITION:

If the ORC detects the passenger seat belt buckle switch circuits shorted to ground.

POSSIBLE CAUSES

Possible Causes
(R57) DRIVER SEAT BELT SWITCH SENSE CIRCUIT SHORTED TO GROUND
(R59) DRIVER SEAT BELT SWITCH GROUND CIRCUIT SHORTED TO GROUND
DRIVER SEAT BELT BUCKLE SWITCH
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B0050-11-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO GROUND DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM

INTERMITTENT TEST.

2. **CHECK DRIVER SEAT BELT SWITCH CIRCUITS FOR A SHORT TO GROUND**

Fig. 83: Checking Driver Seat Belt Switch Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Buckle Switch harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C2 harness connectors.
4. Measure the resistance of the (R57) Driver Seat Belt Buckle Switch Sense circuit between the Driver Seat Belt Buckle Switch harness connector cavity 2 and ground.
5. Measure the resistance of the (R59) Driver Seat Belt Buckle Switch Ground circuit between the Driver Seat Belt Switch harness connector cavity 1 and ground.

Is the resistance below 10k Ohms on any of these circuits?

Yes

- Repair the (R57) or (R59) Driver Seat Belt Buckle Switch circuits for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 4.

3. **CHECK DRIVER SEAT BELT SWITCH CIRCUITS FOR A SHORT TO GROUND**

Fig. 84: Checking Driver Seat Belt Switch Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (R57) Driver Seat Belt Buckle Switch Sense circuit and (R59) Driver Seat Belt Buckle Switch Ground circuit at the Driver Seat Belt Buckle Switch harness connector.

   Is the resistance below 10k Ohms on any of these circuits?

   Yes

   - Repair the (R57) Driver Seat Belt Buckle Switch Sense circuit for a short to the (R59) Driver Seat Belt Buckle Switch Ground circuit.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM

VERIFICATION TEST.

No

- Go To 4.

4. **CHECK OPERATION OF THE DRIVER SEAT BELT SWITCH**
   1. Replace the Driver Seat Belt Buckle Switch.
   2. Reconnect the vehicle body harness connector to the Driver Seat Belt Buckle Switch.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition OFF, and wait 15 seconds before turning the Ignition ON.
   7. Wait one minute, and read active DTCs and if there are none present read the stored DTCs.

   Does the scan tool display active B0050-11-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO GROUND DTC?

   Yes

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   -
   - Replace the ORC in accordance with Service Instructions.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Repair is complete.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B0050-12-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO BATTERY

Fig. 85: Driver Seatbelt Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current across the Driver Seat Belt Buckle Switch circuits every 60 ms to verify the integrity of the switch and wiring. The DTC will set if the circuits are shorted to battery for 2.5 seconds and the code will transitions from active to stored when the current return to normal range for five seconds.

WHEN MONITORED:

With the ignition on and the Occupant Restraint Controller (ORC) configured for a Driver Seat Belt Buckle Switch. The ORC monitors the switch input current ranges.

SET CONDITION:

If the ORC detects a short to voltage on the Driver Seat Belt Buckle Switch circuits.

POSSIBLE CAUSES

Possible Causes
(R57) DRIVER SEAT BELT BUCKLE SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
(R59) DRIVER SEAT BELT BUCKLE SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE
DRIVER SEAT BELT BUCKLE SWITCH
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTC.

      Does the scan tool display active B0050-12-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO BATTERY DTC?

      Yes

      - Go To 2.

      No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK DRIVER SEAT BELT BUCKLE SWITCH SHORT TO VOLTAGE**

Fig. 86: Checking Driver Seat Belt Buckle Switch For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Driver Seat Belt Buckle Switch harness connector.
2. Disconnect the ORC harness connectors.

NOTE: **Check connectors - Clean and repair as necessary.**

3. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC harness connectors.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

4. Measure the voltage on the (R57) Driver Seat Belt Buckle Switch Sense circuit between the Driver Seat Belt Buckle Switch harness connector cavity 2 and ground.
5. Measure the voltage on the (R59) Driver Seat Belt Buckle Switch Ground circuit between the Driver Seat Belt Buckle Switch harness connector cavity 1 and ground.

Is there a short to voltage on any of these circuits?

Yes

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

-
- Repair the (R57, R59) Driver Seat Belt Buckle Switch circuit for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 3.

3. **CHECK OPERATION OF THE DRIVER SEAT BUCKLE BELT SWITCH**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Replace the Driver Seat Belt Buckle Switch.
2. Reconnect the vehicle body harness connector to the Driver Seat Belt Buckle Switch.
3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these**

instructions may result in possible serious or fatal injury.

4. Connect the scan tool to the Data Link Connector - use the most current software available.
5. Use the scan tool and erase the stored DTCs.
6. Turn the Ignition OFF, and wait 15 seconds before turning the Ignition ON.
7. Wait one minute, and read active DTCs and if there are none present read the stored DTCs.

Does the scan tool display active B0050-12-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO BATTERY DTC?

Yes

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

-
-
- Replace the ORC in accordance with Service Instructions.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Repair is complete.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B0050-13-DRIVER SEATBELT SENSOR - CIRCUIT OPEN

Fig. 87: Driver Seatbelt Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current across the Driver Seat Belt Buckle Switch circuits every 60 ms to verify the integrity of the switch and wiring. The DTC will set if the circuits are open for 2.5 seconds and the code will transitions from active to stored when the current return to normal range for 5 seconds.

WHEN MONITORED:

The ORC checks the Driver Seat Belt Buckle Switch input current when the ignition ON and the Occupant Restraint Controller (ORC) configured for a Driver Seat Belt Buckle Switch.

SET CONDITION:

The DTC will set if the ORC detects an open on the Driver Seat Belt Buckle Switch circuits.

POSSIBLE CAUSES

Possible Causes
(R57) DRIVER SEAT BELT BUCKLE SWITCH SENSE CIRCUIT OPEN
(R59) DRIVER SEAT BELT BUCKLE SWITCH GROUND CIRCUIT OPEN
DRIVER SEAT BELT BUCKLE SWITCH
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Ensure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTC.

      Does the scan tool display active B0050-13-DRIVER SEATBELT SENSOR - CIRCUIT OPEN DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM

INTERMITTENT TEST.

2. **VERIFY WIRING**

Fig. 88: Measuring Resistance Of Driver Seat Belt Buckle Switch Sense Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Driver Seat Belt Buckle Switch harness connector.
2. Disconnect the ORC harness connectors.

NOTE: **Check connectors - Clean and repair as necessary.**

3. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C2 harness connector.
4. Measure the resistance of the (R57) Driver Seat Belt Buckle Switch Sense circuit between the Driver Seat Belt Buckle Switch harness connector cavity 2 and the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 10.
5. Measure the resistance of the (R59) Driver Seat Belt Buckle Switch Ground circuit between the Driver Seat Belt Buckle Switch harness connector cavity 1 and SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 18.

   Is the resistance greater than 1.0 Ohms on any of these circuits?

   Yes

   - Repair the (R57, R59) Driver Seat Belt Buckle Switch circuits for an open.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 3.

3. **VERIFY OPEN SWITCH**
   1. Replace the Driver Seat Belt Buckle Switch.
   2. Reconnect the vehicle body harness connector to the Driver Seat Belt Buckle Switch.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored DTCs.
   6. Turn the Ignition OFF, and wait 15 seconds before turning the Ignition ON.
   7. Wait one minute, and read active DTCs and if there are none present read the stored DTCs.

      Does the scan tool display active B0050-13-DRIVER SEATBELT SENSOR - CIRCUIT OPEN DTC?

      Yes

      WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow

these instructions may result in possible serious or fatal injury.

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

-
-
- Replace the ORC in accordance with Service Instructions.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Repair is complete.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

Fig. 89: Front Impact Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of this left front impact sensor is in the Left Crush Zone of the engine compartment. Refer to **SENSOR, IMPACT, DESCRIPTION** . Impact sensors perform internal self-tests and communicate the sensors status using power supplied by the Occupant Restraint Controller (ORC). The sensor communicates this internal failure message using the sensor signal circuit. If the scan tool shows this DTC has a Stored history of setting then the left front impact sensor is to be replaced.

WHEN MONITORED:

Impact sensors perform the self-test for internal circuitry at power up during the initialization process, and continuously through the ignition cycle every 10 ms.

SET CONDITION:

This DTC sets when the ORC receives notification of a self-test failure within the impact sensor. Once set, this DTC is latched for the entire ignition cycle.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT IMPACT SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

NOTE: **If the scan tool shows this DTC has a Stored history of setting then the left front impact sensor is to be replaced.**

NOTE: **Make sure the battery is fully charged.**

1. **VERIFY ACTIVE DTC**
    1. Turn the ignition ON.
    2. With the scan tool, read ORC DTCs.

    Does the scan tool display active B0090-49-LEFT FRONTAL RESTRAINTS SENSOR - INTERNAL ELECTRONIC FAILURE DTC or did the DTC set the Stored history setting?

    Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Left Front Impact Sensor in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINT SYSTEM VERIFICATION TEST.

No (Did not set a active or stored DTC B0090-49- LEFT FRONTAL SENSOR - INTERNAL ELECTRONIC FAILURE)

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

THEORY OF OPERATION

The location of this right front impact sensor is in the Right Crush Zone of the engine compartment. Refer to **SENSOR, IMPACT, DESCRIPTION** . Impact sensors perform internal self-tests and communicate the sensors status using power supplied by the Occupant Restraint Controller (ORC). The sensor communicates this internal failure message using the sensor signal circuit. If the scan tool shows this DTC has a Stored history of setting then the right front impact sensor is to be replaced.

WHEN MONITORED:

Impact sensors perform the self-test for internal circuitry at power up during the initialization process, and continuously through the ignition cycle every 10 ms.

SET CONDITION:

This DTC sets when the ORC receives notification of a self-test failure within the impact sensor. Once set, this DTC is latched for the entire ignition cycle.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT IMPACT SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

NOTE: **If the scan tool shows this DTC has a Stored history of setting then the right front impact sensor is to be replaced.**

NOTE: **Make sure the battery is fully charged.**

1. **VERIFY ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    Does the scan tool display an active B0095-49-RIGHT FRONTAL ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE DTC or shows a setting history in stored?

    Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Right Front Impact Sensor in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINT SYSTEM VERIFICATION TEST.

No (Did not set a active or stored DTC B0095-49- RIGHT FRONTAL SENSOR - INTERNAL ELECTRONIC FAILURE)

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

B0091-49-LEFT SIDE ACCELERATION SENSOR 1 - INTERNAL ELECTRONIC FAILURE

Fig. 91: Left Side Impact Sensor Circuit Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of this left side impact sensor 1 is located in the Left B-pillar just past the first row seating. Refer to **SENSOR, IMPACT, DESCRIPTION** . Impact sensors perform internal self-tests and communicate the sensors status using power supplied by the Occupant Restraint Controller (ORC). The sensor communicates this internal failure message using the sensor signal circuit. If the scan tool shows this DTC has a Stored history of setting then the left side impact sensor is to be replaced.

WHEN MONITORED:

Impact sensors perform the self-test for internal circuitry at power up during the initialization process, and continuously through the ignition cycle every 10 ms.

SET CONDITION:

This DTC sets when the ORC receives notification of a self-test failure within the impact sensor. Once set, this DTC is latched for the entire ignition cycle.

POSSIBLE CAUSES

Possible Causes
LEFT SIDE IMPACT SENSOR 1

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

NOTE: **If the scan tool shows this DTC has a Stored history of setting then the left side impact sensor is to be replaced.**

NOTE: **Make sure the battery is fully charged.**

1. **VERIFY ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    Does the scan tool display active B0091-49-LEFT SIDE ACCELERATION SENSOR 1 - INTERNAL ELECTRONIC FAILURE DTC or shows a setting history in stored?

    Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Left Side Impact Sensor 1 in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINT SYSTEM VERIFICATION TEST.

No (Did not set a active or stored DTC B0091-49- LEFT SIDE SATELLITE SENSOR 1- INTERNAL ELECTRONIC FAILURE)

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

B0092-49-LEFT SIDE ACCELERATION SENSOR 2 - INTERNAL ELECTRONIC FAILURE

Fig. 92: Left Side Impact Sensor Circuit Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of this left side impact sensor 2 is located in the Left C-pillar just past the second row seating. Refer to **SENSOR, IMPACT, DESCRIPTION** . Impact sensors perform internal self-tests and communicate the sensors status using power supplied by the Occupant Restraint Controller (ORC). The sensor communicates this internal failure message using the sensor signal circuit. If the scan tool shows this DTC has a Stored history of setting then the left side impact sensor is to be replaced.

WHEN MONITORED:

Impact sensors perform the self-test for internal circuitry at power up during the initialization process, and continuously through the ignition cycle every 10 ms.

SET CONDITION:

This Diagnostic Trouble Code (DTC) will sets if the ORC receives an internal failure message from the Impact Sensor. The DTC will be latched on for the duration of the ignition cycle.

POSSIBLE CAUSES

Possible Causes
LEFT SIDE IMPACT SENSOR 2

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

NOTE: **If the scan tool shows this DTC has a Stored history of setting then the left side impact sensor is to be replaced.**

NOTE: **Make sure the battery is fully charged.**

1. **VERIFY ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    Does the scan tool display an active B0092-49-LEFT SIDE ACCELERATION SENSOR 2 - INTERNAL ELECTRONIC FAILURE DTC or shows a setting history in stored?

    Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Left Side Impact Sensor 2 in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINT SYSTEM VERIFICATION TEST.

No (Did not set a active or stored DTC B0092-49- LEFT SIDE SATELLITE SENSOR 2- INTERNAL ELECTRONIC FAILURE)

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

B009A-49-LEFT SIDE SATELLITE SENSOR 4 - INTERNAL ELECTRONIC FAILURE

Fig. 93: Left Side Satellite Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of this left side impact sensor (pressure sensor) 4 is located in the Left Front Door. Refer to **SENSOR, IMPACT, DESCRIPTION** . Impact sensors perform internal self-tests and communicate the sensors status using power supplied by the Occupant Restraint Controller (ORC). The sensor communicates this internal failure message using the sensor signal circuit. If the scan tool shows this DC has a Stored history of setting then the left side impact sensor is to be replaced.

WHEN MONITORED:

Impact sensors perform the self-test for internal circuitry at power up during the initialization process, and continuously through the ignition cycle every 10 ms.

SET CONDITION:

This DC sets when the ORC receives notification of a self-test failure within the impact sensor. Once set, this DTC is latched for the entire ignition cycle.

POSSIBLE CAUSES

Possible Causes
LEFT SIDE IMPACT PRESSURE SENSOR (SENSOR 4)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

NOTE: **If the scan tool shows this DTC has a Stored history of setting then the left side impact sensor is to be replaced.**

NOTE: **Make sure the battery is fully charged.**

1. **VERIFY ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    Does the scan tool display active B009A-49-LEFT SIDE SATELLITE SENSOR 4 - INTERNAL ELECTRONIC FAILURE DTC or shows a setting history in stored?

    Yes

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

-
- Replace the Left Side Impact Pressure Sensor in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINT SYSTEM VERIFICATION TEST.

No (Did not set a active or stored DTC B009A-49-LEFT SIDE SATELLITE SENSOR 4-INTERNAL ELECTRONIC FAILURE).

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

B0096-49-RIGHT SIDE ACCELERATION SENSOR 1 - INTERNAL ELECTRONIC FAILURE

Fig. 94: Right Side Impact Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of this right side impact sensor 1 is located in the Right B-pillar just past first row seating. Refer to **SENSOR, IMPACT, DESCRIPTION** . Impact sensors perform internal self-tests and communicate the sensors status using power supplied by the Occupant Restraint Controller (ORC). The sensor communicates this internal failure message using the sensor signal circuit. If the scan tool shows this DTC has a Stored history of setting then the right side impact sensor is to be replaced.

WHEN MONITORED:

Impact sensors perform the self-test for internal circuitry at power up during the initialization process, and continuously through the ignition cycle every 10 ms.

SET CONDITION:

This DTC sets when the ORC receives notification of a self-test failure within the impact sensor. Once set, this DTC is latched for the entire ignition cycle.

POSSIBLE CAUSES

Possible Causes
RIGHT SIDE IMPACT SENSOR 1

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

NOTE: **If the scan tool shows this DTC has a Stored history of setting then the right side impact sensor is to be replaced.**

NOTE: **Make sure the battery is fully charged.**

1. **VERIFY ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B0096-49-RIGHT SIDE ACCELERATION SENSOR 1 - INTERNAL ELECTRONIC FAILURE DTC or shows a setting history in stored?

      Yes

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow**

these instructions may result in possible serious or fatal injury.

-
- Replace the Right Side Impact Sensor 1 in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINT SYSTEM VERIFICATION TEST.

No (Did not set a active or stored DTC B0096-49-RIGHT SIDE SATELLITE SENSOR 1-INTERNAL ELECTRONIC FAILURE)

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

B0097-49-RIGHT SIDE ACCELERATION SENSOR 2 - INTERNAL ELECTRONIC FAILURE

Fig. 95: Right Side Impact Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of this right side impact sensor 2 is located in the Right C-pillar just past second row seating. Refer to **SENSOR, IMPACT, DESCRIPTION** . Impact sensors perform internal self-tests and communicate the sensors status using power supplied by the Occupant Restraint Controller (ORC). The sensor communicates this internal failure message using the sensor signal circuit. If the scan tool shows this DTC has a Stored history of setting then the right side impact sensor is to be replaced.

WHEN MONITORED:

Impact sensors perform the self-test for internal circuitry at power up during the initialization process, and continuously through the ignition cycle every 10 ms.

SET CONDITION:

This DTC sets when the ORC receives notification of a self-test failure within the impact sensor. Once set, this DTC is latched for the entire ignition cycle.

POSSIBLE CAUSES

Possible Causes
RIGHT SIDE IMPACT SENSOR 2

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

NOTE: **If the scan tool shows this DTC has a Stored history of setting then the right side impact sensor is to be replaced.**

NOTE: **Make sure the battery is fully charged.**

1. **VERIFY ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    Does the scan tool display active B0097-49-RIGHT SIDE ACCELERATION SENSOR 2 - INTERNAL ELECTRONIC FAILURE DTC or shows a setting history in stored?

    Yes

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow**

these instructions may result in possible serious or fatal injury.

-
- Replace the Right Side Impact Sensor 2 in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINT SYSTEM VERIFICATION TEST.

No (Did not set a active or stored DTC B0097-49-RIGHT SIDE SATELLITE SENSOR 2-INTERNAL ELECTRONIC FAILURE).

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

B009D-49-RIGHT SIDE SATELLITE SENSOR 4 - INTERNAL ELECTRONIC FAILURE

MODULE-

SENSOR-

Fig. 96: Right Side Satellite Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of this right side impact sensor (pressure sensor) 4 is located in the Right Front Door. Refer to **SENSOR, IMPACT, DESCRIPTION** . Impact sensors perform internal self-tests and communicate the sensors status using power supplied by the Occupant Restraint Controller (ORC). The sensor communicates this internal failure message using the sensor signal circuit. If the scan tool shows this DTC has a Stored history of setting then the right side impact sensor is to be replaced.

WHEN MONITORED:

Impact sensors perform the self-test for internal circuitry at power up during the initialization process, and continuously through the ignition cycle every 10 ms.

SET CONDITION:

This DTC sets when the ORC receives notification of a self-test failure within the impact sensor. Once set, this DTC is latched for the entire ignition cycle.

POSSIBLE CAUSES

Possible Causes
RIGHT SIDE IMPACT PRESSURE SENSOR (SENSOR 4)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

NOTE: **If the scan tool shows this DTC has a Stored history of setting then the right side impact sensor is to be replaced.**

NOTE: **Make sure the battery is fully charged.**

1. **VERIFY ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    Does the scan tool display active B009D-49-RIGHT SIDE SATELLITE SENSOR 4 - INTERNAL ELECTRONIC FAILURE DTC or shows a setting history in stored?

    Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Right Side Impact Pressure Sensor in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINT SYSTEM VERIFICATION TEST.

No (Did not set a active or stored DTC B009D-49-RIGHT SIDE SATELLITE SENSOR 4-INTERNAL ELECTRONIC FAILURE)

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

B1BA5-00-AIRBAG SQUIB CONFIGURATION MISMATCH -

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the Squibs. During this test, the squibs discovered are checked for agreement with the pre-programmed vehicle configuration of squib circuits assigned to the ORC.

WHEN MONITORED:

The ORC checks its feature configuration for a stored airbag and tensioner configuration at power-up and initialization.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects a 2 consecutive message mismatches between the Vehicle Configuration and the ORC configuration. Once set, this DTC is latched for the entire power cycle.

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE (PCM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Ensure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B1BA5-00-AIRBAG SQUIB CONFIGURATION MISMATCH - DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.
2. **VERIFY ORC PART NUMBER**
   1. With the scan tool, read the ORC part number.

      Is the part number correct for the vehicle?

      Yes

      - Go To 3.

      No

      WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

      WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

      -
      -
      - Replace the ORC in accordance with Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.
3. **CHECK THE VIN WITH THE SCAN TOOL**
   1. With the scan tool, read the VIN.

2. Compare the vehicle VIN to the ORC VIN.

   Is the correct VIN displayed?

   Yes

   - Go To 4.

   No

   - Replace the PCM in accordance with Service Information.
   - Refer to **STANDARD PROCEDURE** for 3.7L/4.7L/5.7L or **STANDARD PROCEDURE** for 6.7L and perform the POWERTRAIN VERIFICATION TEST.

4. **VERIFY TIPM CONFIGURATION**
   1. With the scan tool, read the TIPM configuration.

      Does the TIPM configuration match the vehicle equipment?

      Yes

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

      WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

      -
      -
      - Replace the ORC in accordance with Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

      No

      - Re-configure or replace the TIPM in accordance with Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B1BC7-00-DEPLOYMENT DATA RECORD FULL -

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault condition does not involve any external circuitry and centers on verifying the integrity of the module's internal memory.

WHEN MONITORED:

The ORC checks its internal memory for the number of recorded deployment events once at every power up, during the initialization process and after any deployment.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects the third airbag deployment event. Once set, this DTC is latched permanently.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**
    1. Turn the ignition ON.
    2. With the scan tool, read ORC active DTCs.

    Does the scan tool display an active B1BC7-00-DEPLOYMENT DATA RECORD FULL - DTC?

    Yes

    WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

    WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

    -
    -
    - Replace the ORC in accordance with the service information.
    - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B007E-11-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to Wiring Information** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The SRS Load Tool (special tool #8443-24, 32-Way Adapter) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is on. The ORC then monitors the data return wire to determine the state of the circuit.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the squib circuit for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R503) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND
(R505) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO GROUND
DRIVER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

NOTE: Make sure the battery is fully charged.

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

   Does the scan tool display an active B007E-11-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND DTC?

   Yes

   - Go To 2.

   No

   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK DRIVER SEAT BELT RETRACTOR TENSIONER SHORT TO GROUND**

Fig. 97: Checking Driver Seat Belt Retractor Tensioner Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Retractor Tensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Retractor Tensioner harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the ORC DTCs.

   Does the scan tool display an active B007E-11-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND DTC?

   Yes

   - Go To 3.

   No

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   - Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R503, R505) DRIVER SEAT BELT RETRACTOR TENSIONER CIRCUITS FOR A SHORT TO GROUND**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) from the Driver Seat Belt Retractor Tensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
4. Measure the resistance of the (R505) Driver Seat Belt Retractor Tensioner Line 1 circuit between the SRS Load Tool connector C1 cavity 1 and ground.

5. Measure the resistance of the (R503) Driver Seat Belt Retractor Tensioner Line 2 circuit between the SRS Load Tool connector C1 cavity 2 and ground.

   Is the resistance below 10K Ohms on either circuit?

   Yes

   - Repair the Driver Seat Belt Retractor Tensioner circuits for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the ORC in accordance with the Service Information. Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B007E-12-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The SRS Load Tool (special tool #8443-24, 32-Way Adapter) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is on. The ORC then monitors the data return wire to determine the state of the circuit.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to voltage on the squib circuit for more

than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to voltage for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R503) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO VOLTAGE
(R505) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO VOLTAGE
DRIVER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B007E-12-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK DRIVER SEAT BELT RETRACTOR TENSIONER FOR A SHORT TO BATTERY**

Fig. 98: Checking Driver Seat Belt Retractor Tensioner Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Driver Seat Belt Retractor Tensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Retractor Tensioner harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the ORC DTCs.

   Does the scan tool display active B007E-12-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY DTC?

   Yes

   - Go To 3.

   No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R503, R505) DRIVER SEAT BELT RETRACTOR TENSIONER CIRCUITS FOR A SHORT TO BATTERY**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the Jumper from the Driver Seat Belt Retractor Tensioner harness connector.
2. Disconnect the ORC harness connectors. Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL** .

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-24, 32-Way Adapter) Adaptor to the ORC C1 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R505) Driver Seat Belt Retractor Tensioner Line 1 circuit between the (special tool #8443-24, 32-Way Adapter) connector C1 cavity 1 and ground.
5. Measure the voltage of the (R503) Driver Seat Belt Retractor Tensioner Line 2 circuit between the (special tool #8443-24, 32-Way Adapter) connector C1 cavity 2 and ground.

Is there any voltage present on either circuit?

Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Repair the Driver Seat Belt Retractor Tensioner circuits with voltage present.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

-
-
- Replace the ORC in accordance with the Service Information. Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B007E-13-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The SRS Load Tool Adapter provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is on. The ORC then monitors the data return wire to determine the state of the circuit.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects an open on the squib circuit for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from an open condition for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R503) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT OPEN
(R505) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT OPEN
DRIVER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B007E-13-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN DTC?

      Yes

- Go To 2.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK DRIVER SEAT BELT RETRACTOR TENSIONER OPEN**

Fig. 99: Checking Driver Seat Belt Retractor Tensioner Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Retractor Tensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Retractor Tensioner harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the ORC DTCs.

Does the scan tool display B007E-13-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN DTC ?

Yes

- Go To 3.

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R503, R505) DRIVER SEAT BELT RETRACTOR TENSIONER CIRCUITS FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and Jumper from the Driver Seat Belt Retractor Tensioner harness connector.

2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
4. Measure the resistance of the (R505) Driver Seat Belt Retractor Tensioner Line 1 circuit between the Driver Seat Belt Retractor Tensioner harness connector cavity 2 and the (special tool #8443-24, 32-Way Adapter) connector C1 cavity 1.
5. Measure the resistance of the (R503) Driver Seat Belt Retractor Tensioner Line 2 circuit between the Driver Seat Belt Retractor Tensioner harness connector cavity 1 and the (special tool #8443-24, 32-Way Adapter) connector C1 cavity 2.

Is the resistance below 1.0 Ohms?

Yes

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

-
- Replace the ORC in accordance with Service Information. Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Repair the (R503, R505) Driver Seat Belt Retractor Tensioner circuits for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B007E-2B-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The SRS Load Tool (special tool #8443-24, 32-Way Adapter) provides a test point as

well as a method for opening the shorting bar connections within the ORC harness connectors.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is on. The ORC then monitors the data return wire to determine the state of the circuit.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects both circuits of the same squib are shorted together for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from the shorted together condition for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R503) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO THE (R505) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT
DRIVER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B007E-2B-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK DRIVER SEAT BELT RETRACTOR TENSIONER FOR CIRCUITS SHORT**

TOGETHER

Fig. 100: Checking Driver Seat Belt Retractor Tensioner Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Driver Seat Belt Retractor Tensioner harness connector.

NOTE: **Check connectors - Clean and repair as necessary.**

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Retractor Tensioner harness connector.

   WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

3. With the scan tool, read the ORC DTCs.

   Does the scan tool display active B007E-2B-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER DTC?

   Yes

   - Go To 3.

   No

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R505) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT FOR A SHORT TO (R503) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT**

Fig. 101: Checking Driver Seat Belt Retractor Tensioner Line 1 Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the (special tool #8443A, SRS Load Tool) and the Jumper from the Driver Seat Belt Retractor Tensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness

connector.

4. Measure the resistance between the (R505) Driver Seat Belt Retractor Tensioner Line 1 circuit cavity 2 and the (R503) Driver Seat Belt Retractor Tensioner Line 2 circuit cavity 1 at the Driver Seat Belt Retractor Tensioner harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (R505) Driver Seat Belt Retractor Tensioner Line 1 circuit for a short to the (R503) Driver Seat Belt Retractor Tensioner Line 2 circuit.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the ORC in accordance with Service Information. Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B007F-11-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool (special tool #8443-24, 32-Way Adapter) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is on. The ORC then monitors the data return wire to determine the state of the circuit.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the squib circuit for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R504) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND
(R506) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO GROUND
PASSENGER SEAT BELT TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B007F-11-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK PASSENGER SEAT BELT RETRACTOR TENSIONER FOR A SHORT TO GROUND**

Fig. 102: Checking Passenger Seat Belt Retractor Tensioner Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Passenger Seat Belt Retractor Tensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Retractor Tensioner harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the ORC DTCs.

   Does the scan tool display active B007F-11-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND DTC?

   Yes

   - Go To 3.

   No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Passenger Seat Belt Retractor Tensioner in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R504, R506) PASSENGER SEAT BELT RETRACTOR TENSIONER CIRCUITS FOR A SHORT TO GROUND**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and Jumper from the Passenger Seat Belt Retractor Tensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
4. Measure the resistance of the (R506) Passenger Seat Belt Retractor Tensioner Line 1 circuit

between the (special tool #8443-24, 32-Way Adapter) connector C1 cavity 4 and ground.

5. Measure the resistance of the (R504) Passenger Seat Belt Retractor Tensioner Line 2 circuit between the (special tool #8443-24, 32-Way Adapter) connector C1 cavity 3 and ground.

   Is the resistance below 10K Ohms on either circuit?

   Yes

   - Repair the Passenger Seat Belt Retractor Tensioner circuits for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   - Replace the ORC in accordance with the Service Information. Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B007F-12-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to Wiring Information** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool (special tool #8443-24, 32-Way Adapter) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is on. The ORC then monitors the data return wire to determine the state of the circuit.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to voltage on the squib circuit for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to voltage for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R504) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO VOLTAGE
(R506) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO VOLTAGE
PASSENGER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B007F-12-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK PASSENGER SEAT BELT RETRACTOR TENSIONER FOR A SHORT TO VOLTAGE**

Fig. 103: Checking Passenger Seat Belt Retractor Tensioner Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Passenger Seat Belt Retractor Tensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Retractor Tensioner harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the ORC DTCs.

   Does the scan tool display active B007F-12-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY DTC?

   Yes

   - Go To 3.

   No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the Passenger Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R504, R506) PASSENGER SEAT BELT RETRACTOR TENSIONER CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Retractor Tensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait

two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R506) Passenger Seat Belt Retractor Tensioner Line 1 circuit between the SRS Load Tool Adapter connector C1 cavity 4 and ground.
5. Measure the voltage of the (R504) Passenger Seat Belt Retractor Tensioner Line 2 circuit between the SRS Load Tool Adapter connector C1 cavity 3 and ground.

Is there any voltage present on either circuit?

Yes

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

-
- Repair the Passenger Seat Belt Retractor Tensioner circuits for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

-
-
- Replace the ORC in accordance with the Service Information. Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL** .
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B007F-13-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the

integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool (special tool #8443-24, 32-Way Adapter) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100 ms thereafter while the ignition is in on. The ORC then monitors the data return wire to determine the state of the circuit.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects an open on the squib circuit for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from an open condition for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R504) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT OPEN
(R506) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT OPEN
PASSENGER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B007F-13-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN DTC?

      Yes

      - Go To 2.

      No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINT SYSTEM INTERMITTENT TEST.

2. **CHECK FOR PASSENGER SEAT BELT RETRACTOR TENSIONER CIRCUIT OPEN**

Fig. 104: Checking Passenger Seat Belt Retractor Tensioner Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Passenger Seat Belt Retractor Tensioner harness connector.

   NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Retractor Tensioner harness connector.

   WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the active ORC DTCs.

   Does the scan tool display active B007F-13-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN DTC?

   Yes

   - Go To 3.

   No

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   - Replace the Passenger Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R504, R506) PASSENGER SEAT BELT RETRACTOR TENSIONER CIRCUITS FOR AN OPEN**

Fig. 105: Checking Passenger Seat Belt Retractor Tensioner Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Retractor Tensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connectors.
4. Measure the resistance of the (R506) Passenger Seat Belt Retractor Tensioner Line 1 circuit between the Passenger Seat Belt Retractor Tensioner harness connector cavity 2 and the (special tool #8443-24, 32-Way Adapter) cavity 4.
5. Measure the resistance of the (R504) Passenger Seat Belt Retractor Tensioner Line 2 circuit between the Passenger Seat Belt Retractor Tensioner harness connector cavity 1 and the (special tool #8443-24, 32-Way Adapter) cavity 3.

   Is the resistance below 1.0 Ohms on both circuits?

   Yes

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the ORC in accordance with Service Information. Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Repair the (R506) Passenger Seat Belt Retractor Tensioner Line 1 circuit.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B007F-2B-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to Wiring Information** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector.

WHEN MONITORED:

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 100

ms thereafter while the ignition is in on. The ORC then monitors the data return wire to determine the state of the circuit.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects both circuits of the same squib are shorted together for more than 2.5 seconds. This DTC transitions from active to stored when the ORC sees a recovery from the shorted together condition for greater than 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
(R504) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO THE (R506) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1
PASSENGER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B007F-2B-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK PASSENGER SEAT BELT RETRACTOR TENSIONER CIRCUITS SHORT TO TOGETHER**

Fig. 106: Checking Passenger Seat Belt Retractor Tensioner Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Passenger Seat Belt Tensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Tensioner Retractor harness connector.

   WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the ORC DTCs.

   Does the scan tool display active B007F-2B-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER DTC?

   Yes

   - Go To 3.

   No

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   - Replace the Passenger Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK (R506) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT FOR A SHORT TO (R504) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT**

Fig. 107: Checking Passenger Seat Belt Retractor Tensioner Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the (special tool #8443A, SRS Load Tool) and the Jumper from the Passenger Seat Belt Tensioner Retractor harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
4. Measure the resistance between the (R506) Passenger Seat Belt Retractor Tensioner Line 1 circuit cavity 2 and the (R504) Passenger Seat Belt Retractor Tensioner Line 2 circuit cavity 1 at the Passenger Seat Belt Tensioner harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (R506) Passenger Seat Belt Retractor Tensioner Line 1 circuit for a short to the (R504) Passenger Seat Belt Retractor Tensioner Line 2 circuit.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Replace the ORC in accordance with Service Information. Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL** .
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

Fig. 108: Occupant Restraint Controller Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Occupant Restraint Controller (ORC) receives fused ignition voltage from the Totally Integrated Power

Module (TIPM). The ORC is equipped with two voltage sources the F100 and F201 circuit. These circuits power the ORC and the capacitors used to initiate the squib deployment circuits in the event of collision detection.

WHEN MONITORED:

The ORC continuously monitors the voltage on the F100 and F201 supply circuits. The ORC monitors the power circuits at a rate of every 10 ms.

SET CONDITION:

The ORC will set this DTC when the voltage on both supply circuits are below 9 ± 0.5 volts for more than 15 seconds. The DTC changes from Active to Stored when voltage returns to normal level and the power feed circuit voltages goes above 10 ± 0.5 volts for 5 seconds.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE LOW
(F100) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT HIGH RESISTANCE
(F201) FUSED IGNITION RUN/START CONTROL OUTPUT CIRCUIT HIGH RESISTANCE
TOTALLY INTEGRATED CONTROL MODULE (TIPM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read Powertrain Control Module (PCM) DTCs.

      Are there any Charging System DTCs set in the PCM?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate Charging System diagnostic procedures.

      No

      - Go To 2.

2. **VERIFY ACTIVE DTC**
    1. With the scan tool, read all ORC DTCs.

       Does the scan tool display active B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD DTC?

       Yes

       - Go To 3.

       No

       - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.
3. **CHECK LOW VOLTAGE ON THE M16 AND M32 SUPPLY CIRCUITS**
    1. Remove the TIPM M16 and M32 fuse.

       NOTE: Check connectors - Clean and repair as necessary.

    2. Measure the voltage on the Ignition Run Control Output circuit between the TIPM M32 fuse supply terminal TIPM C6 cavity 38 and ground.
    3. Measure the voltage on the Ignition Run/Start Control Output circuit between the TIPM M16 fuse supply terminal TIPM C6 cavity 7 and ground.

       Is the voltage below 9 ± 0.5 volts on both circuits?

       Yes

       - Replace the TIPM in accordance with Service Information.
       - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

       No

       - Go To 4.
4. **CHECK FOR LOW VOLTAGE AT THE ORC**

Fig. 109: Checking Voltage On Fused Ignition Run Control Output Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Install the TIPM M32 and M16 fuses.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C2 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage on the (F100) Fused Ignition Run Control Output circuit between the appropriate terminal of the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) and ground.
5. Measure the voltage on the (F201) Fused Ignition Run/Start Control Output circuit between the appropriate terminal of the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) and ground.

Is the voltage below 9 ± 0.5 volts on both circuits?

Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Repair the F100 and F201 Fused Run and Run/Start Control Output circuits for high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

-
-
- Replace the ORC in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

Fig. 110: Occupant Restraint Controller Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to Wiring Information** .

THEORY OF OPERATION

The Occupant Restraint Controller (ORC) receives fused ignition voltage from the Totally Integrated Power Module (TIPM). The ORC is equipped with two voltage sources the F100 and F201 circuit. These circuits power the ORC and the capacitors used to initiate the squib deployment circuits in the event of collision detection.

WHEN MONITORED:

With the ignition on, the ORC continuously monitors the voltage on the F100 and F201 supply circuits. The ORC monitors the power circuits at a rate of every 10 ms.

SET CONDITION:

The ORC will set this Diagnostic Trouble Code (DTC) when the voltage on one of the supply circuits is above 18 ± 0.5 volts for more than 15 seconds. The DTC changes from Active to Stored when voltage returns to normal level and the power feed circuit voltages goes below 17 ± 0.5 volts for 5 seconds.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

NOTE: Ensure the battery is fully charged.

1. **CHECK PCM FOR CHARGING SYSTEM DTC**
   1. Turn the ignition on.
   2. With the scan tool, read Powertrain Control Module (PCM) DTCs.

      Are there any Charging System DTCs set in the PCM?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** for 3.7L/4.7L/5.7L or **DIAGNOSTIC CODE INDEX** for 6.7L and perform the appropriate Charging System diagnostic procedures.

      No

      - Go To 2.
2. **VERIFY ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read all ORC DTCs.

Does the scan tool display active B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD DTC?

Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Replace the ORC in accordance with Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Occupant Restraint Controller (ORC) receives power for the Run/Start circuit from the Totally Integrated Power Module (TIPM) via fuse M16. This circuits power the ORC and the capacitors used to initiate the squib deployment circuits in the event of collision detection. The use of the Supplemental Restraints System (SRS) Load Tool Adapter in the tests below provides a test point in place of the ORC harness connectors.

WHEN MONITORED:

The ORC monitors the voltage on the Run/Start and Run circuits and compares their voltage at power up during the initialization process, and once every 100 ms throughout the ignition cycle.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects the voltage is below 6 volts on the Fused Ignition Run/Start Control Output circuit for more than 15 seconds while the Fused Ignition Run Control Output circuit remains less than 9 volts. In the event the ORC detects Run/Start voltage has returned to normal operating range and it is above 5 volts for a minimum of 5 seconds, this DTC immediately transitions to stored status.

POSSIBLE CAUSES

Possible Causes
ACTIVE TIPM RUN/START DTC
TIPM M16 FUSE OPEN
(F201) FUSED IGNITION RUN/START CONTROL OUTPUT CIRCUIT OPEN
(F201) FUSED IGNITION RUN/START CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. Using a scan tool, read ORC DTCs.

Does the scan tool display active B212C-13-IGNITION RUN/START INPUT - CIRCUIT OPEN DTC?

Yes

- Go To 2.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK FOR AN ACTIVE TIPM RUN/START DTC**
   1. With the scan tool, read TIPM DTCs.

      Does the scan tool display any active TIPM Run/Start circuit related DTCs?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **INSPECT THE TIPM M16 FUSE**
   1. Turn the ignition to OFF.
   2. Remove and inspect TIPM M16 fuse.

      NOTE: Check connectors. Clean and repair as necessary.

      Is fuse TIPM M16 fuse open?

      Yes

      - Go To 4.

      No

      - Go To 6.

4. **CHECK (F201) FUSED IGNITION RUN/START CONTROL OUTPUT CIRCUIT RESISTANCE**

Fig. 112: Checking Fused Ignition Run/Start Control Output Circuit Resistance
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may

result in possible serious or fatal injury.

1. Measure the resistance of the (F201) Fused Ignition Run/Start Control Output circuit between TIPM M16 fuse terminal (output side) and ground.

   Is the resistance below 100 Ohms?

   Yes

   - Go To 5.

   No

   - Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
   - Replace the TIPM M16 fuse in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

5. **CHECK (F201) FUSED IGNITION RUN/START CONTROL OUTPUT CIRCUIT RESISTANCE WITH ORC DISCONNECTED**

Fig. 113: Checking Fused Ignition Run/Start Control Output Circuit Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect both ORC harness connectors.

   NOTE: Check connectors - Clean and repair as necessary.

2. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C2 harness connector.
3. Measure the resistance of the (F201) Fused Ignition Run/Start Control Output circuit between the appropriate terminal of the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) and ground.

   Is the resistance below 100 Ohms?

   Yes

- Replace the TIPM M16 fuse.
- Repair the (F201) Fused Ignition Run/Start Control Output circuit for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with the Service Information.
- Replace the TIPM M16 fuse.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

6. **CHECK (F201) IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition on.
   2. Measure the voltage of the Ignition Run/Start Control Output circuit at the TIPM M16 fuse terminal (supply side).

   Is the voltage above 6.0 volts?

   Yes

   - Go To 7.

   No

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   - Repair the open Ignition Run/Start Control Output circuit.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.
7. **CHECK FOR ORC CIRCUIT OPEN**

Fig. 114: Checking ORC Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Reinstall the TIPM M16 Fuse.
2. Disconnect both ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Install the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C2 harness connector.

   WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (F201) Fused Ignition Run/Start Control Output circuit between the appropriate terminal of the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) and ground.

   Is the voltage above 6.0 volts?

   Yes

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   -
   - Replace the ORC in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To. Refer to 8.

8. **CHECK FOR OPEN (F201) FUSED IGNITION RUN START CONTROL OUTPUT CIRCUIT**

Fig. 115: Checking For Open Fused Ignition Run Start Control Output Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

Disconnect the TIPM C6 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

1. Measure the resistance of the (F201) Fused Ignition Run/Start Control Output circuit between the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 16 and the TIPM C6 harness connector cavity 7.

   Is the resistance below 5.0 Ohms?

   Yes

   - Turn the ignition OFF.
   - Replace the TIPM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

   No

   - Repair the open (F201) Fused Ignition Run/Start Control Output circuit.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B212D-13-IGNITION RUN ONLY INPUT-CIRCUIT OPEN

Fig. 116: Fused Ignition Run Control Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to Wiring Information** .

THEORY OF OPERATION

The Occupant Restraint Controller (ORC) receives power for the Run circuit from the Totally Integrated Power Module (TIPM) via fuse M32. This circuits power the ORC and the capacitors used to initiate the squib deployment circuits in the event of collision detection. The use of the Supplemental Restraints System (SRS) Load Tool Adapter in the tests below provides a test point in place of the ORC harness connectors.

WHEN MONITORED:

The ORC monitors the voltage on the Run/Start and Run circuits and compares their voltage at power up during the initialization process, and once every 100 ms throughout the ignition cycle.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects the voltage at least 4.8 volts on the Fused Ignition Run Control Output circuit for more than 15 seconds while the Fused Ignition Run/Start Control Output circuit remains below 9 volts. In the event the ORC detects voltage has returned to normal operating range and the Ignition Run only voltage feed is above 5 volts for a minimum of five seconds, this DTC immediately transitions to stored status.

POSSIBLE CAUSES

Possible Causes
ACTIVE TIPM RUN RELAY TROUBLE CODES
TIPM M32 FUSE OPEN
(F100) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT OPEN
(F100) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Ensure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B212D-13-IGNITION RUN ONLY INPUT CIRCUIT OPEN DTC?

      Yes

- Go To 2.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK FOR ACTIVE RUN RELAY DTC**
   1. With the scan tool, read TIPM DTCs.

      Does the scan tool display any active TIPM Run Relay related DTCs?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate TIPM diagnostic procedures.

      No

      - Go To 3.

3. **INSPECT TIPM FUSE M32**
   1. Turn the Ignition OFF.
   2. Remove and inspect the TIPM Fuse M32.

      NOTE: Check connectors - Clean and repair as necessary.

      Is the TIPM Fuse M32 open?

      Yes

      - Go To 4.

      No

      - Go To 6.

4. **CHECK (F100) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT RESISTANCE**

Fig. 117: Checking Fused Ignition Run Control Output Circuit Resistance
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may

result in possible serious or fatal injury.

1. Measure the resistance of the (F100) Fused Ignition Run Control Output circuit between the TIPM Fuse M32 output terminal and ground.

   Is the resistance below 100 Ohms?

   Yes

   - Go To 5.

   No

   - Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
   - Replace TIPM Fuse M32.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

5. **CHECK (F100) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT WITH ORC DISCONNECTED**

Fig. 118: Checking Fused Ignition Run Control Output Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the ORC harness connectors.

   NOTE: Check connectors - Clean and repair as necessary.

2. Connect the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) to the ORC C2 harness connector.
3. Measure the resistance of the (F100) Fused Ignition Run Control Output circuit between SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) cavity 24 and ground.

   Is the resistance below 100 Ohms?

Yes

- Repair the (F100) Fused Ignition Run Control Output circuit for a short to ground.
- Replace the TIPM Fuse M32.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

-
- Replace the ORC in accordance with the Service Information.
- Replace the TIPM Fuse M32.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

6. **CHECK TIPM FUSE M32 SUPPLY CIRCUIT VOLTAGE**
   1. Turn the ignition on.
   2. Measure the voltage of the Ignition Run Control Output circuit between the TIPM Fuse M32 supply terminal and ground.

      Is the voltage above 6.0 volts?

      Yes

      - Go To 7.

      No

      - Repair the open Ignition Run Control Output circuit.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.
7. **CHECK FOR OPEN (F100) FUSED IGNITION RUN CONTROL OUTPUT AT ORC**

Fig. 119: Checking Fused Ignition Run Control Output Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Reinstall the TIPM Fuse M32.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C2 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (F100) Fused Ignition Run Control Output circuit between the appropriate terminal of the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) and ground.

   Is the voltage above 6.0 volts?

   Yes

   - Replace the ORC in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 8.

8. **CHECK FOR OPEN (F100) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT**

Fig. 120: Checking For Open Fused Ignition Run Control Output Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the TIPM C6 harness connector.

NOTE: **Check connectors - Clean and repair as necessary.**

2. Measure the resistance of the (F100) Fused Ignition Run Control Output circuit between the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 24 and the TIPM C6 harness connector cavity 38.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the TIPM in accordance with the Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

   No

   - Repair the (F100) Fused Ignition Run Control Output circuit for an open or high resistance.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B210F-00-LOSS OF BATTERY VOLTAGE

Fig. 121: Fused Ignition Run Control Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to Wiring Information** .

THEORY OF OPERATION

The Occupant Restraint Controller (ORC) receives power for the Run circuit from the Totally Integrated Power Module (TIPM) via fuse M32. This circuits power the ORC and the capacitors used to initiate the squib deployment circuits in the event of collision detection.

WHEN MONITORED:

The ORC monitors the voltage on the Run/Start and Run circuits and compares their voltage at power up during the initialization process, and once every 100 ms throughout the ignition cycle. The use of the Supplemental Restraints System (SRS) Load Tool Adapter in the tests below provides a test point in place of the ORC harness connectors.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects the voltage below 6 volts on the Fused Ignition Run Control Output circuit for more than 15 seconds while the Fused Ignition Run/Start Control Output circuit remains above 9 volts. In the event the ORC detects voltage has returned to normal operating range for a minimum of five seconds, this DTC immediately transitions to stored status.

POSSIBLE CAUSES

Possible Causes
ACTIVE TIPM RUN RELAY TROUBLE CODES
TIPM M32 FUSE OPEN
(F100) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active B210F-00-LOSS OF BATTERY VOLTAGE - DTC?

      Yes

      - Go To 2.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK FOR ACTIVE RUN RELAY DTC**
   1. With the scan tool, read TIPM DTCs.

      Does the scan tool display any active TIPM Run Relay related DTCs?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 3.

3. **INSPECT TIPM FUSE M32**
   1. Turn the Ignition OFF.
   2. Remove and inspect the TIPM Fuse M32.

      NOTE: Check connectors - Clean and repair as necessary.

      Is the TIPM Fuse M32 open?

      Yes

      - Go To 4.

      No

      - Go To 5.

4. **CHECK (F100) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT RESISTANCE**

Fig. 122: Checking Fused Ignition Run Control Output Circuit Resistance
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may

result in possible serious or fatal injury.

1. Measure the resistance of the (F100) Fused Ignition Run Control Output circuit between the TIPM Fuse M32 output terminal TIPM C6 cavity 38 and ground.

   Is the resistance below 100 Ohms?

   Yes

   - Go To 5.

   No

   - Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
   - Replace TIPM Fuse M32.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

5. **CHECK (F100) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT WITH ORC DISCONNECTED**

Fig. 123: Checking Fused Ignition Run Control Output Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) to the ORC C2 harness connector.
3. Measure the resistance of the (F100) Fused Ignition Run Control Output circuit between

appropriate terminal of the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) cavity 24 and ground.

Is the resistance below 100 Ohms?

Yes

- Repair the (F100) Fused Ignition Run Control Output circuit for a short to ground.
- Replace the TIPM Fuse M32.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

-
- Replace the ORC in accordance with the Service Information.
- Replace the TIPM Fuse M32.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B2207-00-OCCUPANT RESTRAINT CONTROLLER INTERNAL 1

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault condition does not involve any external circuitry and centers on verifying the integrity of the module's internal circuitry and software validity.

WHEN MONITORED:

The ORC checks the status and validity of the internal operating hardware and software at power up during the initialization process, and continuously through the ignition cycle.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when a fault is detected internal to ORC hardware and/or software. Once set, this DTC is latched permanently and the module must be replaced.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **REPLACE OCCUPANT RESTRAINT CONTROLLER (ORC)**

   NOTE: When this DTC is set, the module self test has discovered an internal fault that cannot be repaired and the module must be replaced regardless of DTC status.

   When this code is set do not clear codes, view repair.

   Repair

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   -
   - Replace the ORC in accordance with Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B2208-00-OCCUPANT RESTRAINT CONTROLLER INTERNAL 2

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault condition does not involve any external circuitry and centers on verifying the integrity of the module's internal circuitry and software validity.

WHEN MONITORED:

The ORC checks the status and validity of the internal operating hardware and software at power up during the initialization process, and continuously through the ignition cycle.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when a fault is detected internal to ORC hardware and/or software. Once set, this DTC is latched permanently and the module must be replaced.

POSSIBLE CAUSES

   When this code is set do not clear codes, view repair.

   Repair

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   -
   - Replace the ORC in accordance with Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B2209-00-OCCUPANT RESTRAINT CONTROLLER INTERNAL 3

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault condition does not involve any external circuitry and centers on verifying the integrity of the module's internal circuitry and software validity.

WHEN MONITORED:

The ORC checks the status and validity of the internal operating hardware and software at power up during the initialization process, and continuously through the ignition cycle.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when a fault is detected internal to ORC hardware and/or software. Once set, this DTC is latched permanently and the module must be replaced.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **REPLACE OCCUPANT RESTRAINT CONTROLLER (ORC)**

   NOTE: When this DTC is set, the module self test has discovered an internal fault that cannot be repaired and the module must be replaced regardless of DTC status.

   When this code is set do not clear codes, view repair.

   Repair

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   -
   - Replace the ORC in accordance with Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B220A-00-OCCUPANT RESTRAINT CONTROLLER INTERNAL 4

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault condition does not involve any external circuitry and centers on verifying the integrity of the module's internal circuitry and software validity.

WHEN MONITORED:

The ORC checks the status and validity of the internal operating hardware and software at power up during the initialization process, and continuously through the ignition cycle.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when a fault is detected internal to ORC hardware and/or software. Once set, this DTC is latched permanently and the module must be replaced.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **REPLACE OCCUPANT RESTRAINT CONTROLLER (ORC)**

NOTE: **When this DTC is set, the module self test has discovered an internal fault that cannot be repaired and the module must be replaced regardless of DTC status.**

When this code is set do not clear codes, view repair.

Repair

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

-
-
- Replace the ORC in accordance with Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B220B-00-OCCUPANT RESTRAINT CONTROLLER FIRING STORED ENERGY

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault condition does not involve any external circuitry and centers on verifying the integrity of the module's internal circuitry and software validity.

WHEN MONITORED:

The ORC checks the status of firing stored energy circuit at power up during the initialization process, and continuously through the ignition cycle.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when a fault is detected internal to ORC firing stored energy circuit. Once set, this DTC is latched permanently and the ORC must be replaced.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **REPLACE OCCUPANT RESTRAINT CONTROLLER (ORC)**

   NOTE: When this DTC is set, the module self test has discovered an internal fault that cannot be repaired and the module must be replaced regardless of DTC status.

   When this code is set do not clear codes, view repair.

   Repair

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   -

- Replace the ORC in accordance with Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

B223B-00-VEHICLE CONFIGURATION MISMATCH -

Fig. 124: CAN IHS BUS Module Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault centers on verifying ORC and Totally Integrated Power Module (TIPM) configuration.

WHEN MONITORED:

The ORC checks its feature configuration for side airbags present and Passenger Airbag Disable (PAD) Switch present at power-up and initialization.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects a 2 consecutive message mismatches between the TIPM configuration and the ORC configuration. Once set, this DTC is latched for the entire power cycle.

POSSIBLE CAUSES

Possible Causes
TIPM CONFIGURATION
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY ACTIVE ORC DTC**

   NOTE: Ensure the battery is fully charged.

   1. Turn the ignition on.
   2. Wait 12 seconds, with the scan tool, read all ORC DTCs.

      Does the scan tool display active B223B-00-VEHICLE CONFIGURATION MISMATCH - DTC?

      Yes

      - Go To 2.

      No

      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.
2. **VERIFY ORC PART NUMBER**

1. With the scan tool, read the ORC part number.

   Is the part number correct for the vehicle?

   Yes

   - Go To 3.

   No

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

   -
   -
   - Replace the ORC in accordance with Service Information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

3. **CHECK THE TIPM CONFIGURATION**
   1. With the scan tool, check for Side Airbags and PAD Switch configuration.

      Does the Vehicle Configuration in the TIPM match the Vehicle Configuration in the ORC?

      Yes

      WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

      WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

      -
      -
      - Replace the ORC in accordance with Service Information.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- With the scan tool enter program network configuration and program the TIPM to the vehicle configuration.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

B222A-00-VEHICLE LINE MISMATCH -

Fig. 125: CAN IHS BUS Module Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault centers on verifying the ORC programmed and vehicle content configuration.

WHEN MONITORED:

The ORC checks its feature configuration for a stored Vehicle Line and Country Code at power-up and initialization.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC detects a 2 consecutive message mismatches between the Vehicle configuration and the ORC configuration. Once set this DTC is latched active for the ignition cycle.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **REPLACE OCCUPANT RESTRAINT CONTROLLER (ORC)**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

       Does the scan tool display active B222A-00-VEHICLE LINE MISMATCH - DTC?

       Yes

       WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

       WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

       •

-
- Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

B2722-00-ORC UNLOCKED-ALL DEPLOYMENT DISABLED

THEORY OF OPERATION

All Occupant Restraint Controller (ORC) modules destined for service part usage are shipped in a (ORC locked state) that inhibits the deployment of all supplemental restraint squib circuits (ORC unlocked state) for safe, initial installation. Once the ORC initialization procedure is performed (ORC locked state). The ORC enters a full state of readiness and can no longer transition to the unlocked status.

WHEN MONITORED:

The ORC will detect the Deployment Disable Status (ORC LOCKED, ORC UNLOCKED or ORC IS RESPONDING WITH INCORRECT DATA) as soon as the ignition is turned on and the power is supplied to the new ORC.

SET CONDITION:

This DTC will be set as active for all service replacement ORC modules prior to the initialization procedure (ORC locked).

POSSIBLE CAUSES

Possible Causes
UNLOCKED OCCUPANT RESTRAINT CONTROLLER (ORC) Module

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR ADDITIONAL ACTIVE ORC DTCS**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.

2. With the scan tool, read the active ORC DTC.

   Is B2722-00-ORC UNLOCKED-ALL DEPLOYMENT DISABLED the only active DTC?

   Yes

   - Go To 2.

   No

   - Refer to **DIAGNOSIS AND TESTING** and select the appropriate diagnostic procedure.

2. **INITIALIZE ORC**
   1. With the scan tool, select Initialize ORC.
   2. The scan tool will display the current Deployment Disable Status (CURRENT STATUS)

      Select the CURRENT STATUS displayed on the scan tool.

      CURRENT STATUS

      - LOCKED
      - The ORC is in a full state of readiness.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

      CURRENT STATUS

      - UNLOCKED
      - Go To 3.

      CURRENT STATUS

      - ORC is Responding with incorrect Data
      - With the scan tool, select MISC. FUNCTION and then Initialize ORC.
      - After the ORC Initialization is complete: Restart this test at step 1.
      - Go To 1.

3. **CHANGE ORC STATUS**
   1. Follow the instruction on the screen to change the status to LOCKED.
   2. The scan tool will display the result of the initialization.

      Does the scan tool display: ORC LOCK Successful?

      Yes

      - CURRENT STATUS is ORC LOCK Successful

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 4.

4. **INCOMPLETE OR FAILED ORC INITIALIZATION**

   Does the scan tool display: ORC Initialization Failed?

   Yes

   - CURRENT STATUS is ORC Initialization Failed

     WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

     WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   -
   - Replace the ORC in accordance with service information.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - CURRENT STATUS is Current and original VIN have not been learned by ORC
   - With the scan tool, select and rerun Initialize ORC.
   - After the Initialize ORC Procedure is complete: Restart this test at step 1.
   - Go To 1.

U0001-00-CAN C BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller module (ORC) "listens" to the serial data bus for the broadcast of various serial data messages.

WHEN MONITORED:

The ORC checks for serial data message traffic at power up during the initialization process, and continuously through the ignition cycle.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC fails to detect serial data message traffic for more than five seconds. In the event the ORC detects serial data message traffic, this DTC will immediately transition to stored status.

POSSIBLE CAUSES

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the IOD fuse is installed and battery Voltage is between 10 and 16 Volts before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active U0001-00-CAN C BUS - DTC?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the U0001-Can C Bus diagnostic procedure.

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication diagnostic procedure.

U0002-00-CAN C BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts. Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

   1. Turn the ignition on.
   2. With a scan tool, read DTCs.

      Is the DTC active at this time?

      Yes

      - **Diagnose the U0002-00 CAN C BUS OFF PERFORMANCE as the U0001 CAN C BUS CIRCUIT test.** Refer to **DIAGNOSIS AND TESTING** and perform the U0001-Can C Bus diagnostic procedure.

      No

      - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0141-00-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM) POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Is the DTC active at this time?

      Yes

      - **Refer to <u>DIAGNOSIS AND TESTING</u>** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

      No

      - **Refer to <u>DIAGNOSIS AND TESTING</u>** and perform the Stored Lost Communication DTCs diagnostic procedure.

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED:

The impact sensor performs a self test for internal circuitry at power up during the initialization process, and continuously through the ignition cycle every 10 ms.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the ORC receives notification of a self test failure within the impact sensor. Once set, this DTC is latched for the entire ignition cycle.

POSSIBLE CAUSES

Possible Causes
(R79, R81) LEFT FRONT IMPACT SENSOR CIRCUITS SHORTED TO VOLTAGE
(R79, R81) LEFT FRONT IMPACT SENSOR CIRCUITS SHORTED TO GROUND
(R79, R81) LEFT FRONT IMPACT SENSOR CIRCUITS SHORTED TOGETHER
(R79, R81) LEFT FRONT IMPACT SENSOR CIRCUITS OPEN
LEFT FRONT IMPACT SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Using the wiring diagram/schematic as a guide check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.**

NOTE: **If after the harness inspection it appears the impact sensor connector is only seated halfway. Re-seat the harness connector into the impact sensor and lock the tab. Follow the instructions below checking for active codes.**

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Make sure the battery is fully charged.**

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

   Does the scan tool display active U0170-00-LOST COMMUNICATION W/ UP-FRONT LEFT SATELLITE SENSOR - DTC?

   Yes

   - Go To 2.

   No

   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK THE (R79, R81) LEFT FRONT IMPACT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE**

Fig. 127: Checking Left Front Impact Sensor Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Left Front Impact Sensor harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Measure the voltage of the (R79) Left Front Impact Sensor Signal circuit cavity 2 and (R81) Left Front Impact Sensor Ground circuit cavity 1 at the Left Front Impact Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (R79, R81) Left Front Impact Sensor circuits for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 3.

3. **CHECK THE (R79, R81) LEFT FRONT IMPACT SENSOR CIRCUITS FOR A SHORT TO GROUND**

Fig. 128: Checking Left Front Impact Sensor Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance between ground and the (R79) Left Front Impact Sensor Signal circuit at the Left Front Impact Sensor harness connector cavity 2.
2. Measure the resistance between ground and the (R81) Left Front Impact Sensor Ground circuit at the Left Front Impact Sensor harness connector cavity 1.

   Is the resistance below 100K Ohms?

Yes

- Repair the (R79, R81) Left Front Impact Sensor circuits for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (R79, R81) LEFT FRONT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

Fig. 129: Checking Left Front Impact Sensor Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (R79) Left Front Impact Sensor Signal circuit and (R81) Left Front Impact Sensor Ground circuit at the Left Front Impact Sensor harness connector.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the (R79, R81) Left Front Impact Sensor circuits shorted together.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 5.

5. **CHECK THE (R81) LEFT FRONT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 130: Checking Left Front Impact Sensor Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
2. Measure the resistance of the (R81) Left Front Impact Sensor Ground circuit between the Left Front Impact Sensor harness connector cavity 1 and the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 22

   Is the resistance below 1 Ohm?

   Yes

- Go To 6.

No

- Repair the (R81) Left Front Impact Sensor Ground circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

6. **CHECK THE (R79) LEFT FRONT IMPACT SENSOR CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 131: Checking Left Front Impact Sensor Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (R79) Left Front Impact Sensor Ground circuit between the Left Front Impact Sensor harness connector and the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity C1-14.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7.

   No

   - Repair the (R79) Left Front Impact Sensor Signal circuit for an open or high resistance.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

7. **CHECK OPERATION OF THE LEFT FRONT IMPACT SENSOR**
   1. Replace the Left Front Impact Sensor in accordance with the Service Information.
   2. Reconnect the vehicle body harness connector to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the ignition OFF, and wait 15 seconds before turning the ignition ON.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Does the scan tool display active U0170-00-LOST COMMUNICATION W/ UP-FRONT LEFT SATELLITE SENSOR - DTC?

      Yes

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

      WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

      -

-
- Replace the ORC in accordance with Service Information.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Repair is complete.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

(R80, R82) RIGHT FRONT IMPACT SENSOR CIRCUITS SHORTED TOGETHER
(R80, R82) RIGHT FRONT IMPACT SENSOR CIRCUITS OPEN
RIGHT FRONT IMPACT SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Using the wiring diagram/schematic as a guide check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.**

NOTE: **If after the harness inspection it appears the impact sensor connector is only seated halfway. Re-seat the harness connector into the impact sensor and lock the tab. Follow the instructions below checking for active codes.**

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Make sure the battery is fully charged.**

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

   Does the scan tool display active U0171-00-LOST COMMUNICATION W/ UP-FRONT RIGHT SATELLITE SENSOR - DTC?

   Yes

   - Go To 2.

   No

   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK THE (R80, R82) RIGHT FRONT IMPACT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE**

Fig. 133: Checking Right Front Impact Sensor Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Right Front Impact Sensor harness connector.
2. Disconnect the ORC harness connectors.

NOTE: **Check connectors - Clean/Repair as necessary.**

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these**

instructions may result in possible serious or fatal injury.

3. Measure the voltage of the (R80) Right Front Impact Sensor Signal circuit cavity 2 and (R82) Right Front Impact Sensor Ground circuit cavity 1 at the Right Front Impact Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (R80, R82) Right Front Impact Sensor circuits for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 3.

3. **CHECK THE (R80, R82) RIGHT FRONT IMPACT SENSOR CIRCUITS FOR A SHORT TO GROUND**

Fig. 134: Checking Right Front Impact Sensor Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Measure the resistance between ground and the (R80) Right Front Impact Sensor Signal circuit at the Right Front Impact Sensor harness connector cavity 2.
2. Measure the resistance between ground and the (R82) Right Front Impact Sensor Ground circuit at the Right Front Impact Sensor harness connector cavity 1.

Is the resistance below 100K Ohms?

Yes

- Repair the (R80, R82) Right Front Impact Sensor circuits for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (R80, R82) RIGHT FRONT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

Fig. 135: Checking Right Front Impact Sensor Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (R80) Right Front Impact Sensor Signal circuit and (R82) Right Front Impact Sensor Ground circuit at the Right Front Impact Sensor harness connector.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the (R80, R82) Right Front Impact Sensor circuits shorted together.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (R82) RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 136: Checking Right Front Impact Sensor Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
2. Measure the resistance of the (R82) Right Front Impact Sensor Ground circuit between the Right Front Impact Sensor harness connector and the SRS Load Tool Adapter (special tool #8443-24, 32-

Way Adapter) cavity 21.

Is the resistance below 1 Ohm?

Yes

- Go To 6.

No

- Repair the (R82) Right Front Impact Sensor Ground circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

6. **CHECK THE (R80) RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 137: Checking Right Front Impact Sensor Signal Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (R80) Right Front Impact Sensor Signal circuit between the Right Front Impact Sensor harness connector and the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 13.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7.

No

- Repair the (R80) Right Front Impact Sensor Signal circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

7. **CHECK OPERATION OF THE FRONT RIGHT IMPACT SENSOR**
   1. Replace the Right Front Impact Sensor in accordance with the Service Information.
   2. Reconnect the vehicle body harness connector to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the ignition OFF, and wait 15 seconds before turning the ignition ON.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Does the scan tool display active U0171-00-LOST COMMUNICATION W/ UP-FRONT RIGHT SATELLITE SENSOR DTC return?

      Yes

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

      WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

      -
      -
      - Replace the Occupant Restraint Controller (ORC) in accordance with Service Instructions.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

      No

      - Repair is complete.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM

VERIFICATION TEST.

U0172-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 1

Fig. 138: Left Side Impact Sensor Circuit Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of this left side impact sensor 1 is in the B-pillar just past the first row seating. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor. If the scan tool shows this DTC has a Stored history of setting then the left side impact sensor is to be replaced. A short to voltage fault on the left side impact sensor 1 sensor wiring can cause a loss of comm impact sensor 2 code to set and the possible replacement of a good left side impact sensor 2. The left side impact 1, and 2 sensors are wired in a daisy chain pattern. The short to battery fault in a loss of comm or internal circuit failure of the side impact sensor 1 can cause the impact sensor 2 on the same side to set a loss of comm code.

WHEN MONITORED:

The Occupant Restraint Controller (ORC) continuously communicates with the Left Side Impact Sensor 1 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION:

This Diagnostic Trouble Code (DTC) will set, if the ORC and the Left Side Impact Sensor 1 fail to establish and maintain valid data communications.

POSSIBLE CAUSES

Possible Causes
(R13, R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TO VOLTAGE
(R13, R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TO GROUND
(R13, R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TOGETHER
(R13, R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS OPEN
LEFT SIDE IMPACT SENSOR 1
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Using the wiring diagram/schematic as a guide check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.**

NOTE: **If after the harness inspection it appears the impact sensor connector is only seated halfway. Re-seat the harness connector into the impact sensor and lock the tab. Follow the instructions below checking for active codes.**

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Make sure the battery is fully charged.**

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

   Does the scan tool display active B0091-49-LEFT SIDE ACCELERATION SENSOR 1 - INTERNAL ELECTRONIC FAILURE, U0172-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 1, U0173-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 2, U11AD-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 4 - DTC?

   Yes

   - Check for all other internal and lost communication codes indicated in the left side impact sensor daisy chain wiring after diagnosing DTC B0091-49-LEFT SIDE ACCELERATION SENSOR 1 - INTERNAL ELECTRONIC FAILURE, and DTC U0172-LOST COMMUNICATION W/LEFT SIDE SATELLITE ACCELERATION SENSOR 1. Go To The DTC Displayed. Refer to **DIAGNOSIS AND TESTING**. Go To 2.

   No

   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK THE (R13, R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TO VOLTAGE**

Fig. 139: Checking Left Side Impact Sensor 1 Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Left Side Impact Sensor 1 harness connector.
2. Disconnect the ORC harness connectors.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

3. Measure the voltage of the (R13) Left Side Impact Sensor 1 Signal circuit at the Left Side Impact Sensor 1 harness connector cavity 4.
4. Measure the voltage of the (R15) Left Side Impact Sensor 1 Ground circuit at the Left Side Impact Sensor 1 harness connector cavity 3.

   Is there any voltage present?

   Yes

- Repair the (R13, R15) Left Side Impact Sensor 1 circuits for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 3.

3. **CHECK THE (R13, R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TO GROUND**

Fig. 140: Checking Left Side Impact Sensor 1 Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance between ground and the (R13) Left Side Impact Sensor 1 Signal circuit at the Left Side Impact Sensor 1 harness connector cavity 4.
2. Measure the resistance between ground and the (R15) Left Side Impact Sensor 1 Ground circuit at the Left Side Impact Sensor 1 harness connector cavity 3.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the (R13, R15) Left Side Impact Sensor 1 circuit for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (R13, R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TOGETHER**

Fig. 141: Checking Left Side Impact Sensor 1 Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (R13) Left Side Impact Sensor 1 Signal circuit and (R15) Left Side Impact Sensor 1 Ground circuit at the Left Side Impact Sensor 1 harness connector cavity 3 and 4.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the (R13, R15) Left Side Impact Sensor 1 circuits shorted together.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM

VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 142: Checking Left Side Impact Sensor 1 Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.

2. Measure the resistance of the (R15) Left Side Impact Sensor 1 Ground circuit between the Left Side Impact Sensor 1 harness connector and the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 19.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 6.

   No

   - Repair the (R15) Left Side Impact Sensor 1 Ground circuit for an open or high resistance.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

6. **CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 143: Checking Left Side Impact Sensor 1 Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between the Left Side Impact Sensor 1 harness connector and the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 11.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7.

No

- Repair the (R13) Left Side Impact Sensor 1 Signal circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

7. **CHECK OPERATION OF THE LEFT SIDE IMPACT SENSOR 1**
   1. Replace the Left Side Impact Sensor 1 in accordance with the Service Information.
   2. Reconnect the vehicle body harness connector to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the ignition OFF, and wait 15 seconds before turning the ignition ON.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Does the scan tool display active U0172-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 1 - DTC?

      Yes

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

      WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

      -
      -
      - Replace the ORC in accordance with Service Instructions.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

      No

      - Repair is complete.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM

VERIFICATION TEST.

U0173-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 2

Fig. 144: Left Side Impact Sensor Circuit Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of this left side impact sensor 2 is in the C-pillar just past the second row seating. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor. If the scan tool shows this DTC has a Stored history of setting then the left side impact sensor is to be replaced. A short to voltage fault on the left side impact sensor 1 sensor wiring can cause a loss of comm impact sensor 2 code to set and the possible replacement of a good left side impact sensor 2. The left side impact 1, and 2 sensors are wired in a daisy chain pattern. The short to battery fault in a loss of comm or internal circuit failure of the side impact sensor 1 can cause the impact sensor 2 on the same side to set a loss of comm code.

WHEN MONITORED:

The ORC continuously communicates with the Left Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION:

This Diagnostic Trouble Code (DTC) will set, if the ORC is communicating with the Left Side Impact Sensor 1 but fails to establish and maintain valid data communications with the Left Right Side Impact Sensor 2.

POSSIBLE CAUSES

Possible Causes
LOSS OF COMMUNICATION WITH THE LEFT SIDE IMPACT SENSOR 1
(R17, R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TO VOLTAGE
(R17, R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TO GROUND
(R17, R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TOGETHER
(R17, R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS OPEN
LEFT SIDE IMPACT SENSOR 2
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may**

result in possible serious or fatal injury.

NOTE: **Using the wiring diagram/schematic as a guide check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.**

NOTE: **If after the harness inspection it appears the impact sensor connector is only seated halfway. Re-seat the harness connector into the impact sensor and lock the tab. Follow the instructions below checking for active codes.**

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Make sure the battery is fully charged.**

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

   Does the scan tool display active B0091-49-LEFT SIDE ACCELERATION SENSOR 1 - INTERNAL ELECTRONIC FAILURE, B0092-49-LEFT SIDE ACCELERATION SENSOR 2 - INTERNAL ELECTRONIC FAILURE, U0172-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 1, U0173-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 2 - DTC?

   Yes

   - Check for all other internal and lost communication codes indicated in the left side impact sensor daisy chain wiring before diagnosing DTC U0173-LOST COMMUNICATION W/LEFT SIDE SATELLITE ACCELERATION SENSOR 2. Go To The DTC Displayed. Refer to **DIAGNOSIS AND TESTING**. If internal fault 1 and lost comm fault 1 have been checked follow DTC U0173-LOST COMMUNICATION W/LEFT SIDE SATELLITE ACCELERATION SENSOR 2. Go To 2.

   No

   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK THE (R17, R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS FOR A SHORT TO VOLTAGE**

Fig. 145: Checking Left Side Impact Sensor 2 Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Left Side Impact Sensor 1 harness connector.
2. Disconnect the Left Side Impact Sensor 2 harness connector.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these**

instructions may result in possible serious or fatal injury.

3. Measure the voltage of the (R19) Left Side Impact Sensor 2 Ground circuit cavity 3 at the Left Side Impact Sensor 2 harness connector.
4. Measure the voltage of the (R17) Left Side Impact Sensor 2 Signal circuit cavity 4 at the Left Side Impact Sensor 2 harness connector.

   Is there any voltage present?

   Yes

   - Repair the (R17, R19) Left Side Impact Sensor 2 circuits for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 3.

3. **CHECK THE (R17, R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS FOR A SHORT TO GROUND**

Fig. 146: Checking Left Side Impact Sensor 2 Circuit For A Short To Ground

Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance between ground and the (R17) Left Side Impact Sensor 2 Signal circuit between the Left Side Impact Sensor 2 harness connector cavity 4.
2. Measure the resistance between ground and the (R19) Left Side Impact Sensor 2 Ground circuit between the Left Side Impact Sensor 2 harness connector cavity 3.

Is the resistance below 100K Ohms?

Yes

- Repair the (R17, R19) Left Side Impact Sensor 2 circuits for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (R17, R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS FOR A SHORT TOGETHER**

Fig. 147: Checking Left Side Impact Sensor 2 Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (R17) Left Side Impact Sensor 2 Signal circuit and (R19) Left Side Impact Sensor 2 Ground circuits at the Left Side Impact Sensor 2 harness connector cavity 4 and 3.

   Is the resistance below 100K Ohms?

   Yes

- Repair the (R17, R19) Left Side Impact Sensor 2 circuits shorted together.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (R19) LEFT SIDE IMPACT SENSOR 2 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 148: Checking Left Side Impact Sensor 2 Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Left Side Impact Sensor 1 harness connector.
2. Measure the resistance of the (R19) Left Side Impact Sensor 2 Ground circuit between the Left Side Impact Sensor 2 harness connector cavity 3 and the Left Side Impact Sensor 1 harness connector cavity 2.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 6.

   No

   - Repair the (R19) Left Side Impact Sensor 2 Ground circuit for an open or high resistance.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

6. **CHECK THE (R13) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 149: Checking Left Side Impact Sensor 2 Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (R17) Left Side Impact Sensor 2 Signal circuit between the Left Side Impact Sensor 2 harness connector cavity 4 and the Left Side Impact Sensor 1 harness connector cavity 1.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7.

   No

   - Repair the (R17) Left Side Impact Sensor 2 Signal circuit for an open or high resistance.

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

7. **CHECK OPERATION OF THE LEFT SIDE IMPACT SENSOR 2**
    1. Replace the Left Side Impact Sensor 2 in accordance with the Service Information.
    2. Reconnect the vehicle body harness to the impact sensor.
    3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

    WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

    4. Connect the scan tool to the Data Link Connector - use the most current software available.
    5. Use the scan tool and erase the stored codes in all airbag system modules.
    6. Turn the ignition OFF, and wait 15 seconds before turning the ignition ON.
    7. Wait one minute, and read active codes and if there are none present read the stored codes.

    Did the scan tool display active U0173-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 2 - DTC?

    Yes

    WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

    WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

    -
    -
    - Replace the ORC in accordance with Service Instructions.
    - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

    No

    - Repair is complete.
    - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

U0175-00-LOST COMMUNICATION W/ RIGHT SIDE SATELLITE SENSOR 1

Fig. 150: Right Side Impact Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of this right side impact sensor 1 is in the B-pillar just past the first row seating. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor. If the scan tool shows this DTC has a Stored history of setting then the right side impact sensor is to be replaced. A short to voltage fault on the right side impact sensor 1 sensor wiring can cause a loss of comm impact sensor 2 or 4 code to set and the possible replacement of a good right side impact sensor 2 or 4. The right side impact 1, 2, and 4 sensors are wired in a daisy chain pattern. The short to battery fault in a loss of comm or internal circuit failure of the side impact sensor 1 can cause the impact sensor 2 and 4 on the same side to set a loss of comm code.

WHEN MONITORED:

The Occupant Restraint Controller (ORC) continuously communicates with the Right Side Impact Sensor 1 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION:

This Diagnostic Trouble Code (DTC) will set, if the ORC and the Right Side Impact Sensor 1 fail to establish and maintain valid data communications.

POSSIBLE CAUSES

Possible Causes
(R14, R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TO VOLTAGE
(R14, R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TO GROUND
(R14, R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TOGETHER
(R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS OPEN
RIGHT SIDE IMPACT SENSOR 1
OCCUPANT RESTRAINT CONTROLLER (ORC

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Using the wiring diagram/schematic as a guide check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.**

NOTE: **If after the harness inspection it appears the impact sensor connector is only seated halfway. Re-seat the harness connector into the impact sensor and lock the tab. Follow the instructions below checking for active codes.**

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Make sure the battery is fully charged.**

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

   Does the scan tool display active B0096-49-RIGHT SIDE ACCELERATION SENSOR 1 - INTERNAL ELECTRONIC FAILURE, U0175-00-LOST COMMUNICATION W/ RIGHT SIDE SATELLITE SENSOR 1, U0176-00-LOST COMMUNICATION W/ RIGHT SIDE SATELLITE SENSOR 2, U11B0-00-LOST COMMUNICATION W/ RIGHT SIDE SATELLITE SENSOR 4 - DTC?

   Yes

   - Check for all other internal and lost communication codes indicated in the right side impact sensor daisy chain wiring, starting with DTC B0096-49-RIGHT SIDE ACCELERATION SENSOR 1 - INTERNAL ELECTRONIC FAILURE, then DTC U0175-00-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 1. Refer to **DIAGNOSIS AND TESTING**. Then Go To 2.

   No

   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK THE (R14, R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TO VOLTAGE**

Fig. 151: Checking Right Side Impact Sensor 1 Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Right Side Impact Sensor 1 harness connector.
2. Disconnect the ORC harness connectors.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

3. Measure the voltage of the (R14) Right Side Impact Sensor 1 Signal circuit cavity 4 and (R16) Right Side Impact Sensor 1 Ground circuit cavity 3 at the Right Side Impact Sensor 1 harness connector.

   Is there any voltage present?

   Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- Repair the (R14, R16) Right Side Impact Sensor 1 circuits for a short to voltage.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 3.

3. **CHECK THE (R14, R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TO GROUND**

Fig. 152: Checking Right Side Impact Sensor 1 Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance between ground and the (R16) Right Side Impact Sensor 1 Ground circuit at the Right Side Impact Sensor 1 harness connector cavity 3.
2. Measure the resistance between ground and the (R14) Right Side Impact Sensor 1 Signal circuit between the Right Side Impact Sensor 1 harness connector cavity 4.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the (R14, R16) Right Side Impact Sensor 1 circuits for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (R14, R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TOGETHER**

Fig. 153: Checking Right Side Impact Sensor 1 Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (R14) Right Side Impact Sensor 1 Signal and (R16) Right Side Impact Sensor 1 Ground circuits at the Right Side Impact Sensor 1 harness connector cavity 3 and 4.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the (R14, R16) Right Side Impact Sensor 1 circuits shorted together.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 5.

5. **CHECK THE (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 154: Checking Right Side Impact Sensor 1 Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Connect the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
2. Measure the resistance of the (R16) Right Side Impact Sensor 1 Ground circuit between the Right Side Impact Sensor 1 harness connector cavity 3 and the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) cavity 20.

Is the resistance below 1 Ohm?

Yes

- Go To 6.

No

- Repair the (R16) Right Side Impact Sensor 1 Ground circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

6. **CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 155: Checking Right Side Impact Sensor 1 Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (R14) Right Side Impact Sensor 1 Signal circuit between the Right Side Impact Sensor 1 harness connector cavity 4 and the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) cavity 12.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7.

No

- Repair the (R14) Right Side Impact Sensor 1 Signal circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

7. **CHECK OPERATION OF THE RIGHT SIDE IMPACT SENSOR 1**
   1. Replace the Right Side Impact Sensor 1.
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the ignition OFF, and wait 15 seconds before turning the ignition ON.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Does the scan tool display active U0175-00-LOST COMMUNICATION W/ RIGHT SIDE SATELLITE SENSOR 1 - DTC?

      Yes

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

      WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

      -
      -
      - Replace the ORC in accordance with Service Instructions.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

      No

      - Repair is complete.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM

VERIFICATION TEST.

U0176-00-LOST COMMUNICATION W/ RIGHT SIDE SATELLITE SENSOR 2

Fig. 156: Right Side Impact Sensor Circuit Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of this right side impact sensor 2 is in the C-pillar just past the second row seating. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor. If the scan tool shows this DTC has a Stored history of setting then the right side impact sensor is to be replaced. A short to voltage fault on the right side impact sensor 1 sensor wiring can cause a loss of comm impact sensor 2 code to set and the possible replacement of a good right side impact sensor 2. The right side impact 1, and 2 sensors are wired in a daisy chain pattern. The short to battery fault in a loss of comm or internal circuit failure of the side impact sensor 1 can cause the impact sensor 2 on the same side to set a loss of comm code.

WHEN MONITORED:

The Occupant Restraint Controller (ORC) continuously communicates with the Right Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION:

This Diagnostic Trouble Code (DTC) will set, if the ORC is communicating with the Right Side Impact Sensor 1 but fails to establish and maintain valid data communications with the Right Side Impact Sensor 2.

POSSIBLE CAUSES

Possible Causes
LOSS OF COMMUNICATION WITH THE RIGHT SIDE IMPACT SENSOR 1
(R18, R20) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TO VOLTAGE
(R18, R20) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TO GROUND
(R18, R20) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TOGETHER
(R18, R20) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS OPEN
RIGHT SIDE IMPACT SENSOR 2
OCCUPANT RESTRAINT CONTROLLER (ORC

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: **Using the wiring diagram/schematic as a guide check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.**

NOTE: **If after the harness inspection it appears the impact sensor connector is only seated halfway. Re-seat the harness connector into the impact sensor and lock the tab. Follow the instructions below checking for active codes.**

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Make sure the battery is fully charged.**

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

   Does the scan tool display active B1B75-RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL, U0175-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 1, U0176-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 2- DTC?

   Yes

   - Check for all other internal and lost communication codes indicated in the right side impact sensor daisy chain wiring before diagnosing DTC U0176-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 2. Go To The DTC Displayed. Refer to **DIAGNOSIS AND TESTING**. If internal fault 1 and lost comm fault 1 have been checked follow DTC U0176-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 2. Go To 2.

   No

   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK THE (R18, R20) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS FOR A SHORT TO VOLTAGE**

Fig. 157: Checking Right Side Impact Sensor 2 Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Right Side Impact Sensor 1 harness connector.
2. Disconnect the Right Side Impact Sensor 2 harness connector.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these**

instructions may result in possible serious or fatal injury.

3. Measure the voltage of the (R18) Right Side Impact Sensor 1 Signal circuit cavity 4 and (R20) Right Side Impact Sensor 1 Ground circuit cavity 3 at the Right Side Impact Sensor 1 harness connector.

   Is there any voltage present?

   Yes

   - Repair the (R18, R20) Right Side Impact Sensor 1 circuits for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 3.

3. **CHECK THE (R18, R20) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TO GROUND**

Fig. 158: Checking Right Side Impact Sensor 1 Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition on, then reconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Measure the resistance between ground and the (R18) Right Side Impact Sensor 2 Signal circuit at the Right Side Impact Sensor 2 harness connector cavity 4.
2. Measure the resistance between ground and the (R20) Right Side Impact Sensor 2 Ground circuit at the Right Side Impact Sensor 2 harness connector cavity 3.

   Is the resistance below 100K Ohms?

   Yes

- Repair the (R18, R20) Right Side Impact Sensor 2 circuits for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (R18, R20) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS FOR A SHORT TOGETHER**

Fig. 159: Checking Right Side Impact Sensor 2 Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (R18) Right Side Impact Sensor 2 Signal circuit and (R20) Right Side Impact Sensor 2 Ground circuit at the Right Side Impact Sensor 2 harness connector.

   Is the resistance below 100K Ohms?

Yes

- Repair the (R18, R20) Right Side Impact Sensor 2 circuits shorted together.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (R20) RIGHT SIDE IMPACT SENSOR 2 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 160: Checking Right Side Impact Sensor 2 Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Right Side Impact Sensor 1 harness connector.
2. Measure the resistance of the (R20) Right Side Impact Sensor 2 Ground circuit between the Right Side Impact Sensor 2 harness connector cavity 3 and the Right Side Impact Sensor 1 harness connector cavity 2.

   Is the resistance below 1 Ohm?

Yes

- Go To 6.

No

- Repair the (R20) Right Side Impact Sensor 2 Ground circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

6. **CHECK THE (R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 161: Checking Right Side Impact Sensor 2 Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (R18) Right Side Impact Sensor 2 Signal circuit between the Right Side Impact Sensor 1 harness connector cavity 4 and the Right Side Impact Sensor 1 harness connector cavity 1.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7.

   No

   - Repair the (R18) Right Side Impact Sensor 2 Signal circuit for an open or high resistance.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

7. **CHECK OPERATION OF THE RIGHT SIDE IMPACT SENSOR 2**
   1. Replace the Right Side Impact Sensor 2.
   2. Reconnect the vehicle body harness connector to the Right Side Impact Sensor 2.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the ignition OFF, and wait 15 seconds before turning the ignition ON.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the scan tool display active U0176-00-LOST COMMUNICATION W/ RIGHT SIDE SATELLITE SENSOR 2 - DTC?

      Yes

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

      WARNING: **If the Occupant Restraint Controller (ORC) is dropped at**

      -

- **any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**
-
- Replace the ORC in accordance with Service Instructions.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Repair is complete.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

U11AD-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 4

Fig. 162: Left Side Satellite Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The sensor 4 impact sensors are located in the first row driver and passenger doors. Impact pressure sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC. The repair of this fault centers on verifying the integrity of the sensor's internal circuitry and software validity. A short to voltage fault on the left side impact sensor 2 sensor wiring can cause a loss of comm impact sensor 4 code to set and the possible replacement of a good left side impact sensor 4. The left side impact 1, 2, and 4 sensors are wired in a daisy chain pattern. The short to battery fault in a loss of comm or internal circuit failure of the side impact sensor 1 can cause the impact sensors 2 and 4 on the same side to set a loss of comm code.

WHEN MONITORED:

The ORC continuously communicates with the Left Side Impact Pressure Sensor over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION:

This Diagnostic Trouble Code (DTC) will set, if the ORC and the Left Side Impact Pressure Sensor do not establish and maintain valid data communications.

POSSIBLE CAUSES

Possible Causes
(R130, R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS SHORTED TO VOLTAGE
(R130, R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS SHORTED TO GROUND
(R130, R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS SHORTED TOGETHER
(R130, R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS OPEN
LOST COMMUNICATION WITH THE LEFT SIDE IMPACT SENSOR 1 OR 2
LEFT SIDE IMPACT PRESSURE SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Using the wiring diagram/schematic as a guide check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.**

NOTE: **If after the harness inspection it appears the impact sensor connector is only seated halfway. Re-seat the harness connector into the impact sensor and lock the tab. Follow the instructions below checking for active codes.**

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Make sure the battery is fully charged.**

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

   Does the scan tool display active B0091-49-LEFT SIDE ACCELERATION SENSOR 1 - INTERNAL ELECTRONIC FAILURE, B0092-49-LEFT SIDE ACCELERATION SENSOR 2 - INTERNAL ELECTRONIC FAILURE, U0172-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 1, U0173-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 2, U11AD-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 4 - DTC?

   Yes

   NOTE: **Check for the active codes and repair for the fault starting with the Internal failure code or codes, check for active or stored status. Upon fixing the left side impact sensor 1 internal fault then check the left side impact sensor 2 internal fault if status changes to stored for all codes fault is fixed if status is still active proceed to the left side impact sensor 1 loss of comm check for status of the left side impact sensor 1 code status being active. If all codes go to stored status, fault in daisy chain is fixed if code status is still active continue. Check the left side impact sensor 2 check for status of the left side impact sensor 2 code going to stored. If status of all codes goes to stored status, fault in daisy chain is fixed if code status is still active continue. Check the left side impact sensor 4, fix fault and check for status of code going to stored status.**

   -
   - Check for all other internal and lost communication codes indicated in the left side impact sensor daisy chain wiring before diagnosing DTC U11AD-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 4. Go To The DTC Displayed. Refer to **DIAGNOSIS AND TESTING**. If internal fault 1 and 2 and lost comm fault 1 and 2 have been checked follow DTC U11AD-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 4. Go To 2.

   No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK THE (R130, R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TO VOLTAGE**

Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Left Side Impact Pressure Sensor harness connector.
2. Disconnect the ORC harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Measure the voltage of the (R130) Left Side Impact Pressure Sensor Signal circuit and (R150) Left Side Impact Pressure Sensor Ground circuit at the Left Side Impact Pressure Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (R130, R150) Left Side Impact Pressure Sensor circuits for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 3.

3. **CHECK THE (R130, R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TO GROUND**

Fig. 164: Checking Left Side Impact Pressure Sensor Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Measure the resistance between ground and the (R130) Left Side Impact Pressure Sensor Signal circuit at the Left Side Impact Pressure Sensor harness connector.

2. Measure the resistance between ground and the (R150) Left Side Impact Pressure Sensor Ground circuit at the Left Side Impact Pressure Sensor harness connector.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the (R130, R150) Left Side Impact Pressure Sensor circuits for a short to ground.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 4.

4. **CHECK THE (R130, R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TOGETHER**

Fig. 165: Checking Left Side Impact Pressure Sensor Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (R130) Left Side Impact Pressure Sensor Signal and (R150) Left Side Impact Pressure Sensor Ground circuits at the Left Side Impact Pressure Sensor harness connector.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the (R13, R15) Left Side Impact Pressure Sensor circuits shorted together.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM

VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (R150) LEFT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 166: Checking Left Side Impact Pressure Sensor Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) to the ORC harness connector.
2. Measure the resistance of the (R150) Left Side Impact Pressure Sensor Ground circuit between the Left Side Impact Pressure Sensor harness connector cavity 2 and the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 19.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 6.

   No

   - Repair the (R150) Left Side Impact Pressure Sensor Ground circuit for an open or high resistance.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

6. **CHECK THE (R130) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 167: Checking Left Side Impact Pressure Sensor Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (R130) Left Side Impact Pressure Sensor Signal circuit between the Left Side Impact Pressure Sensor harness connector cavity 1 and the SRS Load Tool Adapter (special tool #8443-24, 32-Way Adapter) cavity 11.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7.

No

- Repair the (R13) Left Side Impact Pressure Sensor Signal circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

7. **CHECK OPERATION OF THE LEFT SIDE IMPACT PRESSURE SENSOR**
   1. Replace the Left Side Impact Pressure Sensor in accordance with the Service Information.
   2. Reconnect the vehicle body harness to the impact pressure sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the ignition OFF, and wait 15 seconds before turning the ignition ON.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

   Did the active U11AD-00-LOST COMMUNICATION W/ LEFT SIDE SATELLITE SENSOR 4 - DTC return?

   Yes

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   -
   - Replace the Occupant Restraint Controller (ORC) in accordance with Service Instructions.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Repair is complete.

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   -
   - Check for all other internal and lost communication codes indicated in the right side impact

sensor daisy chain wiring before diagnosing DTC U11B0-00-LOST COMMUNICATION W/ RIGHT SIDE SATELLITE SENSOR 4. Go To The DTC Displayed. Refer to **DIAGNOSIS AND TESTING**. If internal fault 1, internal fault 2, and lost comm fault 1, and lost comm fault 2 have been checked follow DTC U11B0-00-LOST COMMUNICATION W/ RIGHT SIDE SATELLITE SENSOR 4. Go To 2.

No

- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM INTERMITTENT TEST.

2. **CHECK THE (R140, R160) RIGHT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TO VOLTAGE**

Fig. 169: Checking Right Side Impact Pressure Sensor Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Right Side Impact Pressure Sensor harness connector.
2. Disconnect the ORC harness connectors.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these**

instructions may result in possible serious or fatal injury.

3. Measure the voltage of the (R140) Right Side Impact Pressure Sensor Signal circuit at the Right Side Impact Pressure Sensor harness connector.
4. Measure the voltage of the (R160) Right Side Impact Pressure Sensor Ground circuit at the Right Side Impact Pressure Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (R140, R160) Right Side Impact Pressure Sensor circuits for a short to voltage.
   - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

   No

   - Go To 3.

3. **CHECK THE (R140, R1160) RIGHT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TO GROUND**

Fig. 170: Checking Right Side Impact Pressure Sensor Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Measure the resistance between ground and the (R140) Right Side Impact Pressure Sensor Signal circuit at the Right Side Impact Pressure Sensor harness connector.
2. Measure the resistance between ground and the (R160) Right Side Impact Pressure Sensor Ground circuit at the Right Side Impact Pressure Sensor harness connector.

   Is the resistance below 100K Ohms?

Yes

- Repair the (R140, R160) Right Side Impact Pressure Sensor circuits for a short to ground.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 4.

4. **CHECK THE (R140, R160) RIGHT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TOGETHER**

Fig. 171: Checking Right Side Impact Pressure Sensor Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (R140) Right Side Impact Pressure Sensor Signal circuit and (R160) Right Side Impact Pressure Sensor Ground circuit at the Right Side Impact Pressure Sensor harness connector.

   Is the resistance below 100K Ohms?

Yes

- Repair the (R140, R160) Right Side Impact Pressure Sensor circuits shorted together.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- Go To 5.

5. **CHECK THE (R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 172: Checking Right Side Impact Pressure Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) to the ORC C1 harness connector.
2. Measure the resistance of the (R140) Right Side Impact Pressure Sensor Signal circuit between the Right Side Impact Pressure Sensor harness connector cavity 1 and the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) cavity 12.

Is the resistance below 1 Ohm?

Yes

- Go To 6.

No

- Repair the (R140) Right Side Impact Pressure Sensor Signal circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

6. **CHECK THE (R160) RIGHT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 173: Checking Right Side Impact Pressure Sensor Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (R160) Right Side Impact Pressure Sensor Ground circuit between the Right Side Impact Pressure Sensor harness connector cavity 2 and the SRS Load Tool Adaptor (special tool #8443-24, 32-Way Adapter) cavity 20.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7.

   No

- Repair the (R160) Right Side Impact Pressure Sensor ground circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

7. **CHECK OPERATION OF THE RIGHT SIDE IMPACT PRESSURE SENSOR**
   1. Replace the Right Side Impact Pressure Sensor.
   2. Reconnect the vehicle body harness to the Right Side Impact Pressure Sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the ignition OFF, and wait 15 seconds before turning the ignition ON.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active U11B0-00-LOST COMMUNICATION W/ RIGHT SIDE SATELLITE SENSOR 4 - DTC return?

      Yes

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

      WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

      -
      -
      - Replace the Occupant Restraint Controller (ORC) in accordance with Service Instructions.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

      No

      - Repair is complete.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

U1414-00-IMPLAUSIBLE/MISSING ECU NETWORK CONFIGURATION DATA -

Fig. 174: CAN IHS BUS Module Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault centers on verifying that the ORC is configured correctly for the vehicle's restraint system components.

WHEN MONITORED:

The ORC checks for a configuration message from the Totally Integrated Power Module (TIPM) at power-up and initialization.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the configuration message is not equal to the programmed configuration or when the configuration message is missing for 7 seconds. Once set, this DTC is latched for a power cycle.

POSSIBLE CAUSES

Possible Causes
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE ORC DTC**

   NOTE: Ensure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display an active U1414-00-IMPLAUSIBLE/MISSING ECU NETWORK CONFIGURATION DATA - DTC?

      Yes

      - Go To 2.

      No

      - Repair complete.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.
2. **VERIFY ACTIVE TIPM DTC**
   1. With the scan tool, read TIPM DTCs.

Does the scan tool display any active TIPM DTCs?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate TIPM diagnostic procedures.

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with Service Information.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

U1415-00-IMPLAUSIBLE/MISSING VEHICLE CONFIGURATION DATA -

Fig. 175: CAN IHS BUS Module Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault centers on verifying that the ORC is configured correctly for the vehicle's restraint system components.

WHEN MONITORED:

The ORC checks for a configuration message from the Totally Integrated Power Module (TIPM) at power-up and initialization.

SET CONDITION:

This Diagnostic Trouble Code (DTC) sets when the configuration message is not equal to the programmed configuration or when the configuration message is missing for 7 seconds. Once set, this DTC is latched for a power cycle.

POSSIBLE CAUSES

Possible Causes
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY ACTIVE ORC DTC**

   NOTE: Ensure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display an active U1415-00-IMPLAUSIBLE/MISSING VEHICLE CONFIGURATION DATA - DTC?

      Yes

      - Go To 2.

      No

      - Repair complete.
      - Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.
2. **VERIFY ACTIVE TIPM DTC**
   1. With the scan tool, read TIPM DTCs.

      Does the scan tool display any active TIPM DTCs?

      Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate TIPM diagnostic procedures.

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with Service Information.
- Refer to **STANDARD PROCEDURE** and perform the BODY VERIFICATION TEST.

STANDARD PROCEDURE

RESTRAINTS SYSTEM INTERMITTENT TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **RECORD AND ERASE ALL RESTRAINT SYSTEM DTCS**

   With the scan tool, record and erase all DTCs from all restraints system modules. Monitor for any active codes as you work through the following steps.

   - Review the code monitored and set conditions for any DTCs that are stored and attempt to reproduce the conditions listed.
   - Wiggle the wiring harness and connectors of the related airbag circuit, sensor, or component.
   - If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.
   - Turn the ignition off.
   - Refer to any Technical Service Bulletins (TSBs) that may apply.

   Was the source of the customer complaint found or did any DTCs appear and stay active?

   Yes

   - Make the appropriate repairs and either Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.
   - Refer to **DIAGNOSIS AND TESTING** and select the DTC procedure.

   No

   - Go To 2.
2. **ATTEMPT TO REPRODUCE THE CONDITION**

   In the event the customer complaint cannot be duplicated due to an intermittent condition in the restraints system, the following may aid in attempting to reproduce the condition.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Using the wiring diagram/schematic as a guide, inspect the wiring and connectors related to the stored code or component in question.
- Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Reconnect any disconnected components and harness connectors and ensure they are properly seated.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- If numerous trouble codes were set, use a schematic and inspect any common ground or supply circuits.

Was the source of the intermittent condition located?

Yes

- Make the appropriate repairs and Refer to **STANDARD PROCEDURE** and perform the RESTRAINTS SYSTEM VERIFICATION TEST.

No

- The problem cannot be found at this time.

RESTRAINTS SYSTEM PRE-DIAGNOSTIC PROCEDURE

DIAGNOSTIC TEST

1. Before attempting to repair any restraint system, technicians should be familiar with and fully understand the system operation. Refer to **OPERATION** and **DESCRIPTION** for complete details. The following should be used as a checklist to be completed in its entirety prior to referencing specific Restraints Diagnostic Procedures.

   FOLLOW THE BASIC OUTLINE SET FORTH IN THE SIX-STEP TROUBLESHOOTING PROCEDURE

   1. Verification of complaint.
   2. Verification of any related symptoms.
   3. Symptom analysis.
   4. Problem isolation.

5. Repair of isolated problem.
6. Verification of proper operation.

TAKE INTO ACCOUNT CURRENT VEHICLE CONDITION, REPAIR HISTORY, AND TECHNICAL SERVICE BULLETINS (TSBs)

- Verify that there are no outward signs of vehicle damage or effects from a collision that could impact the proper operation of the Restraints system.
- Check for aftermarket vehicle accessories that may have been installed improperly or could interfere with the system.
- Check the vehicle repair history for repairs that may relate to the current condition.
- Check for current Technical Service Bulletins (TSBs) for the Restraints system related to the customer concern. If a TSB applies, follow the procedure outlined in the TSB.

DIAGNOSE ONLY THOSE FAILURES THAT ARE ACTIVE AND CAN BE REPRODUCED

- Check the control module central to the subsystem that is exhibiting the condition for active DTCs.
- For an intermittent failure that is not active at the time of vehicle inspection, perform the RESTRAINTS SYSTEM INTERMITTENT TEST and document the event on the repair order. Refer to **STANDARD PROCEDURE**.

ADDRESS ACTIVE DIAGNOSTIC TROUBLE CODES (DTCs) IN THE CORRECT ORDER

1. Low/High Voltage and Serial Data Loss of Communication Codes.
2. Module Internal Failure and Configuration Mismatch Codes.
3. Circuit specific DTC failures.

Should the malfunction still be present after conducting this Pre-diagnostic Procedure, technicians should continue to the appropriate DTC procedure. Refer to **DIAGNOSIS AND TESTING**.

Was the Pre-Test reviewed and is the DTC still present?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate DTC procedure.

No

- Test Complete.

RESTRAINTS SYSTEM VERIFICATION TEST

DIAGNOSTIC TEST

1. **PERFORM THE RESTRAINTS SYSTEM VERIFICATION TEST**

NOTE: **If the ORC has been replaced, the ORC Initialization Procedure must be performed to clear the ORC Unlocked DTC and bring the module to a full state of readiness. Refer to DIAGNOSIS AND TESTING. Please perform all steps in the sequence presented following exactly the steps to successfully complete the procedures.**

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

   If equipped with the keyless ignition, use this ignition on warning.

   WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   If equipped with the standard key ignition, use this ignition on warning.

   WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

2. Connect the scan tool to the Data Link Connector - use the most current software available.
3. With the scan tool, erase stored DTCs in all airbag system modules.
4. Perform module reset.

   NOTE: **If equipped with an Airbag On - Off switch, read the DTCs in all switch positions.**

5. Exercise the Restraints System to duplicate the appropriate monitor conditions for any DTCs that were set.
6. Wait one minute, and read active codes, if there are none present, read the stored codes.
7. If the scan tool shows any active or stored codes, refer to **DIAGNOSTIC CODE INDEX** and follow the path specified for that trouble code. If no active or stored codes are present, the repair is complete.

Are any DTCs present or, is the original condition still present?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

-
- If the battery was disconnected for any reason, you must perform the Battery Reconnection procedure in the 8F-Engine Systems section of the Service Information.

NOTE: Please follow the ignition on warnings for either the standard key ignition or keyless ignition for reintroducing battery voltage to the restraint airbag system.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- If equipped with the keyless ignition, use this ignition on warning.

  If equipped with the standard key ignition, use this ignition on warning.

- Repair is complete.

WARNING

WARNING

WARNING: **To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.**

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper**

precautions could result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

DESCRIPTION

DESCRIPTION

An occupant restraint system is standard factory-installed safety equipment on this vehicle. Available occupant restraints for this vehicle include both active and passive types. Active restraints are those which require the vehicle occupants to take some action to employ, such as fastening and adjusting a seat belt; while passive restraints require no action by the vehicle occupants to be employed.

ACTIVE RESTRAINTS

The active restraints for this vehicle include:

- **Child Restraint Anchors** - All standard cab vehicles are equipped with two, fixed-position, child seat upper tether anchors that are integral to the upper cab back panel reinforcement and concealed behind individual trim cover and bezel units that are integral to the cab back trim panel. All vehicles with rear seats are equipped with three child seat upper tether anchor straps that are secured to the upper cab back panel reinforcement, behind the upright rear seat back. Two lower anchors are also provided for each rear outboard seating position on quad or crew cabs. Mega cabs have lower anchors provided for all three rear seating positions. These lower anchors are accessed from the front of the seat where the seat back meets the seat cushion. Child seat upper tether and lower anchors for the front seat are unavailable on quad or crew cab and mega cab vehicles. Likewise, lower anchors for the front seat are not available on standard cab vehicles.
- **Front Seat Belts** - Both outboard front seating positions are equipped with three-point seat belt systems employing a lower B-pillar mounted inertia latch-type Emergency Locking Retractor (ELR), a height-adjustable upper B-pillar mounted turning loop, a fixed lower seat belt anchor secured to the lower B-pillar (standard cab) or floor panel adjacent to the B-pillar (quad or crew cab), and a traveling end-release seat belt buckle secured to the inboard seat track. Except for the driver side front seat, the retractors for all vehicles are also switchable from an ELR to an Automatic Locking Retractor (ALR) for compatibility with child seats. The front seat belt buckle for the driver side of all vehicles includes an integral seat belt switch that detects whether its seat belt has been fastened. The center front seating position for standard cabs is also equipped with a three-point seat belt employing a floor panel mounted inertia latch-type ELR, a routing bracket and bezel near the top of the cab back panel, and two fixed end-release buckles secured to the center seat cushion frame. One of the center buckles is specially keyed to serve as the center seat belt lower anchor. The center front seating position for quad or crew cab vehicles with a split bench front seat is equipped with a fixed lap belt and an end-release buckle secured to the center seat cushion frame.
- **Rear Seat Belts** - On all vehicles equipped with rear seats, each rear seating position is equipped with a three-point seat belt system. Each outboard rear seating position seat belt employs a lower C-pillar mounted inertia latch-type Emergency Locking Retractor (ELR), a fixed position upper C-pillar mounted turning loop, and a fixed lower seat belt anchor secured to the lower C-pillar. The quad or crew cab rear seat center seating position has a rear floor panel mounted inertia latch-type ELR and a routing bracket and bezel on the top of the cab back panel, while the mega cab rear seat center position retractor and a

routing bracket and bezel are mounted to the rear seat back panel. A fixed end-release buckle unit for the quad or crew cab right outboard seating position is integral to the right side of the center retractor mounting bracket on the rear floor panel. The end-release buckle units for the quad or crew cab center and left outboard seating positions are individually secured to the rear floor panel on vehicles with the standard equipment rear bench seat, or secured with the rear seat mounting hardware on vehicles with the optional split rear bench seat. The fixed end-release buckle units for all mega cab rear seating positions are secured to the seat cushion frame mounting hardware. The rear seat retractors for all vehicles are also switchable from an ELR to an Automatic Locking Retractor (ALR) for compatibility with child seats.

PASSIVE RESTRAINTS

8098029e

Fig. 1: SRS Logo
Courtesy of CHRYSLER GROUP, LLC

The passive restraints available for this vehicle include the following:

- **Dual Front Airbags** - Multistage driver and front passenger airbags are used in this vehicle. This airbag system consists of passive, inflatable, Supplemental Restraint System (SRS) components and vehicles with this equipment can be readily identified by the **SRS - AIRBAG** logo molded into the driver airbag trim cover in the center of the steering wheel and also into the passenger airbag door on the top of the instrument panel trim cover above the upper glove box or storage bin opening. Vehicles with the airbag system can also be identified by the airbag indicator, which will illuminate in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) from four to six seconds as a bulb test each time the ignition switch is turned to the ON position. A pyrotechnic-type seat belt tensioner is also integral to the front outboard seat belt retractors to work in conjunction with the dual front airbags.
- **Seat Airbags** - Front seat-mounted seat (pelvic and thorax) airbags are optional equipment in this vehicle. This airbag system consists of passive, inflatable, SRS components and vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the front seat back trim cover.
- **Side Curtain Airbags** - Side curtain airbags are standard equipment for this vehicle when it is also equipped with dual front airbags. This airbag system consists of passive, inflatable, SRS components and vehicles with this equipment can be readily identified by a molded identification trim button with the **SRS**

- AIRBAG logo located at the top of each B-pillar trim (all models) and C-pillar trim (quad or crew cab and mega cab only) near the headliner.

The SRS includes the following major components, which are described in further detail elsewhere in this service information:

- **Airbag Indicator -** The airbag indicator is integral to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), which is located on the instrument panel in front of the driver.
- **Clockspring -** The clockspring is located near the top of the steering column, directly beneath the steering wheel.
- **Driver Airbag -** The driver airbag is located in the center of the steering wheel horn pad, beneath the driver airbag trim cover.
- **Driver Knee Blocker -** The driver knee blocker is a structural unit secured to the back side of and integral to the instrument panel steering column opening cover.
- **Front Impact Sensor -** Two front impact sensors are used, one left side and one right side. One sensor is located on the back side of each end of the lower radiator support cross member on each side of the cooling module and below the inboard side of each front lamp unit.
- **Occupant Restraint Controller -** The Occupant Restraint Controller (ORC) is located on a mounting bracket on the floor panel transmission tunnel below the center section of the front seat, or under the center floor console, as the vehicle is equipped.
- **Passenger Airbag -** The passenger airbag is located in the instrument panel, beneath the passenger airbag door integral to the top of the instrument panel trim cover just forward of the upper glove box or storage bin on the passenger side of the vehicle.
- **Passenger Knee Blocker -** The passenger knee blocker is a structural reinforcement that is integral to and concealed within the lower glove box door.
- **Seat Airbag -** On vehicles so equipped, a seat (pelvic and thorax) airbag unit is secured to each outboard front seat back frame, where it is concealed beneath the seat back trim cover and foam.
- **Seat Belt Tensioner -** A seat belt tensioner is integral to both front outboard seat belt retractor units. The seat belt retractor tensioner units are secured to the right and left inner B-pillars and concealed beneath the lower B-pillar trim.
- **Side Curtain Airbag -** A side curtain airbag is secured to each inside roof side rail above the headliner, and extends from the A-pillar to near the cab back.
- **Side Impact Sensor -** Up to six side impact sensors are used on vehicles with side curtain airbags, up to three on each side of the vehicle. One pressure-type sensor is located on each right and left front door module carrier behind the front door trim panel on some vehicles. In addition, an acceleration-type sensor is located on each inner B-pillar behind the lower B-pillar trim on all models, while quad or crew cab and mega cab models also have one acceleration-type sensor on each inner C-pillar behind the lower C-pillar trim.

The ORC and the EMIC each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ORC for control of the airbag indicator in the EMIC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the SRS components to each other through the electrical system of the vehicle.

These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the SRS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

ACTIVE RESTRAINTS

The primary passenger restraints in this or any other vehicle are the standard equipment factory-installed seat belts and child restraint anchors. Seat belts and child restraint anchors are referred to as an active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them.

PASSIVE RESTRAINTS

The passive restraints are referred to as a Supplemental Restraint System (SRS) components because they were designed and are intended to enhance the protection for the occupants of the vehicle **only** when used in conjunction with the seat belts. They are referred to as passive restraints because the vehicle occupants are not required to do anything to make them operate; however, the vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed SRS components.

The SRS electrical circuits are continuously monitored and controlled by a microprocessor and software contained within the Occupant Restraint Controller (ORC). An airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) illuminates for about four to six seconds as a bulb test each time the ignition switch is turned to the ON or START positions. Following the bulb test, the airbag indicator is turned ON or OFF by the ORC to indicate the status of the SRS. If the airbag indicator comes ON at any time other than during the bulb test, it indicates that there is a problem in the SRS electrical circuits. Such a problem may cause airbags not to deploy when required, or to deploy when not required.

Deployment of the SRS components depends upon the angle and severity of an impact. Deployment is not based upon vehicle speed; rather, deployment is based upon the rate of deceleration as measured by the forces of gravity (G force) upon the acceleration-type impact sensors, or by a pressure wave within a front door as measured by the pressure-type impact sensor. When an impact is severe enough, the microprocessor in the ORC signals the inflator of the appropriate airbag units to deploy their airbag cushions.

The outboard front seat belt retractor tensioners are provided with a deployment signal by the ORC in conjunction with the front airbags. The side curtain airbags and, if equipped, the seat airbags (also known as pelvic and thorax airbags) are provided with a deployment signal individually by the ORC based upon a side impact sensor input for the same side of the vehicle. The ORC also contains a rollover sensor. Should the vehicle roll over and not cause any acceleration-type or pressure-type impact sensor to signal the need for a deployment, the rollover sensor in the ORC will deploy the side curtain airbags, the seat airbags and under

certain conditions, will also actuate the seat belt retractor tensioners.

During a frontal vehicle impact, the knee blockers work in concert with properly fastened and adjusted seat belts to restrain both the driver and the right front seat passenger in the proper position for an airbag deployment. The knee blockers also absorb and distribute the crash energy from the driver and the right front seat passenger to the structure of the instrument panel. The seat belt tensioners remove the slack from the outboard front seat belts to provide further assurance that the driver and right front seat passenger are properly positioned and restrained for an airbag deployment.

Typically, the vehicle occupants recall more about the events preceding and following a collision than they do of an airbag deployment itself. This is because the airbag deployment and deflation occur very rapidly. In a typical 48 kilometer-per-hour (30 mile-per-hour) barrier impact, from the moment of impact until the airbags are fully inflated takes about 40 milliseconds. Within one to two seconds from the moment of impact, the airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times will vary somewhat, depending upon the vehicle speed, impact angle, severity of the impact, and the type of collision.

When the ORC monitors a problem in any of the SRS circuits or components, including the seat belt tensioners, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the EMIC to turn ON the airbag indicator. The hard wired circuits between components related to the SRS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls or communication between other modules and devices that provide features of the SRS. The most reliable, efficient, and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUPPLEMENTAL RESTRAINT SYSTEM

The hard wired circuits between modules and components related to the Supplemental Restraint System (SRS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls or communication between other modules and devices that provide features of the SRS. The most reliable, efficient, and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

In addition to a diagnostic scan tool that contains the latest version of the proper diagnostic software, certain

diagnostic procedures for the SRS may require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

STANDARD PROCEDURE

HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS

At no time should any source of electricity be permitted near the inflator on the back of a non-deployed airbag or seat belt tensioner. When carrying a non-deployed airbag, the trim cover or airbag cushion side of the unit should be pointed away from the body to minimize injury in the event of an accidental deployment. If the airbag unit is placed on a bench or any other surface, the trim cover or airbag cushion side of the unit should be face up to minimize movement in the event of an accidental deployment.

When handling a non-deployed seat belt tensioner, take proper care to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover. In addition, the Supplemental Restraint System (SRS) should be disarmed whenever any steering wheel, steering column, seat belt tensioner, airbag, impact sensor, or instrument panel components require diagnosis or service. Failure to observe this warning could result in accidental airbag deployment and possible personal injury.

All damaged, ineffective or non-deployed airbags and seat belt tensioners which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

SUPPLEMENTAL RESTRAINT STORAGE

Airbags and seat belt tensioners must be stored in their original, special container until they are used for service. Also, they must be stored in a clean, dry environment; away from sources of extreme heat, sparks and high electrical energy. Always place or store any airbag on a surface with its trim cover or airbag cushion side facing up, to minimize movement in case of an accidental deployment.

SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT

Any vehicle which is to be returned to use following a Supplemental Restraint System (SRS) component deployment must have the deployed restraints replaced. In addition, the following guidelines MUST be

observed.

- **Following ANY major vehicle impact damage in the vicinity of an impact sensor or the ORC** - It is critical that the mounting surfaces and mounting brackets for the Occupant Restraint Controller (ORC), front impact sensors and side impact sensors located within the proximity of the impact damage be closely inspected and restored to their original conditions. Because the ORC and each impact sensor are used by the SRS to monitor or confirm the direction and severity of a vehicle impact, improper orientation or insecure fastening of these components may cause airbags not to deploy when required, or to deploy when not required.
- **If the driver airbag is deployed** - If the driver airbag has been deployed, the clockspring and the steering column must be replaced.
- **If the passenger airbag is deployed** - If the passenger airbag has been deployed, the instrument panel trim cover must also be replaced.
- **If a seat airbag is deployed** - If a seat (pelvic and thorax) airbag has been deployed, the seat back frame, the seat back foam and the seat back trim cover on the same side of the vehicle as the deployed airbag must also be replaced.
- **If a seat belt tensioner is deployed** - The seat belt tensioners are deployed in conjunction with the front airbags, but can also be deployed with side curtain airbags. The seat belt tensioners must be replaced if either front airbag has been deployed, and must be inspected if either side curtain airbag has been deployed.
- **If a side curtain airbag is deployed** - If a side curtain airbag has been deployed, the headliner as well as the upper A, B and C-pillar trim on the same side of the vehicle as the deployed airbag must also be replaced. On vehicles with an optional sunroof, the sunroof drain tubes and hoses must be closely inspected following a side curtain airbag deployment.

The components identified with the deployed SRS components in the preceding list are not intended for reuse and will be damaged or weakened as a result of an airbag deployment, which may or may not be obvious during a visual inspection. All other vehicle components should be closely inspected following any SRS component deployment, but are to be replaced only as required by the extent of the visible damage incurred.

SQUIB CIRCUIT WIRING REPAIRS

In addition to the preceding guidelines, be aware that the heat created by the initiator during an airbag or tensioner deployment will cause collateral damage to the connected wiring (squib circuits) and connector insulators. There are two methods by which an airbag or seat belt tensioner may be connected to the vehicle electrical system. The first method involves a short pigtail harness and connector insulator that are integral to the airbag or tensioner unit and are replaced as a unit with the service replacement airbag or seat belt tensioner. This connection method typically requires no additional wiring repair following a deployment.

However, the second connection method involves a wire harness takeout and connector insulator that are connected directly to the airbag or tensioner initiator or squib. These direct-connect type take outs and connector insulators **MUST** be repaired following an airbag or seat belt tensioner deployment using the approved Supplemental Restraint System Wiring Repairs procedure. Refer to **STANDARD PROCEDURE**.

AIRBAG SQUIB STATUS

Multistage airbags with multiple initiators (squibs) must be checked to determine that all squibs were used

during the deployment event. The driver and passenger airbags in this vehicle are deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver or passenger squib 1 and squib 2 circuits to the two initiators in the airbag inflators. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used; therefore, it is always necessary to confirm that both initiators have been used in order to avoid the improper handling or disposal of potentially live pyrotechnic or hazardous materials. The following procedure should be performed using a diagnostic scan tool to verify the status of both airbag squibs before either deployed airbag is removed from the vehicle for disposal.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

1. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, outboard of the steering column.
2. Turn the ignition switch to the ON position.
3. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.

Using the active DTC information, refer to the **Airbag Squib Status** table to determine the status of both driver and passenger airbag squibs.

AIRBAG SQUIB STATUS		
IF THE ACTIVE DTC IS:	**CONDITIONS**	**SQUIB STATUS**
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for both Driver or Passenger squibs are within 15 minutes of each other	Both Squib 1 and 2 were used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for Driver or Passenger Squib 2 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 1 by 15 minutes or more	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for Driver or Passenger Squib 1 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 2 by 15 minutes or more	Squib 1 is live; Squib 2 was used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** Driver or Passenger Squib 2 open is NOT an active code	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open	**AND** Driver or Passenger Squib 1 open is NOT an active code	Squib 1 is live; Squib 2 was used.

NOTE: **If none of the Driver or Passenger Squib 1 or 2 open are active codes, the status of the airbag squibs is unknown. In this case the airbag should be handled and disposed of as if the squibs were both live.**

CLEANUP PROCEDURE

Fig. 2: Clean Up Safety Equipment
Courtesy of CHRYSLER GROUP, LLC

Following a Supplemental Restraint System (SRS) component deployment, the vehicle interior will contain a powdery residue. This residue consists primarily of harmless particulate by-products of the small pyrotechnic charge that initiates the propellant used to deploy a SRS component. However, this residue may also contain traces of sodium hydroxide powder, a chemical by-product of the propellant material that is used to generate the inert gas that inflates the airbag. Since sodium hydroxide powder can irritate the skin, eyes, nose, or throat, be certain to wear safety glasses, rubber gloves, and a long-sleeved shirt during cleanup.

WARNING: **To avoid serious or fatal injury, if you experience skin irritation during cleanup, run cool water over the affected area. Also, if you experience irritation of the nose or throat, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.**

Fig. 3: Vacuuming Residual Powder
Courtesy of CHRYSLER GROUP, LLC

1. Begin the cleanup by using a vacuum cleaner to remove any residual powder from the vehicle interior. Clean from outside the vehicle and work your way inside, so that you avoid kneeling or sitting on a non-cleaned area.
2. Be certain to vacuum the heater and air conditioning outlets as well. Run the heater and air conditioner blower on the lowest speed setting and vacuum any powder expelled from the outlets.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to AIRBAG SQUIB STATUS. All damaged, ineffective, or non-deployed Supplemental Restraint System (SRS) components which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

3. Next, remove the deployed SRS components from the vehicle. Refer to the appropriate service removal procedures.
4. You may need to vacuum the interior of the vehicle a second time to recover all of the powder.

SUPPLEMENTAL RESTRAINT SYSTEM WIRING REPAIRS

It is important when repairing any Supplemental Restraint System (SRS) electrical circuits to use the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet:

(http://dto.vftis.com/mopar/disclaimer.asp).

This recommended procedure involves crimping the wires together with a splice band, soldering the crimped connection and, finally, sealing and protecting the repair. The crimp and solder ensure a strong mechanical bond that will always pass a pull test while also maintaining the conductivity and current carrying capacity of the circuit. The adhesive sealant and heat shrink tubing ensures the splice repair will perform as well or better than the original wire and be safe from potential corrosion or short circuits.

There is no limit to the number of splice repairs that can be made in one harness using this procedure. However, as has been past practice, multiple adjacent splices should be offset from each other. This wiring splice repair procedure is approved for harness side repairs only. Repairs and splices to pigtail wires on SRS components such as airbag units, seat belt tensioner units or clocksprings are not approved or recommended.

REPAIR PROCEDURE

CAUTION: If additional wire is needed when making a splice repair to any wire, it is important that the same or next larger size wire gauge be used. Refer to the appropriate wiring information for the original wire gauge size.

Fig. 4: Splice Band
Courtesy of CHRYSLER GROUP, LLC

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.
2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire repair area.
3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

Fig. 5: Crimping Tool

Courtesy of CHRYSLER GROUP, LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number (special tool #10042, Crimper, Wire/Terminal) or equivalent) crimp the splice band and wires together securely.

Fig. 6: Solder Splice
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using rosin core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.

Fig. 7: Heat Shrink Tube
Courtesy of CHRYSLER GROUP, LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of the tubing.

SUPPLEMENTAL RESTRAINTS VERIFICATION TEST

NOTE: The following procedure should be performed using a diagnostic scan tool to verify proper Supplemental Restraint System (SRS) operation following the service or replacement of any SRS component. Refer to the appropriate diagnostic procedures.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering

wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 8: Locating DLC
Courtesy of CHRYSLER GROUP, LLC

1. During the following test, the battery negative cable remains disconnected and isolated, as it was during the Supplemental Restraint System (SRS) component removal and installation procedures.
2. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC) (2). The DLC is located on the driver side lower edge of the instrument panel, near the steering column opening cover (1) and outboard of the steering column.
3. Turn the ignition switch to the ON position and exit the vehicle with the scan tool.
4. Check to be certain that nobody is in the vehicle, then reconnect the battery negative cable.
5. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.
6. Next, use the scan tool to read and record any stored (historical) DTC data.
7. If any DTC is found, refer to the appropriate diagnostic information.
8. Use the scan tool to erase the stored DTC data. If any problems remain, the stored DTC data will not erase. Refer to the appropriate diagnostic information to diagnose any stored DTC that will not erase. If the stored DTC information is successfully erased, refer to 9.
9. Turn the ignition switch to the OFF position for about 15 seconds, and then back to the ON position. Observe the airbag indicator in the instrument cluster. It should light from four to six seconds, and then go out. This indicates that the SRS is functioning normally and that the repairs are complete. If the airbag indicator fails to light, or lights and stays ON, there is still an active SRS fault or malfunction. Refer to the appropriate diagnostic information to diagnose the problem.

ADJUSTER, SEAT BELT TURNING LOOP

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or**

torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

Fig. 9: Front Seat Belt Turning Loop & Height Adjuster
Courtesy of CHRYSLER GROUP, LLC

1. Firmly grasp the top of the trim cover (2) for the front seat belt turning loop height adjuster (1) on the inside of the upper B-pillar and pull it away from the height adjuster far enough unsnap it, then disengage the lower snap features of the trim cover from the adjuster and discard. The trim cover is a one time component and is not intended for reuse.
2. Remove the screw (4) that secures the front seat belt (3) turning loop to the height adjuster on the inside of the upper B-pillar.
3. Remove the seat belt turning loop from the height adjuster.

Fig. 10: B-Pillar
Courtesy of CHRYSLER GROUP, LLC

4. Remove the upper trim from the inside of the B-pillar (1). Refer to **PANEL, B-PILLAR TRIM, UPPER, REMOVAL** .
5. Remove the screw (2) that secures the height adjuster (3) to the inside of the upper B-pillar.
6. Lift the height adjuster upward on the B-pillar far enough to disengage the hook (4) on the back of the adjuster from the B-pillar.
7. Rotate the top of the adjuster down and rearward to a horizontal position in order to disengage the T-tab (5) near the lower end of the height adjuster from the hole in the B-pillar.
8. Remove the height adjuster from the B-pillar.

INSTALLATION

INSTALLATION

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal**

injury.

Fig. 11: B-Pillar
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat belt turning loop height adjuster (3) horizontally to the inside of the upper B-pillar (1) with the top of the adjuster oriented rearward.
2. Engage the T-tab (5) near the lower end of the height adjuster into the hole in the B-pillar.
3. Rotate the top of the height adjuster up and forward to a vertical position on the inside of the B-pillar.
4. Lift the height adjuster upward on the B-pillar far enough to engage the hook (4) on the back of the adjuster into the B-pillar clearance hole.
5. Install and tighten the screw (2) that secures the height adjuster to the inside of the upper B-pillar. Tighten the screw to 39 N.m (29 ft. lbs.).
6. Reinstall the upper trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, UPPER, INSTALLATION** .

Fig. 12: Front Seat Belt Turning Loop & Height Adjuster
Courtesy of CHRYSLER GROUP, LLC

7. Position the front seat belt (3) turning loop onto the height adjuster (1) on the inside of the upper B-pillar.
8. Install and tighten the screw (4) that secures the turning loop to the height adjuster. Tighten the screw to 39 N.m (29 ft. lbs.).
9. Engage the lower snap features of a new trim cover (2) under the height adjuster, then use hand pressure to press the top of the trim cover firmly and evenly over the height adjuster until it snaps into place.

AIR BAG, DRIVER

DESCRIPTION

DESCRIPTION

Fig. 13: Driver Airbag Protective Trim Cover
Courtesy of CHRYSLER GROUP, LLC

The injection molded, thermoplastic driver airbag protective trim cover (2) is the most visible part of the driver airbag. The driver airbag is located in the center of the steering wheel (1), where it is secured to the armature of the four-spoke steering wheel. An injection molded bright emblem with the Dodge Ram logo is applied to the center of the trim cover.

Fig. 14: Airbag Housing & Inflator
Courtesy of CHRYSLER GROUP, LLC

Concealed beneath the driver airbag trim cover (1) are the folded airbag cushion, the airbag housing (4), the airbag inflator (3) and the retainers that secure the inflator to the airbag housing. The airbag cushion, housing, and inflator are secured within an integral receptacle molded into the back of the trim cover. The four vertical

walls of this receptacle have numerous small windows with blocking tabs (2) that are engaged by numerous hook formations around the perimeter of the airbag housing. Each hook is inserted through one of the windows and the blocking tab in each window keeps the hook properly engaged with the trim cover, locking the trim cover securely into place on the airbag housing.

Three wire loop snap retainers (6) extend from the housing to secure the airbag to the steering wheel armature. The wire loop at the 6 o'clock position has a distinctive V-shape to ensure proper orientation of the airbag when it is installed onto the steering wheel. Unlike many prior driver airbags, the horn switch used for this application is not a resistive membrane unit located between the airbag cushion and trim cover. The horn switch used in this vehicle is a floating type switch design that is secured to four pods within the steering wheel hub cavity and is separate from the driver airbag. Refer to **DESCRIPTION** .

The airbag used in this vehicle is a multistage-type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. A radial deploying 67 centimeter (26.5 inch) diameter fabric cushion with internal tethers is used. The airbag inflator is a dual-initiator, non-azide, pyrotechnic-type unit and is secured to the stamped metal airbag housing by four studs using four flanged hex nuts. Two keyed and color-coded connector receptacles (5) on the driver airbag inflator connect the two inflator initiators to the vehicle electrical system through two black-jacketed, two-wire pigtail harnesses of the clockspring. A locator hole has been added to the back of the driver airbag housing at the 12 o'clock position and a routing clip with a plastic push-in retainer has been added to the clockspring pigtail wires to route the wiring away from potential pinch points.

The driver airbag unit cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. The driver airbag trim cover may be disassembled from the driver airbag unit, and is available for separate service replacement.

OPERATION

OPERATION

The multistage driver airbag is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver airbag squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of several delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge, which in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the back of the airbag housing and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the driver airbag trim cover will split at predetermined breakout lines, then fold back out of the way. Following an airbag deployment, the airbag cushion quickly deflates by venting the inert gas towards the instrument panel through vent holes within the fabric used to construct the back (steering wheel side) panel of the airbag cushion.

Some of the chemicals used to create the inert gas may be considered hazardous while in their solid state before they are burned, but they are securely sealed within the airbag inflator. Typically, both initiators are used and all

potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used during a deployment due to an airbag system fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic or hazardous materials. Refer to **STANDARD PROCEDURE**.

The inert gas that is produced when the chemicals are burned is harmless. However, a small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes, or breathing passages. If skin or eye irritation is noted, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breath. If the irritation is not alleviated by these actions, contact a physician.

Proper diagnosis of the driver airbag inflator and squib circuits requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

NOTE: The following procedure is for replacement of an ineffective or damaged driver airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the driver airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

Fig. 15: Airbag Retainer Access Holes
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the upper shroud from the steering column. Refer to **SHROUD, STEE RING COLUMN, REMOVAL** .

   .

3. Release the steering column tilt lever and lower the column to its most downward position for easiest driver airbag removal access.

   NOTE: It may be helpful to use a small mirror to aid visibility during the initial attempt to remove the driver airbag from the steering wheel.

4. There are three airbag retainer access holes (1) on the instrument panel side of the hub of the steering wheel (2), located at the two o'clock, six o'clock and ten o'clock positions. The steering wheel must be rotated to bring each of these access holes up to the twelve o'clock position of the steering column one at a time for removal access.

Fig. 16: Inserting Driver Airbag Removal Tool No. 10187
Courtesy of CHRYSLER GROUP, LLC

5. Insert the short blade (Tip A) of the Driver Airbag Removal Tool (Special Tool #(special tool #10187, Remover Tool, Driver's Airbag)) (1) or the blade of an equivalent prying tool into either of the upper (two o'clock or ten o'clock) access holes (3) of the steering wheel hub rear trim cover (2), being certain to place the blade of the tool on the inboard (steering wheel hub) side of the airbag snap retainer wire loop.

Fig. 17: Snap Retainer Wire Loop
Courtesy of CHRYSLER GROUP, LLC

6. Push the handle of the tool downward for the blade to pry the snap retainer wire loop (3) upward far

enough to disengage the loop from the hook of the steering wheel armature. At the same time, gently pull the driver airbag (1) away from the steering wheel (2) to prevent the retainer from snapping back into place over the hook once it is disengaged.

7. Repeat Steps 5 and 6 at the other upper (two o'clock or ten o'clock) access hole to disengage the other upper snap retainer wire loop.
8. Repeat Steps 5 and 6 at the lower (six o'clock) access hole to disengage the lower snap retainer wire loop. The lower snap retainer wire loop has a distinctive V-shape and must always be installed onto the six o'clock hook of the steering wheel armature.

Fig. 18: Clockspring Pigtail Wiring Harness
Courtesy of CHRYSLER GROUP, LLC

9. Pull the driver airbag away from the steering wheel far enough to access and disengage the plastic push-in retainer (2) of the clockspring pigtail wire harness (1) from the locator hole (3) at the 12 o'clock position on the back of the airbag housing.

CAUTION: Do not pull on the clockspring pigtail wires or pry on the connector insulator to disengage the connector from the driver airbag inflator connector receptacle. Improper removal of these pigtail wires and their connector insulators can result in damage to the airbag circuits or connector insulators.

2128307

Fig. 19: Airbag Pigtail Wire Connector Insulators & Integral Latches
Courtesy of CHRYSLER GROUP, LLC

10. The clockspring driver airbag pigtail wire connector insulators (1) are secured by integral latches (2) to the airbag inflator connector receptacles, which are located on the back of the driver airbag housing. Pinch both latches firmly, then pull the insulators straight out from the airbag inflator to disconnect them from the connector receptacles.
11. Remove the driver airbag from the steering wheel.
12. If the driver airbag has been deployed, the clockspring and the steering column must be replaced.

DISASSEMBLY

DISASSEMBLY

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury, service of this unit should be performed only by Chrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.**

WARNING: **To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped**

between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: **To avoid serious or fatal injury, the Driver AirBag (DAB) trim cover must never be painted. Replacement trim covers are serviced in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

NOTE: **The following procedures can be used to replace the driver airbag trim cover for service of cosmetic damage issues. If the driver airbag is ineffective or deployed, the entire driver airbag and trim cover must be replaced as a unit.**

Fig. 20: Airbag Housing Hooks
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the driver airbag from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL**.
3. Place the driver airbag on a suitable clean and dry work surface with the trim cover (1) facing down. If the trim cover will be reused, be certain to take the proper precautions to prevent the trim cover from receiving cosmetic damage during the following procedures.
4. Disengage each of the twelve hooks (3) of the airbag housing (2) from the twelve windows in the vertical walls of the trim cover, one wall at a time. Start by disengaging the upper wall, then do each of the two side walls, and finish with the lower wall. To disengage the hooks, use hand pressure to push outward on the upper edge of the receptacle wall far enough to clear the locating tab (4) on the airbag housing, at the same time push the adjacent edge of the airbag housing firmly and evenly downward into the trim cover

receptacle.

5. With all of the hooks disengaged, lift the housing, inflator, and cushion as a unit from the receptacle on the back of the driver airbag trim cover.

ASSEMBLY

ASSEMBLY

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, service of this unit should be performed only by Chrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the Driver AirBag (DAB) trim cover must never be painted. Replacement trim covers are serviced in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedures can be used to replace the driver airbag trim cover and horn switch unit for service. If the driver airbag is ineffective or deployed, the entire driver airbag, trim cover and horn switch must be replaced as a unit.

Fig. 21: Airbag Housing Hooks
Courtesy of CHRYSLER GROUP, LLC

1. Place the driver airbag trim cover (1) on a suitable clean and dry work surface with the receptacle facing up. Be certain to take the proper precautions to prevent the trim cover from receiving cosmetic damage during the following procedures.
2. Position the driver airbag housing (2), inflator, and cushion as a unit over the trim cover receptacle.
3. Using hand pressure, push the airbag housing firmly and evenly down into the trim cover receptacle far enough that the hooks (3) of the housing are aligned with the windows in the vertical walls of the receptacle.
4. Work around the perimeter of the unit engaging each of the twelve hooks on the driver airbag housing through the twelve windows in the walls of the trim cover receptacle.
5. After the driver airbag has been assembled, try pulling the trim cover and the airbag housing away from each other. This action will fully seat the edges of the windows into the cradles of the hooks and the vertical walls of the receptacle beneath the locating tabs (4) of the housing.

Fig. 22: Airbag Blocking Tab & Housing Hook
Courtesy of CHRYSLER GROUP, LLC

6. Before reinstalling the airbag onto the steering wheel, check that the blocking tab (1) in each of the trim cover (2) windows is oriented over the airbag housing hook (3) as shown in illustration.
7. Reinstall the driver airbag onto the steering wheel. Refer to **AIR BAG, DRIVER, INSTALLATION**.

INSTALLATION

INSTALLATION

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

WARNING: **To avoid serious or fatal injury, the driver airbag trim cover must never be painted. Replacement airbags are serviced with trim covers in the original**

colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: **The following procedure is for replacement of an ineffective or damaged driver airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the driver airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .**

Fig. 23: Clockspring Pigtail Wiring Harness
Courtesy of CHRYSLER GROUP, LLC

1. Position the driver airbag close enough to the steering wheel to reconnect the two clockspring driver airbag pigtail wire (1) electrical connections (5) to the inflator connector receptacles (4) on the back of the airbag housing.
2. Reconnect the wire connectors to the airbag inflator connector receptacles by pressing straight in on the connector insulator. Be certain to engage each keyed and color-coded connector to the matching connector receptacle. You can be certain that each connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector latches snap into place.
3. Be certain to fully engage the plastic push-in retainer (2) of the clockspring pigtail wires into the locator hole (3) at the 12 o'clock position on the back of the airbag housing.

Fig. 24: Snap Retainer Wire Loop
Courtesy of CHRYSLER GROUP, LLC

4. Carefully position the driver airbag (1) into the hub cavity of the steering wheel (2). Be certain that the clockspring pigtail wires and the steering wheel wire harness are not pinched between the driver airbag and the horn switch, the steering wheel armature or, on vehicles equipped with a diesel engine, the steering wheel damper weight.
5. Engage the lower airbag snap retainer wire loop (3) onto the lower hook of the steering wheel armature. The lower snap retainer wire loop has a distinctive V-shape and must always be installed onto the six o'clock hook of the steering wheel armature.
6. Roll the driver airbag upwards and press firmly and evenly over the two upper snap retainer wire loop locations simultaneously until they snap into place over the two upper hooks of the steering wheel armature.
7. Reinstall the upper shroud onto the steering column. Refer to **SHROUD, STEERING COLUMN, INSTALLATION** .
8. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, PASSENGER

DESCRIPTION

DESCRIPTION

Fig. 25: Instrument Panel Trim Cover
Courtesy of CHRYSLER GROUP, LLC

The horizontal surface of the instrument panel trim cover (1) above the upper glove box/storage bin is the most visible part of the passenger airbag. The passenger airbag door is integral to the top of the instrument panel trim cover forward of the upper glove box/storage bin opening on the instrument panel in front of the front seat passenger seating position.

Fig. 26: Passenger Air Bag
Courtesy of CHRYSLER GROUP, LLC

Located below the passenger airbag door area of the instrument panel trim cover (1), the molded thermoplastic passenger airbag retainer (2) or chute is secured to the underside of the trim cover. The retainer defines the airbag door breakout area of the trim cover and serves as the receptacle for the passenger airbag cushion and housing. Numerous small window openings on the forward and rearward flanges of the receptacle receive mating hook formations stamped into the airbag housing, which locate and secure the housing to the trim cover.

Fig. 27: Passenger Airbag Unit Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

The passenger airbag unit is also secured by two screws through a stamped mounting bracket (2) to the instrument panel structural support. The passenger airbag unit used in this vehicle is a multistage type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles.

The passenger airbag unit consists of a stamped metal housing (1), the airbag cushion, and the airbag inflator (3). The airbag inflator is secured to the housing by four screws and nuts. The airbag housing contains the folded rectangular airbag cushion. The folded airbag cushion within the metal housing should never be unfolded.

The airbag inflator is a non-azide, pyrotechnic-type unit that is secured to and sealed within the airbag housing. Two dedicated takeouts and yellow connectors of the instrument panel wire harness with keyed, and color-coded (black and orange) insulators connect the two inflator initiators (4) to the vehicle electrical system.

The passenger airbag cannot be repaired, and must be replaced if deployed, ineffective, or in any way damaged. The passenger airbag door and retainer are serviced only as a unit with the instrument panel trim cover. If the passenger airbag is deployed, the instrument panel trim cover must also be replaced.

OPERATION

OPERATION

The multistage passenger airbag is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the passenger airbag squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of multiple delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less

forcefully the airbag will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the passenger airbag door area of the instrument panel top pad will split at predetermined tear seam lines concealed on the underside of the instrument panel trim cover, then the door will pivot up over the top of the instrument panel and out of the way. Following an airbag deployment, the airbag cushion quickly deflates by venting the inert gas through a discrete vent hole in each fabric side panel of the airbag cushion.

The airbag cushion in this vehicle also has an active vent located on each side of the cushion. The active vents close during an unobstructed deployment to provide a fully inflated bag. However, if the deployment is obstructed by an out-of-position passenger, the active vents open to reduce the likelihood of an airbag-induced injury.

Typically, both initiators are used during an airbag deployment event. However, it is possible for only one initiator to be used during a deployment due to an airbag system fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic materials. Refer to **STANDARD PROCEDURE**.

Proper diagnosis of the passenger airbag inflator and the passenger airbag squib circuits requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

NOTE: **The following procedure is for replacement of an ineffective or damaged passenger airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the passenger airbag has been**

deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

Fig. 28: Passenger Airbag Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the glove box from the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
3. Remove the upper storage bin/glove box from the instrument panel. Refer to **BIN, INSTRUMENT PANEL, REMOVAL** .
4. Reach through the upper storage bin/glove box opening of the instrument panel to access and remove the two screws (6) that secure the passenger airbag (2) lower bracket to the instrument panel structural support (5).
5. Remove all of the components and fasteners that secure the trim cover (3) to the instrument panel structural support. Refer to **COVER, INSTRUMENT PANEL, REMOVAL** .
6. Slowly and carefully lift the trim cover up from the instrument panel structural support far enough to access and disconnect the instrument panel wire harness connectors (7) from the passenger airbag inflator. To disconnect the connectors:
    1. Pull the connector lock out of the connector insulator.
    2. Pinch both latches firmly, then pull the insulators straight out from the airbag inflator to disconnect them from the connector receptacles.
7. Remove the instrument panel trim cover and passenger airbag from the vehicle as a unit and place it upside down on a suitable work surface. If the trim cover will be reused, be certain to take the proper precautions to protect the trim cover from cosmetic damage.

8. Disengage all of the hooks (4) on one side of the airbag housing from the windows in the forward or rearward vertical wall of the airbag chute/retainer (1) on the underside of the trim cover. To disengage the hooks, use hand pressure to push one edge of the airbag housing firmly and evenly downward into the retainer receptacle. Then, while pulling outward on the adjacent upper edge of the receptacle wall, roll the disengaged side out of the retainer and disengage the hooks on the opposite side from the retainer.
9. With all of the hooks disengaged, lift the housing, inflator, and cushion as a unit from the retainer receptacle on the underside of the instrument panel trim cover.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the instrument panel trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the instrument panel trim cover must never be painted. Replacement trim covers are serviced in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged passenger airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. Refer to STANDARD PROCEDURE. If the passenger airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. .

Fig. 29: Passenger Airbag Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Place the instrument panel trim cover (3) on a suitable work surface with the airbag chute/retainer (1) receptacle facing up. Be certain to take the proper precautions to prevent the trim cover from receiving cosmetic damage during the following procedures.
2. Carefully position the passenger airbag housing (2) into the airbag retainer receptacle.
3. Work around the perimeter of the unit engaging each of the hooks (4) on the passenger airbag housing through the windows in the forward and rearward vertical walls of the retainer receptacle.
4. Position the instrument panel trim cover and passenger airbag over the instrument panel structural support (5) as a unit.
5. Lift the trim cover up from the instrument panel structural support far enough to access and reconnect the instrument panel wire harness connectors (7) to the passenger airbag inflator. Be certain that the latches and lock on each connector are fully engaged.
6. Reinstall all of the fasteners and components that secure the trim cover to the instrument panel structural support. Refer to **COVER, INSTRUMENT PANEL, INSTALLATION** .
7. Reach through the upper storage bin/glove box opening of the instrument panel to install and tighten the two screws (6) that secure the passenger airbag lower bracket to the instrument panel structural support. Tighten the screws to 8 N.m (71 in. lbs.).
8. Reinstall the upper storage bin/glove box into the instrument panel. Refer to **BIN, INSTRUMENT PANEL, INSTALLATION** .
9. Reinstall the glove box into the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
10. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, SEAT

DESCRIPTION

DESCRIPTION

Fig. 30: Two Studs, Plastic Airbag Housing, Molded Plastic Outer Cover & Inflator Initiator
Courtesy of CHRYSLER GROUP, LLC

Seat AirBags (SAB) (also known as thorax or pelvic airbags) are available equipment on this vehicle. These airbags are completely concealed beneath the seat back trim cover on the upper outboard sides of both front seat backs. The airbags are inserted into a sewn pouch called an intensifier on the inside of the trim cover, then secured to the seat back frame by nuts on two studs (4). Both studs are installed on a stamped metal bracket located within the molded plastic inner SAB housing (1) and exit through the inboard side of the housing.

The folded SAB cushion is contained within and protected by the molded plastic inner and outer (2) clamshell-type SAB housing. The cushion is constructed of a coated nylon fabric. The SAB housing also contains the airbag inflator, a high pressure cylinder filled with inert gas and a heat shield. The airbag inflator is a single-initiator, hybrid-type unit that is secured to and sealed within the airbag housing. The SAB is connected to the vehicle electrical system through a dedicated jumper wire harness with a connector insulator that connects directly to the inflator initiator (3). The connector insulators are uniquely keyed and color-coded to ensure they can only be connected to the initiator.

The SAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. If the SAB is deployed, the seat back frame, the seat back foam cushion, the seat back trim cover and the seat airbag jumper wire harness must also be replaced.

OPERATION

OPERATION

Each Seat AirBag (SAB) is deployed individually by an electrical signal generated by the Occupant Restraint

Controller (ORC) to which it is connected through left or right SAB line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected so that all of the released gas is directed into the folded SAB cushion, causing the cushion to inflate. As the cushion inflates it will split open the molded plastic outer clamshell housing, the sewn pouch (intensifier) and the outboard side of the seat back trim cover, then expand into the area between the outboard side of the front seat and the front door to form a cushion to protect the front seat occupant during a side impact collision or a vehicle rollover incident.

Following the deployment, the SAB cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric and the deflated cushion hangs down loosely from the outboard side of the front seat back.

Proper diagnosis of the SAB inflator and squib circuits requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

NOTE: **The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the SAB is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .**

Fig. 31: Front Seat Back Frame, Seat Airbag Jumper Wire Harness, Seat Airbag Inflator Initiator, Two Nuts & Seat Airbag
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the front seat from the vehicle. Refer to **SEAT, FRONT, REMOVAL** and **SEAT, FRONT CENTER, REMOVAL** .

CAUTION: During removal of the seat back trim cover, be certain not to tear or damage the integral nylon pouch that contains the Seat AirBag (SAB). If the nylon pouch or the trim cover are torn or damaged, the entire front seat back trim cover must be replaced with a new unit.

4. Remove the trim from the front and back of the front seat back frame (3), but do not remove the outboard side of the seat back trim cover until after the Seat AirBag (SAB) has been detached from the seat back frame. Refer to **REMOVAL** .

CAUTION: Do not pull on the Seat AirBag (SAB) jumper wire harness take out or pry on the connector insulator to disengage the connector from the SAB inflator connector receptacle. Improper removal of this take out and its connector insulator can result in damage to the airbag circuits or the connector insulator.

5. Disconnect the SAB jumper wire harness (1) connector from the SAB inflator initiator (2). Slide the yellow locking tab down, then squeeze the two latch tabs on the connector insulator. Pull the insulator straight out from the inflator to disconnect it from the connector receptacle.
6. From behind the seat locate and remove the two nuts (4) that secure the SAB to the outboard side of the seat back frame.

7. Working between the seat back trim cover and the seat back frame carefully disengage the two seat airbag studs from the seat back frame and from the nylon pouch (intensifier), then slide the airbag out of the pouch. Be certain not to tear or damage the nylon pouch or the trim cover.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the SAB is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

CAUTION: The Seat AirBag (SAB) must be installed into the nylon pouch integral to the front seat back trim cover before the SAB or the trim cover are installed on the front seat back frame. Failure to do so will adversely affect the function of the SAB system.

Fig. 32: Front Seat Back Frame, Seat Airbag Jumper Wire Harness, Seat Airbag Inflator Initiator, Two Nuts & Seat Airbag

Courtesy of CHRYSLER GROUP, LLC

1. Carefully slide the Seat AirBag (SAB) unit (1) into the nylon pouch (intensifier) integral to the outboard side of the front seat back trim cover and engage the two airbag studs through the holes provided in the pouch. Be certain not to tear or damage the nylon pouch or the trim cover.
2. Position the SAB and seat back trim cover as a unit to the outboard side of the seat back frame (3) and insert the SAB mounting studs through the mounting holes in the frame.
3. Install and tighten the two nuts (4) that secure the SAB to the outboard side of the seat back frame. Tighten the nuts to 10 N.m (88 in. lbs.).
4. Reconnect the seat jumper wire harness connector to the SAB inflator initiator (2). Be certain that the connector latches and lock are fully engaged.

CAUTION: Be certain that all of the trim is properly reinstalled on the front seat back frame. Failure to do so will adversely affect the function of the Seat AirBag (SAB) system.

5. Reinstall the trim onto the front and back of the front seat back frame. Refer to **INSTALLATION** .
6. Reinstall the front seat into the vehicle. Refer to **SEAT, FRONT, INSTALLATION** and **SEAT, FRONT CENTER, INSTALLATION** .
7. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, SIDE CURTAIN

DESCRIPTION

DESCRIPTION

Fig. 33: SRS Logo
Courtesy of CHRYSLER GROUP, LLC

Side curtain airbags are standard equipment on this vehicle. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components, and vehicles with this equipment can be readily identified by a molded identification trim button with the **SRS - AIRBAG** logo located on the upper B-pillar trim. This system is designed to reduce injuries to the vehicle occupants in the event of a side impact collision.

Fig. 34: Curtain Airbags, Side Rails, Tether, Inflator & Manifold
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with side curtain airbags have two individually controlled curtain airbag units (8). These airbag units are concealed and mounted above the headliner where they are each secured to one of the roof side rails (5). Each folded airbag cushion is contained within a fabric wrap and extruded plastic channels that extend along the roof rail from the A-pillar (6) at the front of the vehicle to the rearmost pillar of the vehicle. A long tether (7) extends down the A-pillar toward the belt line from the front of the airbag cushion, where it is retained to the inside of the pillar with plastic push-in fasteners.

The hybrid-type inflator (3) for each airbag is initially secured by a bracket with a T-tab at the front into a keyed slot in the roof rail above the B-pillar (standard cab) or above the rear door opening (quad or crew cab and mega cab), and is connected to the airbag cushion by a long tubular manifold (4). The airbag is then secured during installation with a single plastic push-in fastener to the roof rail. The entire assembly is then secured along the inside of the roof rail with screws.

The initiator of the airbag inflator is connected to the vehicle electrical system by a dedicated two-wire take out and connector of the body wire harness routed up the B-pillar (standard cab) or C-pillar (quad or crew cab and mega cab). A keyed and latched connector insulator (1) is connected directly to the connector receptacle of the initiator near the rear of the inflator. The body wire harness connects each curtain airbag unit to the Occupant Restraint Controller (ORC).

The side curtain airbag unit cannot be adjusted or repaired and must be replaced if deployed, ineffective, or in any way damaged. Once a side curtain airbag has been deployed, the complete airbag unit, the headliner, the upper A, B, and C-pillar trim, and all other visibly damaged components must be replaced.

OPERATION

OPERATION

Each side curtain airbag is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through left or right curtain airbag line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected to a tubular manifold so that all of the released gas is directed into the folded curtain airbag cushion, causing the cushion to inflate. As the airbag cushion inflates it will drop down from the roof rail between the edge of the headliner and the side glass/body pillars to form a curtain-like cushion to protect the vehicle occupants during a side impact collision.

The front tether keeps the front portion of the side airbag cushion taut to the side of the vehicle, thus ensuring that the bag will deploy in the proper position. Following the airbag deployment, the airbag cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric, and the deflated cushion hangs down loosely from the roof rail.

Proper diagnosis of the side curtain airbag inflator and the curtain airbag squib circuits requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

WARNING: **To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

NOTE: **The following procedure is for replacement of an ineffective or damaged side curtain airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .**

Fig. 35: Side Curtain Airbags, Screws, Retainers, Inflator & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.

NOTE: **If a side curtain airbag is being removed, but has not been deployed, the headliner does not have to be removed from the passenger compartment. Lowering the headliner and resting it on the seat backs will allow enough clearance to remove the side curtain airbag from the vehicle. However, if either side curtain airbag has been deployed, the headliner must be removed from the passenger compartment and replaced with a new unit.**

2. Lower or remove the headliner from the vehicle, as required. Refer to **HEADLINER, REMOVAL** .
3. Remove the 2 (standard cab), 4 (quad or crew cab) or 5 (mega cab) screws (8) that secure the side curtain airbag (6) to the inner roof rail.
4. Disengage the 2 plastic push-in retainers (9) that secure the side curtain airbag front tether to the assist handle bracket (1) on the inner A-pillar (2).
5. Disengage the 1 plastic push-in retainer (7) that secures the side curtain airbag to the inner roof rail.
6. The body wire harness connector (5) insulator is secured by integral latches to the connector receptacle at the rear of the inflator (4). Pinch both latches firmly, then pull the insulator straight out from the airbag inflator to disconnect it from the connector receptacle.

7. Slide the inflator rearward far enough to disengage the T-tab at the front of the inflator bracket from the keyed slot (3) in the inner roof rail over the front door opening (standard cab) or rear door opening (quad or crew cab and mega cab).
8. Remove the side curtain airbag from the vehicle as a unit.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged side curtain airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

Fig. 36: Side Curtain Airbags, Screws, Retainers, Inflator & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that the 2 (standard cab), 4 (quad or crew cab) or 5 (mega cab) spring nuts are properly installed in the inner roof rail and that they are in good condition.
2. Position the side curtain airbag (6) into the vehicle as a unit.
3. Insert the T-tab at the front of the inflator (4) bracket into the keyed slot (3) in the inner roof rail over the front door opening (standard cab) or rear door opening (quad or crew cab and mega cab) and slide the inflator forward to engage it.
4. Reconnect the body wire harness (5) connector for the side curtain airbag to the connector receptacle at the back of the inflator. You can be certain that each connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector latches snap into place.
5. Align the 1 plastic push-in retainer (7) that secures the side curtain airbag with the hole in the inner roof side rail and push it straight in until it is fully seated.
6. Working from rear to front, install and tighten the 2 (standard cab), 4 (quad or crew cab) or 5 (mega cab) screws (8) that secure the side curtain airbag to the spring nuts in the inner roof rail. Tighten the screws to 7 N.m (62 in. lbs.).
7. Engage the 2 plastic push-in retainers (9) that secure the side curtain airbag front tether to the assist handle bracket (1) on the inner A-pillar (2).
8. Reinstall the headliner into the vehicle. Refer to **HEADLINER, INSTALLATION** .
9. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

ANCHOR, CHILD SEAT

DESCRIPTION

DESCRIPTION

Fig. 37: Child Restraint Anchor Location - Standard CAB
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a Lower Anchors and Tether for CHildren, or LATCH child restraint anchorage system. The LATCH system provides for the installation of suitable child restraints in certain seating positions without using the standard equipment seat belt provided for that seating position.

Standard cab vehicles are equipped with a fixed-position child restraint upper tether anchor for the front center and outboard seating positions (2); and, child restraint lower anchors for the front outboard seating position (1).

Fig. 38: Child Restraint Anchor Location - Quad CAB
Courtesy of CHRYSLER GROUP, LLC

Quad or crew cab vehicles are equipped with a fixed-position child restraint upper tether anchor strap for the rear center and both rear outboard seating positions (2), and child restraint lower anchors for both rear outboard seating positions (1). All front seat child restraint anchors are deleted on quad or crew cabs.

Fig. 39: Child Restraint Anchor Location - Mega CAB
Courtesy of CHRYSLER GROUP, LLC

Mega cab vehicles are also equipped with a fixed-position child restraint upper tether anchor for the rear center and both rear outboard seating positions (2), and have child restraint lower anchors for all three rear seating positions (1). As on quad or crew cabs, all front seat child restraint anchors are deleted on mega cab vehicles.

Fig. 40: Locating Upper Tether Anchors - Standard CAB
Courtesy of CHRYSLER GROUP, LLC

The two upper tether anchors (3) for standard cabs and three upper tether anchors for mega cabs are integral to the upper cab back panel reinforcement and are concealed behind individual trim cover and bezel units (1) that are integral to the cab back trim panel (2). These upper tether anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with the upper cab back panel reinforcement. The upper tether anchor trim covers and bezels are serviced as a unit with the cab back trim panels.

Fig. 41: Locating Upper Tether Anchor Straps - Quad CAB
Courtesy of CHRYSLER GROUP, LLC

The three upper tether anchor straps (1) for quad or crew cabs are secured to the upper cab back panel (2) reinforcement with screws (3). These anchor straps are concealed behind the upright rear seat back. The upper tether anchor straps are available for individual service replacement.

Fig. 42: Locating Lower Anchors
Courtesy of CHRYSLER GROUP, LLC

The lower anchors (2) for all vehicles are integral to their respective front or rear seat cushion frame. Round markers (3) with an imprinted child seat icon on the standard cab front seat back trim cover helps identify the anchor locations for that application because they may be otherwise difficult to see with the seat back in the upright position. These lower anchors are each constructed from round steel bar stock that is formed into a U-shape, then securely welded at each end to the seat cushion frame. They are each accessed from the front of their respective seats, at each side where the seat back meets the seat cushion. These lower anchors cannot be

adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with the seat cushion frame.

Fig. 43: Locating Lower Seat Anchors - Quad CAB
Courtesy of CHRYSLER GROUP, LLC

On quad or crew cab and mega cab, if the rear seat lower anchors (2) have been bent or broken as a result of a vehicle collision, the latch for the affected rear seat cushion frame unit must also be replaced.

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

OPERATION

OPERATION

All vehicles manufactured for sale in the United States and Canada are required to be equipped with a Lower Anchors and Tether for CHildren, or LATCH child restraint anchorage system. In standard cab models, the outboard front passenger seat has a single set of anchor provisions for installing a LATCH-compatible child seat. In quad or crew cab models, the second row seats have two sets of anchor provisions for installing a LATCH-compatible child seat. A single seat may be mounted in the center seating position, or one in each outboard seating position. In mega cab models, the second row seats have three sets of anchor provisions to

accommodate the installation of a LATCH-compatible child seat in any one, or all three of the second row seating positions.

With LATCH, child seats are secured by direct attachment to the vehicle seat structure, rather than by the seat belts. With LATCH-compatible child seats, lower anchors attach to the seat structure through heavy-gauge wire loops located at the intersection between the seat cushion and the seat back surfaces.

In standard cab models, two upper tether anchors are integral to the upper cab back panel reinforcement, one each for the front passenger and front center seating positions to secure the top tether strap of child seats equipped with this feature. In quad or crew cab models, three upper tether anchor loops are secured to the upper cab back panel reinforcement to secure the top tether strap of child seats equipped with this feature. These upper tether anchors work with both LATCH-compatible and other child seats equipped with a top tether strap. In mega cab models, three upper tether anchors are integral to the upper cab back panel reinforcement, one for each of the three second row seating positions to secure the top tether strap of child seats equipped with this feature.

The owner's information packet in the vehicle glove box contains details and suggestions on the proper use of all of the factory-installed child restraint anchors.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **The following procedure applies only to the rear seat upper child tether straps used on quad or crew cab vehicles. The child restraint anchors used in other vehicles and locations are integral to other components and cannot be serviced separately.**

Fig. 44: Locating Upper Tether Anchor Straps - Quad CAB
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear seat from the vehicle. Refer to **SEAT, REAR, REMOVAL** or **SEAT, MEGA CAB REAR, REMOVAL** .
2. Remove the screw (3) that secures the child tether strap (1) to the upper cab back panel (2) reinforcement.
3. Remove the child tether strap from the upper cab back panel reinforcement.

INSTALLATION

INSTALLATION

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **The following procedure applies only to the rear seat upper child tether straps used on quad or crew cab vehicles. The child restraint anchors used in other vehicles and locations are integral to other components and cannot be serviced**

separately.

Fig. 45: Locating Upper Tether Anchor Straps - Quad CAB
Courtesy of CHRYSLER GROUP, LLC

1. Position the child tether strap (1) onto the cab back panel (2) upper reinforcement.
2. Install and tighten the screw (3) that secures the child tether strap to the upper cab back panel reinforcement. Tighten the screw to 14 N.m (10 ft. lbs.).
3. Reinstall the rear seat into the vehicle. Refer to **SEAT, REAR, INSTALLATION** or **SEAT, MEGA CAB REAR, INSTALLATION** .

BUCKLE, SEAT BELT

REMOVAL

FRONT CENTER AND CENTER ANCHOR

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.**

Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: **A fixed position front center seat belt buckle is located on the left side of the front center seat section (20 percent) used on all vehicles with a split bench front seat. Standard cab vehicles have a unique, fixed position, black, keyed, lower anchor buckle for the three-point center seat belt lower anchor located on the right side of the front center seat section. Quad or crew cab and mega cab vehicles have a fixed position front center seat lap belt located on the right side of the front center seat section. The following procedure applies to the front center seating position belt buckle, the lap belt or the anchor buckle. The three-point front center seat belt and retractor unit is only used on standard cab vehicles. Refer to RETRACTOR, SEAT BELT, REMOVAL.**

Fig. 46: Identifying Front Center Seat Belt Components
Courtesy of CHRYSLER GROUP, LLC

1. Move the adjacent right or left front outboard seat section (40 percent) to its most forward position and tilt the seat back forward for easiest access to the lower anchor of the front center seat belt buckle, lap belt or anchor buckle (1).
2. On standard cab vehicles only, if equipped, remove the stowage tray from the rear floor panel behind the seat. Refer to **BIN, STORAGE, REMOVAL** .
3. From behind the front seat, remove the screw (5) that secures the lower anchor of the front center seat belt buckle, lap belt or anchor buckle to the center seat support bracket (3).
4. From the front of the front seat, reach between the side of the center seat cushion (6) and the adjacent right or left front outboard seat cushion to access and remove the seat belt buckle, lap belt or anchor buckle through the elastic strap (2) on the side of the center seat cushion.
5. Remove the front center seat belt buckle, lap belt or anchor buckle unit from the front seat.

FRONT OUTBOARD

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: A traveling front outboard seat belt buckle is located on the inboard side of each front outboard split bench seat section (40 percent) or bucket seat used on all vehicles. The seat belt buckle on the driver side front seat for all vehicles also includes a seat belt switch.

Fig. 47: Identifying Front Outboard Seat Belt Buckle
Courtesy of CHRYSLER GROUP, LLC

1. Move the right or left front outboard split bench seat section or bucket seat to its most rearward position and tilt the seat back forward for easiest access to the front outboard seat belt buckle lower anchor.
2. On standard cab vehicles only equipped with a split bench seat, also move the outboard seat section opposite the side from which the buckle is to be removed to its most forward position and tilt the seat back forward.

3. On standard cab vehicles only, if equipped, remove the stowage tray from the rear floor panel behind the seat. Refer to **BIN, STORAGE, REMOVAL** .
4. On the driver side only, from behind the front seat disconnect the seat belt switch pigtail wire connector (4) from the seat wire harness take out and connector located on the lower inboard side of the seat cushion frame just forward of the buckle lower anchor.
5. From behind the front seat, remove the screw (3) that secures the buckle (1) lower anchor to the lower inboard side of the seat cushion frame.
6. From the front of the front seat, reach between the center seat cushion (2) or center floor console and the right or left front outboard seat cushion to access and remove the front outboard seat belt buckle from the seat.

REAR CENTER ANCHOR AND RIGHT OUTBOARD - MEGA CAB

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **The rear seat right outboard occupant buckle is serviced as a unit with an anchor bracket. The lower anchor of the rear center seat belt and retractor is also secured to the anchor bracket with a screw so that it can be removed from the anchor bracket and serviced separately from the buckle. Refer to RETRACTOR, SEAT BELT, REMOVAL.**

Fig. 48: Accessing Rear Center & Outboard Buckle Bracket - Mega Cab
Courtesy of CHRYSLER GROUP, LLC

1. Fold the 60 percent section of the rear seat back (2) down onto the seat cushion in the cargo storage position, then lift and prop open the seat back filler panel (3) as necessary for easiest access to the rear center seat belt lower anchor and right outboard buckle anchor bracket.

Fig. 49: Identifying Seat Back, Seat Cushion, Anchor Bracket, Nut, Rear Mounting Bracket, & Screw
Courtesy of CHRYSLER GROUP, LLC

2. Remove the screw (7) that secures the center seat belt lower anchor to the anchor bracket (3) and temporarily secure the belt lower anchor to keep it from being pulled from between the seat back (1) and the seat cushion (2) by the retractor.

3. Remove and discard the screw (6) that secures the buckle anchor bracket and the rear seat rear mounting bracket (5) to the rear floor panel.
4. Remove the nut (4) that secures the buckle anchor bracket to the stud on the rear seat rear mounting bracket.
5. Disengage the buckle from between the seat cushion and the seat back, then remove the anchor bracket and buckle from behind the rear seat as a unit.

REAR CENTER AND LEFT OUTBOARD - MEGA CAB

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

Fig. 50: Accessing Rear Center & Outboard Buckle Bracket - Mega Cab
Courtesy of CHRYSLER GROUP, LLC

1. Fold both the 40 percent section and the 60 percent section of the rear seat back (1 and 2) down onto the seat cushion in the cargo storage position, then lift and prop open the seat back filler panels (3 and 4) as necessary for easiest access to the rear center and left outboard seat belt buckle anchor bracket.

Fig. 51: Identifying Nut, Screws, Stabilizer Bracket & Buckle Anchor Bracket
Courtesy of CHRYSLER GROUP, LLC

2. Remove the four screws (2) that secure the stabilizer bracket (4) to the two inboard seat hinge brackets.
3. Remove the stabilizer bracket from between the seat hinge brackets.
4. Remove and discard the screw (3) that secures the buckle anchor bracket (5) and the rear seat rear mounting bracket to the rear floor panel.
5. Remove the nut (1) that secures the buckle anchor bracket to the stud on the rear seat rear mounting bracket.
6. Disengage the buckles from between the seat cushion and the seat back, then remove the anchor bracket and buckles from between the rear seat sections as a unit.

REAR - QUAD OR CREW CAB

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **The following removal procedure covers service of the rear seat center and left outboard seat belt buckle units. The rear seat right outboard seat belt buckle is serviced as a unit with the rear seat center seat belt and retractor assembly. Refer to RETRACTOR, SEAT BELT, REMOVAL.**

Fig. 52: Cab Back Panel -- Seat Belt Buckle Units
Courtesy of CHRYSLER GROUP, LLC

1. Lift up the rear seat cushion into its stowed position against the rear seat back.
2. Remove the screw (2) that secures either the center (4) or the left outboard (3) occupant buckle unit to the rear floor panel near the base of the cab back panel (1). On vehicles with the optional 60/40 split rear bench, the screw that secures the buckle unit also secures one of the rear seat mounting brackets to the rear floor panel.
3. Remove the center or left outboard occupant buckle unit from the rear floor panel or from the rear seat mounting bracket.

INSTALLATION

FRONT CENTER AND CENTER ANCHOR

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective**

seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: **A fixed position front center seat belt buckle is located on the left side of the front center seat section (20 percent) used on all vehicles with a split bench front seat. Standard cab vehicles have a unique, fixed position, black, keyed, lower anchor buckle for the three-point center seat belt lower anchor located on the right side of the front center seat section. Quad or crew cab and mega cab vehicles have a fixed position front center seat lap belt located on the right side of the front center seat section. The following procedure applies to the front center seating position belt buckle, the lap belt or the anchor buckle. The three-point front center seat belt and retractor unit is only used on standard cab vehicles. Refer to RETRACTOR, SEAT BELT, INSTALLATION.**

Fig. 53: Identifying Front Center Seat Belt Components
Courtesy of CHRYSLER GROUP, LLC

1. From the front of the front seat, position the front center seat belt buckle, lap belt or anchor buckle unit (1) through the elastic strap (2) on the side of the center seat cushion (6).
2. From the front of the front seat, reach between the side of the center seat cushion and the adjacent right or left front outboard seat cushion to route the lower anchor of the seat belt buckle, lap belt or anchor buckle unit down between the side of the center seat cushion and the adjacent right or left front outboard seat cushion. Be certain that the belt webbing is not twisted.
3. From behind the front seat, position the lower anchor of the seat belt buckle, lap belt or anchor buckle to the center seat support bracket (3). Be certain to engage the anti-rotation tab on the lower anchor into the corresponding hole in the center seat support bracket.
4. Install and tighten the screw (5) that secures the lower anchor of the seat belt buckle, lap belt or anchor

buckle to the center seat support bracket. Tighten the screw to 39 N.m (29 ft. lbs.).

5. On standard cab vehicles only, if equipped, reinstall the stowage tray onto the rear floor panel behind the seat. Refer to **BIN, STORAGE, INSTALLATION** .

FRONT OUTBOARD

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: A traveling front outboard seat belt buckle is located on the inboard side of each front outboard split bench seat section (40 percent) or bucket seat used on all vehicles. The seat belt buckle on the driver side front seat for all vehicles also includes a seat belt switch.

Fig. 54: Identifying Front Outboard Seat Belt Buckle
Courtesy of CHRYSLER GROUP, LLC

1. From the front of the front seat, reach between the center seat cushion (2) or center floor console and the

right or left front outboard seat cushion to position the front outboard seat belt buckle to the seat.

2. From behind the front seat, position the front outboard seat belt buckle lower anchor to the lower inboard side of the seat cushion frame. Be certain to engage the anti-rotation tab on the lower anchor into the corresponding hole in the seat cushion frame.
3. Install and tighten the screw (3) that secures the front outboard seat belt buckle lower anchor to the seat cushion frame. Tighten the screw to 25 N.m (18 ft. lbs.).
4. On the driver side only, reconnect the seat belt switch pigtail wire connector (4) to the seat wire harness take out and connector located on the lower inboard side of the seat cushion frame just forward of the buckle lower anchor.
5. On standard cab vehicles only, if equipped, reinstall the stowage tray onto the rear floor panel behind the seat. Refer to **BIN, STORAGE, INSTALLATION** .

REAR CENTER ANCHOR AND RIGHT OUTBOARD - MEGA CAB

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **The rear seat right outboard occupant buckle is serviced as a unit with a mounting bracket. The lower anchor of the rear center seat belt and retractor is also secured to the mounting bracket with a screw so that it can be removed from the mounting bracket and serviced separately from the buckle. Refer to RETRACTOR, SEAT BELT, REMOVAL.**

Fig. 55: Identifying Seat Back, Seat Cushion, Anchor Bracket, Nut, Rear Mounting Bracket, & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Engage the buckle unit between the seat cushion (2) and the seat back (1), then position the anchor bracket (3) to the rear seat rear mounting bracket (5) behind the rear seat as a unit. Be certain to engage the anti-rotation tab on the anchor bracket into the clearance hole in the mounting bracket.
2. Install and tighten the nut (4) that secures the buckle anchor bracket to the stud on the rear seat rear mounting bracket. Tighten the nut to 23 N.m (17 ft. lbs.).
3. Install and tighten a new screw (6) to secure the buckle anchor bracket and the rear seat rear mounting bracket to the rear floor panel. Tighten the screw to 47 N.m (35 ft. lbs.).
4. Route the center seat belt lower anchor between the seat back and the seat cushion and position it to the anchor bracket. Be certain the belt webbing is not twisted between the retractor and the anchor bracket.
5. Install and tighten the screw (7) that secures the seat belt lower anchor to the anchor bracket. Tighten the screw to 40 N.m (30 ft. lbs.).
6. Restore the 60 percent seat back filler panel and the seat back to their previous positions.

REAR CENTER AND LEFT OUTBOARD - MEGA CAB

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and**

unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

Fig. 56: Identifying Nut, Screws, Stabilizer Bracket & Buckle Anchor Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the buckles and anchor bracket (5) between the inboard rear seat hinge brackets and engage the buckle units between the seat cushion and the seat back as a unit. Be certain to engage the anti-rotation tab on the anchor bracket into the clearance hole in the rear seat rear mounting bracket.
2. Install and tighten the nut (1) that secures the buckle anchor bracket to the stud on the rear seat rear mounting bracket. Tighten the nut to 23 N.m (17 ft. lbs.).
3. Install and tighten a new screw (3) to secure the buckle anchor bracket and the rear seat rear mounting bracket to the rear floor panel. Tighten the screw to 47 N.m (35 ft. lbs.).
4. Position the stabilizer bracket (4) between the two inboard rear seat hinge brackets.
5. Install and tighten the four screws (2) that secure the stabilizer bracket to the hinge brackets. Tighten the screws to 5 N.m (44 in. lbs.).
6. Restore both seat back filler panels and both seat backs to their previous positions.

REAR - QUAD OR CREW CAB

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is**

integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: **The following installation procedure covers service of the rear seat center and left outboard seat belt buckle units. The rear seat right outboard seat belt buckle is serviced as a unit with the rear seat center seat belt and retractor assembly. Refer to RETRACTOR, SEAT BELT, INSTALLATION.**

Fig. 57: Cab Back Panel -- Seat Belt Buckle Units
Courtesy of CHRYSLER GROUP, LLC

1. Position the center (4) or the left outboard (3) occupant buckle unit onto the rear floor panel or onto the rear seat mounting bracket near the base of the cab back panel (1). On vehicles with the optional 60/40 split rear bench, the screw that secures the buckle unit also secures one of the rear seat mounting brackets to the rear floor panel.
2. Install and tighten the screw (2) that secures the center or the left outboard occupant buckle unit to the rear floor panel. Tighten the screw to 39 N.m (29 ft. lbs.).
3. Restore the rear seat cushion to its seating position.

CLOCKSPRING

DESCRIPTION

DESCRIPTION

Fig. 58: Multi-Function Switch Assembly
Courtesy of CHRYSLER GROUP, LLC

The clockspring (5) for this vehicle is secured near the top of the steering column below the steering wheel. The clockspring also includes an integral, internal turn signal cancel cam, a Steering Angle Sensor (SAS) and, on vehicles equipped with the optional heated steering wheel, a set of internal slip rings. All of these components are serviced as a unit with the clockspring. The clockspring also supports the multi-function switch (1), the Steering Control Module (SCM) internal to the multi-function switch housing (2) and a blank filler (7) for, or the optional adjustable pedal switch, which are secured to the clockspring mounting bracket with integral keyways and latch feature provisions. The multi-function switch, adjustable pedal switch blank filler or the adjustable pedal switch are available for individual service replacement. When combined, these components are sometimes referred to as the Steering Column Control Module (SCCM).

The clockspring case includes integral tabs at the top and bottom for mounting the unit to the steering column housing with two screws, as well as integral provisions for mounting and supporting the multi-function switch, adjustable pedal switch, SAS and heated steering wheel slip rings. The SAS integral to the clockspring includes an electronic circuit board and a microprocessor, which allows it to communicate with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. The SAS circuitry is contained within a flat, molded plastic case that is secured to the lower surface of the clockspring case that hangs below the steering column.

Within the plastic clockspring case is a spool-like molded plastic rotor with a large exposed hub and an integral turn signal cancel cam. The upper surface of the rotor hub has a large center hole, an engagement dowel or drive pin, a single sleeve containing two short driver airbag squib pigtail wires with connectors, and a connector receptacle that faces toward the steering wheel. On vehicles equipped with the optional heated steering wheel, a third heated steering wheel pigtail wire and connector exits the upper surface of the rotor.

Service replacement clocksprings are shipped pre-centered and with a molded plastic locking pin (4) that snaps into a receptacle on the rotor. The locking pin secures the centered clockspring rotor to the clockspring case and the SAS during shipment and handling, but must be removed from the clockspring after it is installed on the steering column. The locking pin is a one time component and cannot be reinstalled once it has been removed.

The clockspring must be replaced if proper centering has been compromised or the tape may be damaged and Diagnostic Trouble Codes (DTCs) or faults may be set within the SAS.

Fig. 59: Clockspring Case
Courtesy of CHRYSLER GROUP, LLC

The lower surface of the clockspring case (1) facing toward the instrument panel includes two receptacles on the left for mounting the multi-function switch (2) and the optional adjustable pedal switch (3). There are two integral connector receptacles (4) on the left lower corner of the clockspring case. Clocksprings with a SAS (5) also have a dedicated connector (6) near the right lower corner of that unit. Vehicles equipped with the optional heated steering wheel also have a dedicated connector (7) to the internal slip rings on the upper right corner of the clockspring case.

Within the plastic case and wound around the rotor spool is a long ribbon-like tape that consists of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tape terminates at the connector receptacles that face the instrument panel, while the inner end of the tape terminates at the driver airbag squib pigtail wires and connector receptacle on the hub of the clockspring rotor that face the steering wheel.

The clockspring cannot be repaired. If damaged, ineffective or if the driver airbag has been deployed, the clockspring must be replaced.

OPERATION

OPERATION

The clockspring is a mechanical electrical circuit component that is used to provide continuous electrical continuity between the fixed instrument panel wire harness and the electrical components mounted on or in the rotating steering wheel. On this vehicle the rotating electrical components include the driver airbag, the horn

switch, the Electronic Vehicle Information Center (EVIC) switches, the speed control switches, the remote radio switches and the steering wheel heating element, if the vehicle is so equipped. The clockspring case is positioned and secured to the top of the steering column. The fixed connector receptacles on the back of the fixed clockspring case connect the clockspring to the vehicle electrical system through several take outs with connectors from the instrument panel wire harness.

The turn signal cancel cam is integral to the rim of the clockspring rotor hub within the clockspring case so it also moves with the rotation of the steering wheel. Two short, black-sleeved pigtail wires on the upper surface of the clockspring rotor connect the clockspring to the driver airbag, while a steering wheel wire harness connected to the connector receptacle on the upper surface of the clockspring rotor completes circuits to the horn switch, the speed control switch and, if the vehicle is so equipped, to the optional remote radio switches and EVIC switches on the steering wheel. A third pigtail wire is dedicated to providing the high current requirements of the heating element for the optional heated steering wheel received through a dedicated connection on the back of the clockspring through a set of slip rings internal to the clockspring case. Another connector receptacle found on the Steering Angle Sensor (SAS) on the back of the clockspring is dedicated to the inputs and outputs of the SAS.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape and the SAS integral to the clockspring to the movable steering components so that the tape can operate within its designed travel limits and the SAS can accurately monitor and communicate steering wheel inputs. However, if the clockspring is removed from the steering column or if the steering shaft is disconnected from the steering gear, the clockspring spool and the SAS can change position relative to the movable steering components and relative to each other. The clockspring must be replaced if proper centering has been compromised or the tape may be damaged and Diagnostic Trouble Codes (DTC) or faults may be set within the SAS.

Service replacement clocksprings are shipped pre-centered and with a plastic locking pin installed. This locking pin should not be removed until the clockspring has been installed on the steering column. If the locking pin is removed before the clockspring is installed on a steering column, the clockspring must be replaced with a new unit. Proper clockspring installation must also be confirmed by viewing the SAS Menu Item, Data Display function using a diagnostic scan tool.

The hard wired clockspring circuits as well as the hard wired inputs and outputs of the SAS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SAS or the electronic controls or communication between other modules and devices that provide features of the Electronic Stability Program (ESP) or the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the SAS or the electronic controls and communication related to ESP or SRS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

STANDARD PROCEDURE - CLOCKSPRING CENTERING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or

instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: Always turn the steering wheel until the front wheels are in the straight-ahead position. Then, prior to removing the clockspring from the steering column or disconnecting the steering column from the steering gear, lock the steering wheel to the steering column or securely fasten the clockspring rotor to the clockspring case. If clockspring centering has been compromised for ANY reason, the entire clockspring and Steering Angle Sensor (SAS) unit MUST be replaced with a new unit.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape and the SAS integral to the clockspring to the movable steering components so that the tape can operate within its designed travel limits and the SAS can accurately monitor and communicate steering wheel inputs. However, if the clockspring is removed from the steering column or if the steering shaft is disconnected from the steering gear, the clockspring spool and the SAS can change position relative to the movable steering components and relative to each other. The clockspring must be replaced if proper centering has been compromised or the tape may be damaged and Diagnostic Trouble Codes (DTC) or faults may be set within the SAS.

Service replacement clocksprings are shipped pre-centered and with a plastic locking pin installed. This locking pin should not be removed until the clockspring has been installed on the steering column. If the locking pin is removed before the clockspring is installed on a steering column, the clockspring must be replaced with a new unit. Proper clockspring installation must also be confirmed by viewing the SAS Menu Item, Data Display function using a diagnostic scan tool.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: Always turn the steering wheel until the front wheels are in the straight-ahead position. Then, prior to removing the clockspring from the steering column or disconnecting the steering column from the steering gear, lock

the steering wheel to the steering column or securely fasten the clockspring rotor to the clockspring case. If clockspring centering has been compromised for ANY reason, the entire clockspring and Steering Angle Sensor (SAS) unit MUST be replaced with a new unit.

Fig. 60: Clockspring & Steering Column
Courtesy of CHRYSLER GROUP, LLC

1. Place the front wheels in the straight ahead position.
2. Disconnect and isolate the battery negative cable.
3. Remove the driver airbag from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL**.
4. Disconnect the steering wheel wire harness connector from the upper clockspring (3) connector receptacle.
5. If equipped, disconnect the clockspring pigtail wire connector for the steering wheel heater element from the steering wheel connector receptacle.
6. Remove the steering wheel from the steering column (1). Refer to **WHEEL, STEERING, REMOVAL** .
7. If the removed clockspring is to be reused, be certain to secure the clockspring rotor to the clockspring case to maintain clockspring centering until it is reinstalled on the steering column. If clockspring centering is not maintained, the clockspring and Steering Angle Sensor (SAS) unit must be replaced with a new unit. Refer to **CLOCKSPRING, STANDARD PROCEDURE**.
8. Remove the upper and lower shrouds from the steering column. Refer to **SHROUD, STEERING COLUMN, REMOVAL** .
9. Remove the two screws (2) that secure the clockspring to the steering column housing.

Fig. 61: Instrument Panel Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

10. Pull the clockspring rearward away from the top of the steering column far enough to access and disconnect the following instrument panel wire harness (7) connectors and their wiring retainers from the clockspring, as the vehicle is equipped:
    1. Multi-function switch connector (1)
    2. Heated steering wheel slip ring connector (2)
    3. Steering Angle Sensor (SAS) connector (3)
    4. Two clockspring connectors (4 and 5)
    5. Adjustable pedal switch connector (6).
11. Remove the clockspring from the steering column. The clockspring cannot be repaired. It must be replaced if ineffective, damaged, centering has been compromised or the driver airbag has been deployed.
12. Remove the multi-function switch from the clockspring. Refer to **SWITCH, MULTIFUNCTION, REMOVAL** .
13. Remove the adjustable pedal switch blank filler or switch from the clockspring. Refer to **SWITCH, ADJUSTABLE PEDALS, REMOVAL** .

INSTALLATION

INSTALLATION

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate**

the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: If the clockspring is not properly centered in relation to the Steering Angle Sensor (SAS), steering wheel, steering shaft and steering gear, it may be damaged or Diagnostic Trouble Codes (DTC) may be set in the SAS. Refer to CLOCKSPRING, STANDARD PROCEDURE. Service replacement clocksprings are shipped pre-centered and with a locking pin installed. This locking pin should not be removed until the clockspring has been installed on the steering column.

Fig. 62: Instrument Panel Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Reinstall the adjustable pedal switch blank filler or switch onto the clockspring. Refer to **SWITCH, ADJUSTABLE PEDALS, INSTALLATION** .
2. Reinstall the multi-function switch onto the clockspring. Refer to **SWITCH, MULTIFUNCTION, INSTALLATION** .
3. With the centered clockspring rotor and case secured to each other, or with the plastic locking pin installed, carefully slide the clockspring down over the steering column upper shaft far enough to access and reconnect the following instrument panel wire harness (7) connectors and their wiring retainers to the clockspring, as the vehicle is equipped:
    1. Multi-function switch connector (1)
    2. Heated steering wheel slip ring connector (2)

3. Steering Angle Sensor (SAS) connector (3)
4. Two clockspring connectors (4 and 5)
5. Adjustable pedal switch connector (6).

Fig. 63: Clockspring & Steering Column
Courtesy of CHRYSLER GROUP, LLC

4. Position the clockspring (3) onto the steering column housing (1).
5. Install and tighten the two screws (2) that secure the clockspring to the steering column housing. Tighten the screws to 3 N.m (25 in. lbs.).
6. Reinstall the upper and lower shrouds onto the steering column. Refer to **SHROUD, STEERING COLUMN, INSTALLATION** .
7. Remove the plastic locking pin or any other device that is being used to secure the clockspring rotor to the clockspring case to maintain clockspring centering.
8. Reinstall the steering wheel onto the steering column. Refer to **WHEEL, STEERING, INSTALLATION** .

NOTE: **When reinstalling the steering wheel, be certain to index the engagement dowel/drive pin on the upper surface of the clockspring rotor between the two fins cast into the lower surface of the steering wheel armature hub.**

9. If equipped, reconnect the clockspring pigtail wire connector for the steering wheel heater element to the steering wheel connector receptacle.
10. Reconnect the steering wheel wire harness connector to the upper clockspring connector receptacle. Be certain that the steering wheel wire harness is routed between the steering wheel back trim cover and the steering wheel armature.
11. Reinstall the driver airbag onto the steering wheel. Refer to **AIR BAG, DRIVER, INSTALLATION**.
12. Reconnect the battery negative cable.

NOTE: **Proper clockspring installation must also be confirmed by viewing the SAS Menu Item, Data Display function using a diagnostic scan tool.**

CONTROLLER, OCCUPANT RESTRAINT

DESCRIPTION

DESCRIPTION

Fig. 64: Occupant Restraint Controller
Courtesy of CHRYSLER GROUP, LLC

The Occupant Restraint Controller (ORC) (1) is located in the passenger compartment of the vehicle, where it is secured by three nuts to three studs on a stamped steel mounting bracket welded onto the top of the floor panel transmission tunnel under the center front seat section or the center floor console, as the vehicle is equipped. Concealed within a hollow in the center of the die cast aluminum ORC housing is the electronic circuitry of the ORC which includes a microprocessor, an electronic impact sensor, an electronic safing sensor, and an energy storage capacitor. A stamped metal cover plate is secured to the bottom of the ORC housing with screws to enclose and protect the internal electronic circuitry and components.

An arrow (2) printed on the label (3) on the top of the ORC housing provides a visual verification of the proper orientation of the unit, and should always be pointed toward the front of the vehicle. The ORC housing has three integral flanges with mounting holes. Two are on the corners oriented towards the left side of the vehicle, and one is near the center of the side facing the right side of the vehicle. A molded plastic electrical connector (4) with two receptacles, each containing up to 32 terminal pins, exits the forward facing side of the ORC housing. These terminal pins connect the ORC to the vehicle electrical system through two dedicated take outs and connectors, one each from the instrument panel and the body wire harnesses.

A molded plastic protective cover is installed over the ORC to provide additional moisture contamination protection to the unit. Integral latch features on each side of the cover engage a slot (5) on each side of the base of the ORC housing to secure the cover to the ORC. This protective cover **must** be reinstalled following any service requiring its removal.

The impact sensor and safing sensor internal to the ORC are calibrated for the specific vehicle, and are only serviced as a unit with the ORC. The ORC cannot be repaired or adjusted and, if damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The microprocessor in the Occupant Restraint Controller (ORC) contains the Supplemental Restraint System (SRS) logic circuits and controls all of the SRS components. The ORC uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is used for control of the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and for SRS diagnosis and testing through the 16-way Data Link Connector (DLC) located on the driver side lower edge of the instrument panel.

The ORC microprocessor continuously monitors all of the SRS electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends electronic messages to the EMIC over the CAN data bus to turn ON the airbag indicator. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition switch cycle, while a stored fault causes a DTC to be stored in memory by the ORC. For some DTCs, if a fault does not recur for a number of ignition cycles, the ORC will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

The ORC receives battery current through two circuits; a fused ignition switch output (run) circuit through a fuse in the Totally Integrated Power Module (TIPM), and a fused ignition switch output (run-start) circuit through a second fuse in the TIPM. The ORC receives ground through a ground circuit and take out of the instrument panel wire harness that is secured by a ground screw to the body sheet metal. These connections allow the ORC to be operational whenever the ignition switch is in the START or ON positions.

The ORC also contains an energy-storage capacitor. When the ignition switch is in the START or ON positions, this capacitor is continually being charged with enough electrical energy to deploy the SRS components for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup SRS protection in case there is a loss of battery current supply to the ORC during an impact.

Various sensors within the ORC are continuously monitored by the ORC logic. These internal sensors, along with several external impact sensor inputs allow the ORC to determine both the severity of an impact and to verify the necessity for deployment of any SRS components. Two remote front impact sensors are located on the back of the right and left ends of the lower radiator cross member near the front of the vehicle. The electronic impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact.

The ORC also monitors inputs from an internal rollover sensor and up to six additional remote side impact sensors located within both the left and right front doors, B-pillars and C-pillars to control deployment of the side curtain airbag units and, if equipped, the seat (pelvic and thorax) airbag units.

The impact sensors within the ORC are electronic accelerometer sensors that provide additional logic inputs to the ORC microprocessor. These sensors are used to verify the need for a SRS component deployment by

detecting impact energy of a lesser magnitude than that of the primary electronic impact sensors, and must exceed a safing threshold in order for the SRS components to deploy. A separate impact sensor within the ORC provides confirmation to the ORC microprocessor of side impact forces. This separate sensor is a bi-directional unit that detects impact forces from either side of the vehicle.

Pre-programmed decision algorithms in the ORC microprocessor determine when the deceleration rate as signaled by the impact sensors indicate an impact that is severe enough to require SRS protection and, based upon the severity of the monitored impact, determines the level of front airbag deployment force required for each front seating position. When the programmed conditions are met, the ORC sends the proper electrical signals to deploy the dual multistage front airbags at the programmed force levels, the front seat belt tensioners and either side curtain or seat airbag unit.

The hard wired inputs and outputs for the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ORC or the electronic controls or communication between other modules and devices that provide features of the SRS. The most reliable, efficient, and accurate means to diagnose the ORC or the electronic controls and communication related to SRS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

MODULE

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC) as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete or improper SRS component deployment.**

Fig. 65: Occupant Restraint Controller & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the protective cover from the Occupant Restraint Controller (ORC) (1). Refer to **CONTROLLER, OCCUPANT RESTRAINT, REMOVAL**.
3. Disconnect the instrument panel and body wire harness connectors (3) for the ORC from the ORC connector receptacles (2 and 4) located on the forward facing side of the module. To disconnect the connectors from the ORC:
    1. Slide the red Connector Position Assurance (CPA) lock on the top of the connector to the side.
    2. Depress the edge of the CPA lock closest to the ORC to release the connector latch tab and pull the connector straight away from the ORC connector receptacle.

Fig. 66: Occupant Restraint Controller, Mount & Nuts

Courtesy of CHRYSLER GROUP, LLC

4. Remove the three nuts (2) that secure the ORC (1) to the studs of the ORC mount (3) welded onto the top of the floor panel transmission tunnel.
5. Remove the ORC from the ORC mount.

COVER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 67: Occupant Restraint Controller & Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. On vehicles equipped with front bucket seats, remove the front floor console from the vehicle. Refer to **CONSOLE, FLOOR, REMOVAL** .

NOTE: The front bench seat assembly must be unfastened from the floor panel, but need not be removed from the vehicle for access to the Occupant Restraint Controller (ORC) cover for service.

3. On vehicles equipped with a front bench seat, detach the front seat from the floor panel. Refer to **SEAT, FRONT, REMOVAL** and **SEAT, FRONT CENTER, REMOVAL** .

4. Using a trim stick or another suitable wide flat-bladed tool, gently pry the latch feature on either side of the ORC cover (1) away from the base of the ORC (2) far enough to disengage the cover from the module.
5. Remove the ORC cover from over the ORC.

INSTALLATION

MODULE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC) as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete or improper SRS component deployment.

Fig. 68: Occupant Restraint Controller, Mount & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position the Occupant Restraint Controller (ORC) (1) over the three studs of the ORC mount (3) welded

onto the top of the floor panel transmission tunnel. When the ORC is correctly positioned, the arrow on the ORC label will be pointed forward in the vehicle.

2. Install and tighten the three nuts (2) that secure the ORC to the studs of the ORC mount that is welded onto the floor panel transmission tunnel. Tighten the nuts to 12 N.m (9 ft. lbs.).

Fig. 69: Occupant Restraint Controller & Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Reconnect the instrument panel and body wire harness connectors (3) for the ORC (1) to the ORC connector receptacles (2 and 4) located on the forward facing side of the module. Be certain that the latches and the red Connector Position Assurance (CPA) locks on both connectors are each fully engaged.
4. Reinstall the ORC cover onto the ORC. Refer to **CONTROLLER, OCCUPANT RESTRAINT, INSTALLATION**.
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

COVER

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

Fig. 70: Occupant Restraint Controller & Cover
Courtesy of CHRYSLER GROUP, LLC

1. Position the ORC cover (1) over the Occupant Restraint Controller (ORC) (2).
2. Align the latch feature on each side of the ORC cover with the notch in each side at the base of the ORC housing.
3. Using hand pressure, press firmly and evenly downward on the ORC cover until each latch feature is fully engaged with the ORC housing.
4. On vehicles equipped with a front bench seat, reinstall the front seat onto the floor panel. Refer to **SEAT, FRONT, INSTALLATION** and **SEAT, FRONT CENTER, INSTALLATION** .
5. On vehicles equipped with front bucket seats, reinstall the front floor console into the vehicle. Refer to **CONSOLE, FLOOR, INSTALLATION** .
6. Reconnect the battery negative cable.

RETRACTOR, SEAT BELT

DESCRIPTION

DESCRIPTION

Fig. 71: Seat Belt Retractor
Courtesy of CHRYSLER GROUP, LLC

The seat belt retractors (1) used in all seating positions include an inertia-type, emergency locking mechanism as standard equipment. However, the retractor locking mechanisms for all seating positions except the driver side front position are mechanically switchable from an Emergency Locking Retractor (ELR) to an Automatic Locking Retractor (ALR). The primary function of this feature is to securely accommodate a child seat in any seating position of the vehicle without the need for a self-cinching seat belt tip half latch plate unit or another supplemental device that would be required to prevent the seat belt webbing from unwinding freely from the retractor spool of an inertia-type emergency locking retractor mechanism.

The emergency and automatic locking mechanisms are integral to the seat belt and retractor unit and are concealed beneath a molded plastic cover (2) located on one side of the retractor spool. These locking mechanisms cannot be adjusted or repaired and, if ineffective or damaged, the entire seat belt and retractor unit must be replaced.

OPERATION

OPERATION

The locked mode of the Automatic Locking Retractor (ALR) is engaged and the retractor is switched from operating as a standard inertia-type Emergency Locking Retractor (ELR) by first buckling the combination lap and shoulder belt buckle. Then grasp the shoulder belt and pull all of the webbing out of the retractor. Once all of the belt webbing is extracted from the spool, the retractor will automatically become engaged in the pre-locked automatic locking mode and will make a light, audible clicking or ratcheting sound as the shoulder belt is allowed to retract to confirm that the automatic locking mode is now engaged. Once the automatic locking mode is engaged, the retractor will remain locked and the belt will remain tight around whatever it is restraining.

The retractor is returned to standard emergency locking (inertia) mode by unbuckling the combination lap and shoulder belt buckle and allowing the belt webbing to be almost fully retracted onto the retractor spool. The emergency locking mode is confirmed by the absence of the light, audible clicking or ratcheting sound as the belt webbing retracts. This mode will allow the belt to unwind from and wind onto the retractor spool freely unless and until a predetermined inertia load is sensed, or until the retractor is again switched to the automatic locking mode.

REMOVAL

CENTER - STANDARD CAB

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: A front center three-point seat belt and retractor is used only on standard cab vehicles. Quad or crew cab and mega cab vehicles with a front bench seat have a two-point lap belt in the front center seating position. Refer to BUCKLE, SEAT BELT, REMOVAL.

NOTE: All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.

Fig. 72: Front Center Seat Belt, Bezel & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Reach between the center of the front seat cushion and front seat back to access and unbuckle the front center seat belt lower anchor latch plate from the unique black, keyed lower anchor buckle. Use an ignition key or a small screwdriver to depress the small white release button on the anchor buckle.
2. Move the front seat to its most forward position for easiest access to the front center seat belt and retractor unit.
3. Remove the stowage tray from the rear floor panel behind the seat. Refer to **BIN, STORAGE, REMOVAL** .
4. Using a trim stick or another suitable wide flat-bladed tool, gently pry at each side of the front center seat belt bezel (5) on the cab back trim panel (1) to release the snap features that secure the bezel to the panel.
5. Remove the bezel from the webbing of the front center seat belt (4).
6. Remove the trim from the cab back panel. Refer to **PANEL, CAB BACK TRIM, REMOVAL** .

Fig. 73: Front Center Seat Belt, Brackets, Panel & Screws
Courtesy of CHRYSLER GROUP, LLC

7. Remove the two screws (3) that secure the belt bracket (2) of the front center seat belt (7) to the body bracket (1) on the upper cab back panel (8) reinforcement.
8. Remove the belt bracket of the front center seat belt from the body bracket on the upper cab back panel reinforcement.
9. Remove the two screws (4) that secure the front center seat belt retractor bracket (5) to the floor panel (6) near the base of the cab back panel.
10. Remove the front center seat belt and retractor unit from the floor panel.

FRONT OUTBOARD - EXCEPT STANDARD CAB

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles,**

mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: **The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front outboard retractors also include a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .**

NOTE: **All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.**

Fig. 74: Front Seat Belt Lower Anchor
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the front seat to its most forward position for easiest access to the front seat belt lower anchor (3)

and the lower B-pillar trim.

2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. On the passenger side only, remove the trim cover from the front seat riser as necessary to access the front seat belt lower anchor. Refer to **SEAT, FRONT, REMOVAL** .
4. Remove the screw (2) that secures the lower anchor (3) to the floor panel (4) near the base of the B-pillar (1).

Fig. 75: Seat Belt Turning Loop Height Adjuster
Courtesy of CHRYSLER GROUP, LLC

5. Firmly grasp the top of the trim cover (3) for the front seat belt turning loop height adjuster (1) on the inside of the upper B-pillar and pull it away from the height adjuster far enough unsnap it, then disengage the lower snap features of the trim cover from the adjuster and discard. The trim cover is a one time component and is not intended for reuse.
6. Remove the screw (4) that secures the seat belt turning loop (5) to the height adjuster on the upper B-pillar.
7. Remove the seat belt turning loop from the height adjuster.
8. Remove the lower trim from the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, LOWER, REMOVAL** .

Fig. 76: Upper & Lower Retractor Bracket Screws
Courtesy of CHRYSLER GROUP, LLC

9. Disengage the two clips that secure the belt web guide (2) to the B-pillar (1).
10. Remove the screw (3) that secures the upper retractor (6) bracket to the B-pillar.
11. Remove the screw (5) that secures the lower retractor bracket to the B-pillar.
12. Disengage the locating tab on the upper retractor bracket from the clearance hole in the inner B-pillar.

Fig. 77: Seat Belt Tensioner Initiator, Connector & Harness
Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the yellow connector (2) of the body wire harness (3) from the seat belt tensioner initiator on the retractor (1).
14. Remove the front outboard seat belt and retractor from the vehicle as a unit.

OUTBOARD - STANDARD CAB

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front outboard retractors also include a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .**

1. Adjust the front seat to its most forward position for easiest access to the front seat belt lower anchor (4) and the lower B-pillar trim (2).
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the screw (3) that secures the lower anchor to the inner B-pillar (1).
4. Remove the lower trim from the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, LOWER, REMOVAL** .
5. Grasp the upper edge of the lower anchor cover and pull upward to unsnap it from the front seat cushion outboard side shield.

Fig. 79: Seat Belt Turning Loop Height Adjuster
Courtesy of CHRYSLER GROUP, LLC

6. Firmly grasp the top of the trim cover (3) for the front seat belt turning loop height adjuster (1) on the inside of the upper B-pillar and pull it away from the height adjuster far enough unsnap it, then disengage the lower snap features of the trim cover from the adjuster and discard. The trim cover is a one time component and is not intended for reuse.
7. Remove the screw (4) that secures the seat belt turning loop (5) to the height adjuster on the upper B-pillar.
8. Remove the seat belt turning loop from the height adjuster.

Fig. 80: Upper & Lower Retractor Bracket Screws (Standard Cab)
Courtesy of CHRYSLER GROUP, LLC

9. Disengage the two clips that secure the belt web guide (2) to the B-pillar (6).
10. Remove the screw (3) that secures the upper retractor (4) bracket to the B-pillar.
11. Remove the screw (5) that secures the lower retractor bracket to the B-pillar.
12. Disengage the locating tab on the upper retractor bracket from the clearance hole in the inner B-pillar.
13. Remove the front outboard seat belt and retractor from the B-pillar as a unit.

Fig. 81: Seat Belt Tensioner Initiator
Courtesy of CHRYSLER GROUP, LLC

14. Disconnect the yellow connector (2) of the body wire harness (3) from the seat belt tensioner initiator on the retractor (1).
15. Remove the front outboard seat belt and retractor from the vehicle as a unit.

REAR CENTER - MEGA CAB

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and**

unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: **All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.**

Fig. 82: Accessing Rear Center & Outboard Buckle Bracket - Mega Cab
Courtesy of CHRYSLER GROUP, LLC

1. Fold the 60 percent section of the rear seat back (2) down onto the seat cushion in the cargo storage position, then lift and prop open the seat back filler panel (3) as necessary for easiest access to the rear center seat belt lower anchor and right outboard buckle anchor bracket.

Fig. 83: Identifying Seat Back, Seat Cushion, Anchor Bracket, Nut, Rear Mounting Bracket, & Screw
Courtesy of CHRYSLER GROUP, LLC

2. Remove the screw (7) that secures the center seat belt lower anchor to the anchor bracket (3) and, from the front of the seat back, pull the belt lower anchor out from between the seat back (1) and the seat cushion (2).

Fig. 84: Rear Seat Back & Bezel
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two screws (3) that secure the bezel (2) to the top of the 60 percent section of the rear seat back (1).
4. Remove the bezel from the webbing of the rear center seat belt.

5. Remove the trim cover from the 60 percent section of the rear seat back. Refer to **COVER, SEAT BACK, MEGA CAB REAR, REMOVAL** .

Fig. 85: Seat Back Frame, Belt Bracket & Screws
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two screws (6) that secure the belt bracket (1) of the rear center seat belt to the top of the seat back frame (3).
7. Disengage the belt bracket of the rear center seat belt from the seat back frame.
8. Remove the screw (4) that secures the rear center seat belt retractor to the seat back frame.
9. Remove the seat belt and retractor from the rear seat back as a unit.

REAR CENTER - QUAD OR CREW CAB

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **The rear center seat belt and retractor is secured to a mounting bracket that includes the right outboard occupant seat belt buckle. The rear right outboard occupant buckle is available for service only as a unit with the center seat belt and retractor.**

NOTE: **All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.**

Fig. 86: Rear Center Seat Belt Retractor
Courtesy of CHRYSLER GROUP, LLC

1. Lift up the rear seat cushion into its stowed position against the rear seat back.
2. Remove the screw (5) that secures the center seat belt lower anchor (7) and the left side of the seat belt retractor (6) mounting bracket to the rear floor panel (8).
3. Remove the rear seat from the vehicle. On vehicles with the optional 60/40 split rear bench, only the 60 percent section (right side) of the rear seat must be removed. Refer to **SEAT, REAR, REMOVAL** or **SEAT, MEGA CAB REAR, REMOVAL** .
4. Lift upward on the forward edge of the rear center seat belt bezel (1) at the top of the cab back panel to release the snap features that secure the bezel to the belt bracket (3).
5. Remove the bezel from the webbing of the rear center seat belt.
6. Remove the two screws (2) that secure the belt bracket of the rear center seat belt to the body bracket (4) on the upper cab back panel reinforcement.
7. Remove the belt bracket of the rear center seat belt from the body bracket.
8. Remove the screw (10) that secures the right side of the seat belt retractor mounting bracket and the right outboard occupant buckle (9) unit to the rear floor panel near the base of the cab back panel.
9. Remove the rear center seat belt and retractor unit from the vehicle.

REAR OUTBOARD

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.

Fig. 87: Seat Belt Turning Loop, Lower Anchor & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear seat from the vehicle. Refer to **SEAT, REAR, REMOVAL** or **SEAT, MEGA CAB REAR, REMOVAL** .
2. Remove the screw (5) that secures the seat belt lower anchor (6) to the base of the inner C-pillar.
3. Unsnap the trim cover (3) from the front seat belt turning loop (2) and discard. The trim cover is a one time component and is not intended for reuse.

4. Remove the screw (4) that secures the seat belt turning loop to the upper C-pillar.
5. Remove the seat belt turning loop from the upper C-pillar.
6. Remove the upper trim (1) from the inside of the C-pillar. Refer to **PANEL, C-PILLAR TRIM, UPPER, REMOVAL** .

Fig. 88: Identifying Rear Outboard Belt - Quad CAB
Courtesy of CHRYSLER GROUP, LLC

7. Remove the lower trim (2) from the inside of the C-pillar. Refer to **PANEL, C-PILLAR TRIM, LOWER, REMOVAL** .
8. Disengage the two clips that secure the belt web guide (5) to the inner C-pillar.
9. Remove the screw (3) that secures the lower bracket of the retractor (4) to the C-pillar.
10. Disengage the hooks on the upper retractor bracket from the slots in the C-pillar above the retractor mounting hole.
11. Remove the rear outboard seat belt and retractor from the C-pillar as a unit.

INSTALLATION

CENTER - STANDARD CAB

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat**

belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: **A front center three-point seat belt and retractor is used only on standard cab vehicles. Quad or crew cab and mega cab vehicles with a front bench seat have a two-point lap belt in the front center seating position. Refer to BUCKLE, SEAT BELT, INSTALLATION.**

NOTE: **All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.**

Fig. 89: Front Center Seat Belt, Brackets, Panel & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the front center seat belt and retractor unit (5) to the floor panel (6) at the base of the cab back panel (8) to the right of center.
2. Install and tighten the two screws (4) that secure the front center seat belt retractor bracket to the floor panel near the base of the cab back panel. Tighten the screws to 39 N.m (29 ft. lbs.).
3. Position the belt bracket (2) of the front center seat belt (7) to the body bracket (1) on the upper cab back panel reinforcement.

4. Install and tighten the two screws (3) that secure the belt bracket of the front center seat belt to the body bracket on the upper cab back panel reinforcement. Tighten the screws to 20 N.m (15 ft. lbs.).

Fig. 90: Front Center Seat Belt, Bezel & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

5. Reinstall the trim (1) onto the cab back panel. Refer to **PANEL, CAB BACK TRIM, INSTALLATION** .
6. Route the webbing of the front center seat belt (4) through the bezel (5) and position the bezel to the belt opening near the top of the cab back trim panel.
7. Using hand pressure, press firmly and evenly on each side of the front center seat belt bezel until it snaps into place on the cab back trim panel.
8. Reinstall the stowage tray onto the rear floor panel behind the seat. Refer to **BIN, STORAGE, INSTALLATION** .
9. Reach between the center of the front seat cushion and front seat back to access and buckle the front center seat belt lower anchor latch plate to the unique black, keyed lower anchor buckle.

FRONT OUTBOARD - EXCEPT STANDARD CAB

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper**

precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front outboard retractors also include a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .

NOTE: All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.

Fig. 91: Seat Belt Tensioner Initiator, Connector & Harness
Courtesy of CHRYSLER GROUP, LLC

1. Position the front outboard seat belt and retractor (1) into the vehicle.
2. Reconnect the yellow connector (2) of the body wire harness (3) to the seat belt tensioner initiator on the retractor.

Fig. 92: Upper & Lower Retractor Bracket Screws
Courtesy of CHRYSLER GROUP, LLC

3. Position the seat belt (7) and retractor (6) to the inner B-pillar (1) as a unit. Be certain to engage the locating tab on the upper retractor bracket into the clearance hole in the B-pillar.
4. Loosely install the screw (5) that secures the lower retractor bracket to the B-pillar.
5. Install and tighten the screw (3) that secures the upper retractor bracket to the B-pillar. Tighten the screw to 12 N.m (106 in. lbs.).
6. Tighten the screw that secures the lower retractor bracket to the B-pillar. Tighten the screw to 39 N.m (29 ft. lbs.).
7. Position the belt web guide (2) to the B-pillar and use hand pressure to press it firmly and evenly until the two clips that secure it snap into place. Be certain that the seat belt webbing between the retractor and the web guide is not twisted.
8. Reinstall the lower trim (4) onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, LOWER, INSTALLATION** .

Fig. 93: Seat Belt Turning Loop Height Adjuster
Courtesy of CHRYSLER GROUP, LLC

9. Position the seat belt turning loop (5) onto the height adjuster (1) on the upper B-pillar. Be certain that the seat belt webbing between the web guide and the turning loop is not twisted.
10. Install and tighten the screw (4) that secures the turning loop to the height adjuster. Tighten the screw to 39 N.m (29 ft. lbs.).
11. Position a new trim cover (3) over the top of the turning loop, then snap it into place. Engage the lower snap features first, then the upper snap features. The trim cover is a one time component and is not intended for reuse.

Fig. 94: Front Seat Belt Lower Anchor
Courtesy of CHRYSLER GROUP, LLC

12. Position the seat belt lower anchor (3) to the mounting hole in the floor panel (4) near the base of the B-pillar (1) cushion frame. Be certain that the seat belt webbing between the turning loop and the lower anchor is not twisted.
13. Install and tighten the screw (2) that secures the lower anchor to the floor panel. Tighten the screw to 39 N.m (29 ft. lbs.).
14. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

OUTBOARD - STANDARD CAB

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front outboard retractors also include a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .**

3. Position the seat belt and retractor (4) to the inner B-pillar (6) as a unit. Be certain to engage the locating

tab on the upper retractor bracket into the clearance hole in the B-pillar.

4. Loosely install the screw (5) that secures the lower retractor bracket to the B-pillar.
5. Install and tighten the screw (3) that secures the upper retractor bracket to the B-pillar. Tighten the screw to 12 N.m (106 in. lbs.).
6. Tighten the screw that secures the lower retractor bracket to the B-pillar. Tighten the screw to 39 N.m (29 ft. lbs.).
7. Position the belt web guide (2) to the B-pillar and use hand pressure to press it firmly and evenly until the two clips that secure it snap into place. Be certain that the seat belt webbing between the retractor and the web guide is not twisted.
8. Reinstall the lower trim (3) onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, LOWER, INSTALLATION** .

Fig. 97: Seat Belt Turning Loop Height Adjuster
Courtesy of CHRYSLER GROUP, LLC

9. Position the seat belt turning loop (5) onto the height adjuster (1) on the upper B-pillar. Be certain that the seat belt webbing between the web guide and the turning loop is not twisted.
10. Install and tighten the screw (4) that secures the turning loop to the height adjuster. Tighten the screw to 39 N.m (29 ft. lbs.).
11. Position a new trim cover (3) over the top of the turning loop, then snap it into place. Engage the lower snap features first, then the upper snap features. The trim cover is a one time component and is not intended for reuse.

Fig. 98: Lower B-Pillar Trim
Courtesy of CHRYSLER GROUP, LLC

12. Position the seat belt lower anchor (4) to the mounting hole near the base of the inner B-pillar (1). Be certain that the seat belt webbing between the turning loop and the lower anchor is not twisted.
13. Install and tighten the screw (3) that secures the lower anchor to the B-pillar. Tighten the screw to 39 N.m (29 ft. lbs.).
14. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

REAR CENTER - MEGA CAB

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.**

Fig. 99: Seat Back Frame, Belt Bracket & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear center seat belt and retractor unit into the 60 percent section of the rear seat back frame (3). Be certain the tab (5) on the retractor bracket is engaged in the slot in the frame.
2. Install and tighten the screw (4) that secures the rear center seat belt retractor to the seat back frame. Tighten the screw to 60 N.m (44 ft. lbs.).
3. Position the belt bracket (1) of the rear center seat belt onto the top of the seat back frame. Be certain the tab (2) on the bracket is engaged in the slot in the frame.
4. Install and tighten the two screws (6) that secure the belt bracket of the rear center seat belt to the seat back frame. Tighten the screws to 60 N.m (44 ft. lbs.).
5. Reinstall the trim cover onto the 60 percent section of the rear seat back frame. Refer to **COVER, SEAT BACK, MEGA CAB REAR, INSTALLATION** .

Fig. 100: Rear Seat Back & Bezel
Courtesy of CHRYSLER GROUP, LLC

6. Engage the rear center seat belt bezel (2) over the webbing of the rear center seat belt.
7. Position the bezel over the belt bracket on the top of the rear seat back (1).
8. Install and tighten the two screws (3) that secure the bezel to the belt bracket on the top of the rear seat back frame. Tighten the screws to 5 N.m (44 in. lbs.).

Fig. 101: Identifying Seat Back, Seat Cushion, Anchor Bracket, Nut, Rear Mounting Bracket, & Screw
Courtesy of CHRYSLER GROUP, LLC

9. Route the center seat belt lower anchor between the seat back (1) and the seat cushion (2) and position it

to the anchor bracket (3). Be certain the belt webbing is not twisted between the retractor and the anchor bracket.

10. Install and tighten the screw (7) that secures the seat belt lower anchor to the anchor bracket. Tighten the screw to 40 N.m (30 ft. lbs.).
11. Restore the 60 percent seat back filler panel and the seat back to their previous positions.

REAR CENTER - QUAD OR CREW CAB

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: The rear center seat belt and retractor is secured to a mounting bracket that includes the right outboard occupant seat belt buckle. The rear right outboard occupant buckle is available for service only as a unit with the center seat belt and retractor.

NOTE: All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to <u>RETRACTOR, SEAT BELT, DESCRIPTION</u>.

Fig. 102: Rear Center Seat Belt Retractor
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear center seat belt retractor (6) and right outboard occupant buckle unit (9) onto the rear floor panel (8) near the base of the cab back panel.
2. Loosely install the screw (10) that secures the right side of the seat belt retractor mounting bracket and the right outboard occupant buckle unit to the rear floor panel near the base of the cab back panel.
3. Position the belt bracket (3) of the rear center seat belt onto the body bracket (4) on the upper cab back panel reinforcement.
4. Install and tighten the two screws (2) that secure the belt bracket to the body bracket. Tighten the screws to 20 N.m (15 ft. lbs.).
5. Lift the webbing of the rear center seat belt and slide the bezel (1) over the webbing to position it over the belt bracket at the top of the cab back panel. Engage the rearward snap features of the bezel with the belt bracket. Using hand pressure, press firmly and evenly downward on the front of the bezel until it snaps into place over the belt bracket.
6. Reinstall the rear seat into the vehicle. On vehicles with the optional 60/40 split rear bench, only the 60 percent section (right side) of the rear seat must be reinstalled. Refer to **SEAT, REAR, INSTALLATION** or **SEAT, MEGA CAB REAR, INSTALLATION** .
7. Insert the rear center seat belt lower anchor (7) between the rear seat back and the seat cushion, and position the anchor to the left side of the seat belt retractor mounting bracket on the rear floor panel.
8. Install and tighten the screw (5) that secures the center seat belt lower anchor and the left side of the seat belt retractor mounting bracket to the rear floor panel. Tighten the screw to 39 N.m (29 ft. lbs.).
9. Tighten the screw that secures the right side of the seat belt retractor mounting bracket to the rear floor panel. Tighten the screw to 39 N.m (29 ft. lbs.).
10. Restore the rear seat cushion to its seating position.

REAR OUTBOARD

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.

Fig. 103: Identifying Rear Outboard Belt - Quad CAB
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear outboard seat belt and retractor (4) to the inner C-pillar as a unit. Be certain to engage the hooks on the upper retractor bracket into the mounting hole in the C-pillar.
2. Install and tighten the screw (3) that secures the lower retractor bracket to the C-pillar. Tighten the screw to 39 N.m (29 ft. lbs.).
3. Position the belt web guide (5) to the B-pillar and use hand pressure to press it firmly and evenly until the two clips that secure it snap into place. Be certain that the seat belt webbing between the retractor and the web guide is not twisted.

4. Reinstall the lower trim (2) onto the inside of the C-pillar. Refer to **PANEL, C-PILLAR TRIM, LOWER, INSTALLATION** .

Fig. 104: Seat Belt Turning Loop, Lower Anchor & Screws
Courtesy of CHRYSLER GROUP, LLC

5. Reinstall the upper trim (1) onto the inside of the C-pillar. Refer to **PANEL, C-PILLAR TRIM, UPPER, INSTALLATION** .
6. Position the seat belt turning loop (2) onto the upper C-pillar.
7. Install and tighten the screw (4) that secures the turning loop to the C-pillar. Tighten the screw to 39 N.m (29 ft. lbs.).
8. Engage the upper edge of a new trim cover (3) over the top of the turning loop. Then squeeze the lower end of the trim cover and the turning loop together firmly and evenly until the engagement tabs of the trim cover snap into the slots of the turning loop.
9. Position the seat belt lower anchor (6) to the mounting hole at the base of the C-pillar.
10. Install and tighten the screw (5) that secures the lower anchor to the C-pillar. Tighten the screw to 39 N.m (29 ft. lbs.).
11. Reinstall the rear seat into the vehicle. Refer to **SEAT, REAR, INSTALLATION** or **SEAT, MEGA CAB REAR, INSTALLATION** .

SEAT BELT

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles,**

mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: **A fixed position front center seat belt buckle is located on the left side of the front center seat section (20 percent) used on all vehicles with a split bench front seat. Standard cab vehicles have a unique, fixed position, black, keyed, lower anchor buckle for the three-point center seat belt lower anchor located on the right side of the front center seat section. Quad or crew cab and mega cab vehicles have a fixed position front center seat lap belt located on the right side of the front center seat section. The following procedure applies to the front center seating position belt buckle, the lap belt or the anchor buckle. The three-point front center seat belt and retractor unit is only used on standard cab vehicles. Refer to RETRACTOR, SEAT BELT, REMOVAL.**

Fig. 105: Identifying Front Center Seat Belt Components
Courtesy of CHRYSLER GROUP, LLC

1. Move the adjacent right or left front outboard seat section (40 percent) to its most forward position and tilt the seat back forward for easiest access to the lower anchor of the front center seat belt buckle, lap belt or anchor buckle (1).

2. On standard cab vehicles only, if equipped, remove the stowage tray from the rear floor panel behind the seat. Refer to **BIN, STORAGE, REMOVAL** .
3. From behind the front seat, remove the screw (5) that secures the lower anchor of the front center seat belt buckle, lap belt or anchor buckle to the center seat support bracket (3).
4. From the front of the front seat, reach between the side of the center seat cushion (6) and the adjacent right or left front outboard seat cushion to access and remove the seat belt buckle, lap belt or anchor buckle through the elastic strap (2) on the side of the center seat cushion.
5. Remove the front center seat belt buckle, lap belt or anchor buckle unit from the front seat.

INSTALLATION

INSTALLATION

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **A fixed position front center seat belt buckle is located on the left side of the front center seat section (20 percent) used on all vehicles with a split bench front seat. Standard cab vehicles have a unique, fixed position, black, keyed, lower anchor buckle for the three-point center seat belt lower anchor located on the right side of the front center seat section. Quad or crew cab and mega cab vehicles have a fixed position front center seat lap belt located on the right side of the front center seat section. The following procedure applies to the front center seating position belt buckle, the lap belt or the anchor buckle. The three-point front center seat belt and retractor unit is only used on standard cab vehicles. Refer to RETRACTOR, SEAT BELT, INSTALLATION.**

Fig. 106: Identifying Front Center Seat Belt Components
Courtesy of CHRYSLER GROUP, LLC

1. From the front of the front seat, position the front center seat belt buckle, lap belt or anchor buckle unit (1) through the elastic strap (2) on the side of the center seat cushion (6).
2. From the front of the front seat, reach between the side of the center seat cushion and the adjacent right or left front outboard seat cushion to route the lower anchor of the seat belt buckle, lap belt or anchor buckle unit down between the side of the center seat cushion and the adjacent right or left front outboard seat cushion. Be certain that the belt webbing is not twisted.
3. From behind the front seat, position the lower anchor of the seat belt buckle, lap belt or anchor buckle to the center seat support bracket (3). Be certain to engage the anti-rotation tab on the lower anchor into the corresponding hole in the center seat support bracket.
4. Install and tighten the screw (5) that secures the lower anchor of the seat belt buckle, lap belt or anchor buckle to the center seat support bracket. Tighten the screw to 39 N.m (29 ft. lbs.).
5. On standard cab vehicles only, if equipped, reinstall the stowage tray onto the rear floor panel behind the seat. Refer to **BIN, STORAGE, INSTALLATION** .

SENSOR, IMPACT

DESCRIPTION

DESCRIPTION

Remote or satellite impact sensors are located in various locations in the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Sensors at the front of the vehicle provide an additional logic input for use by the Occupant Restraint Controller (ORC) to control the front airbags and the seat belt pretensioners. Sensors on each side of the vehicle provide an additional logic input for use by the ORC to control the side curtain airbags, the seat belt pretensioners and, if equipped, the seat airbags. Two types of sensors are used in this vehicle. They are the acceleration-type and the pressure-type, which are described in further detail in the following paragraphs.

ACCELERATION TYPE

Fig. 107: Impact Sensor Components
Courtesy of CHRYSLER GROUP, LLC

Each vehicle has at least four, but as many as six remote acceleration-type impact sensors (1). Two front sensors, one each for the left and right sides of the vehicle are secured with a screw to the back of the right or left end of the lower radiator cross member within the engine compartment. Two side sensors, one each for the left and right sides of the vehicle are secured with a screw near the base of the right or left inner B-pillar within the passenger compartment. Quad cab or crew cab and mega cab models have two additional side sensors, one each for the left and right sides of the vehicle, secured with a screw near the base of the right or left inner C-pillar within the passenger compartment.

The right and left front impact sensors are identical in construction and calibration. The right and left side impact sensors are also identical in construction and calibration. Although the front and side impact sensors are similar in appearance and construction, they are not interchangeable. The front sensors are designed to withstand the harsher operating environment found within the engine compartment.

Each sensor housing has an integral connector receptacle (4), an integral anti-rotation pin (3), and an integral mounting hole (2) with a metal sleeve to provide crush protection. A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic acceleration sensor. Potting material fills the cavity to seal and protect the internal electronic circuitry and components. The front impact sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness, while the side impact sensors are connected through dedicated take outs and connectors of the body wire harness.

The acceleration-type impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

PRESSURE TYPE

Fig. 108: Pressure-Type Front Door Side Impact Sensors
Courtesy of CHRYSLER GROUP, LLC

Two pressure-type front door side impact sensors (2) are used on all standard cab versions of this vehicle, one each for the left and right sides of the vehicle. These sensors are also used on club, crew or mega cab styles, but only if they are also equipped with the optional seat airbags. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each pressure-type sensor is secured with two screws and is sealed by a resilient gasket (1) to the front door module carrier on the inside of each front door. The sensors are concealed behind the front door trim panel within the passenger compartment.

The right and left front door side impact sensors are identical in construction and calibration, and are interchangeable. The sensor housing has an integral connector receptacle (3), two integral mounting tabs, and an integral hood-like water shield (4) that extends through a hole in the front door module carrier into the interior of the door cavity and protects the sensor orifice from contamination.

A cavity in the center of the molded plastic sensor housing contains the electronic circuitry of the sensor, which includes an electronic communication chip and the electronic pressure sensor. The housing cavity is filled with a potting material to seal and protect the internal electronic circuitry and components. A label on the sensor has a directional arrow and the word **down** imprinted upon it to provide verification of the correct sensor orientation in the vehicle. The pressure-type side impact sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the front door wire harnesses.

The pressure-type side impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

OPERATION

OPERATION

ACCELERATION-TYPE

The acceleration-type impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through shared left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls or communication between other modules and devices that provide some features of the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the acceleration-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PRESSURE-TYPE

The pressure-type front door side impact sensors recognize a side impact in the front door area by monitoring changes in pressure within the front door cavity. A sudden pressure wave is created as the door collapses during an impact event. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through shared left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the current in the sensor plus circuit.

The hard wired circuits between the pressure-type front door side impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls or communication between other modules and devices that provide features of the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the pressure-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or

instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: **To avoid serious or fatal injury, never strike or drop the Electronic Pedestrian Protection (EPP) system impact sensor, as it can damage the impact sensor or affect its calibration. The EPP impact sensor enables the system to deploy the EPP system active hood hinge actuators. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper EPP active hood hinge actuator deployment.**

Fig. 109: Left Front Impact Sensor, Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Disconnect the Front End Module (FEM) (1) wire harness connector (4) from the right or left front impact sensor (5) connector receptacle.
3. Remove the screw (2) that secures the front impact sensor to the back of the right or left end of the lower radiator crossmember (3).
4. Remove the right or left front impact sensor from the engine compartment.

SIDE

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable**

the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: **To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.**

FRONT DOOR

Fig. 110: Side Impact Sensor (Front Door)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Two pressure-type front door side impact sensors are used on all standard cab versions of this vehicle, one each for the left and right sides of the vehicle. These pressure-type impact sensors are also used on club, crew and mega cab versions, but only if they are equipped with the optional seat airbags.**

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim panel from the inside of the right or left front door. Refer to **PANEL, DOOR TRIM, REMOVAL** .

3. Disconnect the front door module wire harness connector (3) from the side impact sensor (1) connector receptacle.
4. Remove the two screws (4) that secure the sensor to the front door module carrier panel (2).
5. Remove the side impact sensor from the front door.

B-PILLAR - STANDARD CAB

Fig. 111: Side Impact Sensor (B-Pillar - Standard Cab)
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the driver or passenger side front seat to its most forward position for easiest access to the B-pillar trim.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the trim from the inside of the lower B-pillar. Refer to **PANEL, B-PILLAR TRIM, LOWER, REMOVAL** .
4. Disconnect the body wire harness connector (1) from the side impact sensor (2) connector receptacle.
5. Remove the screw (3) that secures the sensor to the inner B-pillar.
6. Remove the sensor from the inner B-pillar.

B-PILLAR - EXCEPT STANDARD CAB

Fig. 112: Side Impact Sensor (B-Pillar)
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the driver or passenger side front seat to its most forward position for easiest access to the B-pillar trim.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the trim from the inside of the lower B-pillar. Refer to **PANEL, B-PILLAR TRIM, LOWER, REMOVAL** .
4. Disconnect the body wire harness connector (1) from the side impact sensor (2) connector receptacle.
5. Remove the screw (3) that secures the sensor to the inner B-pillar.
6. Remove the sensor from the inner B-pillar.

C-PILLAR

Fig. 113: Side Impact Sensor (C-Pillar)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim from the inside of the lower C-pillar. Refer to **PANEL, C-PILLAR TRIM, LOWER, REMOVAL** .
3. Disconnect the body wire harness connector (1) from the side impact sensor (2) connector receptacle.
4. Remove the screw (3) that secures the sensor to the inner C-pillar.
5. Remove the sensor from the inner C-pillar.

INSTALLATION

FRONT

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury, never strike or drop the Electronic Pedestrian Protection (EPP) system impact sensor, as it can damage the impact sensor or affect its calibration. The EPP impact sensor enables the system to deploy the EPP system active hood hinge actuators. If an impact sensor is accidentally dropped during service, the sensor must be**

scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper EPP active hood hinge actuator deployment.

Fig. 114: Left Front Impact Sensor, Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Position the right or left front impact sensor (5) onto the back of the right or left end of the lower radiator cross member (3). Be certain that the anti-rotation pin on the back of the sensor is engaged in the clearance hole of the cross member.
2. Install and tighten the screw (2) that secures the sensor to the back of the cross member. Tighten the screw to 10 N.m (90 in. lbs.).
3. Reconnect the Front End Module (FEM) (1) wire harness connector (4) to the sensor connector receptacle.
4. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SIDE

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

FRONT DOOR

Fig. 115: Side Impact Sensor (Front Door)
Courtesy of CHRYSLER GROUP, LLC

NOTE: Two pressure-type front door side impact sensors are used on all standard cab versions of this vehicle, one each for the left and right sides of the vehicle. These pressure-type impact sensors are also used on club, crew and mega cab versions, but only if they are equipped with the optional seat airbags.

NOTE: Be certain that the gasket between the pressure-type side impact sensor and the front door module carrier panel is in good condition and positioned on the back of the sensor. There MUST be a good seal between the sensor and the module carrier panel for the sensor to operate properly. If the gasket is in poor condition, replace the sensor.

1. Position the side impact sensor (1) to the right or left front door module carrier panel (2). When the sensor is correctly positioned, the arrow on the sensor label will be pointed toward the bottom of the door.
2. Install and tighten the two screws (4) that secure the sensor to the carrier panel. Tighten the screws securely.
3. Reconnect the front door module wire harness connector (3) to the sensor connector receptacle.

4. Reinstall the trim panel onto the inside of the right or left front door. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

B-PILLAR - STANDARD CAB

Fig. 116: Side Impact Sensor (B-Pillar - Standard Cab)
Courtesy of CHRYSLER GROUP, LLC

1. Position the side impact sensor (2) to the inside of B-pillar. Be certain that the anti-rotation pin on the back of the sensor is engaged in the clearance hole of the B-pillar.
2. Install and tighten the screw (3) that secures the sensor to the inner B-pillar. Tighten the screw to 9 N.m (80 in. lbs.).
3. Reconnect the body wire harness connector (1) to the sensor connector receptacle.
4. Reinstall the trim onto the inside of the lower B-pillar. Refer to **PANEL, B-PILLAR TRIM, LOWER, INSTALLATION** .
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

B-PILLAR - EXCEPT STANDARD CAB

Fig. 117: Side Impact Sensor (B-Pillar)
Courtesy of CHRYSLER GROUP, LLC

1. Position the side impact sensor (2) to the inside of B-pillar. Be certain that the anti-rotation pin on the back of the sensor is engaged in the clearance hole of the B-pillar.
2. Install and tighten the screw (3) that secures the sensor to the inner B-pillar. Tighten the screw to 9 N.m (80 in. lbs.).
3. Reconnect the body wire harness connector (1) to the sensor connector receptacle.
4. Reinstall the trim onto the inside of the lower B-pillar. Refer to **PANEL, B-PILLAR TRIM, LOWER, INSTALLATION** .
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

C-PILLAR

Fig. 118: Side Impact Sensor (C-Pillar)
Courtesy of CHRYSLER GROUP, LLC

1. Position the side impact sensor (2) to the inside of C-pillar. Be certain that the anti-rotation pin on the back of the sensor is engaged in the clearance hole of the C-pillar.
2. Install and tighten the screw (3) that secures the sensor to the inner B-pillar. Tighten the screw to 9 N.m (80 in. lbs.).
3. Reconnect the body wire harness connector (1) to the sensor connector receptacle.
4. Reinstall the trim onto the inside of the lower C-pillar. Refer to **PANEL, C-PILLAR TRIM, LOWER, INSTALLATION** .
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SWITCH, SEAT BELT, DRIVER

DESCRIPTION

DESCRIPTION

Fig. 119: Driver Side Seat Belt Switch
Courtesy of CHRYSLER GROUP, LLC

All vehicles are equipped with a driver side seat belt switch that is a small, normally open, single pole, single throw, leaf contact, momentary switch. The driver side seat belt switch is integral to the buckle (1) of the driver side front seat belt buckle, which is located within a molded plastic scabbard (2) and secured by a screw to the inboard side of the driver side front seat cushion frame.

The seat belt switch is connected to the vehicle electrical system through a two-lead pigtail wire and connector (3) on the seat belt buckle-half, which is connected to a wire harness connector and take out of the seat wire harness routed beneath the driver side front seat cushion in the passenger compartment.

The seat belt switch cannot be adjusted or repaired. If ineffective or damaged, the entire driver side front seat belt buckle-half unit must be replaced.

OPERATION

OPERATION

The driver side seat belt switch is designed to control a path to ground for the seat belt switch sense input of the Occupant Restraint Controller (ORC). When the driver side front seat belt tip-half is inserted into the seat belt buckle, the switch closes the path to ground; and, when the driver side front seat belt tip-half is removed from the seat belt buckle, the switch opens the ground path. The switch is actuated by the latch mechanism within the seat belt buckle.

The seat belt switch is connected in series between ground and the seat belt switch sense input of the ORC. The ORC relays an electronic **seat belt switch status** message to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. The seat belt switch receives ground at all times through its pigtail wire connection to the seat wire harness from a take out of the body wire harness. An eyelet terminal connector

on the body wire harness ground take out is secured beneath a ground screw to the body sheet metal.

The seat belt switch as well as the hard wired circuits between the switch and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules related to seat belt switch operation. The most reliable, efficient and accurate means to diagnose the seat belt switch requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

TENSIONER, SEAT BELT

DESCRIPTION

DESCRIPTION

Fig. 120: Seat Belt Retractor Tensioner
Courtesy of CHRYSLER GROUP, LLC

Seat belt retractor tensioners supplement the dual front airbag system for all versions of this vehicle. These tensioners are integral to the front seat belt and retractor units (1), which are secured to the B-pillars on the right and left sides of the vehicle. The retractors are concealed beneath the molded plastic B-pillar trim. The seat belt tensioner consists primarily of a molded plastic tensioner housing (3), a tubular metal piston housing (4), a piston, a short rack gear, a set of pinion gears and a pyrotechnically activated gas generator (2).

All of these components are located on one side of the retractor spool on the outside of the retractor housing. The seat belt tensioners are controlled by the Occupant Restraint Controller (ORC) and are connected to the vehicle electrical system through dedicated take outs of the body wire harness by keyed and latching molded

plastic connector insulators to ensure a secure connection.

The retractor tensioners cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. The retractor tensioners are not intended for reuse and must be replaced following any front airbag deployment. A locked retractor that will not allow the seat belt webbing to be retracted or extracted is a sure indication that the seat belt tensioner has been deployed and requires replacement. Refer to **RETRACTOR, SEAT BELT, REMOVAL**.

OPERATION

OPERATION

The seat belt tensioners are deployed in conjunction with the dual front airbags by a signal generated by the Occupant Restraint Controller (ORC) through the driver or passenger seat belt tensioner line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the tensioners, the electrical energy generates enough heat to initiate a small pyrotechnic gas generator.

The gas generator is installed in one end of the tubular metal piston housing, which contains a piston and a small rack gear. As the gas expands, it pushes the piston and the rack gear through the tube. The rack gear engages a pinion gear that drives a gear set within the tensioner housing, which rotates the seat belt retractor spool causing slack to be removed from the front seat belt webbing.

Removing excess slack from the front seat belts not only keeps the occupants properly positioned for an airbag deployment following a frontal impact of the vehicle, but also helps to reduce injuries that the occupant might experience in these situations as a result of harmful contact with the steering wheel, steering column, instrument panel or windshield. Also, the seat belt retractor has a two-stage mechanism that is designed to control the loading being applied to the occupants by the seat belts during a frontal impact, further reducing the potential for occupant injuries.

The ORC monitors the condition of the seat belt tensioners through circuit resistance, and will illuminate the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the seat belt tensioner gas generator and squib circuits requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

2012 STEERING

Steering System - Ram Pickup

DESCRIPTION

DESCRIPTION

CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

The rack and pinion power steering systems consist of:

- Steering column
- Steering gear (rack and pinion or recirculating ball)
- Belt driven hydraulic steering pump
- Pump pressure and return hoses
- Oil Cooler

DIAGNOSIS AND TESTING

STEERING SYSTEM DIAGNOSIS CHARTS

NOTE: There are four diagnosis charts following that cover POWER STEERING NOISE, BINDING AND STICKING, INSUFFICIENT ASST. OR POOR RETURN TO CENTER and LOOSE STEERING AND VEHICLE LEAD.

NOTE: * There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.

NOTE: ** A light clunk may be felt or heard during steering wheel reversal while vehicle is stationary. This results from internal steering gear rack movement at the bushings and in no way affects the performance of the steering system. This movement may be felt in the steering components during steering wheel reversal.

NOTE: * Power steering pump growl/moan/groan results from the development of**

high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.

POWER STEERING NOISE

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
OBJECTIONABLE HISS OR WHISTLE WHILE TURNING STEERING WHEEL WHEN STATIONARY OR MOVING SLOWLY*	1. Damaged or mispositioned steering column shaft/coupling dash boot seal.	1. Check to ensure boot is properly installed and seals against sheet metal. Reposition or replace steering column shaft/coupling dash boot seal as necessary.
	2. Mis-routed power steering hose.	2. Check routing of power steering hoses. Ensure hoses do not come in unwanted contact with other components and objects.
	3. Restriction in pressure or return hose.	3. Using an electronic listening tool, determine if noise is coming from either pressure or return hose. Replace hose that noise is present within.
	4. Noisy valve in power steering gear.	4. For evaluation and correction, refer to **DIAGNOSIS AND TESTING**.
RATTLE OR EXCESSIVE CLUNK**	1. Power steering gear loose on frame.	1. Check fastener torque and tighten to specifications. Replace as necessary. Check steering wheel center following repair.
	2. Loose shock assembly mounting fasteners at tower or knuckle.	2. Check fastener torque and tighten to specifications.
	3. Excessive play in outer tie rod.	3. Inspect and replace if necessary.
	4. Engine cradle/crossmember mounting fasteners loose at frame or bushings worn.	4. Check fastener torque and tighten to specifications. Inspect bushings and repair as necessary.
	5. Wheel Mounting (Lug) nuts loose.	5. Inspect wheel mounting (Lug) nuts and studs and repair as necessary. Tighten nuts to specifications.
	6. Power steering hose touching the body or frame of vehicle.	6. For evaluation and correction, refer to **PUMP, DIAGNOSIS AND TESTING**.
	7. Stabilizer bar link joints worn (occurs with steering input only when moving, not stationary).	7. At park, jounce only one side of vehicle front to exercise stabilizer bar. Replace stabilizer bar link.
	8. Loose lower control arm mounting bolts at engine cradle, frame or crossmember (occurs with steering input only when moving, not stationary).	8. Check control arm mounting bolts and tighten to specified torque.

	9. Loose intermediate shaft or column.	9. Rotate intermediate (steering) shaft in relationship to gear, checking for free-play. Check column fasteners and tighten to specifications as necessary.
	10. Lower control arm pivot bushing worn (occurs with steering input only when moving, not stationary).	10. Inspect bushings for wear and replace lower control arm as necessary.
	11. Internal power steering gear noise.	11. Drive vehicle on rough road, then steer rapidly back and forth when stopped. Replace power steering gear as necessary.
	12. Loose inner tie rod.	12. Inspect and replace if necessary.
	13. Damaged engine cradle/crossmember.	13. Inspect the cradle/crossmember for cracks or other damage. Replace as necessary.
POPPING NOISE	1. Loose steering gear mounting fasteners.	1. Check fasteners for proper torque and retighten as necessary.
	2. Loose outer tie rod mounting nut or jam nut.	2. Check fastener torque. Replace nuts as necessary and tighten to specifications.
	3. Loose intermediate (steering) shaft coupling at gear input shaft.	3. Make sure coupling is fully seated on gear input shaft. Retighten or re-seat as necessary.
	4. Worn tie rod (outer or inner).	4. Inspect and replace if necessary.
	5. Worn axle half-shaft.	5. For evaluation and correction, refer to **DIAGNOSIS AND TESTING - HALF SHAFT** .
CHIRP OR SQUEAL (POWER STEERING PUMP)	1. Loose power steering pump drive belt.	1. Inspect belt. Replace belt if worn or glazed. Tighten/adjust power steering pump drive belt if equipped with a manual tensioner.
	2. Pulley alignment incorrect.	2. Realign accessory drives.
	4. Power steering pump noisy (worn bearing/bushing noise).	4. Using an electronic listening tool, determine if noise is coming from pump. Replace power steering pump as required.
	5. Generator or water pump noisy.	5. Using an electronic listening tool, determine if noise is coming from Generator or water pump. Replace faulty component.
WHINE, GROWL, MOAN OR GROAN (POWER STEERING PUMP)***	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).
	2. Air in power steering fluid.	2. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. Refer to **PUMP, STANDARD PROCEDURE**.

	3. Power steering hose touching body or frame of vehicle.	3. For evaluation and correction, refer to **PUMP, DIAGNOSIS AND TESTING**.
	4. Wear of power steering pump internal components.	4. For evaluation and correction, refer to **PUMP, DIAGNOSIS AND TESTING**.
COLD START WHINE OR MOAN (POWER STEERING PUMP)***	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).
	2. Extremely low ambient temperature (near 0 F° (-18 C°) or below)	2. Some noise is expected as pump attempts to pull cold, thick fluid. Noise should go away as vehicle warms up. Acceptable levels of excessive noise are one second at 0 F° (-18 C°) and 15 seconds at -20 F° (-29 C°). If noise is excessive, look for poor sealing on the return hose or a possible fluid leak.
SQUEAKING OR RUBBING SOUND	1. Steering column shroud or shaft rubbing.	1. While turning the steering wheel, listen down column to locate. Check interference between moving components. Move or realign shrouds or shaft as necessary. Replace components if this does not correct problem.
	2. Clockspring inside steering column noisy.	2. Remove clockspring and reinstall steering wheel for testing. If noise is gone, replace clockspring.
	3. Boot/dash seal lubrication inadequate.	3. Remove boot seal and recheck for noise. Lubricate seal as necessary.
	4. Steering gear outer tie rod noisy.	4. While a helper turns the steering wheel, use an electronic listening tool to determine if noise is coming from either outer tie rod. Replace outer tie rods as necessary.
	5. Steering gear internally noisy.	5. Remove dash seal boot, then exercise the steering wheel. If noise is still present at gear, replace steering gear.
SCRUBBING OR KNOCKING SOUND.	1. Incorrect tire or wheel size.	1. Replace incorrect size tire or wheel with original equipment size.
	2. Worn motor or transmission mount.	2. Drive vehicle, moving accelerator pedal rapidly up and down attempting to locate noise. Try in both forward and reverse. Replace mounts as necessary.
	3. Tires contacting wheel well.	3. Make sure wheel house is properly positioned. If not, reposition as necessary. If steering wheel is properly centered, check steering gear travel left to right by rotating the steering wheel to each stop. Steering wheel should rotate the same amount in both directions from center. If not, replace steering gear.

	4. Interference between moving steering components and other components.	4. Check for bent or misaligned components. Correct or replace as necessary.
	5. Accessory drive pulley rubbing against another component.	5. Check pulleys for wear. Check for worn engine or transmission mount. Reposition components or replace mounts as necessary.

BINDING AND STICKING

CONDITION	POSSIBLE CAUSE	CORRECTION
DIFFICULT TO TURN WHEEL STICKS OR BINDS	1. Low fluid level.	1. Fill to proper level.
	2. Tire pressure.	2. Adjust tire pressure.
	3. Steering components (ball joints/tie rod ends).	3 Inspect and repair as necessary.
	4. Loose belt.	4. Adjust or replace.
	5. Low pump pressure.	5. Pressure test and replace if necessary.
	6. Intermediate shaft binding.	6. Replace intermediate shaft.
	7. Column shaft coupler binding.	7. Replace coupler.
	8. Steering gear worn.	8. Replace gear.
	9. Pump seized / Stuck valve	9. Replace pump.

INSUFFICIENT ASST. OR POOR RETURN TO CENTER

CONDITION	POSSIBLE CAUSE	CORRECTION
HARD TURNING OR MOMENTARY INCREASE IN TURNING EFFORT	1. Tire pressure.	1. Adjust tire pressure.
	2. Low fluid level.	2. Fill to proper level.
	3. Loose belt.	3. Adjust or replace.
	4. Low pump pressure.	4. Pressure test and repair as necessary.
	5. Internal gear leak.	5. Replace gear.
STEERING WHEEL DOES NOT WANT TO RETURN TO CENTER POSITION	1. Tire pressure.	1. Adjust tire pressure.
	2. Wheel alignment.	2. Align front end.
	3. Lack of lubrication.	3. Inspect and lubricate suspension components.
	4. High friction in steering gear.	4. Replace gear.

LOOSE STEERING AND VEHICLE LEAD

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE PLAY IN STEERING WHEEL	1. Worn or loose suspension or steering components.	1. Inspect and repair as necessary.
	2. Worn or loose wheel bearings.	2. Inspect and repair or adjust bearings.
	3. Steering gear mounting.	3. Tighten gear mounting bolts to

		specification.
	4. Gear out of adjustment.	4. Replace gear.
	5. Worn or loose steering coupler.	5. Inspect and replace as necessary.
VEHICLE PULLS OR LEADS TO ONE SIDE.	1. Tire Pressure.	1. Adjust tire pressure.
	2. Radial tire lead.	2. Rotate tires.
	3. Brakes dragging.	3. Repair as necessary.
	4. Wheel alignment.	4. Align front end.
	5. Steering gear valve bias.	5. Replace steering gear.

NOTE: *** Steering shudder can be expected in new vehicles and vehicles with recent steering system repairs. Shudder should dissipate after the vehicle has been driven several weeks.**

NOTE: **** To evaluate this condition, it may be necessary to disconnect the coupling at the base of the steering column. Turn the steering wheel and feel or listen for internal rubbing in steering column. To avoid damaging the column clockspring, note the following. Before disconnecting coupling, place tires in the straight-ahead position and center steering wheel. Once disconnected, DO NOT rotate steering wheel more than one revolution in either direction and place steering wheel in original location before reconnecting coupling. If this position is lost, the steering column clockspring must be recentered. Refer to STANDARD PROCEDURE - CLOCKSPRING CENTERING .**

NOTE: ***** Increased low speed or stationary steering effort can be expected if the steering fluid is at a high temperature. High fluid temperature usually results from high engine rpm due to trailer towing, ascending grades, or racing the engine for prolonged periods of time.**

POWER STEERING FLOW AND PRESSURE

The following procedure is used to test the operation of the power steering system on the vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform test any time a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following pressure and flow test is performed using Power Steering Kit (special tool #6815, Kit, Power Steering) and Power Steering Kit (special tool #6893A, Kit, Power Steering).

GAS ENGINE TOOL CONNECTIONS

Fig. 1: Power Steering Analyzer Components
Courtesy of CHRYSLER GROUP, LLC

1. Connect Hose Assembly (special tool #6959, Assembly, Hose) (1) to the valve side of Power Steering Analyzer (special tool #6800, Analyzer, Power Steering) (3), and connect Adapter (special tool #6826, Adapter, LH P/S Tester) (2) to the hose assembly.
2. Connect Power Steering Hose (special tool #6713, Hose, Power Steering) (6) to the gauge side of Power Steering Analyzer (special tool #6800, Analyzer, Power Steering) (3), and connect P/S Adapter (special tool #6825A, Adapter, Power Steering) or (special tool #6865, Adapter, Power Steering (Jeep)) (as necessary for clearance) to the hose assembly.
3. disconnect the P/S pump pressure line at the P/S pump.
4. Connect the hose from the valve side of the Power Steering Analyzer (special tool #6800, Analyzer, Power Steering) (3) to the pressure line at the P/S pump.
5. Connect the hose from the gauge side of the Power Steering Analyzer (special tool #6800, Analyzer, Power Steering) (3) to the P/S pump.
6. Proceed with the Flow and Pressure Test. Refer to **TEST PROCEDURE**.

DIESEL ENGINE TOOL CONNECTIONS

Fig. 2: Power Steering Analyzer Components
Courtesy of CHRYSLER GROUP, LLC

1. Connect Hose Assembly (special tool #6959, Assembly, Hose) (1) to the valve side of Power Steering Analyzer (special tool #6800, Analyzer, Power Steering) (3), and connect Adapter (special tool #8185-2, Adapter, Power Steering Tester) (2) to the hose assembly.
2. Connect Power Steering Hose (special tool #6713, Hose, Power Steering) (6) to the gauge side of Power Steering Analyzer (special tool #6800, Analyzer, Power Steering) (3), and connect P/S Adapter (special tool #8630-1, Adapter Power Steering) (5) to the hose assembly.
3. Disconnect the P/S pump pressure line at the hydro-boost connection.
4. Connect the hose from the valve side of the Power Steering Analyzer (special tool #6800, Analyzer, Power Steering) (3) to the hydro-boost line.
5. Connect the hose from the gauge side of the Power Steering Analyzer (special tool #6800, Analyzer, Power Steering) (3) to the P/S pump pressure line at the hydro-boost connection.
6. Proceed with the Flow and Pressure Test. Refer to **TEST PROCEDURE**.

TEST PROCEDURE

NOTE: Check the power steering belt to make sure that it is in good condition and properly adjusted.

NOTE: If fluid leaked from the steering system, it should be filled to correct level prior to starting the engine.

1. Open the test valve completely.
2. Start engine and let idle long enough to circulate power steering fluid through flow/pressure test gauge and to get air out of the fluid. Then shut off engine.
3. Check fluid level, add fluid as necessary. Start engine again and let idle.

4. Gauge should read below 2068 kPa (300 psi), If above specification, inspect the hoses for restrictions and repair as necessary.
5. Increase the engine speed to 1500 RPM and read the flow meter. If the flow rate (GPM) is below specification, (refer to **PUMP SPECIFICATION** for GPM) the pump should be replaced.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave the valve closed for more than three seconds as the pump could be damaged.

6. Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**
   - If the pressures are above specifications but not within 345 kPa (50 psi) of each other, replace the pump.
   - If the pressures are within 345 kPa (50 psi) of each other but below specifications, replace the pump.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 3 seconds at a time because, pump damage will result.

7. Open the test valve and turn the steering wheel to the extreme left **AND** right positions three times against the stops. Record the highest pressure reading at each position. If pressures readings are not within 50 psi of each other, the gear is leaking internally and must be replaced.

PUMP SPECIFICATION

GEAR TYPE	RELIEF PRESSURE	FLOW RATE (GPM) AT 1500 RPM
Rack and Pinion	11135 kPa (1615 psi)	3.0 - 3.5
Recirculating Ball	12065 kPa (1750 psi)	3.5 - 4.0

STANDARD PROCEDURE

STANDARD PROCEDURE - OUTER TIE ROD END LUBRICATION

NOTE: View is typical.

Fig. 3: Locating Grease & Tie Rod End Boot
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If a new tie rod end is to be installed, make sure the boot (2) is properly lubricated.**

Any time the outer tie rod end is disconnected from the knuckle, before assembly, clean all old grease and debris from the boot with a clean cloth and apply outer tie rod grease P/N 68088623AA (1) to the boot (2) as shown in illustration.

COLUMN

DESCRIPTION

DESCRIPTION

Fig. 4: Steering Column Assembly
Courtesy of CHRYSLER GROUP, LLC

The tilt and standard column (2) has been designed to be serviced as an assembly; less wiring, switches,

shrouds, steering wheel, etc. Most steering column components can be serviced without removing the steering column from the vehicle. The adjustable pedal switch is now mounted on the left side of the steering column below the multi-function switch and the ignition switch has been moved to the instrument panel.

To service the steering wheel, switches or airbag, follow all WARNINGS and CAUTIONS. Refer to **WARNING** .

WARNING: The airbag system is a sensitive, complex electro-mechanical unit. Before attempting to diagnose, remove or install the airbag system components you must first disconnect and isolate the battery negative (ground) cable. Then wait two minutes for the system capacitor to discharge. Failure to do so could result in accidental deployment of the airbag and possible personal injury. The fasteners, screws, and bolts, originally used for the airbag components, have special coatings and are specifically designed for the airbag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace with the correct fasteners provided in the service package or fasteners listed in the parts books.

CAUTION: Do not hammer on steering column shaft. This may cause damage to the shaft or bearing.

CAUTION: Do not attempt to remove the pivot bolts to disassemble the tilting mechanism. Do not remove shaft lock plate or plate retainer. This will damage the column.

CAUTION: Do not attempt to remove or modify the park lock slider or link.

NOTE: When servicing the steering wheel after removing the old bolt, a new bolt must be used when installing.

NOTE: When servicing the coupler a new bolt must be used when installing.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STEERING COLUMN

The steering column bracket rear mounts that the studs or bolts go through on both sides of the steering column have a plastic/metal capsule designed to fracture or move when enough force to damage the steering column has occurred. There are 2 steering column mounting capsules, one on each side of the column. A collapse may occur where the tube housing may move into the rear bracket assembly OR the tube may move inside the tube housing. Typically if this type of collapse happens, the capsules should have indicated damage. However, if the any of the following steps indicate a collapse, the steering column will still need replacement.

NOTE: **All illustrations within this procedure are typical; however the steering column capsules are the same in all vehicles.**

Fig. 5: Retaining Screws & Steering Column Opening Cover Reinforcement
Courtesy of CHRYSLER GROUP, LLC

1. Grasp the steering wheel at the 9 and 3 o'clock positions, and again at the 12 and 6 o'clock positions and attempt to rock the steering wheel back and forth and up and down. If there is excessive movement or an audible clunking or grinding sound, replace the steering column. Refer to **COLUMN, REMOVAL**.
2. Remove the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
3. If equipped, remove the retaining screws (1) and the steering column opening cover reinforcement (2).

Fig. 6: Inspecting For Fractures In Plastic Area & Movement In Metal Area
Courtesy of CHRYSLER GROUP, LLC

4. Visually inspect for fractures in the plastic area (1) and movement in the metal area (2) of the two capsules while pushing and pulling the steering wheel up and down, and left and right.
5. If capsules are fractured or have moved, replace the steering column. Refer to **COLUMN, REMOVAL**.

Fig. 7: Steering Column Retaining Bolts Or Nuts
Courtesy of CHRYSLER GROUP, LLC

6. Loosen the steering column retaining bolts (or nuts) (2, 5) several turns but do not remove. Remove **only one** of the rear retaining bolts (or nuts) (2). Verify that the capsule has movement, but it should not slide out of the bracket assembly. If the capsule **does** come out of the bracket assembly, replace the steering

column. Refer to **COLUMN, REMOVAL**.

7. Install the previously removed bolt (or nut) (2) several turns, and remove the opposite one (2) and check that capsule in the same way. If the capsule **does** come out of the bracket assembly, replace the steering column. Refer to **COLUMN, REMOVAL**.
8. Install the steering column retaining bolts (or nuts) (2, 5) and tighten to 27 N.m (20 ft. lbs.).

Fig. 8: Measuring Distance From Brake Switch Mounting Bracket To The Flat Of Rear Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

9. Measure the distance from the brake switch mounting bracket (4) to the flat of the rear mounting bracket (3). If less than 144 mm (5.6875 in. or 5 -11/16 in.), replace the steering column. Refer to **COLUMN, REMOVAL**.
10. If the steering column passes all tests and measurements above, the steering column is not collapsed and should not need to be replaced.

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Upper Steering Coupling Pinch Bolt	38	28	-
Lower Steering Coupling Upper Pinch Bolt	38	28	-
Lower Steering Coupling Lower Pinch Bolt (to gear)	57	42	-

REMOVAL

REMOVAL

WARNING: Before servicing the steering column the airbag system must be disarmed. Refer to RESTRAINTS - SERVICE INFORMATION . Failure to do so may result in accidental deployment of the airbag and possible personal injury.

CAUTION: All fasteners must be torqued to specification to ensure proper operation of the steering column.

NOTE: 1500 series shown in illustration, others similar.

Fig. 9: Steering Wheel Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Position the front wheels **straight ahead** .
2. Disconnect the negative battery cable from the battery.
3. Remove the airbag. Refer to **AIR BAG, DRIVER, REMOVAL** .
4. Partially remove the steering wheel bolt (1) and leave the bolt in the column.

5. Install Steering Wheel Puller (special tool #C-3894-A, Puller, Tie Rod) or equivalent using the top of the bolt to push on, and loosen the steering wheel (2).
6. Remove the tool and steering wheel bolt (1), and discard the steering wheel bolt (1).

NOTE: Route the harness through the steering wheel during removal.

7. Remove the steering wheel (2).
8. Remove the clockspring. Refer to **CLOCKSPRING, REMOVAL** .
9. Remove the upper and lower column shrouds. Refer to **SHROUD, STEERING COLUMN, REMOVAL**.
10. Disconnect the wiring harness routing retainers and connectors to the various components of the steering column.

Fig. 10: Steering Column Retaining Bolts Or Nuts
Courtesy of CHRYSLER GROUP, LLC

11. If equipped with a floor shift, remove the shift cable from the routing clip (1).
12. If equipped with a column shift, disconnect the shift cable from the shift assembly lever and remove the cable from the bracket.
13. Remove the brake light switch (3).
14. Remove the upper steering shaft coupler bolt (4) and discard. Separate the shaft from the coupler.
15. Remove the forward steering column mounting nuts (5).
16. Support the steering wheel and remove the forward steering column mounting nuts (2).
17. Remove the steering column assembly from the vehicle.
18. Remove and transfer any necessary components.

INSTALLATION

INSTALLATION

WARNING: Before servicing the steering column the airbag system must be disarmed. Refer to RESTRAINTS - SERVICE INFORMATION . Failure to do so may result in accidental deployment of the airbag and possible personal injury.

CAUTION: All fasteners must be torqued to specification to ensure proper operation of the steering column.

NOTE: 1500 series shown in illustration, others similar.

Fig. 11: Steering Column Retaining Bolts Or Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position the steering column on the dash panel support and loosely install the mounting nuts (2, 5).

NOTE: A new bolt must be used for reinstallation.

2. Install the steering shaft coupler on the steering shaft and loosely install a **new** bolt (4).
3. Center steering column in dash opening and tighten mounting nuts (2, 5) to 27 N.m (20 ft. lbs.).
4. Tighten the coupler bolt (4) to 38 N.m (28 ft. lbs.).
5. Install the brake light switch (3). Refer to **SWITCH, STOP LAMP, INSTALLATION** .
6. If equipped with a floor shift, install the shift cable in the routing clip (1).
7. If equipped with a column shift, install the shift cable to the shift assembly lever and the bracket. Adjust the shift cable.
8. Install the clockspring. Refer to **CLOCKSPRING, INSTALLATION** .
9. Connect the wiring harness routing clips and connectors to the column components.
10. Install the upper and lower shrouds. Refer to **SHROUD, STEERING COLUMN, INSTALLATION**.

Fig. 12: Steering Wheel Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Align the spline on the steering wheel hub to shaft and install the steering wheel (2).

NOTE: A new bolt must be used for reinstallation.

12. Install a **new** steering wheel bolt (1) and tighten the to 61 N.m (45 ft. lbs.).
13. Install the airbag. Refer to **AIR BAG, DRIVER, INSTALLATION** .
14. Connect the negative battery cable to the battery.
15. Test the operation of the horn, Electronic PRNDL Indicator, lights and any other functions that are steering column operated.

COUPLING, STEERING COLUMN, LOWER

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Lock the steering wheel with the wheels in the straight position.
4. Remove the left front tire and wheel assembly.

Fig. 13: Lower Coupling & Pinch Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Mark both lower coupling (5) connections for proper installation.

5. Remove and discard the lower coupling upper pinch bolt (1).

Fig. 14: Lower Steering Coupler
Courtesy of CHRYSLER GROUP, LLC

6. Remove and discard the lower coupling lower pinch bolt (1).
7. Remove the lower steering shaft coupling (2).

INSTALLATION

INSTALLATION

Fig. 15: Lower Steering Coupler
Courtesy of CHRYSLER GROUP, LLC

1. Install the coupling (2) to the steering rack and pinion, and intermediate shaft using the marks made in the removal process.

NOTE: New pinch bolts must be used for reinstallation.

2. Install the lower coupling lower pinch bolt (1) and tighten to 57 N.m (42 ft. lbs.).

Fig. 16: Lower Coupling & Pinch Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install the lower coupling upper pinch bolt (1) and tighten to 38 N.m (28 ft. lbs.).
4. Install the left front tire and wheel assembly. Refer to **STANDARD PROCEDURE** .

5. Remove the support and lower the vehicle.
6. Reconnect the negative battery cable.
7. Unlock the steering wheel.

COUPLING, STEERING COLUMN, UPPER

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Lock the steering wheel with the wheels in the straight position.

Fig. 17: Upper Steering Coupler Shaft
Courtesy of CHRYSLER GROUP, LLC

3. Remove and discard the upper coupling pinch bolt (3).
4. Lower the upper steering coupling shaft (4) from the column.
5. Remove the upper steering coupling shaft seal (2) from the cowl panel.
6. Remove and discard the lower coupling upper pinch bolt (1).
7. Remove the upper steering coupling shaft (3) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 18: Upper Steering Coupler Shaft
Courtesy of CHRYSLER GROUP, LLC

1. Install the upper steering coupling shaft (3) to the vehicle inserting the shaft into the lower coupling.

NOTE: **New steering coupling shaft pinch bolts for the upper and lower shafts must be used.**

2. Install a new lower coupling upper pinch bolt (1) and tighten to 38 N.m (28 ft.lbs.).
3. Install the upper steering coupling shaft seal (2) to the cowl panel.
4. Install the steering column shaft into the upper coupling.
5. Install a new upper coupling pinch bolt (3) and tighten to 38 N.m (28 ft.lbs).
6. Unlock the steering wheel.
7. Reconnect the negative battery cable.

KNOB, TILT LEVER RELEASE

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the steering column upper and lower shrouds. Refer to **SHROUD, STEERING COLUMN, REMOVAL**.

Fig. 19: Multi-Function Switch Mounting Bracket Upper Retaining Screw
Courtesy of CHRYSLER GROUP, LLC

3. Remove the multi-function switch mounting bracket upper retaining screw (2).

Fig. 20: Locating Clockspring Connectors
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the clockspring connectors (1).
5. If equipped, disconnect the Steering Angle Sensor (SAS) harness routing retainer (2) and connector (3).
6. If equipped, disconnect the adjustable pedals switch connector (5).
7. Remove the multi-function switch mounting bracket lower retaining screw (4).

Fig. 21: Tilt Release Lever Screws
Courtesy of CHRYSLER GROUP, LLC

8. Carefully pull the multi-function switch mounting bracket (2) toward the steering wheel (1) to gain access to the tilt release lever screws (3).
9. Remove the tilt release lever screws (3).

Fig. 22: Release Cam Linkage & Release Cam
Courtesy of CHRYSLER GROUP, LLC

NOTE: The release cam linkage (3) is tabbed to lock into the release cam (1) after installation.

10. Remove the tilt release lever/cam linkage from the steering column by rotating the tilt release lever (4) down (clockwise) to align the linkage tabs with the rectangular hole (2) of the cam (1) and pull out.

Fig. 23: Tilt Release Lever
Courtesy of CHRYSLER GROUP, LLC

NOTE: A new tilt release lever (1) includes a pre-loaded spring (3) and the linkage.

11. If the tilt release lever (1) is to be reinstalled on the column, reload the spring (3) against the tab (2) as shown in illustration.

INSTALLATION

INSTALLATION

Fig. 24: Tilt Release Lever
Courtesy of CHRYSLER GROUP, LLC

NOTE: A new tilt release lever (1) includes a pre-loaded spring (3) and the linkage. The

spring will have tension and should not be released prior to installation.

1. If the original tilt release lever (1) is to be reinstalled on the column, carefully reload the spring (3) against the tab (2) as shown in illustration.

Fig. 25: Release Cam Linkage & Release Cam
Courtesy of CHRYSLER GROUP, LLC

NOTE: The release lever/cam linkage (3) is tabbed to lock into the release cam (1) after installation.

2. Insert the tilt release lever/cam linkage (3) into the slotted cam hole (2) and rotate the tilt release lever (4) into position.

Fig. 26: Tilt Release Lever Screws
Courtesy of CHRYSLER GROUP, LLC

3. Install the tilt release lever screws (3).

Fig. 27: Pre-Loaded Spring Tip
Courtesy of CHRYSLER GROUP, LLC

4. From the underside the column, push the pre-loaded spring tip (1) up with a small flat blade screwdriver or suitable tool to release the spring from the tab. The spring should snap against the column in the area shown in illustration (3). Verify the tilt release lever for proper operation before proceeding.

Fig. 28: Locating Clockspring Connectors
Courtesy of CHRYSLER GROUP, LLC

5. Position the multi-function switch mounting bracket and install the lower retaining screw (4).
6. If equipped, connect the adjustable pedals switch connector (5), harness routing retainer (2), and SAS connector (3).
7. Connect the clockspring connectors (1).

Fig. 29: Multi-Function Switch Mounting Bracket Upper Retaining Screw
Courtesy of CHRYSLER GROUP, LLC

8. Install the multi-function switch mounting bracket upper retaining screw (2).
9. Install the steering column shrouds. Refer to **SHROUD, STEERING COLUMN, INSTALLATION**.
10. Connect the negative battery cable.

LEVER, GEARSHIFT

REMOVAL

ASSEMBLY

1. Disconnect the negative battery cable.
2. Remove the upper and lower column shrouds. Refer to **SHROUD, STEERING COLUMN, REMOVAL**.

Fig. 30: Gearshift Lever Assembly Components
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the gearshift harness connector (5).
4. Disconnect the shift cable (3) from the gearshift lever assembly (2).
5. Remove the gearshift lever assembly mounting screws (4).
6. Remove the gearshift lever assembly.

LEVER ONLY

1. Disconnect the negative battery cable.
2. Remove the upper and lower column shrouds. Refer to **SHROUD, STEERING COLUMN, REMOVAL**.

Fig. 31: Gearshift Lever Assembly Components
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the gearshift harness connector (5).
4. Disconnect the gearshift harness retainers (6).
5. Remove the gearshift lever pinch bolt (7) from the gearshift lever assembly (2).
6. Remove the gearshift lever (1) from the gearshift lever assembly (2).

INSTALLATION

ASSEMBLY

Fig. 32: Gearshift Lever Assembly Components
Courtesy of CHRYSLER GROUP, LLC

1. Position the gearshift lever assembly (2), install the retaining screws and tighten to 12 N.m (105 in. lbs.).
2. Connect the shift cable to the lever (2).
3. Connect the gearshift harness connector (5).
4. Ensure the gear shift lever and transmission are in the PARK position and snap the cable adjust clip in place.
5. Install the upper and lower column shrouds, steering column opening cover, and reinforcement. Refer to **SHROUD, STEERING COLUMN, INSTALLATION**.
6. Connect the negative battery cable.

LEVER ONLY

Fig. 33: Gearshift Lever Assembly Components
Courtesy of CHRYSLER GROUP, LLC

1. Install the gearshift lever (1) in the gearshift lever assembly (2).
2. Install the gearshift lever pinch bolt (7) and tighten to 12 N.m (105 in. lbs.).
3. Connect the gearshift harness retainers (6).
4. Connect the gearshift harness connector (5).
5. Install the upper and lower column shrouds, steering column opening cover, and reinforcement. Refer to **SHROUD, STEERING COLUMN, INSTALLATION**.
6. Connect the negative battery cable.

SHROUD, STEERING COLUMN

REMOVAL

UPPER

Fig. 34: Steering Column Shroud
Courtesy of CHRYSLER GROUP, LLC

1. From below the steering column, remove the two outboard screws within the recess areas (2) that secure the upper shroud (1) to the lower shroud (4).

NOTE: **There are snap connections near the instrument cluster and between the shroud and the steering wheel that secure the upper and lower shroud.**

2. Remove the upper shroud (1) by pushing gently inward and upward on both sides of the upper shroud above the parting line of the lower shroud to release the snap features that secure the two shroud halves to each other.

LOWER

Fig. 35: Steering Column Shroud

Courtesy of CHRYSLER GROUP, LLC

1. From below the steering column, remove the two outboard screws within the recess areas (2) that secure the upper shroud (1) to the lower shroud (4).

   NOTE: There are snap connections near the instrument cluster and between the shroud and the steering wheel that secure the upper and lower shroud.

2. Remove the upper shroud (1) by pushing gently inward and upward on both sides of the upper shroud above the parting line of the lower shroud to release the snap features that secure the two shroud halves to each other.
3. Remove the steering column opening cover from the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .

Fig. 36: Steering Column Lower Shroud
Courtesy of CHRYSLER GROUP, LLC

4. Remove the lower shroud to column retaining screw (2) and carefully move the lower shroud over the steering column tilt lever and off the steering column.

INSTALLATION

UPPER

Fig. 37: Steering Column Shroud
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If the vehicle is equipped with an automatic transmission, be certain to engage the gearshift lever boot into the opening in both shroud halves.**

1. Position the upper shroud (1) onto the steering column over the lower shroud (4).
2. Align the snaps features on the upper and lower shroud halves and apply hand pressure to snap together.
3. From below the steering column, install the two outboard screws within the recess areas (2) that secure the upper shroud (1) to the lower shroud (4).

LOWER

Fig. 38: Steering Column Shroud
Courtesy of CHRYSLER GROUP, LLC

1. Position the lower shroud (4) over the steering column tilt lever and align on the steering column.

NOTE: **If the vehicle is equipped with an automatic transmission, be certain to engage the gearshift lever boot into the opening in both shroud halves.**

2. Position the upper shroud (1) onto the steering column over the lower shroud (4).
3. Align the snap features on the upper and lower shroud halves (1, 4) and apply hand pressure to snap together.
4. From below the steering column, install the two outboard screws within the recess areas (2) that secure the upper shroud (1) to the lower shroud (4).

Fig. 39: Steering Column Lower Shroud
Courtesy of CHRYSLER GROUP, LLC

5. Install the lower shroud to column retaining screw (3).
6. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .

WHEEL, STEERING

REMOVAL

REMOVAL

Fig. 40: Removing Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

1. Disable and remove the driver's side airbag. Refer to **AIR BAG, DRIVER, REMOVAL** .
2. Remove the steering wheel bolt and discard.

NOTE: The jaws should point outward from the center of the steering wheel for removal.

3. Install Gear Puller (special tool #L-4407A, Puller, Gear) (1) and OTC® 7929A jaws (3) or equivalent and loosen the steering wheel (2).
4. Remove the tools (1, 3) and then remove the steering wheel (2).

INSTALLATION

INSTALLATION

NOTE: Do not reuse the old steering wheel bolt (a new bolt must be used)

1. Install steering wheel to the column

NOTE: Be certain that the steering wheel mounting bolt is tightened to the proper torque specification to ensure proper clockspring operation.

2. Install the new steering wheel bolt. Tighten the bolt to 61 N.m (45 ft. lbs.).
3. Install the driver's side air bag. Refer to **AIR BAG, DRIVER, INSTALLATION** .

GEAR, INDEPENDENT FRONT SUSPENSION

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Steering Gear to Frame Bolts	319	235	-
Steering Gear Coupler Bolt	49	36	-
Tie Rod End Knuckle Nut	61, Then tighten an additional 90°	45, Then tighten an additional 90°	-
Tie Rod End Jam Nut	127	94	-
Tie Rod End, Inner	169	125	-

Power Steering Pressure Line To Pump	37	27	-
Power Steering Return Line	50	37	-

REMOVAL

REMOVAL

NOTE: **The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.**

Fig. 41: Rack & Pinion, Outer Tie Rods & Knuckles
Courtesy of CHRYSLER GROUP, LLC

1. Lock the steering wheel.

2. Drain and siphon the power steering fluid from the reservoir.
3. Raise and support the vehicle.
4. Remove and discard the steering coupler pinch bolt.
5. Disconnect the power steering hoses from the rack and pinion (2).
6. Remove the front tires and wheels.
7. Remove the outer tie rod nuts and separate outer tie rods (3) from the knuckles (5) using Ball Joint Remover (special tool #8677, Remover, Ball Joint). Refer to **END, TIE ROD, REMOVAL** or **END, TIE ROD, LINK AND COIL, REMOVAL**.

Fig. 42: Front Axle, Steering Gear Mounting Nuts & Bushings
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT AXLE
2 - STEERING GEAR MOUNTING NUTS AND BUSHINGS

NOTE: 4wd model shown in illustration. 2wd model similar.

8. If equipped, remove the skid plate. Refer to **PLATE, SKID, FRONT, REMOVAL** .
9. Remove the rack and pinion mounting bolts (2) and remove the rack from the vehicle.

INSTALLATION

INSTALLATION

NOTE: Before installing gear inspect bushings and replace if worn or damaged.

NOTE: In the frame there are two holes for the mounting of the steering gear, one is slotted and one is round. When tightening the gear to specifications make sure to tighten the mounting bolt with the hole first to avoid movement of the

steering gear.

Fig. 43: Front Axle, Steering Gear Mounting Nuts & Bushings
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT AXLE
2 - STEERING GEAR MOUNTING NUTS AND BUSHINGS

NOTE: 4wd model shown in illustration. 2wd model similar.

1. Position the rack and pinion to the front crossmember.
2. Install the retaining bolts (2). Tighten the bolts (2) to 319 N.m (235 ft. lbs.).

Fig. 44: Rack & Pinion, Outer Tie Rods & Knuckles
Courtesy of CHRYSLER GROUP, LLC

3. Slide the shaft coupler onto the gear and install a **new** pinch bolt. Tighten the pinch bolt to 49 N.m (36 ft. lbs.).

4. Clean and dry the tie rod end studs (3) and the tapers in the knuckles (5).
5. Install the tie rod ends into the steering knuckles. Install and tighten the retaining nuts to 61 N.m (45 ft. lbs.), then turn an additional 90°. Refer to **END, TIE ROD, INSTALLATION** or **END, TIE ROD, LINK AND COIL, INSTALLATION**.
6. Connect the pressure power steering hose to the steering gear and tighten to 32 N.m (23 ft. lbs.). Refer to **HOSE, POWER STEERING, INDEPENDENT FRONT SUSPENSION, INSTALLATION** or **HOSE, POWER STEERING, LINK AND COIL, INSTALLATION**.
7. Connect the return power steering hose to the steering gear and tighten to 50 N.m (37 ft. lbs.). Refer to **HOSE, POWER STEERING, INDEPENDENT FRONT SUSPENSION, INSTALLATION** or **HOSE, POWER STEERING, LINK AND COIL, INSTALLATION**.
8. If equipped, install the front skid plate. Refer to **PLATE, SKID, FRONT, INSTALLATION** .
9. Install the front tires and wheels. Refer to **WHEELS, STANDARD PROCEDURE** .
10. Lower the vehicle.
11. Fill the power steering system with fluid. Refer to **PUMP, STANDARD PROCEDURE**.
12. Adjust the toe alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

BUSHING, STEERING GEAR

REMOVAL

REMOVAL

1. Remove the steering gear. Refer to **GEAR, INDEPENDENT FRONT SUSPENSION, REMOVAL** or **GEAR, LINK AND COIL, REMOVAL**.

CAUTION: Do not overtighten the vise on the gear case.

2. Mount the steering gear in a soft jawed vise.

NOTE: If the bushings are seized a brass punch can be used to remove the bushings from the gear using care not to strike the gear.

3. Remove the front mounting bushings.
4. Remove the rear mounting bushings.
5. Remove the steering gear from the vise and place it on the bench.

INSTALLATION

INSTALLATION

NOTE: Coat all bushings with a thin rubber lubricate oil prior to installation.

NOTE: **A rubber mallet can be used to assist in the installation of the bushings once lubricated.**

1. Coat the rear bushings with a thin rubber lubricate oil then install the rear bushings using a rubber mallet to seat the bushings in the gear.
2. Coat the front bushings with a thin rubber lubricate oil then install the front bushings using a rubber mallet to seat the bushings in the gear.
3. Install the steering gear. Refer to **GEAR, INDEPENDENT FRONT SUSPENSION, INSTALLATION** or **GEAR, LINK AND COIL, INSTALLATION**.
4. Adjust the toe position (if necessary). Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

GEAR, LINK AND COIL

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Steering Gear, Frame Mounting Bolts (2500, 3500)	196	145	-
Steering Coupler to Gear Shaft	49	36	-

REMOVAL

REMOVAL

1. Place the front wheels in a straight-ahead position.

NOTE: **The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.**

2. Lock the steering wheel.
3. Siphon out as much power steering fluid as possible.
4. Disconnect and cap the fluid hoses from steering gear. Refer to **HOSE, POWER STEERING, INDEPENDENT FRONT SUSPENSION, REMOVAL** or **HOSE, POWER STEERING, LINK AND COIL, REMOVAL**.

Fig. 45: Steering Shaft Coupler Pinch Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Remove the steering shaft coupler pinch bolt (1) at the steering gear and slide coupler off steering gear (2).

Fig. 46: Pitman Arm & Remover
Courtesy of CHRYSLER GROUP, LLC

6. Remove the steering gear shaft to pitman arm (1) retaining nut and washer.
7. Mark the steering gear shaft and pitman arm (1) for installation reference.
8. Using the Pitman Arm Remover (special tool #9615A, Remover, Pitman Arm) (2) or equivalent, remove the pitman arm (1) from the steering gear shaft. Refer to **ARM, PITMAN, LINK AND COIL, REMOVAL**.

Fig. 47: Steering Gear & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING GEAR
2 - MOUNTING BOLTS (3)

9. Remove the steering gear (1) three retaining bolts (2) and remove the steering gear (1) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 48: Steering Gear & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the steering gear (1) the frame rail. install the three mounting bolts (2), and tighten to 196 N.m (145 ft. lbs.).

Fig. 49: Steering Shaft Coupler Pinch Bolt
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING COUPLER
2 - STEERING GEAR INPUT SHAFT

2. Align steering coupler (1) on gear shaft (2). Install pinch bolt and tighten to 49 N.m (36 ft. lbs.) torque.

Fig. 50: Pitman Arm, Steering Gear & Nut/Washer
Courtesy of CHRYSLER GROUP, LLC

1 - DRAGLINK
2 - STEERING GEAR
3 - SWAYBAR
4 - NUT/WASHER
5 - PITMAN ARM

3. Align and install the pitman arm (5). Refer to **ARM, PITMAN, LINK AND COIL, INSTALLATION**.
4. Install the washer and retaining nut (4) on the pitman shaft. Tighten the nut to 305 N.m (225 ft. lbs.).
5. Connect fluid hoses to steering gear, tighten to 32 N.m (23 ft. lbs.). Refer to **HOSE, POWER STEERING, INDEPENDENT FRONT SUSPENSION, INSTALLATION** or **HOSE, POWER STEERING, LINK AND COIL, INSTALLATION**.
6. Add fluid. Refer to **PUMP, STANDARD PROCEDURE**.
7. Reset the toe and center the steering wheel. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINKAGE, INDEPENDENT FRONT SUSPENSION

END, TIE ROD

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIE ROD

Tie rod free-play can be measured using the following hand methods:

OUTER TIE ROD

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

2. Remove the front wheels.
3. Install two standard wheel mounting nuts, flat side to rotor, diagonally opposite to each on the rotor.

Fig. 51: Aligning Dial Indicator Pointer With Direction Of Stud Axis
Courtesy of CHRYSLER GROUP, LLC

4. Attach a magnetic dial indicator (2) to the inside or outside of the brake rotor, then align the dial indicator's contact pointer (1) with the direction of the stud axis and touch the outer tie rod.
5. Zero the dial indicator. (3)

Fig. 52: Checking Outer Tie Rod Free-Play
Courtesy of CHRYSLER GROUP, LLC

NOTE: **When checking free-play, DO NOT rotate the tie rod. Just because a tie rod rotates easily does not mean that it is necessarily faulty. Using more than**

light hand pressure will result in a false reading.

6. Grasp the outer tie rod near the ball stud and attempt to move the tie rod straight up and down using light hand pressure. (Less than 10 lbs. of force.)
7. Measure and record any tie rod free-play movement.
8. Remove the magnetic dial indicator.
9. Remove the standard wheel mounting nuts from the two studs.

If the free-play in the tie rod exceeds 0.05 mm (.002 in.), replace the outer tie rod. Refer to **END, TIE ROD, REMOVAL** or **END, TIE ROD, LINK AND COIL, REMOVAL**. If the free-play is less than 0.05 mm (.002 in.) at the outer tie rod check the inner tie rod for free-play. Refer to the following procedure.

INNER TIE ROD

Fig. 53: Checking Inner Tie Rod Free-Play
Courtesy of CHRYSLER GROUP, LLC

1. Grasp the inner tie rod near the steering gear bellows and attempt to move the tie rod straight up and down. If any free-play is felt, replace the inner tie rod end. Refer to **END, TIE ROD, REMOVAL**.
2. If no free-play is felt, install the front wheels. Refer to **WHEELS, STANDARD PROCEDURE** .
3. Remove support and lower the vehicle.

REMOVAL

OUTER TIE ROD END

Fig. 54: Outer Tie Rod End, Jam Nut & Separator
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not twist the boot anytime during removal or installation.

1. Loosen the jam nut (3).
2. Remove the outer tie rod end nut from the ball stud.
3. Separate the tie rod ball stud (1) from the knuckle with Ball Joint Remover (special tool #9360, Remover, Ball Joint) (2) .
4. Unthread the outer tie rod end (1) from the inner tie rod.

INNER TIE ROD END

Fig. 55: Outer Tie Rod End, Jam Nut & Separator
Courtesy of CHRYSLER GROUP, LLC

1. Remove the outer tie rod end (1) **Count the number of turns when removing, this will aid in setting the toe after installation.** . Refer to **END, TIE ROD, REMOVAL**.
2. Remove the jam nut (3).

Fig. 56: Boot & Clamps
Courtesy of CHRYSLER GROUP, LLC

3. Remove the clamps (1, 3) for the inner tie rod boot (2).
4. Remove the boot (2).

Fig. 57: Identifying Socket & Tube
Courtesy of CHRYSLER GROUP, LLC

5. Install Inner Tie Rod Wrench (special tool #10087-3, Wrench, Inner Tie Rod) (2) and Inner Tie Rod Adapter Wrench (special tool #10087-2A, Adapter Wrench, Inner Tie Rod) (1) and remove the inner tie rod end.

INSTALLATION

OUTER TIE ROD END

NOTE: All views are typical.

Fig. 58: Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not twist the boot at anytime during removal or installation.

1. Thread the outer tie rod end (3) onto the inner tie rod (2), to it's original position.

Fig. 59: Locating Grease & Tie Rod End Boot
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If a new tie rod end is to be installed, make sure the boot (2) is properly lubricated.**

2. Clean all old grease and debris from the boot (2) with a clean cloth.
3. Apply outer tie rod grease P/N 68088623AA (1) to the tie rod end boot (2).

Fig. 60: Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

4. Install the outer tie rod end (3) into the steering knuckle.
5. Tighten the ball stud nut on the ball stud to 61 N.m (45 ft. lbs.) then an additional 90°.
6. Set wheel toe pattern. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .
7. Tighten jam nut (1) to 127 N.m (94 ft. lbs.).

INNER TIE ROD END

Fig. 61: Identifying Inner Tie Rod, Rack & Pinion
Courtesy of CHRYSLER GROUP, LLC

1. Thread the inner tie rod (1) to the rack and pinion (2).

Fig. 62: Identifying Socket & Tube
Courtesy of CHRYSLER GROUP, LLC

2. Tighten the inner tie rod end using Inner Tie Rod Wrench (special tool #10087-3, Wrench, Inner Tie Rod) (2) and Inner Tie Rod Adapter Wrench (special tool #10087-2A, Adapter Wrench, Inner Tie Rod) (1) to 169 N.m (125 ft.lbs.).

Fig. 63: Boot & Clamps
Courtesy of CHRYSLER GROUP, LLC

3. Install the inner tie rod end boot (2) and reclamp (1, 3) to the tie rod (4) and rack.

Fig. 64: Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

4. Install the jam nut (1) to the inner tie rod end (2).
5. Install the outer tie rod (3) the same number of turns when removed. Refer to **END, TIE ROD, INSTALLATION**.
6. Install the front wheels.
7. Lower the vehicle.
8. Perform toe adjustment. Refer to **TOE ADJUSTMENT - RACK AND PINION STEERING SYSTEM** .
9. Tighten the jam nut (1) after toe adjustment. Tighten to 50 N.m (37 ft. lbs.).

LINKAGE, LINK AND COIL

DESCRIPTION

DESCRIPTION

CAUTION: If any steering components are replaced or serviced an alignment must be performed.

NOTE: To avoid damaging ball stud seals, use an appropriate puller to remove tie rod ends.

Some late build **4500/5500** vehicles have a new design steering system. The primary difference is that the drag link is connected directly to the knuckle. The **2500/3500, cab chassis, and early build 4500/5500** steering linkage is unchanged from the previous model year with the drag link attached to the RH tie rod. Both designs are shown in illustrations below.

DRAG LINK TO TIE ROD SYSTEM

Fig. 65: Tie Rod End, Tie Rod, Pitman Arm, Drag Link & Steering Damper
Courtesy of CHRYSLER GROUP, LLC

The **2500/3500, cab chassis, and early build 4500/5500** steering linkage is unchanged from the previous model year and is comprised of a tie rod end (1), tie rod (2), pitman arm (3), drag link (4), and steering damper (5). The drag link is connected between the pitman arm (3) and the tie rod (2).

DRAG LINK TO KNUCKLE SYSTEM

Fig. 66: Tie Rod End, Tie Rod, Pitman Arm, Drag Link & Steering Damper (Late Build)
Courtesy of CHRYSLER GROUP, LLC

The **late build 4500/5500** steering linkage is a new design but still comprised of a tie rod end (3), tie rod (4), pitman arm (2), drag link (1), and steering damper (5). The new design has the drag link (1) connected between the pitman arm (2) and the knuckle.

Fig. 67: RH Tie Rod, Ball Stud, Knuckle, Drag Link & Castle Nut
Courtesy of CHRYSLER GROUP, LLC

The RH tie rod (4) contains a ball stud (1) that extends through the knuckle (5) and the outer end of the drag link (3) with a castle nut (2) on top of the drag link (3). The tie rod ball stud is tapered to match with the knuckle, and the drag link end has a sleeve that is also tapered and extends into the knuckle.

STANDARD PROCEDURE

STANDARD PROCEDURE - LUBRICATION

Periodic lubrication of the steering system components is required. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

The following components must be lubricated:

- Tie rod
- Tie rod end
- Drag link

SPECIFICATIONS

TORQUE SPECIFICATIONS

2500/3500

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Pitman Arm Gear Shaft Nut (2500, 3500)	240	177	-

ARM, PITMAN, LINK AND COIL

REMOVAL

REMOVAL

Fig. 68: Pitman Arm, Nuts, Drag Link & Track Bar
Courtesy of CHRYSLER GROUP, LLC

1. Remove the track bar bolt (4) and lower the track bar (5) to allow enough clearance.

Fig. 69: Drag Link Puller
Courtesy of CHRYSLER GROUP, LLC

2. Remove the drag link nut (4) from the pitman arm (2).
3. Install puller C3894-A (1) or equivalent and separate the drag link (3) from the pitman arm (2).
4. Mark the pitman arm (2) and shaft positions for installation reference. Unstake the nut (5) and the remove from the pitman arm (2).

Fig. 70: Identifying Pitman Arm Puller
Courtesy of CHRYSLER GROUP, LLC

5. Remove the pitman arm (1) with Puller OTC® 5055 (2) or an equivalent pitman arm puller tool.

INSTALLATION

INSTALLATION

Fig. 71: Pitman Arm, Nuts, Drag Link & Track Bar
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Care is to be taken to assure the steering gear does not travel more than 25 degrees off center, at the output shaft in either direction, prior to setting of the poppet valves. This is critical during the installation of the pitman arm. Failure to do this will result in the improper setting of the poppet valves. If set**

improperly the gear will not go into relief bypass and there is potential for heat build up and damage to the steering system. Once set, the poppet valves can not be reset.

1. Align reference marks and install pitman arm (3).
2. Install the retaining nut (2) on the pitman shaft and tighten nut to 300 N.m (225 ft. lbs.).
3. Install the drag link (6) to the pitman arm (3). Install the nut (1) and tighten to 54 N.m (40 ft. lbs.). Then an additional 90°.
4. Install the track bar (5) and tighten the bolt (4) to 54 N.m (40 ft. lbs.)
5. Remove the supports and lower the vehicle to the surface. Center steering wheel and adjust toe. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .
6. After adjustment tighten tie rod adjustment sleeve clamp bolts to 61 N.m (45 ft. lbs.).

"SETTING THE POPPET VALVES IN THE STEERING GEAR BOX AFTER ALIGNMENT HAS BEEN PERFORMED"

1. With the engine at idle and the vehicle still on the turn angle plates or with weight off tires, steer the wheels to full travel in one direction until axle stop contact is made (approximately 2 1/8 turns). Maximum input torque to the steering wheel to be applied during this procedure.

NOTE: **Prior to reaching full turn, approximately 1 3/4 turns, a slight increase in turning effort will be experienced and will remain until the steering stop is reached.**

2. Follow the same procedure while turning the steering wheel in the opposite direction. The poppets are now positioned to trip and reduce pressure as the steered wheels approach the axle stops in either direction.

DAMPER, STEERING, LINK AND COIL

REMOVAL

DAMPER - 2500/3500

NOTE: **All views are typical.**

Fig. 72: Link And Coil Steering System Components
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the steering damper mounting nut and bolt (9) at the axle.

Fig. 73: Identifying Steering Damper & Linkage Bracket Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Remove the steering damper mounting nut (6) at the linkage bracket (3).
4. Remove the steering damper (1).

DAMPER - 4500/5500

NOTE: All views are typical.

Fig. 74: Steering Damper, Linkage Bracket, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the steering damper mounting nut and bolt (4) at the axle.
3. Remove the steering damper mounting nut and bolt (2) at the linkage bracket (5).
4. Remove the steering damper (3).

BRACKET - 2500/3500

NOTE: All views are typical.

Fig. 75: Identifying Steering Damper & Linkage Bracket Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the steering damper mounting nut (6) at the linkage bracket (3) and position the steering damper (1) off the retaining bolt (7).

NOTE: Some vehicles may have only one u-bolt retaining the bracket to the tie rod.

3. Remove the four (or two) mounting bracket u-bolt nuts (5) and remove the bracket (3).

BRACKET - 4500/5500

NOTE: All views are typical.

3532464

Fig. 76: Steering Damper, Linkage Bracket, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the steering damper mounting bolt and nut (2) at the linkage bracket (5) and position the steering damper (3) away from the bracket (5).
3. Remove the mounting bracket bolts and nuts (1) and remove the bracket (5).

INSTALLATION

DAMPER - 2500/3500

NOTE: All views are typical.

Fig. 77: Link And Coil Steering System Components
Courtesy of CHRYSLER GROUP, LLC

1. Position the steering damper (8) on the axle bracket. Install the bolt and nut (9) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.

Fig. 78: Identifying Steering Damper & Linkage Bracket Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Position the steering damper (1) on the linkage bracket bolt (7), install the nut (6) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
3. Remove the support and lower the vehicle.

DAMPER - 4500/5500

NOTE: **All views are typical.**

Fig. 79: Steering Damper, Linkage Bracket, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the steering damper (3) on the axle bracket, install the bolt and nut (4) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
2. Position the steering damper (3) on the linkage bracket (5), install the bolt and nut (2) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
3. Remove the supports and lower the vehicle.

BRACKET - 2500/3500

NOTE: **All views are typical.**

Fig. 80: Identifying Steering Damper & Linkage Bracket Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Some brackets may have the steering damper retaining bolt permanently attached to the bracket.**

1. Place the steering damper retaining bolt (7) in the bracket (3) and position the bracket on the flat of the linkage.
2. With the bracket (3) centered on the flat of the linkage, position the u-bolts (2) over the linkage, through the bracket and install the four (or two) u-bolt nuts (5). Do not tighten at this time.
3. Verify the bracket (3) is centered in the flat area of the linkage and tighten the four (or two) u-bolt nuts (5) to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
4. Position the steering damper (1) on the retaining bolt (7).
5. Install the steering damper retaining nut (6) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
6. Remove the support and lower the vehicle.

BRACKET - 4500/5500

NOTE: **All views are typical.**

Fig. 81: Steering Damper, Linkage Bracket, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the steering damper bracket (5), install the bolts and nuts (1) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
2. Position the steering damper (3), install the bolt and nut (2) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
3. Remove the support and lower the vehicle.

DRAG LINK, STEERING, LINK AND COIL

REMOVAL

RH - TO TIE ROD

NOTE: All views are typical.

Fig. 82: Link And Coil Steering System Components
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the drag link to tie rod nut (10).
3. Loosen the nut/bolt on the drag link adjuster sleeve (3) as necessary.
4. Remove the drag link (2) from the tie rod (6). (3).
5. Remove the drag link (2) from the adjuster sleeve (3).

TO PITMAN ARM

NOTE: All views are typical. 2500 shown in illustration, others similar.

Fig. 83: Link And Coil Steering System Components
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the drag link to pitman arm nut (5).
3. Loosen the nut/bolt on the tie rod adjuster sleeve (3).

Fig. 84: Draglink Removal
Courtesy of CHRYSLER GROUP, LLC

1 - PITMAN ARM
2 - DRAG LINK
3 - C -3894-A PULLER

4. Remove the drag link (2) from the pitman arm (1), with (special tool #C-3894-A, Puller, Tie Rod) (3).
5. Remove the drag link from the adjuster sleeve.

TO KNUCKLE

NOTE: All views are typical.

Fig. 85: Drag Link Adjuster Sleeve, Nut & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Loosen the nut/bolt (2) on the drag link adjuster sleeve (1) as necessary.

Fig. 86: Drag Link/Tie Rod To Knuckle Nut & Cotter Key
Courtesy of CHRYSLER GROUP, LLC

3. Remove the cotter key (1) and the drag link/tie rod to knuckle nut (2).

Fig. 87: Removing Tie Rod End From Knuckle
Courtesy of CHRYSLER GROUP, LLC

WARNING: Any time the tie rod end has been disconnected from the knuckle, a new boot/seal must be used or damage to the ball stud may result.

4. Remove the tie rod end (3) from the knuckle (1) with (special tool #10390, Separator, Tie Rod) (2).

Fig. 88: Removing Drag Link End From Knuckle
Courtesy of CHRYSLER GROUP, LLC

5. Remove the drag link end (2) from the knuckle (1) with (special tool #C-3894-A, Puller, Tie Rod) (4) and (special tool #10403, Separator, Drag Link) (3).
6. Remove the drag link end (3) from the adjuster sleeve.

INSTALLATION

RH - TO TIE ROD

NOTE: All views are typical.

Fig. 89: Link And Coil Steering System Components
Courtesy of CHRYSLER GROUP, LLC

1. Install the drag link end (2) to the adjustment sleeve (3) and to the tie rod (6).
2. Install the drag link to tie rod nut (10) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
3. Remove the supports and lower the vehicle. Center the steering wheel and adjust the toe. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

   NOTE: Position the clamp on the adjustment sleeve so retaining bolt is located on the bottom side of the sleeve.

4. After adjustment, tighten drag link adjustment sleeve clamp bolts to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.

TO PITMAN ARM

NOTE: All views are typical. 2500 shown in illustration, others similar.

Fig. 90: Link And Coil Steering System Components
Courtesy of CHRYSLER GROUP, LLC

1. Install the drag link end (4) to the adjustment sleeve (3) and to the pitman arm.
2. Install the drag link to pitman arm nut (5) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
3. Remove the supports and lower the vehicle. Center the steering wheel and adjust the toe. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

NOTE: **Position the clamp on the adjustment sleeve so retaining bolt is located on the bottom side of the sleeve.**

4. After adjustment, tighten the tie rod adjustment sleeve clamp bolts to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.

TO KNUCKLE

NOTE: **All views are typical.**

Fig. 91: Drag Link Adjuster Sleeve, Nut & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install the drag link end to the adjustment sleeve (1).

Fig. 92: Drag Link/Tie Rod To Knuckle Nut & Cotter Key
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Any time the tie rod end has been disconnected from the knuckle, a new boot/seal must be used or damage to the ball stud may result.**

2. Install the tie rod end (4) with a new boot/seal, and drag link (3) into the knuckle (5).
3. Install the drag link/tie rod to knuckle nut (2) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
4. Install the cotter key (1).

5. Install the wheel. Refer to **WHEELS, STANDARD PROCEDURE** .

Fig. 93: Drag Link Adjuster Sleeve, Nut & Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Remove the supports and lower the vehicle. Center the steering wheel and adjust the toe. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

NOTE: Position the clamp on the adjustment sleeve (1) so retaining bolt is located on the bottom side of the sleeve.

7. After adjustment tighten tie rod adjustment sleeve clamp bolts (2) to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.

END, TIE ROD, LINK AND COIL

REMOVAL

RH - DRAG LINK TO TIE ROD

NOTE: All views are typical.

Fig. 94: Link And Coil Steering System Components
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel.
3. Remove tie rod to knuckle nut (1).
4. Remove the drag link to tie rod retaining nut (10).
5. Loosen the nut/bolt on the tie rod adjuster sleeve (7).

Fig. 95: Tie Rod Puller
Courtesy of CHRYSLER GROUP, LLC

6. Remove tie rod (3) from the knuckle (2) and the drag link from the tie rod with (special tool #8677, Remover, Ball Joint) (1).
7. Remove the tie rod end from the adjuster sleeve.

NOTE: **All views are typical.**

Fig. 96: Link And Coil Steering System Components
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel.
3. Remove tie rod to knuckle nut (1).
4. Loosen the nut/bolt on the tie rod adjuster sleeve (7) as necessary.

Fig. 97: Tie Rod Puller
Courtesy of CHRYSLER GROUP, LLC

5. Remove tie rod (3) from the knuckle (2) with (special tool #8677, Remover, Ball Joint) (1).
6. Remove the tie rod end from the adjuster sleeve.

RH - WITH DRAG LINK TO KNUCKLE

NOTE: All views are typical.

Fig. 98: Tie Rod Adjuster Sleeve, Nut & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel.
3. Loosen the nut/bolt (1) on the tie rod adjuster sleeve (2) as necessary.

Fig. 99: Drag Link/Tie Rod To Knuckle Nut & Cotter Key

Courtesy of CHRYSLER GROUP, LLC

4. Remove the cotter key (1) and the drag link/tie rod to knuckle nut (2).

Fig. 100: Removing Tie Rod End From Knuckle
Courtesy of CHRYSLER GROUP, LLC

WARNING: Any time the tie rod end has been disconnected from the knuckle, a new boot/seal must be used or damage to the ball stud may result.

5. Remove the tie rod end (3) from the knuckle (1) with (special tool #10390, Separator, Tie Rod) (2).

Fig. 101: Steering Damper, Linkage Bracket, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not allow the LH tie rod to hang freely from the knuckle. Damage to the tie rod ball stud may result.

6. Remove the steering damper/mounting bracket bolts and nuts (1) and remove the bracket and shock from the tie rod end.
7. Remove the tie rod end from the adjuster sleeve.

INSTALLATION

RH - DRAG LINK TO TIE ROD

NOTE: All views typical.

Fig. 102: Link And Coil Steering System Components
Courtesy of CHRYSLER GROUP, LLC

1. Install the tie rod (6) into the adjuster sleeve (7) and into the steering knuckle.
2. Install the drag link (2) to the tie rod (6). Install the nut (10) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
3. Install the wheels as necessary. Refer to **WHEELS, STANDARD PROCEDURE** .
4. Remove the supports and lower the vehicle. Center the steering wheel and adjust the toe. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

NOTE: Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.

5. After adjustment tighten tie rod adjustment sleeve clamp bolts to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.

LH - ALL

NOTE: **All views typical.**

Fig. 103: Link And Coil Steering System Components
Courtesy of CHRYSLER GROUP, LLC

1. Install the tie rod (6) into the adjuster sleeve (7) and into the steering knuckle.
2. Install the wheel. Refer to **WHEELS, STANDARD PROCEDURE** .
3. Remove the supports and lower the vehicle to the surface. Center the steering wheel and adjust the toe. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

   NOTE: **Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.**

4. After adjustment tighten tie rod adjustment sleeve clamp bolts to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.

RH - WITH DRAG LINK TO KNUCKLE

NOTE: **All views typical.**

Fig. 104: Tie Rod Adjuster Sleeve, Nut & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install the tie rod into the adjuster sleeve (2).

Fig. 105: Drag Link/Tie Rod To Knuckle Nut & Cotter Key
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Any time the tie rod end has been disconnected from the knuckle, a new boot/seal must be used or damage to the ball stud may result.**

2. Install the tie rod (4) with a new boot/seal to the knuckle (5).
3. Install the nut (2) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
4. Install the cotter pin (1).

Fig. 106: Steering Damper, Linkage Bracket, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install the steering damper/mounting bracket, bolts and nuts (1) and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.
6. Install the wheel. Refer to **WHEELS, STANDARD PROCEDURE** .
7. Remove the supports and lower the vehicle to the surface. Center the steering wheel and adjust the toe. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

NOTE: Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.

8. After adjustment tighten tie rod adjustment sleeve clamp bolts to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS**.

PUMP

DESCRIPTION

DESCRIPTION

CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

The pump is connected to the steering gear via the pressure hose and the return hose. The pump shaft has a pressed-on pulley that is belt driven by the crankshaft pulley.

All vehicles are equipped with a power steering fluid cooler.

NOTE: **Power steering pumps are not interchangeable with pumps installed on other vehicles.**

OPERATION

OPERATION

Fig. 107: Power Steering Pump
Courtesy of CHRYSLER GROUP, LLC

1 - 3.7L AND 4.7L (6 GROOVE) PHENOLIC (PLASTIC TYPE) PULLEY
1 - 5.7L AND 8.0L (7 GROOVE) PHENOLIC (PLASTIC TYPE) PULLEY
2 - PUMP ASSEMBLY
3 - RESERVOIR
4 - CAP

Hydraulic pressure is provided for the power steering gear by the belt driven power steering pump (2). Refer to **Fig. 107**. The power steering pumps are constant flow rate and displacement, vane-type pumps.

DIAGNOSIS AND TESTING

PUMP LEAKAGE

The pump is serviced as an assembly and should not be disassembled. The plastic pump reservoir and the reservoir o-rings can be replaced.

Check for leaks in the following areas:

- Pump shaft seal behind the pulley
- Pump to reservoir O-ring

- Reservoir cap
- Pressure and return lines
- Flow control valve fitting

POWER STEERING PUMP AND HOSES

NOTE: This information is designed to be used in conjunction with the diagnostic charts at the beginning of the Steering service information. Refer to DIAGNOSIS AND TESTING.

CHECKING FOR WEAR OF POWER STEERING PUMP INTERNAL COMPONENTS

1. Place gear selector in PARK (or NEUTRAL) with wheels chalked.
2. With the engine idling, have a helper turn the steering wheel.
3. Using an electronic listening tool, determine if noise is coming from the pump.
4. Increase the engine speed and have a helper turn the steering wheel. Does the noise change with load?
5. Replace the power steering pump if excessive noise is present. Refer to **PUMP, REMOVAL**.

CHECKING FOR POWER STEERING HOSES TOUCHING BODY OR FRAME OF VEHICLE

Check hoses and hose tubes as following:

- Inspect hoses and hose tubes for witness marks. If witness marks are present, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. Refer to **PUMP, SPECIFICATIONS**. **Do not bend tubing to adjust.** Replace the hose assembly if damaged.
- Check fastener torque of hose mounting brackets and tube nuts. Refer to **PUMP, SPECIFICATIONS**.
- Have a helper bump the steering gear off of the stops to induce pressure fluctuations which may move the hose. If hose contact is made, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. Refer to **PUMP, SPECIFICATIONS**. **Do not bend tubing to adjust.** Replace the hose assembly if damaged.

STANDARD PROCEDURE

POWER STEERING SYSTEM BLEEDING

WARNING: The fluid level should be checked with engine off to prevent injury from moving components.

CAUTION: Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid is to be used in the power steering system. Both Fluids have the same material standard specifications (MS-9602). No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if another fluid is used. Do not overfill the system.

CAUTION: If the air is not purged from the power steering system correctly, pump failure could result.

Fig. 108: Connecting Hand Vacuum Pump For Power Steering System Bleeding
Courtesy of CHRYSLER GROUP, LLC

NOTE: Be sure the vacuum tool used in the following procedure is clean and free of any fluids.

1. Check the fluid level. As measured on the side of the reservoir, the level should indicate between MAX and MIN when the fluid is at normal ambient temperature. Adjust the fluid level as necessary. Refer to **FLUID, STANDARD PROCEDURE**.
2. Tightly insert P/S Cap Adapter (special tool #9688A, Cap Adapter, Power Steering Pump) (4) into the mouth of the reservoir (3).

CAUTION: Failure to use a vacuum pump reservoir (1) may allow power steering fluid to be sucked into the hand vacuum pump.

3. Attach Hand Vacuum Pump (special tool #C-4207-A, Vacuum Pump, Hand) (2), or equivalent, with reservoir (1) attached, to the P/S Cap Adapter (special tool #9688A, Cap Adapter, Power Steering Pump) (4).

CAUTION: Do not run the vehicle while vacuum is applied to the power steering system. Damage to the power steering pump can occur.

NOTE: When performing the following step make sure the vacuum level is maintained during the entire time period.

4. Using Hand Vacuum Pump (2), apply 68-85 kPa (20-25 in. Hg) of vacuum to the system for a minimum of three minutes.
5. Slowly release the vacuum and remove the special tools.
6. Adjust the fluid level as necessary. Refer to 1.
7. Repeat through until the fluid no longer drops when vacuum is applied. Refer to 1.
8. Start the engine and cycle the steering wheel lock-to-lock three times.

NOTE: Do not hold the steering wheel at the stops.

9. Stop the engine and check for leaks at all connections.
10. Check for any signs of air in the reservoir and check the fluid level. If air is present, repeat the procedure as necessary.

FLUSHING POWER STEERING SYSTEM

Flushing is required when the power steering/hydraulic booster system fluid has become contaminated. Contaminated fluid in the steering/booster system can cause seal deterioration and affect steering gear/booster spool valve operation.

NOTE: The engine should not be run so that all of the fluid is drained from the system. The pump should never be run without fluid.

1. Raise the front end of the vehicle off the ground until the wheels are free to turn.
2. Remove the return line from the pump.
3. Plug the return line port/ports at the pump.
4. Position the return line/lines into a large container to catch the fluid.
5. While an assistant is filling the pump reservoir start the engine.
6. With the engine running at idle turn the wheel back and forth.

NOTE: Do not contact or hold the wheel against the steering stops.

7. Run a quart of fluid through the system then stop the engine and install the return line/lines.
8. Fill the system with fluid and perform Steering Pump Initial Operation. Refer to **PUMP, STANDARD PROCEDURE**.
9. Start the engine and run it for fifteen minutes then stop the engine.
10. Remove the return line/lines from the pump and plug the pump port/ports.
11. Pour fresh fluid into the reservoir and check the draining fluid for contamination. If the fluid is still contaminated, then flush the system again.
12. Install the return line/lines and perform Steering Pump Initial Operation. Refer to **PUMP, STANDARD PROCEDURE**.

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.

REMOVAL

REMOVAL

Fig. 109: Power Steering Pump & Hoses
Courtesy of CHRYSLER GROUP, LLC

1 - POWER STEERING PULLEY
2 - POWER STEERING RESERVOIR
3 - RETURN HOSE
4 - HIGH PRESSURE HOSE

1. Drain and siphon the power steering fluid from the reservoir.

2. Remove the serpentine belt. Refer to **BELT, SERPENTINE, REMOVAL** .

CAUTION: Do not remove the fitting on the pump that the high pressure hose screws into. The fitting may come loose unless it is backed up using another wrench. If the fitting does come loose, it must be retightened before continuing. (57 - 67 Nm, 40 - 50 lb.ft.). If this fitting comes out of the pump body, the internal spring and valve parts will fall out of the pump and they cannot be reinstalled properly. If this occurs the pump needs to be replaced with a new pump.

3. Disconnect the return hose (3).
4. Disconnect the pressure hose (4).
5. Remove the three bolts securing the pump to the cylinder head thru the pulley holes (1).

INSTALLATION

INSTALLATION

Fig. 110: Power Steering Pump & Hoses
Courtesy of CHRYSLER GROUP, LLC

1 - POWER STEERING PULLEY
2 - POWER STEERING RESERVOIR
3 - RETURN HOSE
4 - HIGH PRESSURE HOSE

1. Align the pump with the mounting holes in the left cylinder head.
2. Install 3 pump mounting bolts through the pulley access holes (1). Tighten the bolts to 28 N.m (21 ft. lbs.).
3. Reconnect the pressure line (4) and return hose (3) to the pump and reservoir (2). Tighten the pressure line to 31 N.m (23 ft. lbs.).

4. Install the serpentine drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
5. Fill the power steering pump. Refer to **PUMP, STANDARD PROCEDURE**.

COOLER, POWER STEERING

REMOVAL

REMOVAL

Fig. 111: Splash Shield & Push Pins
Courtesy of CHRYSLER GROUP, LLC

1. Drain and siphon the power steering fluid.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. If equipped, remove the eight lower engine splash shield push pins (1) and remove the splash shield (2).

Fig. 112: Power Steering Fluid Cooler & Lines
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the return and supply hoses connected to the power steering fluid cooler lines (3).
5. Remove the mounting bracket bolts (2) securing the fluid cooler (1) to the brace.
6. Remove the fluid cooler (1) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 113: Power Steering Fluid Cooler & Lines
Courtesy of CHRYSLER GROUP, LLC

1. Position the fluid cooler (1) to the vehicle.
2. Install the mounting bracket bolts (2) securing the fluid cooler (1) to the brace.
3. Install and clamp the return and supply hoses to the power steering fluid cooler lines (3).

Fig. 114: Splash Shield & Push Pins
Courtesy of CHRYSLER GROUP, LLC

4. If equipped, position the lower engine splash shield (2) and install the eight retainers (1).
5. Remove the support and lower the vehicle.
6. Refill the power steering fluid. Refer to **PUMP, STANDARD PROCEDURE**.

FLUID

DESCRIPTION

DESCRIPTION

NOTE: **It is normal that some pressure will build up inside the reservoir, especially, with a warm vehicle. A slight popping noise upon removal of the cap is normal. The fluid level should read between the ADD and the FULL COLD marks. When the fluid is hot it should read between ADD and FULL HOT marks. Only add fluid when the vehicle is cold.**

The recommended fluid for the power steering system is Mopar® ATF +4.

Mopar® ATF+4, when new is red in color. The ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition, As the vehicle is driven, the ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

STANDARD PROCEDURE

STANDARD PROCEDURE - POWER STEERING FLUID LEVEL CHECKING

WARNING: FLUID LEVEL SHOULD BE CHECKED WITH THE ENGINE OFF TO PREVENT PERSONAL INJURY FROM MOVING PARTS.

CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

The power steering fluid level can be viewed on the dipstick attached to the filler cap. There are two ranges listed on the dipstick, COLD and HOT. Before opening power steering system, wipe the reservoir filler cap free of dirt and debris. Remove the cap and check the fluid level on its dipstick. When the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F), the fluid level should read between the minimum and maximum area of the cold range. When the fluid is hot, fluid level is allowed to read up to the highest end of the HOT range. Only add fluid when the vehicle is cold.

Use only Mopar® ATF+4. Do not overfill the power steering system.

HOSE, POWER STEERING, INDEPENDENT FRONT SUSPENSION

REMOVAL

RETURN HOSE - GEAR TO COOLER

Fig. 115: Hose Connections
Courtesy of CHRYSLER GROUP, LLC

1 - RETURN HOSE
2 - PRESSURE HOSE

1. Drain and siphon the power steering system.
2. Raise and support the vehicle.
3. Disconnect the return hose at the cooler.

4. Disconnect the return hose (1) at the gear. Refer to **Fig. 115**.
5. Remove the return hose from the routing clamp at the fan shroud and then remove from the vehicle.

PRESSURE HOSE

Fig. 116: Hose Connections
Courtesy of CHRYSLER GROUP, LLC

1 - RETURN HOSE
2 - PRESSURE HOSE

1. Drain and siphon the power steering system.
2. Raise and support the vehicle.
3. Disconnect the pressure hose at the pump.
4. Disconnect the pressure hose (2) at the gear .
5. Remove the pressure hose from the vehicle.

RETURN HOSE - RESERVOIR TO COOLER

1. Drain and siphon the power steering system.
2. Disconnect the return hose at the reservoir.
3. Raise and support the vehicle.
4. Remove the return hose from the routing clamp at the fan shroud.
5. Disconnect the return hose at the cooler.
6. Remove the hose from the vehicle.

INSTALLATION

RETURN HOSE - GEAR TO COOLER

Fig. 117: Hose Connections
Courtesy of CHRYSLER GROUP, LLC

1 - RETURN HOSE
2 - PRESSURE HOSE

1. Install the return hose to the vehicle.
2. Reconnect the return hose at the cooler.
3. Reconnect the return hose (1) at the gear. Tighten the hose to 50 N.m (37 ft. lbs.) .
4. Reattach the hose to the routing clip at the fan shroud.
5. Remove the support and lower the vehicle.
6. Refill the power steering system. Refer to **PUMP, STANDARD PROCEDURE**.

PRESSURE HOSE

Fig. 118: Hose Connections
Courtesy of CHRYSLER GROUP, LLC

1 - RETURN HOSE
2 - PRESSURE HOSE

NOTE: **Be sure to align the pressure hose so it does not contact the fan shroud or the frame rail.**

1. Install the pressure hose to the vehicle.
2. Reconnect the pressure hose (2) at the gear. Tighten the hose to 32 N.m (23 ft. lbs.) .
3. Reconnect the pressure hose at the pump. Tighten the hose to 31 N.m (23 ft. lbs.).
4. Remove the support and lower the vehicle.
5. Refill the power steering system. Refer to **PUMP, STANDARD PROCEDURE**.

RETURN HOSE - RESERVOIR TO COOLER

1. Install the return hose to the vehicle.
2. Reconnect the return hose at the cooler.
3. Reattach the hose to the routing clip at the fan shroud.
4. Remove the support and lower the vehicle.
5. Reconnect the return hose at the reservoir.
6. Refill the power steering system. Refer to **PUMP, STANDARD PROCEDURE**.

1 - LOWER COUPLING BOLT
2 - HIGH PRESSURE HOSE
3 - RETURN HOSE
4 - STEERING GEAR
5 - PITMAN ARM

NOTE: **Be sure to align the pressure hose so it does not contact the fan shroud or the frame rail.**

1. Install the pressure hose to the vehicle.
2. Reconnect the pressure hose (2) at the gear (4). Tighten the hose to 32 N.m (23 ft. lbs.) .
3. Reconnect the pressure hose at the pump. Tighten the hose to 36 N.m (27 ft. lbs.).
4. Remove the support and lower the vehicle.
5. Refill the power steering system. Refer to **PUMP, STANDARD PROCEDURE**.

RETURN HOSE - RESERVOIR TO COOLER

1. Install the return hose to the vehicle.
2. Reconnect the return hose at the cooler.
3. Reattach the hose to the routing clip at the fan shroud.
4. Remove the support and lower the vehicle.
5. Reconnect the return hose at the reservoir.
6. Refill the power steering system. Refer to **PUMP, STANDARD PROCEDURE**.

PULLEY, POWER STEERING PUMP

REMOVAL

REMOVAL

Fig. 123: Removing Pulley
Courtesy of CHRYSLER GROUP, LLC

1 - POWER STEERING PUMP
2 - PULLEY
3 - POWER STEERING PULLEY REMOVAL TOOL

CAUTION: Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

1. Remove the power steering pump assembly (1). Refer to **PUMP, REMOVAL**.
2. Remove the pulley (2) from the pump using (OTC® 7185) power steering pulley removal tool or equivalent (3). Refer to **Fig. 123**.

INSTALLATION

INSTALLATION

Fig. 124: Installing Pulley
Courtesy of CHRYSLER GROUP, LLC

1 - POWER STEERING PUMP
2 - PULLEY
3 - POWER STEERING PUMP PULLEY INSTALLATION TOOL

CAUTION: Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

1. Replace the pulley (2) if it's bent, cracked, or loose.
2. Install the pulley (2) on the pump (1) using (OTC® 7771) power steering pulley installation tool or equivalent (3) making sure it is flush with the end of the shaft. Refer to **Fig. 124**. Ensure the tool and pulley remain aligned with the pump shaft.
3. Install the power steering pump assembly. Refer to **PUMP, INSTALLATION**.
4. Run engine until warm (5 min.) and note any belt chirp. If chirp exists, move pulley outward approximately 0.5 mm (0.020 in.). If noise increases, press on 1.0 mm (0.040 in.). **Be careful that pulley does not contact mounting bolts.**

RESERVOIR, POWER STEERING PUMP

REMOVAL

REMOVAL

1. Drain and siphon the power steering fluid from the reservoir.
2. Remove the serpentine belt.
3. Remove the power steering pump. Refer to **PUMP, REMOVAL**.

Fig. 125: Reservoir & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the reservoir mounting bolts (2).
5. Remove the reservoir (1).
6. Remove the rear bracket to the pump mounting bolts (if equipped).

INSTALLATION

INSTALLATION

Fig. 126: Reservoir & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Install the reservoir bracket to the pump housing (if equipped). **Do not reuse the o-rings (install new o-rings).** Tighten bolts to 7 N.m (62 in. lbs.).

NOTE: Ensure the reservoir (1) is fully seated onto the pump (3).

2. Install the reservoir (1) to the bracket/pump body (3).
3. Install the reservoir mounting bolts (2). Tighten bolts to 13 N.m (120 in. lbs.).
4. Install the power steering pump (3). Refer to **PUMP, INSTALLATION**.
5. Install the serpentine drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
6. Fill the power steering pump. Refer to **PUMP, STANDARD PROCEDURE**.

WHEEL ALIGNMENT

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PRE-ALIGNMENT INSPECTION

Before starting wheel alignment, the following inspection and necessary corrections must be completed. Refer to Suspension and Steering System Diagnosis Chart below for additional information.

1. Inspect tires for size, air pressure and tread wear.
2. Inspect front wheel bearings for wear.
3. Inspect front wheels for excessive radial or lateral runout and balance.
4. Inspect ball studs, linkage pivot points and steering gear for looseness, roughness or binding.
5. Inspect suspension components for wear and noise.
6. Road test the vehicle.

SUSPENSION AND STEERING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT END NOISE	1. Loose or worn wheel bearing.	1. Replace wheel bearing.
	2. Loose or worn steering or suspension components.	2. Tighten or replace components as necessary.

	3. Loose or worn steering or suspension components.	3. Tighten or replace components as necessary.
EXCESSIVE PLAY IN STEERING	1. Loose or worn wheel bearing.	1. Replace wheel bearing.
	2. Loose or worn steering or suspension components.	2. Tighten or replace components as necessary.
	3. Loose or worn steering gear.	3. Replace steering gear.
FRONT WHEELS SHIMMY	1. Loose or worn wheel bearing.	1. Replace wheel bearing.
	2. Loose or worn steering or suspension components.	2. Tighten or replace components as necessary.
	3. Tires worn or out of balance.	3. Replace or balance tires.
	4. Alignment.	4. Align vehicle to specifications.
VEHICLE INSTABILITY	1. Loose or worn wheel bearing.	1. Replace wheel bearing.
	2. Loose or worn steering or suspension components.	2. Tighten or replace components as necessary.
	3. Tire pressure.	3. Adjust tire pressure.
	4. Alignment.	4. Align vehicle to specifications.
EXCESSIVE STEERING EFFORT	1. Loose or worn steering gear.	1. Replace steering gear.
	2. Column coupler binding.	2. Replace coupler.
	3. Tire pressure.	3. Adjust tire pressure.
	4. Alignment.	4. Align vehicle to specifications.
VEHICLE PULLS TO ONE SIDE	1. Tire pressure.	1. Adjust tire pressure.
	2. Tire.	2. Criss-Cross Front Tires.
	3. Alignment.	3. Align vehicle to specifications.
	4. Loose or worn steering or suspension components.	4. Tighten or replace components as necessary.
	5. Radial tire lead.	5. Rotate or replace tire as necessary.
	6. Brake pull.	6. Repair brake as necessary.
	7. Weak or broken spring.	7. Replace spring.

STANDARD PROCEDURE

ALIGNMENT - RACK AND PINION STEERING SYSTEM

Fig. 1: Lower Control Arm Components
Courtesy of CHRYSLER GROUP, LLC

Camber and caster angle adjustments involve changing the position of the lower control arm (2) with the slots in the frame brackets (1). Vehicle should be at normal ride height.

CASTER

Moving the front or rear position of the lower control arm in or out, will change the caster angle and camber angle significantly. To maintain the camber angle while adjusting caster, move one pivot bolt of the lower control arm in or out. Then move the other pivot bolt of the lower control arm in the opposite direction.

To increase positive caster angle, move the rear position of the lower control arm inward (toward the engine). Move the front of the lower control arm outward (away from the engine) slightly until the desired camber angle is obtained.

CAMBER

Move both pivot bolts of the lower control arm together in or out. This will change the camber angle significantly and little effect on the caster angle.

After adjustment is made tighten the lower control arm nuts to proper torque specification. Refer to **SPECIFICATIONS**. .

TOE ADJUSTMENT

The wheel toe position adjustment is the final adjustment.

1. Start the engine and turn wheels both ways before straightening the wheels. Secure the steering wheel with the front wheels in the straight-ahead position.

Fig. 2: Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

2. Loosen the tie rod jam nuts (1).

NOTE: **Each front wheel should be adjusted for one-half of the total toe position specification. This will ensure the steering wheel will be centered when the wheels are positioned straight-ahead.**

3. Adjust the wheel toe position by turning the inner tie rod (2) as necessary.
4. Tighten the tie rod jam nut (1) to 127 N.m (94 ft. lbs.). **Make sure the toe setting does not change during tightening.**
5. Verify the specifications.
6. Road test the vehicle.

ALIGNMENT - RECIRCULATING BALL STEERING SYSTEM

Fig. 3: Alignment Adjustment Cam

1 - BRACKET REINFORCEMENT
2 - ADJUSTING BOLT
3 - ADJUSTMENT CAM

NOTE: **For all EXCEPT late build 4500/5500, if an alignment is being performed WITHOUT having replaced the LH tie rod end, the Tie Rod Ball Stud Housing Misalignment Check procedure must be performed as the first step. The Tie Rod Ball Stud Housing Misalignment Check procedure will determine if the LH tie rod end needs to be serviced due to excessive internal stress during turns. For a description of the late build 4500/5500 difference, refer to LINKAGE, LINK AND COIL, DESCRIPTION .**

Before each alignment reading the vehicle should be jounced (rear first, then front). Grasp each bumper at the center and jounce the vehicle up and down several times. Always release the bumper in the down position. **Set the front end alignment to specifications while the vehicle is in its NORMALLY LOADED CONDITION.**

CAMBER: The wheel camber angle is preset and is not adjustable.

CASTER adjustment: Check the caster of the front axle for correct angle. Be sure the axle is not bent or twisted. Road test the vehicle and make left and right turns. Observe the steering wheel return-to-center position. Low caster will cause poor steering wheel returnability.

For 2500/3500, caster can be adjusted by rotating the cams (3) on the lower suspension arm.

For 4500/5500, caster can be adjusted by loosening the bolts on the lower suspension arm, moving the arm within the slot and tightening the bolt.

TOE POSITION: The wheel toe position adjustment should be the final adjustment.

1. For all **EXCEPT late build 4500/5500** , if an alignment is being performed **without** having replaced the LH tie rod end, the Tie Rod Ball Stud Housing Misalignment Check procedure **must be performed prior to loosening any adjustment sleeve** . Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**. If the LH tie rod end has just been replaced, proceed with step 2.
2. Start the engine and turn wheels both ways before straightening the wheels. Center and secure the steering wheel and turn off engine.
3. Loosen the adjustment sleeve clamp bolts.

   NOTE: **With the vehicle in a level position, verify the drag link/tie rod ball joints are not twisted and are centered. Rotate drag link/tie rod until ball joints are level.**

4. Adjust the right wheel toe position with the drag link adjuster sleeve. Turn the sleeve until the right wheel is at the correct specification. **Verify a level drag link ball joint.** Position clamp bolts to their original position and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS** .

Make sure the toe setting does not change during clamp tightening.

5. Adjust the left wheel toe position with the tie rod adjuster sleeve. Turn the sleeve until the left wheel is at the correct specification. **Verify a level tie rod ball joint.** Position clamp bolts to their original position and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS** . **Make sure the toe setting does not change during clamp tightening.**

CAUTION: For all EXCEPT late build 4500/5500, setting the toe can put the tie rod ball stud alignment out of specifications causing damage to the LH tie rod. The procedure must be run again to verify or reset.

6. For all **EXCEPT late build 4500/5500** , check to verify it is still within specifications. Refer to **TIE ROD BALL STUD HOUSING MISALIGNMENT CHECK**.

NOTE: Toe setting may change during tightening, make sure to verify reading after tightening.

7. Verify the steering wheel is straight and the toe settings are correct (repeat steps 2-6 if necessary).
8. Road test the vehicle.

TOE ADJUSTMENT - RACK AND PINION STEERING SYSTEM

1. Start the engine and turn wheels both ways before straightening the wheels. Secure the steering wheel with the front wheels in the straight-ahead position.

Fig. 4: Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

2. Loosen the tie rod jam nuts (1).

NOTE: Each front wheel should be adjusted for one-half of the total toe position specification. This will ensure the steering wheel will be centered when the wheels are positioned straight-ahead.

3. Adjust the wheel toe position by turning the inner tie rod (2) as necessary.

NOTE: Make sure the toe setting does not change during tightening.

4. Tighten the tie rod jam nut (1) to 127 N.m (94 ft. lbs.).
5. Verify the specifications.
6. Road test the vehicle.

TOE ADJUSTMENT - RECIRCULATING BALL STEERING SYSTEM

NOTE: For all EXCEPT late build 4500/5500, if an alignment is being performed WITHOUT having replaced the LH tie rod end, the Tie Rod Ball Stud Housing Misalignment Check procedure must be performed as the first step. The Tie Rod Ball Stud Housing Misalignment Check procedure will determine if the LH tie rod end needs to be serviced due to excessive internal stress during turns. For a description of the late build 4500/5500 difference, refer to LINKAGE, LINK AND COIL, DESCRIPTION .

The wheel toe position adjustment is the final adjustment.

1. For all **EXCEPT late build 4500/5500** , if an alignment is being performed **without** having replaced the LH tie rod end, the Tie Rod Ball Stud Housing Misalignment Check procedure **must be performed prior to loosening any adjustment sleeve** . Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**. If the LH tie rod end has just been replaced, proceed with step 2.
2. Start the engine and turn wheels both ways before straightening the wheels. Center and secure the steering wheel and turn off engine.
3. Loosen the adjustment sleeve clamp bolts.

NOTE: With the vehicle in a level position, verify the drag link/tie rod ball joints are not twisted and are centered. Rotate drag link/tie rod until ball joints are level.

4. Adjust the right wheel toe position with the drag link adjuster sleeve. Turn the sleeve until the right wheel is at the correct specification. **Verify a level drag link ball joint.** Position clamp bolts to their original position and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS** . **Make sure the toe setting does not change during clamp tightening.**
5. Adjust the left wheel toe position with the tie rod adjuster sleeve. Turn the sleeve until the left wheel is at the correct specification. **Verify a level tie rod ball joint.** Position clamp bolts to their original position and tighten to specifications. Refer to **LINKAGE, LINK AND COIL, SPECIFICATIONS** . **Make sure the toe setting does not change during clamp tightening.**

CAUTION: For all EXCEPT late build 4500/5500, setting the toe can put the tie rod ball stud alignment out of specifications causing damage to the LH tie rod. The procedure must be run again to verify or reset.

6. For all **EXCEPT late build 4500/5500** , check to verify it is still within specifications. Refer to **TIE ROD BALL STUD HOUSING MISALIGNMENT CHECK**.

NOTE: Toe setting may change during tightening, make sure to verify reading after tightening.

7. Verify the steering wheel is straight and the toe settings are correct (repeat steps 2-5 if necessary).
8. Road test the vehicle.

TIE ROD BALL STUD HOUSING MISALIGNMENT CHECK

NOTE: This procedure describes how to check for parallel alignment of the RH and LH steering tie rod ball stud housings. It is essential to have these within +/-3 degrees of parallel to prevent ball stud durability issues.

NOTE: All views, left side shown in illustration, right side similar.

Fig. 5: Tie Rod Ball Stud Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the vehicle on a level surface with vehicle weight on the front tires, and place the front wheels in the straight ahead position
2. Make sure the circular bottom plane (2) of the LH and RH tie rod ball stud housings (1) are free of debris and burrs.

Fig. 6: Measuring Tie Rod Angle
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Measure and record the RH tie rod angle first to establish a baseline for the truck, then measure and record the LH tie rod angle using the same procedure used on the right tie rod. Measure both the RH and LH tie rod ball stud housing angles from underneath the truck using the following steps.**

3. Hold the (special tool #10326-1, Adapter, Tie Rod Alignment) (2) securely under the circular bottom plane of the ball stud housing (1). Make sure the tool makes contact with the entire perimeter of the ball stud housing (1) and is not resting on the domed cap or grease fitting.

Fig. 7: Mounting The Inclinometer
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The angle on the inclinometer is POSITIVE WHEN THE NEEDLE IS FORWARD of the zero degree mark (pointing toward the front of the truck on both the LH or RH sides) and NEGATIVE WHEN AFTER the zero (pointing toward the rear of the truck). The tie rod angle readings should always be positive unless castor is significantly out of specifications.**

4. Mount the (special tool #10326-2, Inclinometer) (2) on the flat bottom surface of (special tool #10326-1, Adapter, Tie Rod Alignment) (1) in the fore-aft orientation. Record the tie rod angle, then repeat steps 3, 4 on the LH tie rod end.
5. Determine the offset of the RH and LH tie rod ball stud housings by calculating the **difference** between the LH and RH ball stud angles. **For example, if one side is +3 degrees and the other side is -4 degrees then the difference is 7 degrees.**
   - Equal to or less than 3 degree difference - no further action needs to be taken, return to the **previous procedure** step and continue that procedure.
   - Over 3 degree difference **with** a new LH tie rod end - Loosen the LH tie rod adjustment sleeve bolts and rotate the tie rod end to adjust the ball stud housing to within 3 degrees of the RH side, then proceed with alignment or toe adjustment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.
   - Over 3 degree difference **without** a new LH tie rod end - Replace the LH tie rod end. Refer to **END, TIE ROD, REMOVAL** or **END, TIE ROD, LINK AND COIL, REMOVAL** .

NOTE: **Any future alignment process on a recirculating ball steering systems should use this procedure.**

CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment. Vehicle height is checked with the fuel tank full of fuel, and no passenger or luggage compartment load.

Inspect the vehicle for bent or weak suspension components. Compare the parts tag on the suspect coil spring(s) to the parts book and the vehicle sales code, checking for a match. Once removed from the vehicle, compare the coil spring height to a correct new or known good coil spring. The heights should vary if the suspect spring is weak.

Fig. 8: Front Curb Height Measurement (LD)
Courtesy of CHRYSLER GROUP, LLC

1. Front - On each side of the vehicle, measure the distance from the center of the rear lower control arm bolt (1) to the ground (2) **Record the measurement** . Next measure the distance from the spindle center (3) to the ground (4) **Record the measurement.**
2. Take the two measurements and subtract them to get the curb height specification.

Fig. 9: Rear Curb Height Measurement (LD)
Courtesy of CHRYSLER GROUP, LLC

3. Rear - On each side of the vehicle, measure the distance from the center of the lower control arm forward

bolt (2) to the ground (3) **Record the measurement** . Next measure the distance from the center of the rear wheel (1) to the ground (4) **Record the measurement.**

4. Subtract the control arm bolt to floor measurement from the wheel to floor measurement to calculate the ride height. (wheel - control arm = ride height).

CURB HEIGHT SPECIFICATIONS - FRONT

MODEL	FRONT
4X4 Without TRX	64 mm - 84 mm 2.5 in. - 3.3 in.
4X4 With TRX	45 mm - 65 mm 1.77 in. - 2.5 in.

CAMBER - LEFT	0.10°	-0.40° to +0.60°
CAMBER - RIGHT	0.10°	-0.40° to +0.60°
CROSS-CAMBER	0.00°	-0.50° to +0.50°
CASTER - LEFT	+3.80°	+2.80° to +4.80°
CASTER - RIGHT	+4.00°	+3.00° to +5.00°
CROSS-CASTER	-2.83°	-2.83°
TOE - TOTAL*	+0.20°	+0.10° to +0.30°
Positive toe (+) is toe-in and negative toe (?) is Toe-out. * TOTAL TOE is the sum of both the left and right wheel toe settings. TOTAL TOE should be equally split between each wheel on the same axle to ensure the steering wheel is centered after setting toe.		

REAR ALIGNMENT	PREFERRED SETTING	ACCEPTABLE RANGE
CAMBER	-0.10°	-0.45° to +0.25°
CROSS-CAMBER	0.00°	-0.30° to +0.30°
TOE - TOTAL*	+0.10°	-0.20° to +0.40°
THRUST ANGLE	0.00°	-0.30° to +0.30°
Positive toe (+) is toe-in and negative toe (?) is Toe-out. * TOTAL TOE is the sum of both the left and right wheel toe settings. TOTAL TOE should be equally split between each wheel on the same axle to ensure the steering wheel is centered after setting toe.		

FRONT, INDEPENDENT FRONT SUSPENSION

DESCRIPTION

4X2

The front suspension is designed to allow each wheel to adapt to different road surfaces independently. The wheels are mounted to hub/bearings units bolted to the steering knuckle. The double-row hub bearings are sealed and lubricated for life. The steering knuckles turn (pivot) on ball joints.

Fig. 13: 4X2 Independent Front Suspension
Courtesy of CHRYSLER GROUP, LLC

The front suspension is comprised of:

- Shock Absorbers
- Coil Spring
- Control Arms (1 and 3)
- Steering Knuckles (2)
- Stabilizer Bar
- Stabilizer Link
- Tie Rod Ends
- Hub/Bearing
- Rack and Pinion
- Ball Joints

NOTE: Components attached with a nut must be torqued to specification.

NOTE: **Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.**

4X4

The front suspension is designed to allow each wheel to adapt to different road surfaces independently. The wheels are mounted to hub/bearings units bolted to the steering knuckle. The double-row hub bearings are sealed and lubricated for life. The steering knuckles turn (pivot) on ball joints.

Fig. 14: 4X4 Coil Over Front Suspension
Courtesy of CHRYSLER GROUP, LLC

The front suspension is comprised of:

- Coil over Shock absorbers (5)
- Coil over Springs (4)
- Control arms (1, 7)
- Steering knuckles (3)
- Stabilizer bar (9)
- Stabilizer link (8)
- Tie Rod Ends (6)
- Hub/Bearing
- Rack and Pinion
- Ball Joints (2)

NOTE: **Components attached with a nut must be torqued to specification.**

NOTE: **Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.**

CONTROL ARMS

Fig. 15: Lower Control Arm Components
Courtesy of CHRYSLER GROUP, LLC

The lower control arm (2) bolts in frame brackets. The frame brackets have slotted holes which allow the arms (2) to be adjusted with cambolts (1) for caster and camber adjustment.

Fig. 16: Identifying Upper Control Arms & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

The upper control arms (2) bolt to the upper frame brackets and pivots through bushings.

The control arms have lube for life ball studs (3). The control arm travel (jounce) is limited through the use of rubber/urethane bumpers. Rebound travel is limited by the shock absorber.

Having the suspension at curb ride height when torquing bolts ensures good ride characteristics and longer bushing life by preventing excessive "wind-up" of the bushing.

STANDARD PROCEDURE

STANDARD PROCEDURE - OUTER TIE ROD END LUBRICATION

NOTE: View is typical.

Fig. 17: Locating Grease & Tie Rod End Boot
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If a new tie rod end is to be installed, make sure the boot (2) is properly lubricated.**

Any time the outer tie rod end is disconnected from the knuckle, before assembly, clean all old grease and debris from the boot with a clean cloth and apply outer tie rod grease P/N 68088623AA (1) to the boot (2) as shown in illustration.

ARM, LOWER CONTROL

REMOVAL

4X2

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.

Fig. 18: Steering Knuckle, Lower Control Arm, Shock & Spring
Courtesy of CHRYSLER GROUP, LLC

3. Support the lower control arm at the outboard side of the lower control arm to support vehicle weight.
4. Remove the shock (3). Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL**.

NOTE: Do not allow the caliper to hang freely, support the caliper assembly.

5. Remove the disc brake caliper adapter. Refer to **ADAPTER, DISC BRAKE CALIPER, REMOVAL** .
6. Remove the rotor.
7. Remove the upper ball joint nut.

Fig. 19: Coil Spring Compressor Tool

Courtesy of CHRYSLER GROUP, LLC

8. Install Front Spring Compressor (special tool #DD-1278, Compressor, Front Spring) (3) up through the lower control arm, coil spring (2) and shock hole in the frame. The bell-shaped adapter goes against the lower control arm. Install the nut on top of the tool at the shock hole.
9. Tighten the spring compressor nut against bell-shaped adapter finger tight then loosen 1/2 turn to hold the spring in place.

Fig. 20: Separating Upper Ball Joint From Knuckle
Courtesy of CHRYSLER GROUP, LLC

10. Separate the upper ball joint (4) from the knuckle (6) using Ball Joint Remover (special tool #9360, Remover, Ball Joint) (5).
11. Remove the knuckle from the vehicle.
12. Remove the lower stabilizer link nut.

Fig. 21: Lower Ball Joint Separation

Courtesy of CHRYSLER GROUP, LLC

1 - STEERING KNUCKLE
2 - SPECIAL TOOL 8677

13. Remove the lower ball joint nut at the steering knuckle (1).
14. Separate the ball joint from the knuckle using Ball Joint Remover (special tool #8677, Remover, Ball Joint) (2).

NOTE: Do not allow the upper control arm to rebound downward, it must be supported.

Fig. 22: Coil Spring Tool Support
Courtesy of CHRYSLER GROUP, LLC

15. Remove the lower control arm support.
16. Tighten the spring compressor tool to allow clearance for the lower ball joint to be removed out of the knuckle.
17. Loosen the tension on the spring compressor tool (2) slowly allowing the lower control arm to pivot downward.
18. Remove the spring compressor tool (2).
19. Remove coil spring (1) and isolator pad from the vehicle.
20. Remove the front and rear pivot bolts.
21. Remove the lower control arm.

Fig. 23: Half Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove half shaft nut (1) from the shaft (2).

Fig. 24: Identifying Disc Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

4. Compress the disc brake caliper (6).

Fig. 25: Identifying Caliper Slide Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the caliper adapter bolts (1)

Fig. 26: Caliper Removal/Install
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

6. Remove the disc brake caliper (1) and the caliper adapter (2) as an assembly.
7. Remove the rotor from the hub/bearing.

8. If equipped with ABS, remove the wheel speed sensor wiring clips and disconnect the electrical connector.

Fig. 27: Separating Upper Ball Joint From Knuckle
Courtesy of CHRYSLER GROUP, LLC

9. Remove the upper ball joint nut (7).
10. Separate the ball joint from the steering knuckle using Ball Joint Remover (special tool #9360, Remover, Ball Joint) (5).

Fig. 28: Half Shaft
Courtesy of CHRYSLER GROUP, LLC

11. Disengage inner C/V joint (1) from axle shaft with two pry bars between the C/V housing and axle housing.
12. Remove the front halfshaft.

Fig. 29: Lower Control Arm Components
Courtesy of CHRYSLER GROUP, LLC

13. Remove the shock absorber lower nut/bolt (7).
14. Remove the stabilizer bar link lower nut (8).

Fig. 30: Lower Ball Joint Separation
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING KNUCKLE
2 - SPECIAL TOOL 8677

15. Using a suitable tie strap, support the knuckle. Remove the lower ball joint nut. Separate ball joint from the steering knuckle using Ball Joint Remover (special tool #8677, Remover, Ball Joint) (2).

Fig. 31: Lower Control Arm Components
Courtesy of CHRYSLER GROUP, LLC

16. Remove the two control arm pivot bolts (1) and control arm (2) from frame rail brackets.

INSTALLATION

4X2

1. Install the lower control arm into place on the vehicle.
2. Install the front and rear control arm pivot bolts finger tight.

Fig. 32: Coil Spring Tool Support
Courtesy of CHRYSLER GROUP, LLC

3. Install the coil spring (1) into the frame pocket. Refer to **SPRING, FRONT COIL, INSTALLATION**.
4. Install the Spring Compressor (special tool #DD-1278, Compressor, Front Spring) (2) up through the lower suspension arm, coil spring and shock hole in the frame.
5. Tighten the tool nut to compress the coil spring (1).

Fig. 33: Coil Spring Compressor Tool
Courtesy of CHRYSLER GROUP, LLC

6. Install the knuckle (1) to the control arms.
7. Position the lower ball joint into the steering knuckle.
8. Install the retaining nut on the lower ball joint and tighten to specifications. Refer to **SPECIFICATIONS**. .
9. Position the upper ball joint to the knuckle (1).
10. Install the retaining nut on the upper ball joint and tighten to specifications. Refer to **SPECIFICATIONS**. .
11. Support the lower control arm at the outboard side of the lower control arm to support vehicle weight.
12. Remove the spring compressor tool (3).
13. Install the shock absorber. Refer to **SHOCK ABSORBER, SUSPENSION, INSTALLATION**.
14. Install the stabilizer link. Refer to **LINK, STABILIZER BAR, INSTALLATION**.
15. Remove the lower control arm support.
16. Install the wheel and tire assembly and lower the vehicle. Refer to **WHEELS, STANDARD PROCEDURE** .
17. Lower the vehicle to the floor with vehicle weight and tighten the front and rear pivot bolts to the frame to specifications. Refer to **SPECIFICATIONS**. .
18. Perform a wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

Fig. 34: Lower Control Arm Components
Courtesy of CHRYSLER GROUP, LLC

1. Position the lower control arm (2) at the frame rail brackets. Install the pivot bolts (1) and nuts, and tighten the nuts finger-tight.

CAUTION: The ball joint stud taper must be CLEAN and DRY before installing the knuckle. Clean the stud taper with mineral spirits to remove dirt and grease.

2. Insert the lower ball joint stud into the steering knuckle. Install and tighten the retaining nut to specifications. Refer to **SPECIFICATIONS**. .
3. Install shock absorber lower bolt/nut (7) and tighten to specifications. Refer to **SPECIFICATIONS**. .
4. Install the stabilizer bar link lower nut (8) and tighten to specifications. Refer to **SPECIFICATIONS**. .

Fig. 35: Half Shaft

Courtesy of CHRYSLER GROUP, LLC

5. Install the front halfshaft to the axle by pushing the inner C/V (1) firmly to engage axle shaft snap ring into the inner C/V housing.
6. Clean hub bearing bore, hub bearing mating surface and half shaft splines (2) and apply a light coating of grease to the front axle shaft output splines.

Fig. 36: Half Shaft & Hub/Bearing
Courtesy of CHRYSLER GROUP, LLC

7. Install half shaft (2) into the knuckle.

Fig. 37: Separating Upper Ball Joint From Knuckle
Courtesy of CHRYSLER GROUP, LLC

8. Insert the upper ball joint (4) into the steering knuckle (6).
9. Install and tighten the upper ball joint retaining nut to specifications. Refer to **SPECIFICATIONS**. .

10. Tighten the lower control arm front pivot nut and rear pivot bolt to specifications. Refer to **SPECIFICATIONS**. .

Fig. 38: Half Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

11. Install half shaft hub nut (1) and tighten to specifications. Refer to **SPECIFICATIONS**. .
12. Install the wheel and tire assembly. Refer to **WHEELS, STANDARD PROCEDURE** .
13. Remove the support and lower the vehicle.
14. Perform a wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

ARM, UPPER CONTROL

REMOVAL

REMOVAL

Fig. 39: Separating Upper Ball Joint From Knuckle
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove wheel and tire assembly.
3. Remove the disc brake caliper adapter with the caliper. Refer to **ADAPTER, DISC BRAKE CALIPER, REMOVAL** .
4. Remove the rotor.
5. Remove the wheel speed sensor wire from the upper control arm.
6. Remove the nut from upper ball joint (4).

CAUTION: When installing Remover (special tool #9360, Remover, Ball Joint) (5) to separate the ball joint, be careful not to damage the ball joint seal.

7. Separate upper ball joint (4) from the steering knuckle (6) with Ball Joint Remover (special tool #9360, Remover, Ball Joint) (5).

Fig. 40: Identifying Control Arm, Pivot Bolts, & Flag Nuts
Courtesy of CHRYSLER GROUP, LLC

8. Remove the control arm pivot bolts (3) and flag nuts (2) remove control arm (1).

INSTALLATION

INSTALLATION

Fig. 41: Identifying Control Arm, Pivot Bolts, & Flag Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position the control arm (1) into the frame brackets. Install bolt (3) and nut (2), and tighten to specifications. Refer to **SPECIFICATIONS**. .

Fig. 42: Steering Knuckle & Upper Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

2. Insert the ball joint in the steering knuckle (3) and tighten the upper ball joint nut (2) to specifications. Refer to **SPECIFICATIONS**. .
3. Install the rotor to the hub.
4. Install the disc brake caliper and adapter to the knuckle. Refer to **ADAPTER, DISC BRAKE CALIPER, INSTALLATION** .
5. Install the wheel speed sensor wire to the upper control arm.
6. Install the wheel and tire assembly. Refer to **WHEELS, STANDARD PROCEDURE** .
7. Remove the support and lower vehicle.
8. Perform a wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

BALL JOINT, SUSPENSION, LOWER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LOWER BALL JOINT - INDEPENDENT FRONT SUSPENSION

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

NOTE: **When using floor stands on aluminum control arms a wood block or similar should be placed between the stand and the control arm.**

2. Place safety floor stands under both lower control arms as far outboard as possible. Lower the vehicle to allow the stands to support some or all of the vehicle weight.
3. Mount a dial indicator solidly to the topside of the lower control arm.

NOTE: **The dial indicator plunger must be perpendicular to the machined surface of the steering knuckle.**

4. Position the indicator plunger against the bottom surface of the steering knuckle and then zero the dial indicator.
5. Position a pry bar under the tire assembly. Pry upwards on the tire assembly.

NOTE: **On the 4x4 replacement of the lower ball joint is not recommended. If the ball joint movement exceeds specifications, replacement of the lower control arm is necessary.**

6. If the travel exceeds 0.5 mm (0.020 in.), replace the lower ball joint. **For 4x2** . Refer to **BALL JOINT, SUSPENSION, LOWER, REMOVAL**. **For 4x4** . Refer to **ARM, LOWER CONTROL, REMOVAL**.

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the knuckle. Refer to **KNUCKLE, STEERING, REMOVAL**.

Fig. 43: Lower Ball Joint Removal
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

3. Press the ball joint from the lower control arm using Ball Joint Press (special tool #C-4212F, Press, Ball

Joint) (PRESS) (1), Remover/Installer (special tool #8836-6, Remover, Bushing) (DRIVER) (2) and Ball Joint Remover/Installer (special tool #8698-2, Remover, Receiver Cup) (RECEIVER) (3).

INSTALLATION

INSTALLATION

Fig. 44: Installing Lower Ball Joint
Courtesy of CHRYSLER GROUP, LLC

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

1. Install the ball joint (4) into the control arm (3) and press in using Ball Joint Press C-4212F (press) (1), Ball Joint Remover/Installer (special tool #8698-3, Remover/Installer) (driver) (2) and Ball Joint Remover/Installer (special tool #8698-1, Installer, Ball Joint) (receiver) (5).
2. Stake the ball joint flange in four evenly spaced places around the ball joint flange, using a punch and hammer.
3. Install the steering knuckle. Refer to **KNUCKLE, STEERING, INSTALLATION**.
4. Install the tie rod end into the steering knuckle. Refer to **END, TIE ROD, INSTALLATION** .
5. Install the brake caliper and rotor. Refer to **ROTOR, BRAKE, INSTALLATION** .
6. Install the tire and wheel assembly. Refer to **WHEELS, STANDARD PROCEDURE** .
7. Check the vehicle ride height. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.
8. Perform a wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

BALL JOINT, SUSPENSION, UPPER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - UPPER BALL JOINT - INDEPENDENT FRONT SUSPENSION

1. Raise the front of the vehicle. Place safety floor stands under both lower control arms as far outboard as possible. Lower the vehicle to allow the stands to support some or all of the vehicle weight.
2. Remove the front tires.

NOTE: The dial indicator plunger must be perpendicular to the machined surface of the ball joint.

3. Mount a dial indicator solidly to the frame.

NOTE: Use care not to pry or tear the ball joint boot (5), when checking the free play.

4. Position dial indicator plunger on the topside of the upper ball joint and then zero the dial indicator.
5. Position a pry bar between the steering knuckle and the upper control arm. Pry upwards on the upper control arm.
6. If the travel exceeds 0.5 mm (0.020 in.), replace the upper ball joint. Refer to **BALL JOINT, SUSPENSION, UPPER, REMOVAL**.
7. If the upper ball joint is within specs reinstall the front tires. Refer to **WHEELS, STANDARD PROCEDURE** .

REMOVAL

REMOVAL

Fig. 45: Separating Upper Ball Joint From Knuckle
Courtesy of CHRYSLER GROUP, LLC

1. Raise vehicle and support the vehicle.

2. Remove the tire and wheel.
3. Remove the upper ball joint retaining nut.
4. Separate the upper ball joint (4) from the knuckle (6) using Ball Joint Remover (special tool #9360, Remover, Ball Joint) (5).
5. Remove the wheel speed sensor wire from the upper control arm.
6. Move the knuckle out of the way for access to remove the ball joint.
7. Remove the ball joint boot.

NOTE: It may be necessary to install a block of wood between the control arm and frame bracket to allow clearance for the ball joint press tool.

Fig. 46: Removing Upper Ball Joint
Courtesy of CHRYSLER GROUP, LLC

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

8. Remove the ball joint (4) from the upper control arm (3) using Ball Joint Press (special tool #C-4212F, Press, Ball Joint) (1), Ball Joint Remover (special tool #9770-1, Receiver, Ball Joint) (2) and Ball Joint Remover (special tool #9770-2, Remover, Ball Joint) (5).

INSTALLATION

INSTALLATION

Fig. 47: Installing Upper Ball Joint
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

1. Install the ball joint (3) into the upper control arm (4) and press in using Ball Joint Press (special tool #C-4212F, Press, Ball Joint) (1), Ball Joint Installer (special tool #9652, Remover/Installer, Ball Joint) (2) and Installer (special tool #8445-1, Installer, Cup) (5).
2. Install the upper ball joint into the knuckle.
3. Install the upper ball joint retaining nut and tighten to specifications. Refer to **SPECIFICATIONS**. .
4. Install the wheel speed sensor wire to the upper control arm.
5. Install the tire and wheel.
6. Remove the supports and lower the vehicle.
7. Perform a wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

HUB AND BEARING

REMOVAL

4X2

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the brake caliper and rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

Fig. 48: Hub/Bearing 4X2
Courtesy of CHRYSLER GROUP, LLC

1 - HUB/BEARING
2 - DUST SHIELD
3 - STEERING KNUCKLE
4 - WHEEL SPEED SENSOR WIRE
5 - HUB/BEARING MOUNTING BOLT

4. Remove the ABS wheel speed sensor if equipped (4). Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
5. Remove the three hub/bearing mounting bolts (5) from the steering knuckle (3).
6. Slide the hub/bearing (1) out of the steering knuckle (3).
7. Remove the brake dust shield (2).

4X4

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the brake caliper and rotor. Refer to **ROTOR, BRAKE, REMOVAL** .
4. Remove the ABS wheel speed sensor if equipped. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
5. Remove the halfshaft nut.

NOTE: **Do not strike the knuckle with a hammer to remove the tie rod end or the ball joint. Damage to the steering knuckle will occur.**

6. Remove the tie rod end nut and separate the tie rod from the knuckle using Ball Joint Remover (special tool #9360, Remover, Ball Joint).
7. Remove the upper ball joint nut and separate the upper ball joint from the knuckle using Ball Joint

Remover (special tool #9360, Remover, Ball Joint).

Fig. 49: Half Shaft & Hub/Bearing
Courtesy of CHRYSLER GROUP, LLC

8. Pull down on the steering knuckle to separate the halfshaft (2) from the hub/bearing.
9. Remove the three hub/bearing mounting bolts (1) from the steering knuckle.
10. Slide the hub/bearing out of the steering knuckle.
11. Remove the brake dust shield.

INSTALLATION

4X2

1. Install the brake dust shield (2).
2. Install the hub/bearing (1) into the steering knuckle (3) and tighten the bolts to specifications. Refer to **SPECIFICATIONS**. .
3. Install the brake rotor and caliper. Refer to **ROTOR, BRAKE, INSTALLATION** .
4. Install the ABS wheel speed sensor if equipped. Refer to **SENSOR, WHEEL SPEED, FRONT,**

INSTALLATION .

5. Install the upper ball joint nut to the steering knuckle and tighten to specifications. Refer to **SPECIFICATIONS**. .
6. Install the tie rod end nut to the steering knuckle and tighten to specifications. Refer to **SPECIFICATIONS**. .
7. Install the halfshaft nut and tighten to specifications. Refer to **SPECIFICATIONS**. .
8. Install the wheel and tire assembly. Refer to **WHEELS, STANDARD PROCEDURE** .
9. Remove the support and lower vehicle.

KNUCKLE, STEERING

DESCRIPTION

DESCRIPTION

Fig. 52: Steering Knuckle, Lower Control Arm, Shock & Spring
Courtesy of CHRYSLER GROUP, LLC

The knuckle (1) is a single casting with legs machined for the upper and lower ball joints. The knuckle also has machined mounting locations for the front brake calipers and hub bearing.

OPERATION

OPERATION

The steering knuckle pivot between the upper and lower ball joint. Steering linkage attached to the knuckle allows the vehicle to be steered.

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel and tire assembly.
3. Remove the ABS wheel speed sensor, disconnecting the electrical harness as necessary to remove knuckle. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .

Fig. 53: Removing Outer Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

4. Remove the tie rod end nut from the ball stud.
5. Separate the tie rod ball stud (1) from the knuckle with Ball Joint Remover (special tool #9360, Remover, Ball Joint) (2).
6. Remove the halfshaft nut (4X4 only).

Fig. 54: Separating Upper Ball Joint From Knuckle
Courtesy of CHRYSLER GROUP, LLC

7. Remove the upper ball joint nut. Separate the ball joint (4) from the knuckle (6) with Ball Joint Remover (special tool #9360, Remover, Ball Joint) (5)

Fig. 55: Separating Ball Joint From Steering Knuckle
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING KNUCKLE
2 - SPECIAL TOOL 8677

CAUTION: When installing puller (special tool #8677, Remover, Ball Joint) to separate the ball joint, be careful not to damage the ball joint seal.

8. Support the outboard side of the lower control arm to support vehicle weight.

9. Remove the lower ball joint nut. Separate the ball joint from the knuckle with Ball Joint Remover (special tool #8677, Remover, Ball Joint) (2).

Fig. 56: Steering Knuckle, Lower Control Arm, Shock & Spring
Courtesy of CHRYSLER GROUP, LLC

10. Remove the steering knuckle (1) from the vehicle.
11. If required, remove the hub/bearing and dust shield from the knuckle (1).
    a. Remove the three hub/bearing mounting bolts from the steering knuckle (1).
    b. Slide the hub/bearing out of the steering knuckle (1).
    c. Remove the brake dust shield.

INSTALLATION

INSTALLATION

NOTE: All views are typical.

Fig. 57: Steering Knuckle, Lower Control Arm, Shock & Spring
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The ball joint stud tapers must be CLEAN and DRY before installing the knuckle. Clean the stud tapers with a clean cloth to remove dirt and grease.

NOTE: When installing hub/bearing with ABS brakes, position the speed sensor opening towards the front of the vehicle.

1. Install the brake dust shield and hub/bearing to the steering knuckle (1) and tighten the 3 bolts to specifications. Refer to **SPECIFICATIONS**. .
2. Install the knuckle (1) onto the upper and lower ball joints.
3. Install the upper and lower ball joint nuts and tighten to specifications. Refer to **SPECIFICATIONS**. .
4. Remove the hydraulic jack from the lower control arm (4).

Fig. 58: Locating Grease & Tie Rod End Boot
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If a new tie rod end is to be installed, make sure the boot (2) is properly lubricated.**

5. Clean all old grease and debris from the boot (2) with a clean cloth.
6. Apply outer tie rod grease P/N 68088623AA (1) to the tie rod end boot (2).
7. Install the tie rod end and tighten the nut to specifications. Refer to **SPECIFICATIONS**. .
8. Install the front halfshaft into the hub/bearing (if equipped).
9. Install the halfshaft nut (if equipped) and tighten to specifications. Refer to **SPECIFICATIONS**. .
10. Install the ABS wheel speed sensor (if equipped) and brake shield, rotor and caliper. Refer to **SENSOR, WHEEL SPEED, FRONT, INSTALLATION** and **ROTOR, BRAKE, INSTALLATION** .
11. Install the wheel and tire assembly. Refer to **WHEELS, STANDARD PROCEDURE** .
12. Remove the support and lower the vehicle.
13. Perform a wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

LINK, STABILIZER BAR

REMOVAL

REMOVAL

NOTE: **4X4 shown in illustration, 4x2 similar.**

Fig. 59: Stabilizer Bar, Grommets, Mounting Bolts, Retainers & Bushings
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It may be necessary to remove the other stabilizer link upper nut (4) in order to remove the link (5) being worked on from the vehicle.**

1. Raise and support the vehicle.
2. Remove the lower nut (6).
3. Remove the upper nut, retainers and grommets (4).
4. Remove the stabilizer link (5) from the vehicle.

INSTALLATION

INSTALLATION

NOTE: **4X4 shown in illustration, 4x2 similar.**

Fig. 60: Stabilizer Bar, Grommets, Mounting Bolts, Retainers & Bushings
Courtesy of CHRYSLER GROUP, LLC

1. Install the stabilizer link (5) to the vehicle.
2. Install the lower nut (6) and tighten to specifications. Refer to **SPECIFICATIONS**. .
3. Install the retainers, grommets and upper nut (4) and tighten to specifications. Refer to **SPECIFICATIONS**. .
4. Remove the support and lower the vehicle.

SHOCK ABSORBER, SUSPENSION

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SHOCK ABSORBER

A knocking or rattling noise from a shock absorber may be caused by movement between mounting bushings and metal brackets or attaching components. These noises can usually be stopped by tightening the attaching nuts. If the noise persists, inspect for damaged and worn bushings, and attaching components. Repair as necessary if any of these conditions exist.

WARNING: **The shock absorbers are under high pressure. Do Not heat or attempt to open the shock absorbers.**

A squeal noise from the shock absorber may be caused by the hydraulic valving and may be intermittent. This condition is not repairable and the shock absorber must be replaced.

A squeak or creak noise coming from the shock area may be related to any of the suspension components or mounts, but not necessarily the shock.

NOTE: **When inspecting the shock absorber, do not clamp the body or the piston rod.**

NOTE: **Monotube shock absorber compression forces will be much higher than standard shock absorbers.**

The shock absorbers are not refillable or adjustable. If a malfunction occurs, the shock absorber must be replaced. To check a shock absorber, grasp the tube and invert the shock so the piston rod touches the ground, then compress the shock four or five times. The action throughout each stroke should be smooth and even, and the piston rod should extend from the shock on its own.

The shock absorber bushings do not require any type of lubrication. Do not attempt to stop bushing noise by lubricating them. Grease and mineral oil-base lubricants will deteriorate the bushing.

REMOVAL

4X2

1. Raise and support vehicle.
2. Support the lower control arm outboard end.

Fig. 61: Shock Wrench & Grommet
Courtesy of CHRYSLER GROUP, LLC

3. Remove the upper shock absorber nut by using Strut Nut Wrench (special tool #9362, Wrench, Strut Nut) (1), retainer and grommet (2). If necessary, insert 11/32 socket though Wrench onto hex located on end of shock shaft to prevent shaft from turning.
4. Remove the lower bolts and remove the shock absorber.

4X4-COIL OVER

Fig. 62: Upper Shock Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly.
3. Support the lower control arm outboard end.
4. Remove the three upper shock nuts (1).

Fig. 63: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

5. Remove the lower shock bolt (6) and nut.
6. Remove the caliper adapter with the caliper. Refer to **ADAPTER, DISC BRAKE CALIPER,**

REMOVAL .

7. Remove the rotor. Refer to **ROTOR, BRAKE, REMOVAL** .
8. Disconnect the wheel speed sensor wiring from the knuckle and upper control arm.

Fig. 64: Separating Upper Ball Joint From Knuckle
Courtesy of CHRYSLER GROUP, LLC

9. Remove the upper ball joint retaining nut and separate the upper ball joint (4) from the knuckle (6) using Ball Joint Remover (special tool #9360, Remover, Ball Joint) (5).

Fig. 65: Shock Assembly & Stabilizer Link Lower Nut
Courtesy of CHRYSLER GROUP, LLC

10. Remove the stabilizer link lower nut (2).

11. Remove the axle hub nut.
12. Remove the shock assembly (1).

INSTALLATION

4X2

Fig. 66: Shock Wrench & Grommet
Courtesy of CHRYSLER GROUP, LLC

NOTE: Upper shock nut must be replaced or use Mopar Lock 'N Seal or Loctite® 242 on existing nut.

1. Install the lower retainer and grommet on the shock absorber stud. Insert the shock absorber through the frame bracket hole.
2. Install the lower bolts and tighten the bolts to specifications. Refer to **SPECIFICATIONS**. .
3. Install the upper grommet, retainer (2) and new nut or use Mopar Lock 'N Seal or Loctite® 242 on existing nut, on the shock absorber stud. Using Strut Nut Wrench (special tool #9362, Wrench, Strut Nut) (1), tighten nut to specifications. Refer to **SPECIFICATIONS**. .
4. Remove the support from the lower control arm outboard end.
5. Remove the support and lower the vehicle.

4X4-COIL OVER

NOTE: All suspension components should be tighten with the weight of the vehicle on them (curb height).

Fig. 67: Shock Assembly & Stabilizer Link Lower Nut
Courtesy of CHRYSLER GROUP, LLC

1. Install the shock (1) back in place in the vehicle.

Fig. 68: Upper Shock Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Install the upper part of the shock (2) into the frame bracket (3).
3. Install the upper nuts (1) and tighten to specifications. Refer to **SPECIFICATIONS**. .

Fig. 69: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

4. Install the lower part of the shock (5) into the lower control arm shock bushing (7).
5. Install and position bolt (6) so head of bolt is facing rearward of vehicle and hand start nut. Tighten the bolt (6) and nut to specifications. Refer to **SPECIFICATIONS**. .
6. Install the upper ball joint to the knuckle and install the retaining nut and tighten to specifications. Refer to **SPECIFICATIONS**. .
7. Install the axle hub nut and tighten to specifications. Refer to **SPECIFICATIONS**. .
8. Install the stabilizer link lower nut and tighten to specifications. Refer to **SPECIFICATIONS**. .
9. Reconnect the wheel speed sensor wiring to the knuckle and upper control arm.
10. Install the rotor. Refer to **ROTOR, BRAKE, INSTALLATION** .
11. Install the caliper adapter with the caliper. Refer to **ADAPTER, DISC BRAKE CALIPER, INSTALLATION** .
12. Remove the support from the lower control arm outboard end.
13. Install the tire and wheel assembly. Refer to **WHEELS, STANDARD PROCEDURE** .
14. Remove the support and lower the vehicle.

SPRING, FRONT COIL

REMOVAL

4X2

Fig. 70: Coil Spring
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the front wheel and tire assembly.
3. Support the lower control arm (4) at the outboard side of the lower control arm to support vehicle weight.
4. Remove the shock absorber (5). Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL**.

Fig. 71: Coil Spring Compressor Tool
Courtesy of CHRYSLER GROUP, LLC

5. Install Front Spring Compressor (special tool #DD-1278, Compressor, Front Spring) (3) up through the lower suspension arm, coil spring and shock hole in the frame. The bell-shaped adapter (3) goes against the lower suspension arm. Install the nut on top of the tool at the shock hole.
6. Tighten the spring compressor nut against bell-shaped adapter finger tight then loosen 1/2 turn.

NOTE: **This will hold the spring in place until the lower suspension arm is separated from the steering knuckle.**

Fig. 72: Coil Spring Tool Support
Courtesy of CHRYSLER GROUP, LLC

7. Remove the steering knuckle. Refer to **KNUCKLE, STEERING, REMOVAL**.
8. Remove the stabilizer link. Refer to **LINK, STABILIZER BAR, REMOVAL**.
9. Remove the lower control arm support.
10. Tighten the spring compressor tool (2) to collapse the coil spring.

NOTE: **It may necessary to loosen the control arm pivot bolt to allow downward swing.**

11. Loosen the tension on the spring compressor tool (2) slowly allowing the lower suspension arm to pivot downward.
12. Remove the spring compressor tool (2).
13. Remove coil spring (1) and isolator pad from the vehicle.

Fig. 73: Shock Assembly & Stabilizer Link Lower Nut
Courtesy of CHRYSLER GROUP, LLC

1. Remove the shock (1). Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL**.

Fig. 74: Shock Assembly & Spring Compressor Tool
Courtesy of CHRYSLER GROUP, LLC

2. Install the shock assembly (3) in the Branick 7200® spring removal/installation tool or equivalent (1).
3. Compress the spring (2).

Fig. 75: Strut Nut Wrench 9362
Courtesy of CHRYSLER GROUP, LLC

4. Position Strut Nut Wrench (special tool #9362, Wrench, Strut Nut) (1), on shock shaft retaining nut. Next, insert 8 mm socket though Wrench onto hex located on end of shock shaft. While holding shock shaft from turning, remove nut from shock shaft using Wrench (1).
5. Remove the upper shock nut.

Fig. 76: Upper Spring Isolator
Courtesy of CHRYSLER GROUP, LLC

6. Remove the shock upper mounting plate.
7. Remove the dust cover.

8. Remove and inspect the upper spring isolator (2).
9. Remove the shock.

INSTALLATION

4X2

1. Tape the isolator pad to the top of the coil spring. Position the spring in the lower suspension arm well. Be sure that the coil spring is seated in the well.

Fig. 77: Coil Spring Tool Support
Courtesy of CHRYSLER GROUP, LLC

2. Install Front Spring Compressor (special tool #DD-1278, Compressor, Front Spring) (2) up through the lower suspension arm, coil spring and shock hole in the frame.
3. Tighten the tool nut to compress the coil spring.

Fig. 78: Coil Spring Compressor Tool
Courtesy of CHRYSLER GROUP, LLC

4. Install the steering knuckle. Refer to **KNUCKLE, STEERING, INSTALLATION**.
5. Install the retaining nut on the upper ball joint and tighten to specifications. Refer to **SPECIFICATIONS**. .
6. Remove the spring compressor tool.
7. Support the lower control arm at the outboard side of the lower control arm to support vehicle weight.
8. Install the shock absorber. Refer to **SHOCK ABSORBER, SUSPENSION, INSTALLATION**.
9. Install the stabilizer link. Refer to **LINK, STABILIZER BAR, INSTALLATION**.
10. Remove the lower control arm support.
11. Install the wheel and tire assembly. Refer to **WHEELS, STANDARD PROCEDURE** .
12. remove the support and lower the vehicle to the floor with vehicle weight. Tighten the front and rear control arm frame pivot bolts if loosened to specifications. Refer to **SPECIFICATIONS**. .
13. Perform a wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

4X4-COIL OVER

Fig. 79: Upper Spring Isolator
Courtesy of CHRYSLER GROUP, LLC

1. Position the shock (1) into the coil spring (3).
2. Install the upper isolator (2).

Fig. 80: Strut Nut Wrench 9362
Courtesy of CHRYSLER GROUP, LLC

3. Install the dust cover.
4. Install the upper shock mounting plate (2).
5. Install the shock upper mounting nut.
6. Install Strut Nut Wrench (special tool #9362, Wrench, Strut Nut) (1) (on end of a torque wrench), on

shock shaft retaining nut. Next, insert 8 mm socket though Wrench onto hex located on end of shock shaft. While holding shock shaft from turning, tighten nut to specifications. Refer to **SPECIFICATIONS**. .

Fig. 81: Shock Assembly & Spring Compressor Tool
Courtesy of CHRYSLER GROUP, LLC

7. Decompress the spring (2).
8. Remove the shock assembly from the spring compressor tool (1).

Fig. 82: Shock Assembly & Stabilizer Link Lower Nut
Courtesy of CHRYSLER GROUP, LLC

9. Install the shock assembly (1). Refer to **SHOCK ABSORBER, SUSPENSION, INSTALLATION**.

STABILIZER BAR, FRONT

DESCRIPTION

DESCRIPTION

Fig. 83: Stabilizer Bar/Links & Lower Control Arms
Courtesy of CHRYSLER GROUP, LLC

The stabilizer bar (4) extends across the front underside of the chassis and connects to the frame crossmember. The ends of the bar mount to the stabilizer links (2), The stabilizer links (2) are then connected to the lower control arms (5). All mounting points of the stabilizer bar (4) are isolated by bushings.

OPERATION

OPERATION

The stabilizer bar is used to minimize vehicle front sway during turns. The bar helps to maintain a flat attitude to the road surface.

REMOVAL

REMOVAL

Fig. 84: Stabilizer Bar, Grommets, Mounting Bolts, Retainers & Bushings
Courtesy of CHRYSLER GROUP, LLC

NOTE: To service the stabilizer bar the vehicle should be on a drive on hoist. The vehicle suspension must be at curb height for stabilizer bar installation.

1. Remove the stabilizer bar link upper nuts and remove the retainers and grommets (4).
2. Remove the stabilizer bar mounting bolts (1) **and discard the mounting bolts** .
3. Remove the retainers (7) from the frame crossmember and remove the bar (3).
4. If necessary, remove the bushings (2) from the stabilizer bar (3), **Do not cut the old bushings off the stabilizer bar use a mixture of soapy water in order to aid in sliding the bushing off** .

INSTALLATION

INSTALLATION

NOTE: To service the stabilizer bar the vehicle must be on a drive on hoist. The vehicle suspension must be at curb height for stabilizer bar installation.

1. If the bushings were removed, Clean the bar and install the bushings on the stabilizer bar using a mixture of soapy water or equivalent in order to slide the bushing over the bar with ease. **Do not cut the new bushing for installation.**

Fig. 85: Stabilizer Bar/Links & Lower Control Arms
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Install new mounting bolts Do not reuse old bolts.**

NOTE: **Check the alignment of the bar to ensure there is no interference with the either frame rail or chassis component. Spacing should be equal on both sides.**

2. Position the stabilizer bar (4) on the frame crossmember brackets and install the bracket (3) bolts finger-tight.

Fig. 86: Stabilizer Bar, Grommets, Mounting Bolts, Retainers & Bushings

3. Install the stabilizer bar (3) to the stabilizer link (5) and install the grommets and retainers.
4. Install the nuts (4) to the stabilizer link (3) and tighten to specifications. Refer to **SPECIFICATIONS**. .
5. Tighten the brackets to the frame to specifications. Refer to **SPECIFICATIONS**. .

FRONT, LINK AND COIL

SPECIFICATIONS

SPECIFICATIONS

NOTE: **Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.**

ACTUATOR, STABILIZER BAR

DESCRIPTION

DESCRIPTION

Fig. 87: Identifying Stabilizer Bar Actuator
Courtesy of CHRYSLER GROUP, LLC

The actuator (1) is a motor driven unit that engages and disengages the disconnecting stabilizer bar (4).

This system allows greater front suspension travel in off-road situations. It consists of a disconnecting unit (3), electronic actuator (1), stabilizer bar (4).

REMOVAL

REMOVAL

Fig. 88: Identifying Stabilizer Bar Actuator
Courtesy of CHRYSLER GROUP, LLC

WARNING: The disconnecting stabilizer bar unit (3) is not serviced separately from the bar (4). Do not disassemble this unit from the stabilizer bar.

1. Raise and support the vehicle.

NOTE: Before removing the connector from the actuator (1) clean the outside of the connector with a cleaner and compressed air, to remove any dirt or debris.

2. Disconnect the electronic actuator electrical connector for the disconnecting stabilizer bar.
3. Remove the 3 actuator bolts (2) then remove the actuator (1).

INSTALLATION

INSTALLATION

Fig. 89: Identifying Stabilizer Bar Actuator
Courtesy of CHRYSLER GROUP, LLC

WARNING: The disconnecting stabilizer bar unit (3) is not serviced separately from the bar (4). Do not disassemble this unit from the stabilizer bar.

1. Install the actuator (1) to the disconnecting unit (3) and tighten the bolts (2) to specifications. Refer to **SPECIFICATIONS**. .

NOTE: **The seal must be clean and intact in the electrical connector when reconnecting to the actuator (1).**

2. Reconnect the electronic actuator electrical connector for the disconnecting stabilizer bar.
3. Remove the supports and lower the vehicle.
4. Using a scan tool program the new stabilizer bar to the vehicle.

ARM, LOWER CONTROL

REMOVAL

REMOVAL

Fig. 90: Adjustment Cam
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Paint or scribe alignment marks on the cam adjusters (1) and control arm (4) for installation reference.

Fig. 91: Identifying Axle, Frame Rail Bracket, & Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Discard the nuts and bolts and do not reuse, New nuts and bolts should be used when replacing or servicing the control arms.**

3. Remove the lower control arm nut, cam and cam bolt from the axle (3).
4. Remove the nut and bolt from the frame rail bracket (1) and remove the lower control arm (2).

INSTALLATION

INSTALLATION

Fig. 92: Identifying Axle, Frame Rail Bracket, & Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Discard the nuts and bolts and do not reuse. New nuts and bolts should be used when replacing or servicing the control arms.**

1. Position the lower control arm (2) at the axle bracket (3) and frame rail bracket (1).
2. Install the rear bolt and finger tighten the nut.

Fig. 93: Adjustment Cam
Courtesy of CHRYSLER GROUP, LLC

3. Install the cam bolt (1), cam and nut in the axle and align the reference marks.
4. Remove support and lower the vehicle.
5. Tighten cam nut at the axle bracket and the rear nut at the frame bracket to specifications. Refer to **SPECIFICATIONS**. .

5. Install the exhaust system back into place.
6. Reconnect the rubber exhaust mounts.
7. Reconnect the exhaust (2) at the manifold(s) (1).
8. Reconnect the exhaust bracket (4) at the transmission.
9. Remove the supports and lower the vehicle.

BALL JOINT, SUSPENSION, LOWER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LOWER BALL JOINT - LINK AND COIL

To properly diagnose the lower ball joint two readings from the dial indicator are necessary, The two readings must be added together to find a total ball joint movement as identified in the steps below.

NOTE: All views typical.

1. Raise and support the vehicle.

Fig. 100: Dial Indicator Position
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING KNUCKLE
2 - DIAL INDICATOR

2. Attach a dial indicator (2) with the indicator resting on the flat part of the steering knuckle (1) by the lower ball stud.
3. Set the dial indicator (2) to zero.

Fig. 101: Prying Between Knuckle & Axle Tube Yoke Next To Upper Ball Joint
Courtesy of CHRYSLER GROUP, LLC

1 - PRY BAR
2 - UPPER BALL JOINT
3 - GREASE SEAL
4 - STEERING KNUCKLE

NOTE: Use care not to damage the upper ball joint grease seal (3).

4. Pry between the knuckle (4) and the axle tube yoke next to the upper ball joint (2), Record the reading on the dial indicator. **This will be the first reading** .

Fig. 102: Using A Long Prybar To Lift Knuckle Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - PRY BAR
2 - DIAL INDICATOR

3 - JACK STAND

5. Set the dial indicator (2) back to zero.
6. Set up a jack stand (3) and use a long pry bar (1) to lift the knuckle assembly.

Fig. 103: Prying Upward On Flat Part Of Steering Knuckle Next To Ball Joint Stud & Nut
Courtesy of CHRYSLER GROUP, LLC

1 - PRY BAR
2 - UPPER BALL JOINT
3 - AXLE YOKE
4 - GREASE SEAL
5 - STEERING KNUCKLE

7. Pry upwards on the flat part of the steering knuckle (5) next to the ball joint stud and nut (2) using the jack stand as leverage. Record the reading on the dial indicator. **This will be the second reading** .
8. Add the two reading together for a total lower ball joint movement, If this reading is above 2.29 mm (0.090 in) then replacement of the lower ball joint is necessary. Refer to **BALL JOINT, SUSPENSION, LOWER, REMOVAL**.

REMOVAL

2500, 3500

Fig. 104: Lower Snap Ring
Courtesy of CHRYSLER GROUP, LLC

1. Remove the steering knuckle. Refer to **KNUCKLE, STEERING, REMOVAL**.
2. Remove the axle shaft from the axle. Refer to **REMOVAL** or **REMOVAL** .
3. Remove lower snap ring from the lower ball joint.

Fig. 105: Removing Lower Ball Joint

2 - SPECIAL TOOL 8975-1
3 - BALL JOINT
4 - KNUCKLE
5 - SPECIAL TOOL 8975-3

1. Position Ball Joint Remover/Installer (special tool #8975-1, Installer, Ball Joint) (DRIVER) (2) and Ball Joint Remover/Installer (special tool #8975-3, Cup, Remover) (RECEIVER) (5) with Ball Joint Press (special tool #C-4212F, Press, Ball Joint) (1) as shown in illustration to install lower ball stud (3).
2. Install the axle shaft into the axle. Refer to **INSTALLATION** or **INSTALLATION** .
3. Install the steering knuckle. Refer to **KNUCKLE, STEERING, INSTALLATION**.

4500 AND 5500

Fig. 108: Installing Lower Ball Stud
Courtesy of CHRYSLER GROUP, LLC

1. Position special tool (special tool #9859-1, Cup, Installation) (DRIVER) (5) and (special tool #9859-2, Base, Pressing) (RECEIVER) (2) with (special tool #C-4212F, Press, Ball Joint) (PRESS) (1) as shown in illustration to install lower ball stud (4).
2. Install the steering knuckle. Refer to **KNUCKLE, STEERING, INSTALLATION**.
3. Install the axle shaft into the axle.

BALL JOINT, SUSPENSION, UPPER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - UPPER BALL JOINT - LINK AND COIL

To properly diagnose the upper ball joint two readings from the dial indicator are necessary, The two readings must be added together to find a total ball joint movement as identified in the steps below.

1. Raise and support the vehicle.

NOTE: All views typical.

Fig. 109: Upper Ball Joint Movement
Courtesy of CHRYSLER GROUP, LLC

1 - UPPER BALL JOINT
2 - AXLE YOKE
3 - DIAL INDICATOR
4 - STEERING KNUCKLE FLAT

2. Attach a dial indicator (3) with the indicator resting on either the front or back sides of the steering knuckle (4) as close to the upper ball joint (1) as possible.
3. Set the dial indicator (3) to zero.
4. Grab the tire by pushing in on the top of the tire and pulling out on the bottom of the tire. Record the reading on the dial indicator (3). **This will be the first reading** .
5. Set the dial indicator (3) back to zero.
6. Grab the tire by pulling in on the top of the tire and pushing out on the bottom of the tire. Record the reading on the dial indicator (3). **This will be the second reading** .
7. Add the two readings together for a total upper ball joint movement. If this reading is above 1.52 mm (0.060 in) then replacement of the upper ball joint is necessary. Refer to **BALL JOINT, SUSPENSION, UPPER, REMOVAL**.

REMOVAL

2500, 3500

Fig. 110: Upper Ball Joint Removal
Courtesy of CHRYSLER GROUP, LLC

1 - SPECIAL TOOL C4212F
2 - SPECIAL TOOL 6761
3 - KNUCKLE
4 - SPECIAL TOOL 8445-3

1. Remove the steering knuckle. Refer to **KNUCKLE, STEERING, REMOVAL**.
2. Remove the axle shaft from the axle. Refer to **REMOVAL** or **REMOVAL** .
3. Position Ball Joint Installer (special tool #6761, Installer, Ball Joint) (RECEIVER) (2) and Remover/ Installer (special tool #8445-3, Remover, Ball Joint) (DRIVER) (4) with Ball Joint Press (special tool #C-4212F, Press, Ball Joint) (1) as shown in illustration to remove upper ball stud.

4500 AND 5500

NOTE: The upper ball joints screw in and out (they are not pressed in).

Fig. 111: Upper Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

1. Remove the wheel and tire assembly.
2. Support the lower part of the steering knuckle.
3. Remove the upper ball joint nut (1).

Fig. 112: Upper Ball Joint & Wheel Speed Sensor Wire Bracket
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the wheel speed sensor wire from the bracket (3).
5. Install a 60 mm socket (1) and unscrew the upper ball joint (2) from the steering knuckle.
6. Remove the wheels speed sensor wire bracket (3).

INSTALLATION

2500, 3500

Fig. 113: Installing Upper Ball Joint
Courtesy of CHRYSLER GROUP, LLC

1 - SPECIAL TOOL C4212-F
2 - SPECIAL TOOL 8445-2
3 - BALL JOINT
4 - KNUCKLE
5 - SPECIAL TOOL 8975-5

1. Position Remover/ Installer (special tool #8445-2, Installer, Cup) (DRIVER) (2) and Ball Joint Remover/Installer (special tool #8975-5, Receiver, Ball Joint) (RECEIVER) (5) with Ball Joint Press (special tool #C-4212F, Press, Ball Joint) (1) as shown in illustration to install upper ball stud (3).
2. Install the axle shaft into the axle. Refer to **INSTALLATION** or **INSTALLATION** .
3. Install the steering knuckle. Refer to **KNUCKLE, STEERING, INSTALLATION**.

4500 AND 5500

Fig. 114: Upper Ball Joint & Wheel Speed Sensor Wire Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Install the wheel speed sensor bracket (3) to the upper ball joint (2).
2. Screw the upper ball joint (2) into the steering knuckle and tighten to specifications. Refer to **SPECIFICATIONS**. .
3. Reconnect the wheel speed sensor wire into the bracket (3).

Fig. 115: Upper Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

4. Install the upper ball joint mounting nut and tighten to specifications. Refer to **SPECIFICATIONS**. .
5. Remove the support from the steering knuckle.
6. Install the tire and wheel assembly.

HUB AND BEARING

REMOVAL

2500, 3500

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.

Fig. 116: Hub Extension
Courtesy of CHRYSLER GROUP, LLC

3. Remove the hub extension (1) mounting nuts and remove the extension from the rotor if equipped.

Fig. 117: Hub Nut Cotter Pin
Courtesy of CHRYSLER GROUP, LLC

4. Remove the brake caliper. Refer to **CALIPER, DISC BRAKE, REMOVAL** .
5. Remove the cotter pin (2) and the hub nut (1) from the axle shaft.
6. Remove the caliper adapter. Refer to **ADAPTER, DISC BRAKE CALIPER, REMOVAL** .
7. Remove the disc brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .
8. Disconnect the wheel speed sensor wire.

9. Remove the hub/bearing 4 mounting bolts and remove the hub/bearing.

4500 AND 5500

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the brake caliper. Refer to **CALIPER, DISC BRAKE, REMOVAL** .
4. Remove the caliper adapter. Refer to **ADAPTER, DISC BRAKE CALIPER, REMOVAL** .

Fig. 118: Disc Brake Rotor, Hub Extension & Axle Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

5. Remove the hub extension (2) and disc brake rotor (1). Refer to **ROTOR, BRAKE, REMOVAL** .
6. Remove the axle shaft nut (3) from the axle shaft.

Fig. 119: Wheel Speed Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the wheel speed sensor wire and remove the wheel speed sensor bolt (1) from the hub/bearing then remove the sensor (2).

Fig. 120: Hub/Bearing Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Remove the hub/bearing 4 mounting bolts (1) and remove the hub/bearing.

INSTALLATION

2500, 3500

Fig. 121: Brake Shield
Courtesy of CHRYSLER GROUP, LLC

1. Position the brake shield (1) on bolts.
2. Install the hub/bearing to the knuckle and tighten the hub/bearing bolts (2) to specifications. Refer to **SPECIFICATIONS**. .
3. Install the hub nut and tighten to specifications. Refer to **SPECIFICATIONS**. .
4. Install the wheel speed sensor to the hub. Refer to **SENSOR, WHEEL SPEED, FRONT, INSTALLATION** .
5. Install the disc brake rotor. Refer to **ROTOR, BRAKE, INSTALLATION** .
6. Install the brake caliper adapter with the caliper. Refer to **ADAPTER, DISC BRAKE CALIPER, INSTALLATION** .
7. If equipped, install the hub extension and nuts to the front rotor and tighten nuts to specifications. Refer to **SPECIFICATIONS**. .
8. Install the wheel and tire assemblies. Refer to **WHEELS, STANDARD PROCEDURE** .
9. Remove the support and lower the vehicle.
10. Apply the brakes several times to seat the brake shoes and caliper piston. Do not move the vehicle until a firm brake pedal is obtained.

4500 AND 5500

NOTE: **If installing a NEW hub/bearing on a 4X4 only Steps 1-3 should be followed for the correct shim size.**

Fig. 122: Measuring From Hub/Bearing Unit Crimp To Flange
Courtesy of CHRYSLER GROUP, LLC

1. Measure from the new hub/bearing unit crimp (2) to the flange (3).
2. Choose the correct shim according to the table:

HUB MEASURED	29.50 to 29.83 mm (1.16 to 1.17 in)	29, 84 to 30, 18 (1.17 to 1.18 in)	30, 19 to 30, 53 (1.18 to 1.20 in)	30, 54 to 30, 88 (1.20 to 1.21 in)	30, 89 to 31, 23 (1.21 to 1.22 in)	31, 24 to 31, 50 (1.22 to 1.23 in)
SHIM THICKNESS	7.00 mm (0.27 in)	6.65 (0.26 in)	6.30 (0.24 in)	5.95 (0.23 in)	5.60 (0.22 in)	5.25 (0.20 in)

Fig. 123: Installing Shim
Courtesy of CHRYSLER GROUP, LLC

3. Check the shim (2) on the axle shaft (3). Be sure that the shim (2) is placed with the radius side (1) to the

joint.

Fig. 124: Hub/Bearing Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the hub/bearing to the knuckle and tighten the hub/bearing bolts (1) to specifications. Refer to **SPECIFICATIONS**. .

Fig. 125: Disc Brake Rotor, Hub Extension & Axle Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

5. Install the axle nut (3) and tighten to specifications. Refer to **SPECIFICATIONS**. .

Fig. 126: Wheel Speed Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Install the wheel speed sensor 2) to the hub and tighten the bolt (1). Refer to **SENSOR, WHEEL SPEED, FRONT, INSTALLATION** .

Fig. 127: Disc Brake Rotor, Hub Extension & Axle Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

7. Install the disc brake rotor (1). Refer to **ROTOR, BRAKE, INSTALLATION** .
8. Install the hub extension (2) and nuts to the front rotor and tighten nuts to specifications. Refer to **SPECIFICATIONS**. .
9. Install the brake caliper adapter with the caliper. Refer to **ADAPTER, DISC BRAKE CALIPER, INSTALLATION** .
10. Install the wheel and tire assemblies. Refer to **WHEELS, STANDARD PROCEDURE** .

11. Remove the support and lower the vehicle.
12. Apply the brakes several times to seat the brake shoes and caliper piston. Do not move the vehicle until a firm brake pedal is obtained.

KNUCKLE, STEERING

REMOVAL

2500, 3500

1. Remove the hub bearing. Refer to **HUB AND BEARING, REMOVAL**.
2. Remove tie-rod or drag link end from the steering knuckle arm.
3. Remove the wheel speed sensor. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
4. Loosen the upper ball stud nut.**Do not remove the nut at this time.**
5. Remove the lower ball joint nut.

Fig. 128: Separating Lower Ball Joint
Courtesy of CHRYSLER GROUP, LLC

6. Separate the lower ball joint (4) using Ball Joint Press (special tool #C-4150A, Press, Ball Joint) (3).
7. Remove the upper ball joint nut.
8. Remove the steering knuckle (2).

4500 AND 5500

1. Remove tie-rod or drag link end from the steering knuckle arm.

Fig. 129: Disc Brake Caliper & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the disc brake caliper bolts (1) and the disc brake caliper (2).

Fig. 130: Disc Brake Caliper Adapter & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the disc brake caliper adapter bolts (1) and remove the adapter (2).

Fig. 131: Disc Brake Rotor, Hub Extension & Axle Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

4. Remove the disc brake rotor (1) and the hub extension (2).

Fig. 132: Wheel Speed Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Remove the wheel speed sensor (2). Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .

Fig. 133: Hub/Bearing Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the hub bearing bolts (1) and the hub/bearing. Refer to **HUB AND BEARING, REMOVAL**.

Fig. 134: Disc Brake Rotor, Hub Extension & Axle Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

7. Remove the axle shaft nut (3) if equipped.

Fig. 135: Upper Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

8. Remove the upper ball stud nut (1).

Fig. 136: Upper Ball Joint & Wheel Speed Sensor Wire Bracket
Courtesy of CHRYSLER GROUP, LLC

9. Remove the upper ball joint (2). Refer to **BALL JOINT, SUSPENSION, UPPER, REMOVAL**.

Fig. 137: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

10. Remove the lower ball joint nut (3).

Fig. 138: Separating Lower Ball Joint From Knuckle
Courtesy of CHRYSLER GROUP, LLC

11. Separate the lower ball joint (3) from the knuckle (2) using special tool (special tool #8677, Remover, Ball Joint) separator (4).
12. Remove the steering knuckle (2).

Fig. 139: Dust Shield
Courtesy of CHRYSLER GROUP, LLC

13. Remove the dust shield (2) from the knuckle if needed.

INSTALLATION

2500, 3500

1. Position the steering knuckle on the ball studs.
2. Install and tighten lower ball stud nut to **initial torque** specifications. Refer to **SPECIFICATIONS**. .
3. Install and tighten upper ball stud nut to specifications. Refer to **SPECIFICATIONS**. .
4. Re-torque lower ball stud nut to **final torque** specifications. Refer to **SPECIFICATIONS**. .
5. Install the hub bearing. Refer to **HUB AND BEARING, INSTALLATION**.
6. Install tie-rod or drag link end onto the steering knuckle arm and tighten to specifications. Refer to **SPECIFICATIONS**. .
7. Install the wheel speed sensor. Refer to **SENSOR, WHEEL SPEED, FRONT, INSTALLATION** .

4500 AND 5500

Fig. 140: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

1. Position the steering knuckle (1) on the ball stud.
2. Install and tighten the lower ball stud nut (3) to specifications. Refer to **SPECIFICATIONS**. .

Fig. 141: Upper Ball Joint & Wheel Speed Sensor Wire Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Make sure the wheel speed sensor bracket (3) for the wire is installed between the knuckle and ball joint (2).**

3. Install the upper ball joint (2) into the steering knuckle and tighten to specifications. Refer to **SPECIFICATIONS**. .

Fig. 142: Upper Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

4. Install and tighten the upper ball stud nut (1) to specifications. Refer to **SPECIFICATIONS**. .
5. Retorque the lower ball stud nut to specifications. Refer to **SPECIFICATIONS**. .

Fig. 143: Hub/Bearing Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Install the hub bearing and tighten the bolts (1) to specifications. Refer to **SPECIFICATIONS**. .

Fig. 144: Wheel Speed Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Install the wheel speed sensor (2). Refer to **SENSOR, WHEEL SPEED, FRONT, INSTALLATION** .

Fig. 145: Dust Shield
Courtesy of CHRYSLER GROUP, LLC

8. Install the dust shield (2) if removed.

Fig. 146: Disc Brake Rotor, Hub Extension & Axle Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

9. Install the disc brake rotor (1) and extension (2) to the hub/bearing.

Fig. 147: Disc Brake Caliper Adapter & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Install the disc brake caliper adapter (2) and bolts (1).

Fig. 148: Disc Brake Caliper & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the disc brake caliper (2) and tighten the bolts (1).
12. Install tie-rod or drag link end onto the steering knuckle arm.

LINK, STABILIZER BAR

REMOVAL

STABILIZER LINK

Fig. 149: Identifying Retainer, Grommet, Stabilizer Bar, Axle Bracket & Stabilizer Link
Courtesy of CHRYSLER GROUP, LLC

1 - RETAINER
2 - GROMMET
3 - STABILIZER BAR
4 - AXLE BRACKET
5 - STABILIZER LINK

1. Raise and support the vehicle.
2. Hold the stabilizer link (5) shafts with a wrench and remove the link nuts at the stabilizer bar (3).
3. Remove the retainers (1) and grommets (2) from the stabilizer bar links (5).

Fig. 150: Stabilizer Link
Courtesy of CHRYSLER GROUP, LLC

1 - PULLER
2 - LINK

4. Remove the stabilizer bar link nuts from the axle brackets.
5. Remove the links (2) from the axle brackets with Puller (special tool #C-3894-A, Puller, Tie Rod) (1). Refer to **Fig. 150**.

STABILIZER LINK WITH DISCONNECTING STABILIZER BAR

Fig. 151: Identifying Stabilizer Link, Nuts & Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Hold the stabilizer link (1) shafts with a wrench and remove the link nuts (3) at the stabilizer bar (2).

Fig. 152: Removing Links From Axle Brackets
Courtesy of CHRYSLER GROUP, LLC

3. Remove the stabilizer bar link nuts from the axle brackets (2).
4. Remove the links (1) from the axle brackets (2) with Puller (special tool #9360, Remover, Ball Joint) (3) .

INSTALLATION

STANDARD LINK

Fig. 153: Identifying Retainer, Grommet, Stabilizer Bar, Axle Bracket & Stabilizer Link
Courtesy of CHRYSLER GROUP, LLC

1 - RETAINER
2 - GROMMET
3 - STABILIZER BAR
4 - AXLE BRACKET
5 - STABILIZER LINK

1. Install links (5) to the axle bracket (4) and tighten nut to specifications. Refer to **SPECIFICATIONS**. .
2. Install links (5), retainers (1), grommets (2) and nuts to the stabilizer bar. Hold the link shaft with a wrench and tighten the nuts to specifications. Refer to **SPECIFICATIONS**. .
3. Remove the supports and lower the vehicle.

WITH DISCONNECTING STABILIZER BAR

Fig. 154: Identifying Stabilizer Link, Nuts & Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

1. Install links (1) to the axle bracket (5) and tighten nut (4) to specifications. Refer to **SPECIFICATIONS**. .
2. Install links (1) and nuts (3) to the stabilizer bar (2). Hold the link shaft with a wrench and tighten the nuts to specifications. Refer to **SPECIFICATIONS**. .
3. Remove the supports and lower the vehicle.

SHOCK ABSORBER, SUSPENSION

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SHOCK ABSORBER

Fig. 155: Shock Absorber Components
Courtesy of CHRYSLER GROUP, LLC

1 - GROMMET
2 - RETAINER
3 - BRACKET
4 - RETAINER
5 - SHOCK
6 - GROMMET

A knocking or rattling noise from a shock absorber (5) may be caused by movement between mounting grommets (1 and 6) and metal brackets (3) or attaching components. These noises can usually be stopped by tightening the attaching nuts. If the noise persists, inspect for damaged and worn bushings, and attaching components. Repair as necessary if any of these conditions exist.

A squeaking noise from the shock absorber may be caused by the hydraulic valving and may be intermittent. This condition is not repairable and the shock absorber must be replaced.

The shock absorbers are not refillable or adjustable. If a malfunction occurs, the shock absorber must be replaced. To test a shock absorber, hold it in an upright position and force the piston in and out of the cylinder four or five times. The action throughout each stroke should be smooth and even.

The shock absorber bushings do not require any type of lubrication. Do not attempt to stop bushing noise by lubricating them. Grease and mineral oil-base lubricants will deteriorate the bushing.

REMOVAL

REMOVAL

3. Install the upper shock bracket (3) and three nuts and tighten nuts to specifications. Refer to **SPECIFICATIONS**. .
4. Install upper grommet (1) and retainer (2). Install upper shock nut and tighten to specifications. Refer to **SPECIFICATIONS**. .

SPRING, FRONT COIL

REMOVAL

REMOVAL

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support it.

2. Paint or scribe alignment marks on lower suspension arm cam adjusters and axle bracket for installation reference.
3. Remove the upper suspension arm and loosen lower suspension arm bolts.
4. Mark and disconnect the front propeller shaft from the axle 4x4 models.
5. Disconnect the track bar from the frame rail bracket.
6. Disconnect the drag link from pitman arm.
7. Disconnect the stabilizer bar link and shock absorber from the axle.
8. Lower the axle until the spring is free from the upper mount. Remove the coil spring.

INSTALLATION

INSTALLATION

1. Position the coil spring on the axle pad.
2. Raise the axle into position until the spring seats in the upper mount.
3. Connect the stabilizer bar links and shock absorbers to the axle bracket. Connect the track bar to the frame rail bracket.
4. Install the upper suspension arm.
5. Install the front propeller shaft to the axle, if equipped.
6. Install drag link to pitman arm and tighten nut to specifications. Refer to **SPECIFICATIONS**. . Install a new cotter pin.
7. Remove the supports and lower the vehicle.
8. Tighten the following suspension components to specifications. Refer to **SPECIFICATIONS**. .

- Link to stabilizer bar nut.
- Lower shock bolt.
- Track bar bolt at axle shaft tube bracket.
- Upper suspension arm nut at axle bracket.
- Upper suspension nut at frame bracket.
- Align lower suspension arm reference marks and tighten cam nut.
- Lower suspension nut at frame bracket.

STABILIZER BAR, FRONT

DESCRIPTION

STABILIZER BAR

The bar extends across the front underside of the chassis and connects to the frame crossmember. The ends of the bar mount to the lower suspension arm. All mounting points of the stabilizer bar are isolated by bushings.

DISCONNECTING STABILIZER BAR

Fig. 161: Disconnecting Stabilizer Bar Unit
Courtesy of CHRYSLER GROUP, LLC

WARNING: **The disconnecting stabilizer bar unit (2) is not serviced separately from the bar (4). Do not disassemble this unit (2) from the stabilizer bar (4).**

NOTE: **The stabilizer links (5), stabilizer bar retainers/ bushings (3), stabilizer bar with the disconnecting unit as an assembly (4) and the stabilizer bar actuator (1) are the only are serviceable components.**

NOTE: **When replacing the disconnecting stabilizer bar with a new bar you must use a scan tool to program the new stabilizer bar to the vehicle.**

This system allows greater front suspension travel in off-road situations. It consists of a disconnecting unit (2), electronic actuator (1), stabilizer bar (4), stabilizer bar mounting retainers (3), stabilizer links (5) and a anti-rotational bracket (6) connected to the stabilizer bar retainer (3).

Fig. 162: Disconnecting Stabilizer Switch
Courtesy of CHRYSLER GROUP, LLC

The electronic disconnecting stabilizer bar is operated by a combined transfer case and disconnecting stabilizer switch on the dash: The 2 mode positions are: On-Road mode (1), and Off-Road mode (2). The electronic disconnecting stabilizer bar is designed to be driven in On-Road mode (1) (indicated by a solid on-road mode light) for normal street and highway conditions (dry hard surfaced roads).

To service the switch, remove the Instrument panel center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL** .

OPERATION

STABILIZER BAR

The stabilizer bar is used to minimize vehicle front sway during turns. The bar helps to maintain a flat attitude to the road surface.

DISCONNECTING STABILIZER BAR

Fig. 163: Disconnecting Stabilizer Switch
Courtesy of CHRYSLER GROUP, LLC

NOTE: The off-road mode (2) is intended for use at low speed only and is equipped with a vehicle speed sensor. When in off-road mode, if the vehicle speed exceeds 18 MPH, the system will return to on-road mode (indicated by a flashing off-road mode light). If vehicle speed is reduced to 14 MPH, the system will once again return to off-road mode (indicated by a solid off-road mode light).

When in a severe off-road situation, the stabilizer bar may be placed into off-road mode to increase maneuverability. To engage the off-road mode, place the vehicle in 4WD HI or LO, and depress the Stabilizer Bar Control Switch for off-road mode (2). The off-road mode indicator light will flash until mode has been fully engaged, indicated by a solid light.

To disengage off-road mode, depress the Stabilizer Bar Control Switch for on-road mode (1). The on-road mode indicator light will flash until mode has been fully engaged, indicated by a solid light.

REMOVAL

STABILIZER BAR

Fig. 164: Identifying Retainer, Grommet, Stabilizer Bar, Axle Bracket & Stabilizer Link
Courtesy of CHRYSLER GROUP, LLC

1 - RETAINER
2 - GROMMET
3 - STABILIZER BAR
4 - AXLE BRACKET
5 - STABILIZER LINK

1. Raise and support the vehicle.
2. Hold the stabilizer link (5) shafts with a wrench and remove the link nuts at the stabilizer bar (3).
3. Remove the retainers (1) and grommets (2) from the stabilizer bar links (5).
4. Remove the stabilizer bar clamps from the frame rails and remove the stabilizer bar.

DISCONNECTING STABILIZER BAR

Fig. 165: Disconnecting Stabilizer Bar Unit
Courtesy of CHRYSLER GROUP, LLC

WARNING: The disconnecting stabilizer bar unit (2) is not serviced separately from the bar (4). Do not disassemble this unit (2) from the stabilizer bar (4).

NOTE: The stabilizer links (5), stabilizer bar retainers/ bushings (3), stabilizer bar with the disconnecting unit as an assembly (4) and the stabilizer bar actuator (1) are the only are serviceable components.

NOTE: When replacing the disconnecting stabilizer bar with a new bar you must use a scan tool to program the new stabilizer bar to the vehicle.

Fig. 166: Identifying Stabilizer Link, Nuts, & Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Hold the stabilizer link (1) shafts with a wrench and remove the link nuts (3) at the stabilizer bar (2).

Fig. 167: Disconnecting Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before removing the connector (4) from the actuator clean the outside of the connector with a cleaner and compressed air, to remove any dirt or debris.**

3. Disconnect the electronic actuator electrical connector (4) for the disconnecting stabilizer bar (5).
4. Remove the 3 bolts securing the disconnecting stabilizer actuator **If replacing the stabilizer bar** . Refer to **ACTUATOR, STABILIZER BAR, REMOVAL**.

Fig. 168: Identifying Stabilizer Bar & Retainers
Courtesy of CHRYSLER GROUP, LLC

5. Remove the stabilizer bar retainers (1) from the frame rails and remove the stabilizer bar (4).

INSTALLATION

STANDARD STABILIZER BAR

Fig. 169: Identifying Retainer, Grommet, Stabilizer Bar, Axle Bracket & Stabilizer Link
Courtesy of CHRYSLER GROUP, LLC

1 - RETAINER
2 - GROMMET

3 - STABILIZER BAR
4 - AXLE BRACKET
5 - STABILIZER LINK

1. Position the stabilizer bar on the frame rail and install the clamps and bolts. Ensure the bar is centered with equal spacing on both sides.
2. Tighten the clamp bolts to specifications. Refer to **SPECIFICATIONS**. .
3. Install links (5), retainers (1), grommets (2) and nuts to the stabilizer bar (3). Hold the link shaft with a wrench and tighten the nuts to specifications. Refer to **SPECIFICATIONS**. .
4. Remove the supports and lower the vehicle.

DISCONNECTING STABILIZER BAR

Fig. 170: Identifying Stabilizer Bar & Retainers
Courtesy of CHRYSLER GROUP, LLC

WARNING: **The disconnecting stabilizer bar unit (2) is not serviced separately from the bar (4). Do not disassemble this unit (2) from the stabilizer bar (4).**

NOTE: **The stabilizer links (3), stabilizer bar retainers/ bushings (1), stabilizer bar with the disconnecting unit as an assembly (4) and the stabilizer bar actuator are the only are serviceable components.**

NOTE: **When replacing the disconnecting stabilizer bar with a new bar you must use a scan tool to program the new stabilizer bar to the vehicle.**

1. Position the stabilizer bar (4) on the frame rail and install the retainers with bushings and bolts (1). Ensure the bar is centered with equal spacing on both sides.

2. Tighten the retainer bolts (1) to specifications. Refer to **SPECIFICATIONS**. .

Fig. 171: Disconnecting Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The seal must be clean and intact in the electrical connector when reconnecting to the actuator.**

3. **If the actuator was removed** , install the actuator (4) to the disconnecting unit (3). Refer to **ACTUATOR, STABILIZER BAR, INSTALLATION**.
4. Reconnect the electronic actuator electrical connector for the disconnecting stabilizer bar (5).

Fig. 172: Identifying Stabilizer Link, Nuts, & Stabilizer Bar

Courtesy of CHRYSLER GROUP, LLC

5. Install links (1) and nuts (3) to the stabilizer bar (2). Hold the link shaft with a wrench and tighten the nuts to specifications. Refer to **SPECIFICATIONS**. .
6. Remove the supports and lower the vehicle.
7. Using a scan tool program the new stabilizer bar to the vehicle.

TRACK BAR, FRONT

REMOVAL

REMOVAL

Fig. 173: Track Bar, Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

1 - TRACK BAR
2 - BOLT
3 - NUT

1. Raise and support the axle.
2. Remove the track bar bolts (2) and nuts (3). Refer to **Fig. 173**.
3. Remove the track bar (1). Refer to **Fig. 173**.

INSTALLATION

INSTALLATION

Fig. 174: Track Bar, Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

1 - TRACK BAR
2 - BOLT
3 - NUT

1. Install the track bar (1).
2. Install the new bolts (2) and nuts (3) and torque to specifications. Refer to **SPECIFICATIONS**. .
3. Remove the supports under the axle and lower the vehicle to the ground.

DESCRIPTION

DESCRIPTION

Fig. 1: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

The rear suspension system on the 1500 series is a coil spring system, while the 2500 and 3500 series is a leaf spring system. The suspension systems are comprised of:

- Shock Absorbers (7)
- Jounce Bumpers (3)
- Stabilizer Bar (9) (1500 series)
- Stabilizer links (1) (1500 series)
- Coil Springs (2) (1500 series)
- Upper Control Arms (above lower control arms, not shown in illustration) (1500 series).
- Lower Control Arms (6) (1500 series)
- Track Bar (5) (1500 series)
- Leaf Springs (2500 and 3500 series, not shown in illustration)
- Auxiliary Leaf Spring (3500 series, not shown in illustration)
- Auxiliary Spring Bumpers (3500 series, not shown in illustration)
- Leaf Spring Eye Bushings (2500 and 3500 series, not shown in illustration)
- Leaf Spring Tip Inserts (2500 and 3500 series, not shown in illustration)

CAUTION: A vehicle should always be loaded so the vehicle weight center-line is located immediately forward of the rear axle. Correct vehicle loading provides proper front tire-to-road contact. This results in maximum vehicle handling stability and safety. Incorrect vehicle weight distribution can cause excessive tire tread wear, spring fatigue or failure, and erratic steering.

CAUTION: Suspension components with rubber/urethane bushings (except stabilizer bar) should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COIL SPRING AND SHOCK

A knocking or rattling noise from a shock absorber may be caused by movement between mounting bushings and metal brackets or attaching components. These noises can usually be stopped by tightening the attaching nuts. If the noise persists, inspect for damaged and worn bushings, and attaching components. Repair as necessary if any of these conditions exist.

A squeaking noise from the shock absorber may be caused by the hydraulic valving and may be intermittent. This condition is not repairable and the shock absorber must be replaced.

The shock absorbers are not refillable or adjustable. If a malfunction occurs, the shock absorber must be replaced. To test a shock absorber, hold it in an upright position and force the piston in and out of the cylinder four or five times. The action throughout each stroke should be smooth and even.

If the vehicle is used for severe, off-road operation, the springs should be examined periodically. Check for broken springs.

SPRING AND SHOCK ABSORBER

CONDITION	POSSIBLE CAUSES	CORRECTION
REAR OF VEHICLE SAGS	1. Broken spring.	1. Replace spring.
	2. Spring fatigue.	2. Replace spring.
SPRING NOISE	1. Worn springs.	1. Replace spring.
	2. Worn isolators.	2. Replace isolators.
	3. Severely overloaded.	3. Check GVW of vehicle (Unload cargo).
SHOCK NOISE	1. Loose mounting fastener.	1. Tighten to specification.
	2. Worn bushings.	2. Replace shock.
	3. Leaking shock.	3. Replace shock.

LEAF SPRING AND SHOCK

A knocking or rattling noise from a shock absorber may be caused by movement between mounting bushings and metal brackets or attaching components. These noises can usually be stopped by tightening the attaching nuts. If the noise persists, inspect for damaged and worn bushings, and attaching components. Repair as necessary if any of these conditions exist.

WARNING: The shock absorbers are under high pressure. Do Not heat or attempt to open the shock absorbers.

A squeal noise from the shock absorber may be caused by the hydraulic valving and may be intermittent. This condition is not repairable and the shock absorber must be replaced.

NOTE: When inspecting the shock absorber, do not clamp the body or the piston rod.

NOTE: Monotube shock absorber compression forces will be much higher than standard shock absorbers.

The shock absorbers are not refillable or adjustable. If a malfunction occurs, the shock absorber must be replaced. To check a shock absorber, grasp the tube and invert the shock so the piston rod touches the ground, then compress the shock four or five times. The action throughout each stroke should be smooth and even, and the piston rod should extend from the shock on its own.

The shock absorber bushings do not require any type of lubrication. Do not attempt to stop bushing noise by lubricating them. Grease and mineral oil-base lubricants will deteriorate the bushing.

A squeak or creak noise coming from the shock area may be related to any of the suspension components or mounts, but not necessarily the shock.

The spring eye and shock absorber bushings do not require any type of lubrication. Do not attempt to stop spring bushing noise by lubricating them. Grease and mineral oil-base lubricants will deteriorate the bushing rubber.

If the vehicle is used for severe, off-road operation, the springs should be examined periodically. Check for broken and shifted leafs, loose and missing clips, and broken center bolts. Refer to Spring and Shock Absorber Diagnosis chart for additional information.

SPRING AND SHOCK ABSORBER

CONDITION	POSSIBLE CAUSES	CORRECTION
SPRING SAGS	1. Broken leaf.	1. Replace spring.
	2. Spring fatigue.	2. Replace spring.
SPRING NOISE	1. Loose spring clamp bolts.	1. Tighten to specification.
	2. Worn bushings.	2. Replace bushings.
	3. Worn or missing spring tip inserts.	3. Replace spring tip inserts.

SHOCK NOISE	1. Loose mounting fastener.	1. Tighten to specification.
	2. Worn bushings.	2. Replace shock.
	3. Leaking shock.	3. Replace shock.

ARM, LOWER CONTROL

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Support the rear axle with a suitable holding fixture.

Fig. 2: Guide Bolt, Upper Control Arm Bolts & Nut
Courtesy of CHRYSLER GROUP, LLC

3. Remove the parking brake cable guide bolt (Left side only).

Fig. 3: Lower Control Arm Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the lower control arm bolt (1) and nut at the axle **and discard the nut** .
5. Remove the lower control arm bolt and nut (2) at the frame.
6. Remove the lower control arm from the vehicle.

INSTALLATION

INSTALLATION

NOTE: The small bushing attaches to the frame and the large bushing to the axle.

1. Install the lower control arm to the vehicle.

Fig. 4: Lower Control Arm Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Install the lower control arm bolt (1) with a **new** nut at the axle. Do not tighten.
3. Install the lower control arm bolt and nut (2) at the frame. Do not tighten.

Fig. 5: Guide Bolt, Upper Control Arm Bolts & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Position the parking brake cable guide (Left side only), install the guide bolt (3) and tighten to specifications. Refer to **SPECIFICATIONS**.
5. Remove the holding fixture supporting the axle.
6. Remove the support and lower the vehicle.
7. Tighten the lower control arm bolts to specifications. Refer to **SPECIFICATIONS**.

ARM, UPPER CONTROL

REMOVAL

REMOVAL

Fig. 6: Guide Bolt, Upper Control Arm Bolts & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Support the rear axle with a suitable holding fixture.
3. Remove the upper control arm bolt and nut (2) at the axle **and discard the nut** .
4. Remove the upper control arm front bolt (1) and nut at the frame.
5. Remove the upper control arm from the vehicle.

INSTALLATION

INSTALLATION

Fig. 7: Guide Bolt, Upper Control Arm Bolts & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: The small bushing attaches to the axle and the large bushing to the frame.

1. Position the upper control arm to the vehicle.
2. Install the upper control arm bolt (1) and nut at the frame. Do not tighten.
3. Install the upper control arm bolt with a **new** nut (2) at the axle. Do not tighten.
4. Remove the holding fixture supporting the axle.
5. Remove the support and lower the vehicle.
6. Tighten the upper control arm bolts/nuts to specifications. Refer to **SPECIFICATIONS**.

BUMPER, JOUNCE

REMOVAL

COIL SPRING SYSTEM

Fig. 8: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

NOTE: **Rocking motion may be required while pulling the jounce bumper from the seating bracket**

2. Twist and pull out the jounce bumper (3) to remove from the seating bracket.

LEAF SPRING SYSTEM

Fig. 9: Jounce Bumper & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - MOUNTING BOLTS
2 - JOUNCE BUMPER

1. Remove the two bolts (1) securing the jounce bumper (2) to the bracket.
2. Remove the jounce bumper (2).

INSTALLATION

COIL SPRING SYSTEM

Fig. 10: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

1. Install the jounce bumper (3) and twist to seat in the bracket.
2. Remove the support and lower the vehicle.

LEAF SPRING SYSTEM

NOTE: **Some vehicles may snap into position instead using bolts. The jounce bumper will be located in the same position.**

Fig. 11: Jounce Bumper & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - MOUNTING BOLTS
2 - JOUNCE BUMPER

1. Install the jounce bumper (2).
2. Install the two bolts (1) securing the jounce bumper (2) to the bracket and tighten to specifications. Refer to **SPECIFICATIONS**.

BUSHING(S)

REMOVAL

REMOVAL

CAUTION: Handling of springs must be done with care. Impact marks or nicks as small as 0.5 mm (0.0196 in.) deep in the spring eye or in the leaf incorporating the eye may result in premature spring failure.

1. Remove the spring from the vehicle. Refer to **SPRING(S), REMOVAL**.
2. Make small relief cuts in the flared up end of the bushing metal being careful not to cut the spring. Use a punch to bend the flared bushing metal down for push out.
3. Position the spring eye in a press.
4. Press the bushing out with an appropriate size driver.

INSTALLATION

INSTALLATION

CAUTION: Handling of springs must be done with care. Impact marks or nicks as

small as 0.5 mm (0.0196 in.) deep in the spring eye or in the leaf incorporating the eye may result in premature spring failure.

1. Press new bushing into the spring eye with an appropriate size driver. The bushing should be centered in the spring eye.
2. Stake the outer metal of the bushing in a minimum of six points to retain the bushing.
3. Install the spring on the vehicle. Refer to **SPRING(S), INSTALLATION**.

INSERT, SPRING TIP

REMOVAL

REMOVAL

Fig. 12: C-Clamp, Pry Bar & Leaf Spring Clinch Clamp
Courtesy of CHRYSLER GROUP, LLC

1 - REAR LEAF SPRING CLINCH CLAMP
2 - PRY BAR
3 - C-CLAMP

1. Raise and support the vehicle.
2. Remove both rear tire and wheel assemblies
3. Position a large C-Clamp (3) adjacent to the spring clinch clip (1) and clamp the leaves of the spring together

CAUTION: When working on the front leaf spring clinch clamps finish the front before starting on the rear to prevent personal injury.

4. Use an appropriate pry bar (2) to bend open the spring clinch clip (1). Refer to **Fig. 12**. If necessary,

remove the existing spring clinch clip isolators.

Fig. 13: Separating Spring Using Pry Bar
Courtesy of CHRYSLER GROUP, LLC

1 - REAR LEAF SPRING
2 - PRY BAR

5. Use the pry bar (2) to spread apart the leaf (1). Refer to **Fig. 13**. The clearance between the leaves should be enough to remove the old liner (if necessary) and install the replacement liner.

Fig. 14: Removing Spring Tip Liner
Courtesy of CHRYSLER GROUP, LLC

1 - SPRING TIP LINER
2 - RUBBER MALLET

6. If necessary, remove the old spring tip liner (1). Refer to **Fig. 14**.

INSTALLATION

INSTALLATION

Fig. 15: C-Clamp & Spring Clinch Clip
Courtesy of CHRYSLER GROUP, LLC

1 - C-CLAMP
2 - SPRING CLINCH CLAMP

1. With the prybar still inserted between the leaves, install a new spring tip liner onto the leaf.
2. Firmly seat the spring tip liner onto the leaf. A C-Clamp (1) can be used to compress the adjacent leaves together which will seat the liner retaining pin into the hole. Refer to **Fig. 15**.

NOTE: **The spring tip liner is properly installed when the retaining pin is pointing toward the pavement and the wear pad is contacting the leaf spring.**

Fig. 16: Spring Clinch Clip Isolator

Courtesy of CHRYSLER GROUP, LLC

1 - SPRING CLINCH CLIP ISOLATOR
2 - C-CLAMP

3. Apply a small amount of lubricant oil onto the tip liner wear pad.
4. Install all the spring tip liners.
5. Place one spring clinch clip isolator (1) onto the outboard side of the spring clinch clip and one isolator on the inboard side of the spring clinch clip. Refer to **Fig. 16**.

Fig. 17: Closing Spring Clinch Clip
Courtesy of CHRYSLER GROUP, LLC

1 - SPRING CLINCH CLIP
2 - ADJUSTABLE PLIERS
3 - C-CLAMP

6. Using large adjustable pliers (2), close the spring clinch clip (1) until the isolator contacts the leaf spring. Refer to **Fig. 17**.

CAUTION: Do not use a hammer to close the spring clinch clip. Damage to the isolator may result.

7. Use an appropriate pry bar to bend open the spring clinch clip. If necessary, remove the existing spring clinch clip isolators.
8. Repeat procedure for the other side of the vehicle.
9. Install the tire wheel assemblies.
10. Lower the vehicle.

LINK, STABILIZER BAR

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Support the rear axle with a suitable holding fixture.

Fig. 18: Stabilizer Link Components
Courtesy of CHRYSLER GROUP, LLC

3. Remove the stabilizer link upper bolt (2) and nut.
4. Remove the stabilizer link lower nut (4).
5. Remove stabilizer link (3).

INSTALLATION

INSTALLATION

NOTE: All views are typical.

Fig. 19: Stabilizer Link Components
Courtesy of CHRYSLER GROUP, LLC

1. Position the stabilizer link and install the link upper bolt (2) and nut. Do not tighten.
2. Install the stabilizer link lower nut (4). Do not tighten.
3. Remove the holding fixture supporting the axle.
4. Remove the support and lower the vehicle.
5. Tighten stabilizer link lower nuts (2, 4) to specifications. Refer to **SPECIFICATIONS**.

SHOCK ABSORBER, SUSPENSION

REMOVAL

REMOVAL

NOTE: **View is typical of a coil spring system. A leaf spring system is similar.**

Fig. 20: Shock Absorber & Shock Upper/Lower Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Support the rear axle with a suitable holding fixture.
3. Remove the shock upper bolt (1) and nut.
4. Remove the shock lower bolt (3) and nut.
5. Remove the shock absorber (2) from the vehicle.

INSTALLATION

INSTALLATION

NOTE: View is typical of a coil spring system. A leaf spring system is similar.

Fig. 21: Shock Absorber & Shock Upper/Lower Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **All torques should be made with the full vehicle weight on the ground being supported by the tires.**

1. Position the shock absorber (2) in the brackets.
2. Install the bolts (1, 3) through the brackets and the shock (2).
3. Install the nuts on the bolts (1, 3) and do not tighten.
4. Remove the holding fixture supporting the axle.
5. Remove the support and lower the vehicle.
6. Tighten shock bolts (1, 3) and nuts to specifications. Refer to **SPECIFICATIONS**.

SPRING(S)

REMOVAL

COIL SPRING

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Support the axle with a suitable holding fixture.

Fig. 22: Shock Absorber & Shock Upper/Lower Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Remove the shock lower bolt (3) and nut.

Fig. 23: Rear Coil Spring
Courtesy of CHRYSLER GROUP, LLC

NOTE: Lower the axle carefully and avoid putting stress on the flexible brake line.

4. Lower the axle support and tilt the axle to remove the spring (3) and isolator (2) from the vehicle.

LEAF SPRING

NOTE: Two types of shackles are used for different vehicle applications. There are tension shackles and compression shackles. A tension shackle sits on its frame mounting bracket (spring above), and a compression shackle hangs from its mounting bracket (spring below. The tension type shackle must be removed with the spring.

NOTE: All views are typical.

Fig. 24: Identifying Nuts, Spring Clamp U-Bolts & Spring
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Support the axle with a suitable holding fixture.
3. Remove the nuts (2), spring clamp bolts (1) and the plate that attach the spring (3) to the axle.
4. Remove the nuts and bolts from the spring front eye to frame.

Fig. 25: Identifying Nuts, Rear Shackle & Spring
Courtesy of CHRYSLER GROUP, LLC

5. For a tension type shackle (3) only, remove the shackle to mounting bracket bolt (4) and flag nut (5).

Fig. 26: Compression Type Shackle Components
Courtesy of CHRYSLER GROUP, LLC

6. For a compression type shackle (2) only, remove the spring eye to shackle bolt and nut (3).
7. Remove the spring from the vehicle.
8. Remove and transfer any necessary components.

INSTALLATION

COIL SPRING

Fig. 27: Rear Coil Spring
Courtesy of CHRYSLER GROUP, LLC

NOTE: **All torques should be made with the full vehicle weight on the ground being supported by the tires.**

1. Position spring (3) and isolator (2) on the axle and align into the spring upper pocket.
2. Carefully raise the rear axle into place.

Fig. 28: Shock Absorber & Shock Upper/Lower Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install the shock lower bolt (3) and nut, and do not tighten.
4. Remove the holding fixture for the rear axle.
5. Remove the support and lower the vehicle.
6. Tighten shock lower bolt (3) and nut to specifications. Refer to **SPECIFICATIONS**.

LEAF SPRING

NOTE: **Two types of shackles are used for different vehicle applications. There are tension shackles and compression shackles. A tension shackle sits on its frame mounting bracket (spring above), and a compression shackle hangs from its mounting bracket (spring below. The tension type shackle must be removed with the spring.**

NOTE: **All views are typical.**

Fig. 29: Rear Suspension Components (Leaf Spring)
Courtesy of CHRYSLER GROUP, LLC

1. Position spring (1) on axle shaft tube so spring center bolt is inserted into the locating hole in the axle tube.
2. Align the front of the spring with the bolt hole in the front bracket. Install the eye pivot bolt and nut (4). Do not tighten.

Fig. 30: Compression Type Shackle Components
Courtesy of CHRYSLER GROUP, LLC

3. For a compression type shackle (2) only, align the spring (5) to the shackle (2) and install the spring eye to shackle bolt and nut (3). Do not tighten.

Fig. 31: Identifying Nuts, Rear Shackle & Spring
Courtesy of CHRYSLER GROUP, LLC

4. For a tension type shackle (3) only, align the shackle (3) to the mounting bracket and install the shackle to mounting bracket bolt (4) and flag nut (5). Do not tighten.

Fig. 32: Identifying Nuts, Spring Clamp U-Bolts & Spring
Courtesy of CHRYSLER GROUP, LLC

5. Install the spring clamp bolts (1), plate (3) and the retaining nuts (2).
6. Remove the holding fixture for the rear axle.
7. Remove the supports and lower the vehicle so that the weight is being supported by the tires.
8. Tighten the spring clamp retaining nuts, spring front and rear pivot nuts, and the shackle nut/bolts to specifications. Refer to **SPECIFICATIONS**.

STABILIZER BAR, REAR SUSPENSION

REMOVAL

REMOVAL

Fig. 33: Rear Stabilizer Bar Components
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove both stabilizer bar link lower mounting nuts (2).
3. Remove stabilizer bar retainer bolts (3) and retainers (4).
4. Remove stabilizer bar (5).
5. Remove and transfer the bushings if necessary.

INSTALLATION

INSTALLATION

Fig. 34: Rear Stabilizer Bar Components
Courtesy of CHRYSLER GROUP, LLC

1. Install stabilizer bar bushings.
2. Install the stabilizer bar (5) and center it with equal spacing on both sides.
3. Install stabilizer bar retainers (4) and bolts (3). Do not tighten.
4. Install the stabilizer bar links on the stabilizer bar (5) and install link lower mounting nuts. Do not tighten.
5. Remove the support and lower the vehicle.
6. Tighten the stabilizer bar retainer bolts (3) and stabilizer lower link nuts to specifications. Refer to **SPECIFICATIONS**.

TRACK BAR, REAR

REMOVAL

REMOVAL

Fig. 35: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Support the rear axle with a suitable holding fixture.
3. Remove the track bar bolt/nut from the frame bracket.
4. Remove the track bar bolt/nut from the axle bracket.
5. Remove the track bar (5).

INSTALLATION

INSTALLATION

Fig. 36: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

1. Position the track bar (5) onto the vehicle.
2. Install the track bar bolt and nut in the frame bracket. Do not tighten.
3. Install the track bar bolt and nut in the axle bracket. Do not tighten.
4. Remove the holding fixture supporting the axle.
5. Remove the supports and lower the vehicle.
6. Tighten the track bar mounting bolts/nuts to specifications. Refer to **SPECIFICATIONS**.

DIAGNOSIS AND TESTING

B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

Fig. 1: TPM Power Supply Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

Any time the Tire Pressure Monitoring (TPM) Module senses voltage input below 8.0 volts for over 20 ms, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
NON-FCC COMPLIANT COMPONENTS
LOW VOLTAGE ENGINE DTC
(A27) FUSED B(+) CIRCUIT HIGH RESISTANCE
(Z906) GROUND CIRCUIT HIGH RESISTANCE
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN CONTROL MODULE (PCM) DTC's**

   NOTE: Make sure the battery is fully charged before proceeding.

   1. Ignition on, engine not running.
   2. With the scan tool, read PCM DTC's.

      Are there any battery or charging systems DTC's?

      Yes

      - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.

2. **VERIFY THE DTC IS ACTIVE**
   1. With the scan tool, record and erase stored DTC's.
   2. Start the engine and run for two minutes.
   3. With the scan tool, read DTC's.

Is the DTC active at this time?

Yes

- Go To 3.

No

- Go To 5.

3. **(A27) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 2: Checking Fused B(+) Circuit For An Open Or High Resistance

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position
2. Disconnect the TPM Module harness connector.
3. Ignition on, engine not running.
4. Using a 12-volt test light connected to ground, check (A27) Fused B(+) circuit in the TPM Module harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Go To 4.

No

- Repair the (A27) Fused B(+) circuit for an open or high resistance.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 3: Checking Ground Circuit In TPM Module Harness Connector For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position
2. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit in the TPM Module harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Replace the Tire Pressure Monitoring (TPM) Module in accordance with Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the (Z906) Ground circuit for an open or high resistance.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

Any time the Tire Pressure Monitoring (TPM) Module senses voltage input above 16.0 volts for over 20ms, this

code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
NON-FCC COMPLIANT COMPONENTS
HIGH VOLTAGE ENGINE DTC
TIRE PRESSURE MODULE (TPM)

NOTE: **Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.**

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN CONTROL MODULE (PCM) DTC's**
    1. With the scan tool, read PCM DTC's.

       Are there any ENGINE DTC's present?

       Yes

       - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **VERIFY THE DTC IS ACTIVE**
    1. With the scan tool, record and erase stored DTC's.
    2. Start the engine and run for two minutes.
    3. With the scan tool, read DTC's.

       Is the DTC active at this time?

       Yes

       - Replace the Tire Pressure Monitoring (TPM) Module in accordance with Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
       - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

- Go To 3.

3. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
    - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B21DD-84-SYSTEM VOLTAGE - SIGNAL VOLTAGE BELOW ALLOWABLE RANGE

Fig. 4: TPM Power Supply Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

Anytime the Tire Pressure Monitoring (TPM) Module senses voltage input below 8.0 volts for over 20 ms, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
NON-FCC COMPLIANT COMPONENTS
LOW VOLTAGE ENGINE DTC
(A27) FUSED B(+) CIRCUIT HIGH RESISTANCE
(Z906) GROUND CIRCUIT HIGH RESISTANCE
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN CONTROL MODULE (PCM) DTC's**

   NOTE: Make sure the battery is fully charged before proceeding.

   1. Ignition on, engine not running.
   2. With the scan tool, read PCM DTC's.

      Are there any battery or charging system DTC's?

      No

      - Go To 2.

      Yes

      - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic procedure.
2. **VERIFY THE DTC IS ACTIVE**
   1. With the scan tool, record and erase stored DTC's.
   2. Start the engine and run for two minutes.
   3. With the scan tool, read DTC's.

Is the DTC active at this time?

Yes

- Go To 3.

No

- Go To 5.

3. **(A27) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 5: Checking Fused B(+) Circuit For An Open Or High Resistance

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TPM harness connector.
3. Ignition on, engine not running.
4. Using a 12-volt test light connected to ground, check (A27) Fused B(+) circuit in the Tire Pressure Module harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Go To 4.

No

- Repair the (A27) Fused B(+) circuit for an open or high resistance.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 6: Checking Ground Circuit In TPM Module Harness Connector For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position
2. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit in the Tire Pressure Module harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Replace the Tire Pressure Monitoring (TPM) Module in accordance with Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the (Z906) Ground circuit for an open or high resistance.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B21DD-85-SYSTEM VOLTAGE - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously.

SET CONDITION:

Any time the Tire Pressure Monitoring (TPM) Module senses voltage input above 16.0 volts for over 20ms, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
NON-FCC COMPLIANT COMPONENTS
HIGH VOLTAGE ENGINE DTC
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: **Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.**

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN CONTROL MODULE (PCM) DTC's**
   1. With the scan tool, read PCM DTC's.

      Are there any battery or charging system DTC's present?

      Yes

      - Refer to **3.7L/4.7L/5.7L - DIAGNOSTIC CODE INDEX - NGC - 1500 & 2500** or **6.7L - DIAGNOSTIC CODE INDEX - 2500 & 3500** or **5.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS** or **6.7L - DIAGNOSTIC CODE INDEX - 3500 CAB & CHASSIS, 4500 & 5500** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **VERIFY THE DTC IS ACTIVE**
   1. With the scan tool, record and erase stored DTC's.
   2. Start the engine and run for two minutes.
   3. With the scan tool, read DTC's.

      Is the DTC active at this time?

      Yes

      - Replace the Tire Pressure Monitoring (TPM) Module in accordance with Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
      - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
    - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0077-00-LOW TIRE PRESSURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously while driving.

SET CONDITION:

A low pressure condition will exist when the tire pressure falls below or is equal to the low pressure threshold value as specified for the vehicle.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
INCORRECT TIRE PRESSURE
INCORRECT PLACARD VALUES

TIRE PRESSURE MONITORING (TPM) SENSOR
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: **Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.**

NOTE: **Adjust all tired to cold placard values and test drive before continuing with diagnostic procedure.**

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   Note if any the following conditions are present:

   - Low Tire Pressure DTC's.
   - TPM Sensor Internal fault.
   - Spare tire is not equipped with a TPM Sensor and is currently on the vehicle. Repair the tire and install it back on the vehicle.

   NOTE: **Before beginning diagnostic procedure, verify that tire pressures are correct.**

   1. Turn the ignition on.
   2. With the scan tool, read and record TPM Module DTC's.
   3. With the scan tool, erase stored TPM Module DTC's.
   4. Test drive the vehicle at a speed greater than 24 km/h (15 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
   5. With the scan tool, select View DTC's in the TPM Module.

      Is the DTC status Active at this time?

      Yes

      - Go To 2.

      No

      - Go To 7.

2. **LOW TIRE PRESSURE**

   NOTE: **Some vehicles will not receive TPM Sensor data when the vehicle is stationary. The vehicle will need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.**

1. Verify that all tire pressures are to the recommended cold inflation tire pressure specifications.
2. With the scan tool, clear DTC's in the TPM Module.
3. With the scan tool, select View DTC's in the TPM Module.

   Does the DTC reset or is the status Active for this DTC?

   Yes

   - Go To 3.

   No

   - Test Complete.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **TIRE PRESSURE SENSOR**

NOTE: **Before continuing with any TPM diagnostic test, use the scan tool and read the "Tire Placard Pressure - Front" and "Tire Placard Pressure - Rear" under "Data Display" in the TPM. Confirm that the values match the Tire Inflation Pressure (Placard) label located on the driver's side B-Pillar. If the incorrect Placard Values have been programmed in the TPM, use the scan tool and read the "Tire Placard Pressure - Front" and "Tire Placard Pressure - Rear" under "Data Display" in the Totally Integrated Power Module (TIPM). If the Placard values are incorrect in the TIPM, select the TIPM, then under "Miscellaneous Functions", select "Update Pressure Threshold" and follow the procedure in the scan tool. Enter the front and rear placard pressure values as seen on the Tire Inflation Pressure (Placard) label. Repeat step #2.**

NOTE: **The following tests are used to locate the TPM Sensor that is setting the low pressure fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor ID's. You MUST locate the TPM Sensor that set the fault before continuing.**

1. With the scan tool, select View Data Display in the TPM Module and find the compensated tire pressure values located under each of the TPM Sensor Identification locations.

   Are any of the compensated tire pressure values below the Placard Value?

   Yes

   - Go To 4.

   No

- Test complete.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **TPM-RKE ANALYZER**

   Is there a TPM-RKE Analyzer (9936) available?

   Yes

   - Go To 5.

   No

   - Go To 6.

5. **TIRE PRESSURE SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER CH9936**

   NOTE: The following procedure is used to locate the TPM Sensor that is setting the sensor internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor ID's. You MUST locate the correct TPM Sensor that set the fault before continuing. Use the following method below at every tire location.

   NOTE: If the TPM sensor ID's do not match, it may be necessary to move the vehicle to a location away from other TPM sensors and repeat this step.

   NOTE: Always be certain to select proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM sensor. If the incorrect vehicle line and/or model year is selected, the TPM sensor will not respond to the tool.

   1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive no response from any of the TPM sensors, check to make sure that the TPM-RKE Analyzer is set correctly, and repeat the process on each non-responsive wheel.
   2. Replace the TPM sensor if the results show a "Damaged Accel", "Damaged Temp", "Damaged Press", "H/W fail", "S/W fail" or the Tire Pressure Sensor does not respond after repeated attempts. Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. With the scan tool, select Data Display for the TPM.
   4. Check to see if the Sensor ID's match what is programmed into the TPM.

      Has the Tire Pressure Sensor been located?

      Yes

      - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service

Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .

- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace the Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **TPM SENSOR INTERNAL FAULT SET**

NOTE: **Some vehicles will not receive TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.**

1. Turn the ignition on.
2. Starting with the left front wheel, deflate the tire to 20 PSI, wait Two minutes, and check the scan tool for changes to any compensated tire pressure values.
3. Look for a tire location with a non-responsive TPM Sensor ID.
4. Repeat this test on each wheel on the vehicle until the sensor in question has been identified

Has the TPM Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace the Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **INTERMITTENT TIRE PRESSURE SENSOR DTC**

1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTC's in the TPM.
4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24 km/h (15 mph).

5. With the scan tool, select View DTC's in the TPM.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C1501-96-TIRE PRESSURE SENSOR 1 - INTERNAL COMPONENT FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, the direction of the tire rotation and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Tire Pressure Monitoring (TPM) Module.

WHEN MONITORED:

With vehicle speed greater than 24 km/h (15 mph).

SET CONDITION:

The TPM Module will monitor the signals from the four active road tire TPM Sensors. A loss of RF signal error is detected if data is not received or cannot be accurately decoded for a maximum of 20 minutes when the vehicle speed is above 24 km/h (15 mph). An internal sensor hardware error condition will be set when an error in the shock sensor, pressure sensor, or temperature sensor is detected. The Tire Pressure Monitoring Telltale Lamp will flash on and off for 75 seconds then remain on solid when a system fault is detected.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
AFTERMARKET TIRES/WHEELS
INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC
TIRE PRESSURE MONITORING (TPM) SENSOR
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: **Check for and remove any non-FCC compliant components, and verify that the tire pressures are correct, before beginning this diagnostic procedure.**

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read and record TPM Module DTC's.
    3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
    4. With the scan tool, erase stored TPM Module DTC's.
    5. With the scan tool, select View DTC's in the TPM Module.

    Is the DTC status Active at this time?

    Yes

    - Go To 2.

    No

    - Go To 8.
2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, select Data Display for the TPM Module and locate the following:
        - Tire 1 Pressure Sensor HW Fault
        - Tire 1 Pressure Sensor Missing ID
        - Tire 1 Temperature Sensor HW Fault
        - Tire 1 Temperature Sensor SW O/U
        - Tire 1 Acceleration Sensor HW Fault
        - Tire 1 Loss of Signal from Pressure Sensor

    Do any of the above faults read "Set"?

    Yes

    - Go To 3.

    No

    - Go To 7.
3. **TPM-RKE ANALYZER CH9936**

Is there a TPM-RKE Analyzer CH9936 available?

Yes

- Go To 4.

No

- Go To 7.

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

NOTE: **This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle. If the spare tire is currently installed on the vehicle, and it is not equipped with a TPM Sensor, this DTC can be set. Replace the spare with a TPM Sensor equipped wheel and tire assembly. Test drive the vehicle. If the DTC resets, continue with the diagnostic procedure.**

1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

   Is the correct TPM Sensor installed on the vehicle?

   Yes

   - Go To 5.

   No

   - Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor ID's. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.**

NOTE: **If the TPM Sensor ID's do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

NOTE: **Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.
2. Replace the TPM Sensor if the results show a "Damaged Accel", "Damaged Temp", "Damaged Press", "H/W fail", "S/W fail" or the TPM Sensor does not respond after repeated attempts. Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. With the scan tool, select Data Display for the TPM Module.
4. Check to see if the Sensor ID's match what is programmed into the TPM Module.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6.

6. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: **If the TPM Sensor ID's do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor ID's match what is programmed into the TPM Module. The TPM Sensor Identifications are located under "Data Display" for the TPM Module.

   Do the TPM Sensor ID's match what is stored in the TPM Module?

   Yes

   - Replace the Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .

- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

NOTE: **Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.**

1. Turn the ignition on.
2. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
3. Look for a tire location with a non-responsive TPM Sensor ID.
4. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

Has the TPM Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

8. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTC's in the Tire Pressure Monitoring (TPM) Module.
4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24 km/h (15 mph).
5. With the scan tool, select View DTC's in the Tire Pressure Monitoring (TPM) Module.

Does the DTC reset or is the status Active for this DTC?

Yes

- Return to the beginning of this test and perform the diagnostic procedure as necessary.

No

- Test complete.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1502-96-TIRE PRESSURE SENSOR 2 - INTERNAL COMPONENT FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, the direction of the tire rotation and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Tire Pressure Monitoring (TPM) Module.

WHEN MONITORED:

With vehicle speed greater than 24 km/h (15 mph).

SET CONDITION:

The TPM Module will monitor the signals from the four active road tire TPM Sensors. A loss of RF signal error is detected if data is not received or cannot be accurately decoded for a maximum of 20 minutes when the vehicle speed is above 24 km/h (15 mph). An internal sensor hardware error condition will be set when an error in the shock sensor, pressure sensor, or temperature sensor is detected. The Tire Pressure Monitoring Telltale Lamp will flash on and off for 75 seconds then remain on solid when a system fault is detected.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
AFTERMARKET TIRES/WHEELS
INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC
TIRE PRESSURE MONITORING (TPM) SENSOR
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: **Check for and remove any non-FCC compliant components, and verify that the tire pressures are correct, before beginning this diagnostic procedure.**

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**
    1. Turn the ignition on.

2. With the scan tool, read and record TPM Module DTC's.
3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
4. With the scan tool, erase stored TPM Module DTC's.
5. With the scan tool, select View DTC's in the TPM Module.

   Is the DTC status Active at this time?

   Yes

   - Go To 2.

   No

   - Go To 8.

2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, select Data Display for the TPM Module and locate the following:
      - Tire 2 Pressure Sensor HW Fault
      - Tire 2 Pressure Sensor Missing ID
      - Tire 2 Temperature Sensor HW Fault
      - Tire 2 Temperature Sensor SW O/U
      - Tire 2 Acceleration Sensor HW Fault
      - Tire 2 Loss of Signal from Pressure Sensor

      Do any of the above faults read "Set"?

      Yes

      - Go To 3.

      No

      - Go To 7.

3. **TPM-RKE ANALYZER CH9936**

   Is there a TPM-RKE Analyzer CH9936 available?

   Yes

   - Go To 4.

   No

- Go To 7.

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

NOTE: **This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle. If the spare tire is currently installed on the vehicle, and it is not equipped with a TPM Sensor, this DTC can be set. Replace the spare with a TPM Sensor equipped wheel and tire assembly. Test drive the vehicle. If the DTC resets, continue with the diagnostic procedure.**

1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

   Is the correct TPM Sensor installed on the vehicle?

   Yes

   - Go To 5.

   No

   - Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER CH9936**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor ID's. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.**

NOTE: **If the TPM Sensor ID's do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

NOTE: **Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set

correctly and repeat the process on each non-responsive wheel.

2. Replace the TPM Sensor if the results show a "Damaged Accel", "Damaged Temp", "Damaged Press", "H/W fail", "S/W fail" or the TPM Sensor does not respond after repeated attempts. Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. With the scan tool, select Data Display for the TPM Module.
4. Check to see if the TPM Sensor ID's match what is programmed into the TPM Module.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6.

6. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: **If the sensor ID's do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor ID's match what is programmed into the TPM Module. The TPM Sensor Identifications are located under "Data Display" for the TPM Module.

   Do the TPM Sensor ID's match what is stored in the TPM Module?

   Yes

   - Replace the Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

NOTE: **Some vehicles will not receive TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.**

1. Turn the ignition on.
2. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
3. Look for a tire location with a non-responsive TPM Sensor ID.
4. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

8. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Perform any Technical Service Bulletins that may apply to this condition.
   3. With the scan tool, clear DTC's in the Tire Pressure Monitoring (TPM) Module.
   4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24 km/h (15 mph).
   5. With the scan tool, select View DTC's in the Tire Pressure Monitoring (TPM) Module.

      Does the DTC reset or is the status Active for this DTC?

      Yes

      - Return to the beginning of this test and perform the diagnostic procedure as necessary.

      No

      - Test complete.
      - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1503-96-TIRE PRESSURE SENSOR 3 - INTERNAL COMPONENT FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, the direction of the tire rotation and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Tire Pressure Monitoring (TPM) Module.

WHEN MONITORED:

With vehicle speed greater than 24 km/h (15 mph).

SET CONDITION:

The TPM Module will monitor the signals from the four active road tire TPM Sensors. A loss of RF signal error is detected if data is not received or cannot be accurately decoded for a maximum of 20 minutes when the vehicle speed is above 24 km/h (15 mph). An internal sensor hardware error condition will be set when an error in the shock sensor, pressure sensor, or temperature sensor is detected. The Tire Pressure Monitoring Telltale Lamp will flash on and off for 75 seconds then remain on solid when a system fault is detected.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
AFTERMARKET TIRES/WHEELS
INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC
TIRE PRESSURE MONITORING (TPM) SENSOR
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: Check for and remove any non-FCC compliant components, and verify that the tire pressures are correct, before beginning this diagnostic procedure.

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

   NOTE: Before beginning diagnostic procedure, verify that tire pressures are correct.

   1. Turn the ignition on.
   2. With the scan tool, read and record TPM Module DTC's.
   3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
   4. With the scan tool, erase stored TPM Module DTC's.

5. With the scan tool, select View DTC's in the TPM Module.

   Is the DTC status Active at this time?

   Yes

   - Go To 2.

   No

   - Go To 8.

2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, select Data Display for the TPM and locate the following:
      - Tire 3 Pressure Sensor HW Fault
      - Tire 3 Pressure Sensor Missing ID
      - Tire 3 Temperature Sensor HW Fault
      - Tire 3 Temperature Sensor SW O/U
      - Tire 3 Acceleration Sensor HW Fault
      - Tire 3 Loss of Signal from Pressure Sensor

      Do any of the above faults read "Set"?

      Yes

      - Go To 3.

      No

      - Go To 7.

3. **TPM/RKE ANALYZER CH9936**

   Is there a TPM-RKE Analyzer CH9936 available?

   Yes

   - Go To 4.

   No

   - Go To 7.

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

   NOTE: This fault can be set if the incorrect or no TPM Sensor is installed on the

vehicle. If the spare tire is currently installed on the vehicle, and it is not equipped with a TPM Sensor, this DTC can be set. Replace the spare with a TPM Sensor equipped wheel and tire assembly. Test drive the vehicle. If the DTC resets, continue with the diagnostic procedure.

1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

   Are the correct TPM sensors installed on the vehicle?

   Yes

   - Go To 5.

   No

   - Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM/RKE ANALYZER**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor ID's. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.**

NOTE: **If the TPM Sensor ID's do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

NOTE: **Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.
2. Replace the TPM Sensor if the results show a "Damaged Accel", "Damaged Temp", "Damaged Press", "H/W fail", "S/W fail" or the TPM Sensor does not respond after repeated attempts. Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information.

Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. With the scan tool, select Data Display for the TPM Module.
4. Check to see if the Sensor ID's match what is programmed into the TPM Module.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6.

6. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

   NOTE: If the TPM Sensor ID's do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

   1. Use a TPM-RKE Analyzer to verify the TPM Sensor ID's match what is programmed into the TPM Module. The TPM Sensor Identifications are located under "Data Display" for the TPM Module.

      Do the TPM Sensor ID's match what is stored in the TPM Module?

      Yes

      - Replace the Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
      - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.
      - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

   NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.

   1. Turn the ignition on.

2. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
3. Look for a tire location with a non-responsive TPM Sensor ID.
4. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

8. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Perform any Technical Service Bulletins that may apply to this condition.
   3. With the scan tool, clear DTC's in the Tire Pressure Monitoring (TPM) Module.
   4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24 km/h (15 mph).
   5. With the scan tool, select View DTC's in the Tire Pressure Monitoring (TPM) Module.

      Does the DTC reset or is the status Active for this DTC?

      Yes

      - Return to the beginning of this test and perform the diagnostic procedure as necessary.

      No

      - Test complete.
      - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1504-96-TIRE PRESSURE SENSOR 4 - INTERNAL COMPONENT FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire,

the direction of the tire rotation and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Tire Pressure Monitoring (TPM) Module.

WHEN MONITORED:

With vehicle speed greater than 24 km/h (15 mph).

SET CONDITION:

The TPM Module will monitor the signals from the four active road tire TPM Sensors. A loss of RF signal error is detected if data is not received or cannot be accurately decoded for a maximum of 20 minutes when the vehicle speed is above 24 km/h (15 mph). An internal sensor hardware error condition will be set when an error in the shock sensor, pressure sensor, or temperature sensor is detected. The Tire Pressure Monitoring Telltale Lamp will flash on and off for 75 seconds then remain on solid when a system fault is detected.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
AFTERMARKET TIRES/WHEELS
INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC
TIRE PRESSURE MONITORING (TPM) SENSOR
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: Check for and remove any non-FCC compliant components, and verify that the tire pressures are correct, before beginning this diagnostic procedure.

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

   NOTE: Before beginning diagnostic procedure, verify that tire pressures are correct.

   1. Turn the ignition on.
   2. With the scan tool, read and record TPM Module DTC's.
   3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
   4. With the scan tool, erase stored TPM Module DTC's.
   5. With the scan tool, select View DTC's in the TPM Module.

   Is the DTC status Active at this time?

   Yes

- Go To 2.

No

- Go To 8.

2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, select Data Display for the TPM Module and locate the following:
      - Tire 4 Pressure Sensor HW Fault
      - Tire 4 Pressure Sensor Missing ID
      - Tire 4 Temperature Sensor HW Fault
      - Tire 4 Temperature Sensor SW O/U
      - Tire 4 Acceleration Sensor HW Fault
      - Tire 4 Loss of Signal from Pressure Sensor

      Do any of the above faults read "Set"?

      Yes

      - Go To 3.

      No

      - Go To 7.
3. **TPM/RKE ANALYZER CH9936**

   Is there a TPM-RKE Analyzer CH9936 available?

   Yes

   - Go To 4.

   No

   - Go To 7.
4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

   NOTE: This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle. If the spare tire is currently installed on the vehicle, and it is not equipped with a TPM Sensor, this DTC can be set. Replace the spare with a TPM Sensor equipped wheel and tire assembly. Test drive the vehicle. If the DTC resets, continue with the diagnostic procedure.

   1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.

2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

   Is the correct TPM Sensor installed on the vehicle?

   Yes

   - Go To 5.

   No

   - Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

   NOTE: The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor ID's. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.

   NOTE: If the TPM Sensor ID's do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

   NOTE: Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.

   1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.
   2. Replace the TPM Sensor if the results show a "Damaged Accel", "Damaged Temp", "Damaged Press", "H/W fail", "S/W fail" or the TPM Sensor does not respond after repeated attempts. Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. With the scan tool, select Data Display for the TPM Module.
   4. Check to see if the Sensor ID's match what is programmed into the TPM Module.

      Has the TPM Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 6.

6. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: **If the TPM Sensor ID's do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor ID's match what is programmed into the TPM Module. The TPM Sensor Identifications are located under "Data Display" for the TPM Module.

   Do the TPM Sensor ID's match what is stored in the TPM Module?

   Yes

   - Replace the Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

NOTE: **Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.**

1. Turn the ignition on.
2. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
3. Look for a tire location with a non-responsive TPM Sensor ID.
4. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

   Has the TPM Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

8. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Perform any Technical Service Bulletins that may apply to this condition.
   3. With the scan tool, clear DTC's in the Tire Pressure Monitoring (TPM) Module.
   4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24 km/h (15 mph).
   5. With the scan tool, select View DTC's in the Tire Pressure Monitoring (TPM) Module.

      Does the DTC reset or is the status Active for this DTC?

      Yes

      - Return to the beginning of this test and perform the diagnostic procedure as necessary.

      No

      - Test complete.
      - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C151C-00-TIRE PRESSURE SENSORS MISSING

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When installing a new Tire Pressure Monitoring (TPM) Module, the module is programed with universal ID's for the Tire Pressure Monitoring (TPM) Sensors. The TPM Module must be programmed with the correct TPM Sensor ID's.

NOTE: **FF is the default value. If this value is found, the TPM controller has not been programmed.**

WHEN MONITORED:

During vehicle TPM Sensor ID locate process.

SET CONDITION:

When installing a new Tire Pressure Monitoring (TPM) Module.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
INCORRECT TIRE PRESSURE MONITORING (TPM) SENSOR ID(S)
TIRE PRESSURE MONITORING (TPM) SENSOR
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Before beginning diagnostic procedure, verify that tire pressures are correct.

   1. Turn the ignition on.
   2. With the scan tool, read and record TPM Module DTC's.
   3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 20 minutes in order to receive TPM data and allow for the system to update.
   4. With the scan tool, erase active TPM Module DTC's.
   5. With the scan tool, select View DTC's in the Tire Pressure Module (TPM).

   Is the DTC status Active at this time?

   Yes

   - Go To 2.

   No

   - Test complete.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **TPM-RKE ANALYZER CH9936**

   Is there a TPM-RKE Analyzer CH9936 available?

Yes

- Go To 3.

No

- Go To 4.

3. **WITH TPM-RKE TOOL CHECK TIRE PRESSURE MONITORING (TPM) SENSOR ID(S)**

NOTE: **Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the Sensor. If the incorrect vehicle line and/or model year is selected, the Sensor will not respond to the tool.**

NOTE: **If you receive no response from any of the tire pressure sensors, check to make sure that the TPM-RKE Analyzer is set correctly, and repeat the process on each of the non-responsive wheel(s)**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for an ID, store in the proper location in the TPM-RKE Analyzer.
2. Use a TPM-RKE Analyzer to upload the correct ID's and proper locations in the scan tool.
3. With the scan tool, select the TPM Module under "Miscellaneous Functions", follow the procedure for uploading TPM Sensor ID's.
4. With the scan tool, erase TPM Module DTC's.
5. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 20 minutes in order to receive TPM data and allow for the system to update.
6. With the scan tool, check to see if the TPM sensor ID's match what is programmed into the TPM Module.

   Do the TPM ID's match?

   Yes

   - Test complete.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **WITHOUT TPM-RKE TOOL CHECK TIRE PRESSURE MONITORING (TPM) SENSOR ID(S)**
   1. Turn the ignition on.

2. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
3. Repeat the above step on each wheel of the vehicle.
4. With the scan tool, erase TPM Module DTC's.
5. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 20 minutes in order to receive TPM data and allow for the system to update.
6. With the scan tool, check to see if the TPM sensor ID's are programmed into the TPM Module.

   Are the TPM Sensor ID's in the TPM Module?

   Yes

   - Test complete.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C151D-00-TIRE PRESSURE SENSOR LOCATION UNDETERMINED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The vehicle Tire Pressure Monitoring (TPM) Sensor locate process occurs after the vehicle is stationary for more than 20 min. The TPM system will determine the sensor positions while driving at speeds above 24 km/h (15 mph). This process can take up to 20 min to determine TPM Sensor positions.

WHEN MONITORED:

During vehicle TPM Sensor locate process.

SET CONDITION:

Must fail multiple vehicle TPM Sensor locate processes if localization fails due to Left/Right fail or Front/Rear fail or if the TPM Module is new and has never attempted localization. If missing TPM Sensors are present on first drive, C151D will set to show that the TPM Sensor location cannot be determined/guaranteed (cannot revert to last known good locations).

POSSIBLE CAUSES

Possible Causes

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: **The DTC C151D should not exist on its own. If any other DTC's are present, refer to the appropriate diagnostic procedure in this information first before continuing.**

NOTE: **If a new TPM Module was installed, the vehicle must remain stationary for 20 minutes before proceeding with this diagnostic procedure.**

1. Turn the ignition on.
2. With the scan tool, read and record TPM Module DTC's.
3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 20 minutes in order to receive TPM Sensor data and allow for the system to update.
4. With the scan tool, erase TPM Module DTC's.
5. With the scan tool, select View DTC's in the TPM Module.

Is DTC C151D Active on its own at this time?

Yes

- Install a new TPM Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1580-00-LEFT/RIGHT SIDE TIRE PRESSURE SENSOR LOCATION UNDETERMINED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The vehicle Tire Pressure Monitoring (TPM) Sensor locate process occurs after the vehicle remains stationary for 20 minutes. The Tire Pressure Monitoring (TPM) Module will determine the TPM Sensor positions. The TPM Sensors themselves determine which side of the vehicle they are located on.

WHEN MONITORED:

During vehicle TPM Sensor locate process.

SET CONDITION:

Must fail multiple vehicle TPM sensor locate processes if localization fails due to Left/Right fail or if the TPM module is new and has never attempted localization.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
TIRE PRESSURE MONITORING (TPM) SENSOR
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: **Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.**

NOTE: **The vehicle must remain stationary for 20 minutes before proceeding with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read and record TPM Module DTC's.
    3. With the scan tool, erase stored TPM Module DTC's.
    4. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 20 minutes in order to receive TPM Sensor data and allow for the system to update.
    5. With the scan tool, select View DTC's in the TPM Module.

    Is the DTC status Active at this time?

    Yes

    - Go To 2.

    No

    - Go To 3.
2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, select Data Display for the TPM Module and locate the following for each TPM

Sensor:

- Tire Pressure Sensor HW Fault
- Tire Temperature Sensor HW Fault
- Tire Acceleration Sensor HW Fault

Do any of the above HW faults read "Set"?

Yes

- For each TPM Sensor with a HW Fault. Install a new Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Perform any Technical Service Bulletins that may apply to this condition.
   3. With the scan tool, clear DTC's in the Tire Pressure Monitoring (TPM) Module.
   4. Have the vehicle remain stationary for 20 minutes.
   5. With the scan tool, select View DTC's in the Tire Pressure Monitoring (TPM) Module.

   Does the DTC reset or is the status Active for this DTC?

   Yes

   - Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1581-00-FRONT/REAR TIRE PRESSURE SENSOR LOCATION UNDETERMINED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The vehicle Tire Pressure Monitoring (TPM) Sensor locate process occurs after the vehicle remains stationary for 20 minutes. The Tire Pressure Monitoring (TPM) Module will determine the Tire Pressure Monitoring (TPM) Sensor positions. The TPM Module measures the signal strength of each TPM sensor and determines if the are in the front or rear.

WHEN MONITORED:

During vehicle TPM Sensor locate process.

SET CONDITION:

Must fail multiple vehicle TPM sensor locate processes if localization fails due to Front/Rear fail or if the TPM module is new and has never attempted localization.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
TIRE PRESSURE MONITORING (TPM) MODULE HARNESS
INCORRECT TIRE PRESSURE MONITORING (TPM) MODULE INSTALLATION
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

   NOTE: The vehicle must remain stationary for 20 minutes before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read and record TPM Module DTC's.
   3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 10 minutes in order to receive TPM Sensor data and allow for the system to update.
   4. With the scan tool, erase stored TPM Module DTC's.
   5. With the scan tool, select View DTC's in the TPM Module.

   Is the DTC status Active at this time?

   Yes

- Go To 2.

No

- Go To 3.

2. **TIRE PRESSURE MONITORING (TPM) MODULE INTERFERENCE**

NOTE: Interference may occur if the TPM Module is installed incorrectly or the TPM harness is not fastened properly to the body.

1. Turn the ignition off.

   Verify the following:

   - Aftermarket devices are installed or in the vehicle.
   - The TPM Module harness is damaged or is routed incorrectly.
   - The TPM Module is installed incorrectly.

   Are there any of the above conditions present?

   Yes

   - Repair as necessary.
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTC's in the Tire Pressure Monitoring (TPM) Module.
4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24 km/h (15 mph).
5. With the scan tool, select View DTC's in the Tire Pressure Monitoring (TPM) Module.

   Does the DTC reset or is the status Active for this DTC?

   Yes

   - Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service

Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .

- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1597-00-TPM SYSTEM DEACTIVATED-WINTER MODE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

NOTE: When this DTC is active the TPM Module will enter a deactivation mode (Winter Mode) and the TPM system becomes deactivated. If winter tires and wheel assemblies are installed no repair is required.

The Tire Pressure Monitor (TPM) Module determines the TPM Sensor positions by performing the vehicle Tire Pressure Monitoring (TPM) Sensor locate procedure. This procedure is run after the vehicle has been stationary for 20 minutes. After driving the vehicle at speeds greater than 24 km/h (15 mph) for a minimum of 10 minutes without the TPM Sensor installed, the TPM Module sends a bus message commanding the TPM telltale lamp to flash for 75 seconds. After the 75 seconds of flashing, the lamp will remain on solid and a chime will be heard. The message center will display SERVICE TPM SYSTEM for five seconds and shut off, all while the tire pressure values will be displayed as dashes. After the ignition has been cycled off and on the TPM telltale lamp will remain off, the message center will no longer display SERVICE TPM SYSTEM, and the tire pressures continue to be displayed as dashes.

WHEN MONITORED:

During vehicle TPM Sensor locate process.

SET CONDITION:

For BUX/Canada vehicles only where all four TPM Sensors fail the locate processes at the same time because the TPM sensors are not installed on winter tire and wheel assemblies.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
TIRE PRESSURE MONITORING (TPM) SENSORS NOT PRESENT
TIRE PRESSURE MONITORING (TPM) SENSORS
TIRE PRESSURE MONITORING (TPM) MODULE

NOTE: **Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.**

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read and record the TPM Module DTC's.
    3. With the scan tool, erase stored TPM Module DTC's.
    4. Drive the vehicle at speeds greater than 24 km/h (15 mph) for 10 minutes.
    5. With the scan tool, read DTC's in the TPM Module.

    Is DTC C1597-00 Active at this time?

    Yes

    - Go To 2.

    No

    - Go To 4.
2. **TIRE PRESSURE MONITORING (TPM) WINTER MODE**

    NOTE: **Repair all other TPM Module DTC's before continuing with this test procedure.**

    1. Turn the ignition off.
    2. Cycle the ignition from off to on.
    3. Check for the following conditions:
        - The telltale lamp is off.
        - The tire pressure values in the Instrument Cluster are displayed as dashes.
        - The message center **is not** displaying "SERVICE TPM SYSTEM".

    Are all of the above conditions correct?

    Yes

    - The Tire Pressure Monitoring (TPM) Module is now in deactivation mode (Winter Mode). This DTC will remain active until the correct tire and wheel assemblies are installed back on the vehicle. Once one of the correct tire and wheel assemblies are reinstalled, the other three must also be reinstalled prior to turning the ignition on.

    No

- Go To 3.

3. **TIRE PRESSURE MONITORING (TPM) SENSORS**
    1. Turn the ignition off.
    2. Verify the correct TPM Sensors are installed in all of the tire and wheel assemblies.

    Are the correct TPM Sensors installed?

    Yes

    - Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
    - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Install all new Tire Pressure Monitoring (TPM) Sensors in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
    - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Perform any Technical Service Bulletins that may apply to this condition.
    3. With the scan tool, clear DTC's in the Tire Pressure Monitoring (TPM) Module.
    4. Test drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 24 km/h (15 mph).
    5. With the scan tool, select View DTC's in the Tire Pressure Monitoring (TPM) Module.

    Does the DTC reset or is the status Active for this DTC?

    Yes

    - Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
    - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.
    - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2209-00-TIRE PRESSURE MONITOR INTERNAL

WHEN MONITORED:

Ignition on. The Tire Pressure Monitoring (TPM) Module monitors its internal microprocessors for correct operation.

SET CONDITION:

If the Tire Pressure Module detects an internal fault, the DTC is set.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
TIRE PRESSURE MONITORING (TPM) MODULE - INTERNAL FAULT

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

DIAGNOSTIC TEST

1. **TPM INTERNAL FAILURE DTC PRESENT**
    1. Turn the ignition on.
    2. With the scan tool, read DTC's.
    3. With the scan tool, erase stored DTC's.
    4. Turn the ignition off.
    5. Turn the ignition on.
    6. With the scan tool, read DTC's.

    Does the scan tool display TIRE PRESSURE MODULE INTERNAL FAILURE?

    Yes

    - Replace the Tire Pressure Monitoring (TPM) Module in accordance with the Service Information. Refer to **MODULE, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
    - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
    - Perform the TPM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0001-00-CAN C BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on, battery voltage between 9 and 16 volts, and engine run time greater than Three seconds.

SET CONDITION:

The Tire Pressure Monitoring (TPM) Module does not receive any Can C bus messages for a specific amount of time. One trip fault.

POSSIBLE CAUSES

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION TIRE PRESSURE MONITORING (TPM) MODULE

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: **For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.**

1. Turn the ignition on.
2. With a scan tool, select View DTC's.

   Is the status Active for this DTC?

   Yes

   - **Refer to U0001-CAN C BUS** and perform the diagnostic procedure.

   No

   - **Refer to STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

U0100-00-LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts. Engine run time greater

than three seconds.

SET CONDITION:

Bus messages not received from the Powertrain Control Module (ECM/PCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
POWERTRAIN CONTROL MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
POWERTRAIN CONTROL MODULE (ECM/PCM)
MODULE THAT SET THIS DTC

NOTE: If present, diagnose and repair DTC U0002-88-CAN C BUS OFF PERFORMANCE- BUS OFF before diagnosing this DTC.

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read the active DTC's.

      Is this DTC active?

      Yes

      - **Refer to U0100-LOST COMMUNICATION WITH ECM/PCM** and perform the diagnostic procedure.

      No

      - **Refer to STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

The battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Anti-lock Brake System (ABS) Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is the DTC active at this time?

      Yes

      - **Refer to U0121-LOST COMMUNICATION WITH ABS** and perform the diagnostic procedure.

      No

      - **Refer to STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

U0141-00-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

The battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTC's RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTC's.

      Is this DTC active?

      Yes

      - **Refer to U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)** and perform the diagnostic procedure.

No

- **Refer to STORED LOST COMMUNICATION DTC's** and perform the diagnostic procedure.

STANDARD PROCEDURE

STANDARD PROCEDURE - TPM VERIFICATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **TIRE PRESSURE MONITORING (TPM) MODULE**

   Was the TPM Module replaced during the test procedure?

   Yes

   - Go To 2.

   No

   - Go To 3.
2. **PLACARD PRESSURE VALUES**
   1. Reconnect the previously removed and/or disconnected components and connectors.
   2. With the scan tool, select "Miscellaneous Functions" in the Totally Integrated Power Module (TIPM). Then select the desired procedure and follow the display on the scan tool.
   3. Program the Placard Pressure Values into the Totally Integrated Power Module (TIPM).
   4. Go To "Tire Pressure Module (TPM)", select "Data Display", read "'Tire Placard Pressure - Front" and "'Tire Placard Pressure -Rear" and confirm the values match the Tire Inflation Pressure (Placard) label. Also, go into the Totally Integrated Power Module (TIPM), select Data Display and read "'Tire Placard Pressure - Front" and "'Tire Placard Pressure -Rear" to confirm the values were programmed correctly. If the Placard values are incorrect in the TIPM or TPM Module, select the Totally Integrated Power Module (TIPM) then under "Miscellaneous Functions", select "Update Pressure Threshold" and enter the placard pressure value as seen on the Tire Inflation Pressure (Placard) label.
   5. With the scan tool, erase all stored DTC's.
   6. With the scan tool, read TPM Module DTC's.

   Are there any DTC's present?

   Yes

   - Repair not complete, perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND**

TESTING.

No

- Go To 3.

3. **TPM SENSOR REPLACEMENT**

NOTE: **If a TPM-RKE Tool is not available, let the vehicle sit stationary for more then 20 minutes, and then proceed to step 4.**

1. Using an updated TPM-RKE Analyzer Tool, select TPM Functions, then enter the Model Year and the Body Style of the vehicle, and for the Trigger Selection select PARK SENSOR
2. Scan each TPM Sensor at each road wheel, and store each TPM Sensor ID in the correct location. (LEFT FRONT, LEFT REAR, RIGHT FRONT, RIGHT REAR, and SPARE TIRE (if equipped).)
3. Connect the TPM-RKE Analyzer Tool to the scan tool, and then follow the programming steps outlined in the diagnostic scan tool for "Program Tire Pressure Sensor ID w/ TPM Tool" under "MISC" for the TPM.
4. Drive the vehicle for a minimum of 20 minutes while maintaining a continuous speed above 24 km/h (15 mph).
5. With the scan tool, read TPM DTC's.

Are there any TPM DTC's present?

Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

No

- Repair complete.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE AND WHEEL VIBRATION

Tire and wheel imbalance, runout and tire road force variation can cause vehicles to exhibit steering wheel vibration and/or seat vibration.

VISUAL INSPECTION

Visual inspection of the vehicle is recommended prior to road testing or performing any other procedure. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Inspect for the following:

- Verify correct (OEM) wheel and tire, as well as presence of wheel weights.
- Inspect tires and wheels for damage, mud packing and unusual wear; correct as necessary.
- Check and adjust tire air pressure to the pressure listed on the label attached to the driver's door opening.

ROAD TEST

NOTE: If a Noise & Vibration Analyzer is available, use it to diagnosis the issue during the road test.

NOTE: If the vehicle has been sitting for an extended period of time it is recommended to drive to warm the tires. This process could eliminate flat spots that can cause vibration.

Road test vehicle on a smooth road **at and near the designated speed** where legal speed limits allow. Lightly place hands on steering wheel at the 10:00 and 2:00 positions and observe for:

- Steering wheel oscillation: clockwise/counterclockwise
- Steering wheel high frequency movement: rapid vibration up and down
- Seat high frequency movement: rapid vibration up and down

To rule out vibrations due to brakes or powertrain:

- Lightly apply brakes at the designated speed; if vibration occurs or is enhanced, vibration is likely due to a brake concern.
- Shift transmission into neutral while vibration is occurring, if vibration is eliminated, vibration is likely due to a powertrain concern. Refer to **PROPELLER SHAFT VIBRATION** .

TIRE/WHEEL BALANCE AND ROAD FORCE VARIATION

NOTE: **If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.**

Balance the tire and wheel assemblies as necessary, and if wheel balance equipment is capable, also test for tire and wheel runout and road force variation following the wheel balancer manufacturer's instructions and using the information listed in Tire And Wheel Balance. Refer to **STANDARD PROCEDURE**. Repeat the road test above to verify the vibration is repaired.

STANDARD PROCEDURE

TIRE AND WHEEL BALANCE

NOTE: **Always verify the wheel and tire balance before removing any wheel weights. If assembly is within specification and weights are not corroded or loose, do not remove weights. The process of removing and adding weight could damage wheel protective coating.**

NOTE: **Balance and road force variation equipment must be calibrated and maintained per equipment manufacturer's specifications.**

NOTE: **If a tire sealant & inflator kit was used to temporarily repair small punctures then the tire must be removed from wheel and all the sealant must be removed with a water damped cloth before repairing & balancing the assembly.**

NOTE: **Some wheels may not have an outer flange. Apply adhesive weights on midplane surface to balance.**

2460193

Fig. 1: Balancing Wheels Using Cone/Collet
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Balance equipment could read an incorrect balance result when measuring Chrome Clad wheels. This is caused by the equipments mounting cone/collet contacting the cladding or the cone/collet is not balanced. A dual-taper collet (1) type wheel centering tool is recommended as opposed to a high-taper cone (2) type wheel centering tool. Always use the manufacturer's recommended balance equipment.**

- **Dual-taper collet type (1)**
- **High-taper cone type (2)**
- **Possible obstruction (3)**
- **May not seat properly (4)**
- **No obstruction (5)**
- **Properly seated (6)**

NOTE: **If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.**

Fig. 2: Dynamic Balancing
Courtesy of CHRYSLER GROUP, LLC

For dynamic balancing (**recommended**), the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (2).

Fig. 3: Static Balancing
Courtesy of CHRYSLER GROUP, LLC

For static balancing (**not recommended**), find the location of the heavy spot causing the imbalance (1). Counter balance the wheel directly opposite the heavy spot. Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (3) at the predetermined spots.

Aluminum wheels use a different type wheel weight than steel wheels. Be sure to use the correct wheel weight for the wheel type.

Always verify the balance. When using off-vehicle equipment, remount the tire and wheel assembly 180 degrees on the balancer spindle and recheck balance. Balance variation from one spot to the other should not be more than 0.125 (?) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning, or the wrong collet/cone may have been used.

If difficult to balance, break down the tire and wheel assembly and check for loose debris inside the tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

TIRE ROTATION

Tires on the front and rear axles operate at different loads and perform different steering, driving, and braking functions. For these reasons, the tires wear at unequal rates. They may also develop irregular wear patterns. These effects can be reduced by rotating the tires according to the maintenance schedule in the Owners Manual. This will improve tread life, traction and maintain a smooth quiet ride.

Fig. 4: Tire Rotation Pattern - Single Rear Wheel
Courtesy of CHRYSLER GROUP, LLC

The recommended method of tire rotation for a single rear wheel vehicle is to cross the front wheels to the rear, and to move the rear wheels straight forward to the front. Other methods can be used, but may not provide the same tire longevity benefits.

Fig. 5: Tire Rotation Pattern - Dual Rear Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: 3500 Dual rear tires have a new tire rotation pattern. This is to accommodate the outlined white letter (OWL) tires. When replacing a flat, the spare tire may have to be remounted on the rim or installed at a different location to maintain the correct placement of the outlined white letter (OWL) tires.

The recommended method of tire rotation for the 3500 dual wheel vehicle is to crisscross the front wheels with the inside rear wheels, and to switch the outside right and left rear wheels. Other methods can be used, but may not provide the same tire longevity benefits.

Fig. 6: Tire Rotation Pattern - 4500 & 5500
Courtesy of CHRYSLER GROUP, LLC

The recommended method of tire rotation for the 4500 and 5500 dual wheel vehicles to switch the 2 front wheels, switch the inside left rear with the outside right rear, and to switch the inside right rear with the outside left rear.

TIRES

DESCRIPTION

TIRES

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval. Refer to **STANDARD PROCEDURE**. This will help to achieve a greater tread life.

TIRE IDENTIFICATION

Fig. 7: Tire Identification Information
Courtesy of CHRYSLER GROUP, LLC

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code.

Performance tires have a speed rating letter after the aspect ratio number. The speed rating is not always printed on the tire sidewall. These ratings are:

- **Q** up to 99 mph
- **S** up to 112 mph
- **T** up to 118 mph
- **U** up to 124 mph
- **H** up to 130 mph
- **V** up to 149 mph
- **W** (consult the tire manufacturer for the specific speed rating)

- **Z** more than 149 mph (consult the tire manufacturer for the specific speed rating)

An All Season type tire will have either **M + S, M AND S or M-S** (indicating mud and snow traction) imprinted on the side wall.

TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

SPARE / TEMPORARY TIRE

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 KMH (50 MPH). when using the temporary spare tire. Refer to Owner's Manual for complete details.

SPARE / FULL SIZE WITH MATCHING TIRE

The spare is a full usage wheel with a matching tire, It can be used within the (posted legal) speed limits or distance limitations as of the rest of the vehicles four tires. Refer to Owner's Manual for complete details.

RADIAL - PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 80 KMH (50 MPH) is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

REPLACEMENT TIRES

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life

- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

WARNING: Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure.

TIRE INFLATION PRESSURES

Fig. 8: Under Inflation
Courtesy of CHRYSLER GROUP, LLC

WARNING: Over or under inflated tires can affect vehicle handling and tread wear. This may cause the tire to fail suddenly, resulting in loss of vehicle control.

Under inflation will cause rapid shoulder wear (1), tire flexing, and possible tire failure.

Fig. 9: Over Inflation
Courtesy of CHRYSLER GROUP, LLC

Over inflation will cause rapid center wear (1) reduction in the tire's ability to cushion shocks.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

For proper tire pressure specification, refer to the tire label placard usually located on the drivers door latch pillar.

DIAGNOSIS AND TESTING

PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.

TREAD WEAR INDICATORS

Fig. 10: Identifying Tread Wear Indicators
Courtesy of CHRYSLER GROUP, LLC

Tread wear indicators (3) are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators (3) will appear as a 13 mm (1/2 in.) band.

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

TIRE WEAR PATTERNS

Fig. 11: Identifying Tire Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

TIRE/VEHICLE LEAD

Use the following Vehicle Lead Diagnosis And Correction Chart to diagnose and correct a vehicle lead or drift problem.

Fig. 12: Vehicle Lead Diagnosis & Correction Chart

Courtesy of CHRYSLER GROUP, LLC

STANDARD PROCEDURE

STANDARD PROCEDURE - TIRE REPAIR AREA

Fig. 13: Identifying Tire Repair Area
Courtesy of CHRYSLER GROUP, LLC

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification.

WINCH, SPARE TIRE CARRIER

REMOVAL

REMOVAL

Fig. 14: Spare Tire Carrier Winch
Courtesy of CHRYSLER GROUP, LLC

NOTE: **"Do NOT use impact tools on the Spare Tire Winch assembly to raise or lower the Spare Tire".**

1. Remove the spare tire.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the spare tire winch bolts (2) and then remove the winch (1).

INSTALLATION

INSTALLATION

Fig. 15: Spare Tire Carrier Winch
Courtesy of CHRYSLER GROUP, LLC

1. Position the winch (1) on the crossmember. Install the bolts (2) and tighten to 20 N.m (15 ft.lbs.).
2. Remove the supports and lower the vehicle.

NOTE: "Do NOT use impact tools on the Spare Tire Winch assembly to raise or lower the Spare Tire".

3. Install the spare tire back into position.

WHEELS

DESCRIPTION

GENERAL INFORMATION

Fig. 16: Identifying Wheel/Rim Design
Courtesy of CHRYSLER GROUP, LLC

The rim size is on the vehicle safety certification label located on the drivers door shut face. Original equipment wheels/rims are designed for operation up to the specified maximum vehicle capacity.

All models use stamped steel, cast aluminum or forged aluminum wheels. Every wheel has raised sections between the rim flanges (1) and rim drop well (3) called safety humps.

Initial inflation of the tire forces the bead over these raised sections. In case of rapid loss of air pressure, the raised sections help hold the tire on the wheel.

The wheel studs and nuts are designed for specific applications. All aluminum and some steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels. Do not use replacement studs or nuts with a different design or lesser quality.

HD - WHEELS

Original equipment wheels are designed for the specified Maximum Vehicle Capacity.

All models use steel or aluminum drop center wheels.

Aluminum wheels require special balance weights and alignment equipment.

Fig. 17: Flat Face Wheel
Courtesy of CHRYSLER GROUP, LLC

1 - FLAT FACE
2 - VALVE STEM

1. On vehicles equipped with dual rear wheels, the rim is an eight stud hole pattern wheel. The wheels have a flat mounting surface (1).

Fig. 18: Dual Rear Wheels
Courtesy of CHRYSLER GROUP, LLC

1 - WINDOW OPENINGS (5)
2 - INBOARD VALVE STEM
3 - OUTBOARD VALVE STEM

2. The slots (1) in the wheel must be aligned to provide access to the valve stem.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: Failure to use equivalent replacement wheels may adversely affect the safety and handling of the vehicle. Used wheels are not recommended. The service history of the wheel may have included severe treatment or very high mileage. The rim could fail without warning.

WARNING: Chrysler LLC does not recommend that customers use "reconditioned" wheels (wheels that have been damaged and repaired) because they can result in a sudden catastrophic wheel failure which could cause loss of control and result in injury or death.

For Clarification:

- **Cosmetic refinishing for the purpose of repairing a superficial flaw is an acceptable procedure providing it is limited to paint or clear coat only, the wheel is not modified in any way, and there is no exposure to paint curing heat over 200 degrees Fahrenheit.**
- **Damaged wheels are those which have been bent, broken, cracked or sustained some other physical damage which may have compromised the wheel structure**
- **Repaired indicates that the wheel has been modified through bending, welding, heating, straightening, or material removal to rectify damage.**
- **Re-plating of chrome plated wheels is not an acceptable procedure nor is chrome plating of original equipment painted or polished wheels, as this may alter mechanical properties and affect fatigue life.**

STANDARD PROCEDURE

DUAL REAR WHEEL INSTALLATION

Dual rear wheels use a special heavy duty lug nut wrench. It is recommended to remove and install dual rear wheels only when the proper wrench is available. The wrench is also used to remove wheel center caps for more information, refer to Owner's Manual.

The tires on both wheels must be completely raised off the ground when tightening the lug nuts. This will ensure correct wheel centering and maximum wheel clamping.

Fig. 19: Lug Nut Oil Application Area
Courtesy of CHRYSLER GROUP, LLC

1 - PLACE TWO DROPS OF OIL HERE

A two piece flat face lug nut with right-hand threads is used for retaining the wheels on the hubs. Refer to **Fig. 19**.

The dual rear wheel lug nuts should be tightened according to the following procedure:

NOTE: Do not use more then two drops of oil on the nut/washer (1), since the center caps attach in this area.

- Place two drops of oil to the interface of the nut/washer (1) before installing on the wheel stud. Refer to **Fig. 19**.
- Tighten the wheel lug nuts in the numbered sequential pattern until they are snug tight. Then tighten lug nut to specified torque following same number sequence. Refer to **SPECIFICATIONS**.
- Tighten lug nuts in same numbered sequence a second time to the specified torque. This will ensure that the wheels are thoroughly mated.
- Check lug nut specified torque after 100 miles (160 kilometers). Also after 500 miles (800 kilometers) of vehicle operation.

NOTE: Wheel lug nuts should be tightened to specified torque at every maintenance

interval thereafter.

WHEEL REPLACEMENT

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

Fig. 20: Wheel Installation (8-Lug Shown)
Courtesy of CHRYSLER GROUP, LLC

1 - CENTER CAP
2 - LUG NUT
3 - TIRE/WHEEL ASSEMBLY
4 - WHEEL STUDS

NOTE: Do not use chrome plated lug nuts with chrome plated wheels.

NOTE: All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification.

NOTE: Never use oil or grease on studs or nuts.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. Refer to **Fig. 20**. This could affect the safety and handling of your vehicle.

To install the wheel (3), first position it properly on the mounting surface. Refer to **Fig. 20**.

Courtesy of CHRYSLER GROUP, LLC

5-lug pattern.

Fig. 23: 6-Lug Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6- bolt pattern.

Wheels must be replaced if they have:

- Excessive runout
- Bent or dented
- Leak air through welds
- Have damaged bolt holes

Wheel repairs employing hammering, heating, or welding are not allowed.

Original equipment wheels are available through your dealer. Replacement wheels from any other source should be equivalent in:

- Load carrying capacity
- Diameter
- Width
- Offset
- Mounting configuration

Failure to use equivalent replacement wheels may affect the safety and handling of your vehicle. Replacement with **used** wheels is not recommended. Their service history may have included severe treatment.

COVER, WHEEL

REMOVAL

REMOVAL

NOTE: **The hub caps must be removed before raising the vehicle off the ground.**

NOTE: **You must use the flat end of the hub/cap remover/installer combination tool to pry off the wheel skins. Insert the flat tip completely and using a back and forth motion, loosen the wheel skin. repeat this procedure around the tire until the wheel skin pops off.**

1. On 2500/3500 single rear wheel (SRW) models, insert a hub/cap remover/installer combination tool using the blade on the end of the tool to pry the cap off in a back and forth motion.
2. On 3500 models with dual rear wheels (DRW), you must first remove the hub caps. The hub/cap remover/installer combination tool must be inserted in the pry off notch of the rear hub caps.
3. Position the hub/cap remover/installer combination tool and pull out on the tool firmly. The cap should come off.

   NOTE: **Failure to use a back and forth motion could damage the wheel skin chrome finish.**

4. The wheel skins can now be removed from the wheel. Use the flat end of the lug nut wrench to pry off the wheel skins. Make sure that the flat end is inserted and use a back and forth motion to remove the wheel skin.
5. On 3500 models front hub caps use the hub/cap remover/installer combination tool to pry off the cap in a back and forth motion. The wheel skins can now be removed.

INSTALLATION

INSTALLATION

FRONT

1. Align the valve stem with the notch in the wheel skin.
2. Seat on side of the wheel skin's wire retainer on to the wheel.
3. Using a rubber mallet, strike the opposite side of the wheel skin until the skin is properly seated.

   NOTE: **The wheel skin and the hub cap are fully seated when there is a consistent gap between the skin/ cap and the wheel.**

4. Tug on the hub cap/wheel skin to ensure that they are properly installed.

REAR

1. Install one 1 1/2 inch valve stem extension on each rear inner wheel.

   NOTE: **A 3/8 in. drive 10mm deep wheel socket with a 10 in. or greater extension can be used to remove the existing valve stem cap and install the extension.**

2. Install one 1 in. valve stem extension on each outer wheel.
3. Align the cooling windows of the wheel skin with the cooling windows of the wheel. Seat one side of the wheel skin's retainer onto the wheel. Using a rubber mallet, strike thew wheel skin on the outer circumference. Strike at several locations around the circumference until the skin is fully seated.

NOTE: **The wheel skin and the hub cap are fully seated when there is a consistent gap between the skin/cap and the wheel.**

4. Tug on the hub/cap wheel skin to ensure that they are properly installed.

STUD, WHEEL

REMOVAL

FRONT

Fig. 24: Removing Stud Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the brake caliper, caliper adapter and rotor. Refer to **ROTOR, BRAKE, REMOVAL** .
4. Remove the wheel speed sensor from the hub.

NOTE: **After the wheel stud is pressed from the flange, the axle shaft will not turn past the hub/bearing retaining bolt end. Before pressing the wheel stud from the flange, rotate the axle shaft so the stud that needs replacement is aligned with the wheel speed sensor opening.**

5. Press the stud from the hub using remover (special tool #C-4150A, Press, Ball Joint) (1).

Fig. 25: Stud, Hub & Access Hole
Courtesy of CHRYSLER GROUP, LLC

6. Remove the stud (2) from the hub (1) through the backing plate access hole (3).

REAR - 1500 ONLY

Fig. 26: Removing Stud From Hub
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Move axle shaft carefully to prevent damage to the shaft bearing and seal in the axle tube.

1. Pull the axle shaft out of the axle approximately 25mm (1 in.) for clearance to remove the wheel stud. Refer to **SHAFT, AXLE** .
2. Press the stud (1) from the hub using Ball Joint Press (special tool #C-4150A, Press, Ball Joint) (3).

3. Remove the stud (1) from the rear of the hub flange.

REAR

Fig. 27: Parking Brake Shoes, Adjuster & Spring
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel and tire assembly.
3. Remove the brake caliper, caliper adapter and rotor. Refer to **ROTOR, BRAKE, REMOVAL** .
4. Using appropriate tools, remove the spring (3) at parking brake adjuster (2).
5. Spread the parking brake shoes (1) apart enough to remove the adjuster (may need to back off adjustment), then remove the adjuster (2).

Fig. 28: Removing Stud From Hub

Courtesy of CHRYSLER GROUP, LLC

6. Rotate the axle around until the wheel stud (1) lines up with the opening where the adjuster was removed.
7. Press the stud (1) from the hub using Ball Joint Press (special tool #C-4150A, Press, Ball Joint) (3).
8. Remove the stud (1) from the rear of the hub flange. It may be necessary to work the hub flange back and forth to ease stud removal.

INSTALLATION

FRONT

Fig. 29: Stud, Hub & Access Hole
Courtesy of CHRYSLER GROUP, LLC

1. Install the new stud (2) into the hub flange (1).
2. Install three proper sized washers onto the stud, then install lug nut with the flat side of the nut against the washers.
3. Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
4. Remove the lug nut and washers.
5. Install the brake rotor, caliper adapter, and caliper. Refer to **ROTOR, BRAKE, INSTALLATION** .
6. Install the wheel speed sensor.
7. Install the wheel and tire assembly, use new lug nut on the stud or studs that were replaced.
8. Remove the support and lower the vehicle.

REAR - 1500 ONLY

Fig. 30: Stud Installation
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Move axle shaft carefully to prevent damage to the shaft bearing and seal in the axle tube.

1. Install the new stud (4) into the back of the hub flange (2) and seat as follows:
    1. Install three proper sized washers (1) onto the new stud (4), then install a lug nut (3) with the flat side of the nut against the washers.
    2. Tighten the lug nut (3) until the stud (4) is pulled into the hub flange (2). Verify that the stud is properly seated into the flange.
    3. Remove the lug nut (3) and washers (1).
2. Install the axle shaft. Refer to **INSTALLATION** .
3. Using a new lug nut on the new stud, install the wheel and tire assembly. Refer to **WHEELS, STANDARD PROCEDURE**.
4. Remove the supports and lower the vehicle.

REAR

Fig. 31: Stud Installation
Courtesy of CHRYSLER GROUP, LLC

1. Install the new stud (4) into the hub flange (2) at the opening where the adjuster was removed.
2. Install three proper sized washers (1) onto the new stud (4), then install a lug nut (3) with the flat side of the nut against the washers.
3. Tighten the lug nut (3) until the stud (4) is pulled into the hub flange (2). Verify that the stud is properly seated into the flange.
4. Remove the lug nut (3) and washers (1).

Fig. 32: Parking Brake Shoes, Adjuster & Spring
Courtesy of CHRYSLER GROUP, LLC

5. Install the parking brake adjuster (2) between the parking brake shoes (1) with the adjuster star wheel near the adjustment window in the brake shield.
6. Using appropriate tools, install the spring (3) at the adjuster (2).

7. Adjust parking brake shoes as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
8. Install the brake rotor, caliper adapter and caliper. Refer to **ROTOR, BRAKE, INSTALLATION** .
9. Using a new lug nut on the new stud, install the wheel and tire assembly. Refer to **WHEELS, STANDARD PROCEDURE**.
10. Remove the supports and lower the vehicle.

TIRE PRESSURE MONITORING

DESCRIPTION

DESCRIPTION

There are two tire pressure monitoring systems available, a base system and a premium system. On the 2500 series base and premium systems there is a light load switch located on the instrument panel in the center stack.

Fig. 33: Tire Pressure Monitoring Sensor Components
Courtesy of CHRYSLER GROUP, LLC

The **Base TPM system** consists of tire pressure monitoring sensors (1) attached to each road wheel (and spare if equipped with a sensor) valve stem (2), a central receiver module, an indicator lamp, and on some applications a Light Load switch located on the instrument panel center stack. The valve stem (2) used on this system is redesigned to look similar to a standard valve stem. The 2500 series truck uses a Tire Pressure Monitoring (TPM) module as the central receiver module, located in the left front wheel well forward of the splash shield. The 1500 series uses the Wireless Ignition Node (WIN) as the central receiver module.

Fig. 34: Tire Pressure Monitor Module & Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

The **Premium TPM system** used on the 1500 and 2500 series consists of tire pressure monitoring sensors attached to each road wheel (and spare if equipped with a sensor) valve stem (similar to the base system valve stem in the previous illustration above), a Tire Pressure Monitoring (TPM) module (3) located in the left front wheel well forward of the splash shield, an electronic display, an indicator lamp, and on some applications a Light Load switch located on the instrument panel center stack.

OPERATION

OPERATION

The Tire Pressure Monitoring (TPM) system monitors air pressure in the four road tires, or if the vehicle original equipment includes a full size matching spare, then all five tires. Pressure in the spare tire is not monitored with a compact spare or a "non-matching spare.

There are two tire pressure monitoring systems available, a base system and a premium system. The base system does not specify how many tires are low or where they are located. The premium system does indicate which tire is low.

LIGHT LOAD SWITCH

On the 2500 series base and premium systems there is a "Light Load" switch located on the instrument panel in the center stack. If equipped, these vehicles will have two different recommended tire pressure values depending on the vehicle load/switch setting. The Light Load switch which will allow the driver to change between two different recommended "Placard Pressure", "Low-pressure Threshold" and Hysteresis Pressure Values". These values are stored in the modules non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label or Supplemental Tire Pressure Information Label, and then apply the placard pressure to the following table. The Low Pressure OFF Threshold is defined as the Low Pressure ON Threshold plus the Hysteresis Pressure Value.

BASE TIRE PRESSURE MONITORING

The tire pressure monitoring (TPM) system is designed to operate without loss of function for all OEM tire construction for this vehicle. Sensors, mounted to each road wheel (and spare if equipped with a sensor) as part of the valve stem, transmit an RF signal indicating their individual pressure to the Tire Pressure Monitoring (TPM) module for the 2500 series, or the Wireless Ignition Node (WIN) for the 1500 series. These transmissions occur approximately once every minute at speeds over 15 mph (24 km/h). For more information on sensors, refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), OPERATION**.

If the TPM system detects that the tire pressure in any road tire is going low, beyond the Low Pressure (lamp) ON threshold (refer to placard table below), the TPM system will continuously illuminate an indicator lamp. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds, then remain on solid.

If the WIN or TPM module detects a warning or fault condition at ignition key "ON" it will wait ten seconds +/- 10 % before sending the first request to illuminate the indicator lamp. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle for each "warning" or "fault" condition detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and removed/reset.

The WIN or TPM module will store all warning and fault conditions, placard pressure values and low-pressure threshold values (lamp ON and OFF) in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The WIN or TPM module will store all wheel sensor ID's and locations and faults in memory that can be accessed through diagnostic communication, and all other data values transmitted from each active wheel sensor.

The WIN or TPM module shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during both the ignition key "ON" and key "OFF" cycles. The wheel sensor ID's and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are learned by the WIN or TPM during the initial Manufacturing Plant Process, or during a service procedure, as required.

The TPM System will continue to warn the driver of low tire pressure as long as the condition exists, and will not turn off the indicator lamp until the tire pressure is at or above the Low Pressure (lamp) OFF threshold (refer to placard table below). The system will automatically update and the TPM indicator lamp will extinguish once the updated tire pressures have been received.

NOTE: **A new sensor ID can also be programmed directly into the WIN or TPM module by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the vehicle will need to be driven above 15 mph until the fault is no longer active (lamp extinguishes) and display is updated (for up to 20 minutes).**

The WIN or TPM automatically learns and stores the sensor IDs while driving "within 20 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate when the vehicle has been stopped for more than 20 minutes.

Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when

the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure (placard pressure). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours (and in outside ambient temperature). The tire pressure will also increase as the vehicle is driven; this is normal and there should be no adjustment for this increased pressure. For a system fault, the system will return to normal once the WIN receives a valid transmission from that sensor location.

The recommended "Placard Pressure", "Low-pressure Threshold" (Low Pressure ON) and "Hysteresis Pressure" values for the tires installed on the vehicle, are learned by the WIN module configuration during the initial Manufacturing Plant Process, or during a service procedure, as required.

To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label, and then apply the placard pressure to the following table. The Low Pressure OFF Threshold is defined as the Low Pressure ON Threshold plus the Hysteresis Pressure value.

For further information, refer to the Owners Manual or the Appropriate Diagnostic Information.

PREMIUM TIRE PRESSURE MONITORING

The Tire Pressure Monitoring (TPM) system is designed to operate without loss of function for all OEM tire construction for this vehicle. Sensors, mounted to each road wheel (and spare if equipped with a sensor) as part of the valve stem, transmit an RF signal indicating their individual pressure to a receiver located in the Tire Pressure Monitoring (TPM) module. These transmissions occur approximately once every minute at speeds over 15 mph (24 km/h). For more information on sensors, refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), OPERATION**.

If the TPM module detects that the tire pressure in any road tire is going low, beyond the Low Pressure (lamp) ON threshold (refer to placard table below), a chime will sound and the indicator lamp will turn on. In addition to the chime and lamp, a graphic display of the pressure value(s) and position of the low tire(s) will flash in the Electronic Vehicle Information Center (EVIC). Once pressure in the suspect tire(s) raises above the Low Pressure (lamp) OFF Threshold (refer to placard table below), and the TPM module receives a valid transmission from the sensor the lamp will go out. If a system fault is detected due to a missing sensor signal, in addition to a chime and a indicator lamp flashing, a "Check TPM System" text message will be displayed in the instrument cluster, and the tire pressure graphic display will display "- -" in place of the pressure value. After the flash sequence the TPM indicator lamp will remain illuminated. The system will return to normal once the TPM module receives a valid transmission from that sensor location. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds and then remain on solid.

If the TPM module detects a warning or fault condition at ignition key "ON" it will wait approximately ten seconds before sending the first request to illuminate the indicator lamp. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle when a "warning" or "fault" condition is detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and reset.

NOTE: **A new sensor ID can also be programmed directly into the WIN or TPM module by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the vehicle will need to be driven above 15 mph until the fault is no longer active (lamp extinguishes) and display is updated (for up to 20 minutes).**

The TPM module shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during the ignition key "ON" cycle. The wheel sensor ID's and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are learned by the TPM control module using signal strength and direction of wheel rotation as received by the TPM module from each of the sensors, and updates the graphic display when necessary or during a service procedure, as required.

The TPM System will continue to warn the driver of low tire pressure as long as the condition exists, and will not turn off the indicator lamp until the tire pressure is at or above the Low Pressure (lamp) OFF threshold (refer to placard table below). The system will automatically update and the TPM indicator lamp will turn off once the updated tire pressures have been received.

Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure (placard pressure). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours (and in outside ambient temperature). The tire pressure will also increase as the vehicle is driven? this is normal and there should be no adjustment for this increased pressure. For a system fault, the system will return to normal once the TPM module receives a valid transmission from that sensor location.

The recommended "Placard Pressure", "Low-pressure Threshold" (Low Pressure ON) and "Hysteresis Pressure" values for the tires installed on the vehicle, are learned by the TPM module configuration during the initial Manufacturing Plant Process, or during a service procedure, as required.

To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label, and then apply the placard pressure to the following table. The Low Pressure OFF Threshold is defined as the Low Pressure ON Threshold plus the Hysteresis Pressure value.

For further information, refer to the Owners Manual or the Appropriate Diagnostic Information.

TPM THRESHOLD PRESSURES

NOTE: **To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label found on the Driver's B-Pillar, then apply the placard pressure to the following table.**

Placard Pressure (Cold) (PSI)	Low Pressure ON Threshold (PSI)	Low Pressure OFF Threshold (PSI)
28	22	28
29	23	29
30	24	30

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE PRESSURE MONITORING SYSTEM

When diagnosing a tire pressure issue, first check the Tire Pressure Monitoring (TPM) indicator lamp in the instrument cluster during ignition key ON. From the OFF position, turn the key to ON and check the TPM indicator lamp to observe one of the following:

- If after 10 seconds the indicator lamp is illuminating continuously (not flashing), refer to LOW PRESSURE below.
- If after 10 seconds the indicator lamp flashes on/off for 75 seconds, then remains on solid, there is a system fault detected. Refer to SYSTEM FAULT below.

LOW PRESSURE

NOTE: **Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.**

NOTE: **Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will also decrease. Tire pressure should always be set based on cold**

inflation tire pressure. For details, refer to TIRES, DESCRIPTION.

Check air pressure as necessary in all tires using a known accurate air gauge and adjust to the specification listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver side B-pillar). After adjusting air pressure in a tire on the vehicle, allow approximately two minutes for the message or indicator lamp to go out.

If air pressure in any tire is low, inspect **all** the tires for leaks. A water "dunk tank" or other water test may be used to check for a leak around the sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original (special) valve stem cap is securely installed to keep moisture out of the sensor.

If the indicator lamp is still ON continuously, refer to the appropriate diagnostic information.

SYSTEM FAULT

After an ignition key ON, if a system fault is detected, a chime will sound, and the TPM indicator (telltale) lamp will flash for 75 seconds, then remain on solid. A system fault can occur by many scenarios, including the following:

- Signal interference due to electronic devices or driving next to facilities emitting the same Radio Frequencies as the TPM sensors.
- Installing some form of aftermarket window tinting that affects radio wave signals.
- Accumulation of snow or ice around the wheels or wheel housings.
- Using tire chains on the vehicle.
- Using wheels not equipped with TPM sensors.

If a system fault is detected, refer to **DIAGNOSIS AND TESTING** .

MODULE, TIRE PRESSURE MONITORING (TPM)

DESCRIPTION

DESCRIPTION

Fig. 35: Tire Pressure Monitor Module & Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

The TPM Module (3) is a stand-alone receiver that is used to perform all TPM functionality in a Premium TPM System (1500 and 2500), and on the Base TPM System (2500 only). The TPM is located in the left front wheel well forward of the splash shield, near the body to frame mount and is mounted to the frame with a bracket. The TPM uses information transmitted from each of the sensors as well as the difference in the strength of the signal received to determine the location of each of the sensors.

OPERATION

OPERATION

The TPM receives information from each of the sensors in the form of RF signals. The information contained in each of the transmissions provides all the information necessary for the TPM to determine the pressure in each tire as well as the position of the sensor. This auto-locating process only happens in the first 10 minutes of any drive cycle while traveling at speeds above 15mph (24 km/h) (The auto-locating process will start again only if the vehicle has been shut off for approximately 20 minutes or longer). The TPM then transmits the required information directly to the CCN in order to update the lamp, chime and display as required.

REMOVAL

REMOVAL

NOTE: The TPM is located in the left front wheel well forward of the splash shield, near the body to frame mount and is mounted to the frame with a bracket.

Fig. 36: Tire Pressure Monitor Module & Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Disconnect the wiring harness connector (2) and wiring harness retainer (1) at the Tire Pressure Module (3).
4. Remove mounting nut (4), then remove the Tire Pressure Module (3) from the frame.

INSTALLATION

INSTALLATION

Fig. 37: Tire Pressure Monitor Module & Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Verify that the two tabs (5) are properly positioned on the edge of the frame.

1. Position the tire pressure monitor module (3) on the frame, install mounting nut (4) and torque to 8 N.m (71 in. lbs.).
2. Connect wiring harness connector (2) and wiring harness retainer at the Tire Pressure Module (3).
3. Remove the support and lower the vehicle.
4. Perform one of the following to make the system learn the new sensor ID.
    1. Use the TPM-RKE Analyzer 9936, with the Scan Tool to program the TPM Module with the tire pressure sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .
    2. Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 20 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID. This is part of the TPM Verification Test. Refer to **STANDARD PROCEDURE** .

SENSOR, TIRE PRESSURE MONITORING (TPM)

CAUTION

CAUTION

CAUTION: The use of tire sealants is not recommended for vehicles equipped with the Tire Pressure Monitoring system. Tire sealants may clog tire pressure sensors.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: It is not recommended to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only.

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

DESCRIPTION

DESCRIPTION

Fig. 38: Tire Pressure Monitoring Sensor Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: Replace the valve stem assembly and tire pressure sensor mounting screw with each tire change.

One tire pressure sensor (1) is mounted to a valve stem (2) specifically designed for mounting the pressure sensor (1) in each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor (1) must be replaced. The TPM system operates on a 433 MHz radio frequency. The tire pressure sensor valve stem (2) looks similar to a standard valve stem with the tire mounted on the wheel. To visually identify a tire pressure sensor/valve stem, the valve stem cap (3) is longer than a standard valve stem.

NOTE: This vehicle uses the 433 MHz TPM sensor. Although 315 MHz and 433 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct sensor is being used. A RKE-TPM Analyzer can be used to determine the sensor's frequency without having to dismount the tire.

The TPM sensors are designed for original style factory wheels. It is not recommended to install a tire pressure sensor in an aftermarket wheel. (This could cause sealing and system performance issues.)

The serviceable components of the tire pressure sensor are:

- Tire pressure sensor (1), including all components below
- Valve stem (2), including screw (4), core, and cap (3)
- Valve stem core (not shown in illustration)
- Valve stem cap (3)

The valve stem caps and cores used are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

OPERATION

OPERATION

CAUTION: The TPMS has been optimized for the original equipment tires and wheels. TPMS pressures have been established for the tire size equipped on your vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, and/or style. After-market wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with a TPMS, as damage to the sensors may result.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Monitoring Sensor.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

The battery operated tire pressure sensor is both a transmitter and a receiver. The TPM sensor can be forced to transmit if using a special tool such as a TPM-RKE Analyzer. The TPM-RKE Analyzer has the ability to change the sensor mode and to diagnose a faulty TPM sensor. Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor.

Each sensor's (transmitter) broadcast is uniquely coded so that the module can monitor the state of each of the sensors on the four rotating road wheels. The module can automatically learn and store the sensor's ID while driving "within 10 minutes continuously above 15 m.p.h. (24 Km/h)" after a sensor has been replaced. The vehicle must be stationary for more then 20 minutes in order to initiate the learning sequence.

The sensor IDs can also be programmed using the TPM-RKE Analyzer Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location. (LEFT FRONT, LEFT REAR, RIGHT FRONT, and RIGHT REAR) Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool".

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE PRESSURE SENSOR

NOTE: **Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.**

NOTE: **Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12 F° (6.5 C). This means that when the outside temperature decreases, the tire pressure will also decrease. Tire pressure should always be set based on cold inflation tire pressure.**

When diagnosing a tire pressure issue, always check air pressure in the tires first with a known accurate air gauge. Adjust air pressure as necessary to that listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver's side B-pillar). After adjusting air pressure in a tire on the vehicle, allow approximately two minutes for the message or indicator lamp to go out.

Check the tire pressure indicator lamp in the instrument cluster. If the lamp is illuminating continuously, inspect all the tires for leaks. A water "dunk tank" or other water test may be used to check for leaks around the sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original valve stem cap is securely installed to keep moisture out of the sensor. If the gauge-read pressure in the tires does not indicate a tire pressure issue, refer to the appropriate diagnostic information.

If the indicator lamp is flashing on/off for 75 seconds and then remains on solid, a system fault was detected. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove tire and wheel assembly.

CAUTION: **The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Do not substitute a regular valve stem cap in its place.**

Fig. 39: Positioning Tire Mounting/Dismounting Tool
Courtesy of CHRYSLER GROUP, LLC

3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
    1. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor (1). That includes both outer and inner beads of the tire.
    2. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280° from the valve stem ± 10°, then proceed to dismount the tire from the wheel. Use this process on both outer and inner tire beads.

Fig. 40: Valve Stem Retainer Screw, Sensor & Valve Stem
Courtesy of CHRYSLER GROUP, LLC

4. Remove the sensor to valve stem retainer screw (3) and remove the sensor (1) from the valve stem (2).
5. Remove the valve stem (2) from the wheel (4).

INSTALLATION

INSTALLATION

NOTE: **If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem. If replacing a valve stem only (using the existing tire pressure sensor), the new valve stem will include a new tire pressure sensor mounting screw. Always use a new mounting screw when attaching a sensor to a valve stem.**

Fig. 41: Valve Stem Retainer Screw, Sensor & Valve Stem
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.**

1. Wipe area clean around sensor/valve stem mounting hole in wheel (4). Make sure surface of wheel is not damaged.

   NOTE: **A new valve stem is pre-lubricated for proper installation with a standard tool.**

   NOTE: **If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem.**

2. Insert valve stem (2) through wheel (4) and pull through to seat with standard valve stem installation tool.

Fig. 42: Tire Pressure Monitoring Sensor Components
Courtesy of CHRYSLER GROUP, LLC

3. If replacing the valve stem (2) only (using the existing tire pressure sensor), verify that the flat sides of the brass extension on the bottom of the valve stem (2) are at a 90 degree angle with the wheel. Position the pressure sensor (1) over the brass extension, install the retainer screw (4) and tighten to 1.4 N.m (12 in. lbs.).
4. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

Fig. 43: Mounting Tire Using Rotating Wheel Machine
Courtesy of CHRYSLER GROUP, LLC

1.

1 - HEAD OF CHANGER LOCATED HERE
2 - VALVE STEM

Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 280° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the outer and inner tire beads.

Fig. 44: Mounting Tire Using Rotating Tool Machine
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE STEM
2 - INSTALLATION END OF MOUNTING/DISMOUNTING TOOL
3 - BEAD BREAKER (KEEP CLEAR OF SENSOR)

2. Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located approximately 210° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the outer and inner tire beads.

5. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.
6. Install tire and wheel assembly on the vehicle.
7. Remove the support and lower the vehicle.
8. Perform one of the following to make the system learn the new sensor ID.

1. Use the TPM-RKE Analyzer, 9936, with the Scan Tool to program the WIN with the tire pressure sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .
2. Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .

NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.

SWITCH

DESCRIPTION

DESCRIPTION

Fig. 45: Tire Light Load Inflation Reset Switch
Courtesy of CHRYSLER GROUP, LLC

The Tire Pressure Monitor (TPM) system "Tire Light Load Inflation" reset switch will allow the driver to switch between the max load inflation pressure (cold) low pressure warning threshold and the light load inflation pressure (cold) low pressure warning threshold depending on the vehicle's load condition. The Tire and Loading Information label defines the recommended front and rear cold tire inflation pressures for the vehicle when operating in the Max Load condition. A Supplemental Tire Pressure Information label is also available defining Tire Light Load Inflation pressures when operating in the light load condition. When the "Tire Light Load Inflation" reset switch LED is ON (only the words (LIGHT LOAD" will illuminate), the Tire Pressure Monitoring (TPM) system is using the light load inflation pressure (cold) low inflation warning thresholds.

OPERATION

OPERATION

Fig. 46: Tire Light Load Inflation Reset Switch
Courtesy of CHRYSLER GROUP, LLC

This vehicle may have different recommended tire pressure values between the front and rear tires as shown in both the Tire Loading Information Label and the Supplemental Tire Pressure Information Label. It is also equipped to be driven with tire pressures appropriate to either a Light Load condition or the vehicle Max Load condition.

The "Tire Light Load Inflation" reset switch will allow the driver to change between the max load inflation pressure (cold) low pressure warning threshold and the light load inflation pressure (cold) low pressure warning threshold depending on the vehicle's load condition. Refer to the "Supplemental Tire Pressure Information" label for the vehicle's Light Load inflation pressures and "Tire and Loading Information" label for the vehicle's Max Load inflation pressures.

To switch from the max load inflation pressure (cold) low pressure warning threshold to the light load inflation pressure (cold) low pressure warning threshold, begin by placing the Ignition switch in the RUN position. Next, lower all four road tire pressures to the Light Load Inflation Pressure values as listed on the Supplemental Tire Pressure Information label. The Supplemental Tire Pressure Information label is located on the rear face of the driver door. Use an accurate tire gauge to check the tire pressures when lowering all four tire pressures. After all four tire pressures have been lowered to the Light Load inflation pressures, press the "Tire Light Load Inflation" reset switch. If the "Tire Light Load Inflation" switch's amber colored LED turns ON (only the words LIGHT LOAD will illuminate), the Tire Pressure Monitoring (TPM) system is using the light load inflation pressure (cold) low pressure warning thresholds. When the vehicle light or max load condition has been changed, the Electronic Vehicle Information Center (EVIC) will display "TIRE PRESSURE LT LOAD SET" or "TIRE PRESSURE MAX LOAD SET" depending on the system conditions.

If the "Tire Light Load Inflation" reset switch amber colored LED flashes on and off for 10 seconds (only the words LIGHT LOAD will illuminate), after all four tire pressures have been lowered to the Light Load inflation pressures, the pressure in any one of the four tires may not be at the light load inflation pressure (cold) values as indicated for the Light Load condition as defined in the Supplemental Tire Pressure Information label located on the rear face of the driver door. Using an accurate tire pressure gauge, re-check the tire pressures for the light load inflation pressure (cold) value.

WARNING: It is the driver's responsibility to change to the max load inflation pressure (cold) low pressure warning threshold condition when not driving in the light load condition as defined as two occupants (150 lbs each) plus 200 pounds of cargo. The vehicle "Light Load Definition" is found in the Supplemental Tire Pressure Information Label located on the rear face of the driver door. Failure to do so may cause you to lose control resulting in an accident, causing serious or fatal injury.

To switch back to the max load inflation pressure (cold) low pressure warning threshold, press the "Tire Light Load Inflation" reset switch. It is not necessary to first fill the tires to the max load inflation pressure (cold) values to switch the TPMS system to the max load inflation pressure (cold) low pressure warning threshold. If after pressing the "Tire Light Load Inflation" reset switch and tire pressures are below the max load inflation pressure (cold) low pressure warning thresholds, the TPMS low pressure warning telltale lamp located in the Instrument Cluster will turn ON and a chime will sound. The tire pressures are now required to be inflated to the max load inflation pressure (cold) values described on the Tire and Loading Information label. The Tire and Loading Information label is located on the drivers side B-pillar. If the "Tire Light Load Inflation" reset switch LED turns OFF the TPMS has been reset and the Tire Pressure Monitoring (TPM) system is using the max load inflation pressure (cold) low pressure warning thresholds.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LIGHT LOAD SWITCH

In order to obtain conclusive testing, the Tire Pressure Monitor (TPM) system and the Controller Area Network (CAN) data bus circuit must be checked. **Any diagnosis of the TPM system should begin with, the use of a scan tool and the appropriate diagnostic service information** .

Refer to the appropriate wiring information for complete wiring diagrams.

Fig. 47: Light Load Switch Connector Terminals
Courtesy of CHRYSLER GROUP, LLC

1. Remove the light load switch. Refer to **SWITCH, REMOVAL**.
2. Disconnect the wire harness connector from the back of the light load switch. Check for continuity between the light load switch harness connector cavity terminal 4 and a good ground. Resistance should be less than 5 ohms. If OK, go to the next step, if not OK repair the ground circuit of the light load switch.

Fig. 48: Light Load Switch Pins
Courtesy of CHRYSLER GROUP, LLC

3. Test the continuity of the light load switch (component side) between pins three and four with the switch depressed (closed) and with the switch released (open). There should be continuity (less than 100 Ohms) with the switch depressed and no continuity (infinity) with the switch released. If OK, go to the next step. If not OK, replace the light load switch. Refer to **SWITCH, REMOVAL**.
4. Test the TPM switch signal circuit between the light load switch harness connector cavity 3 and the instrument cluster harness connector C3 cavity 5 for an open or short to ground. Repair the circuit as required, and install the light load switch. Refer to **SWITCH, INSTALLATION**.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL** .
3. Disconnect the switch/module electrical connectors.
4. Using an appropriate flat bladed tool, remove the light load switch/module from the bezel.

INSTALLATION

INSTALLATION

1. Align the tabs of the switch/module to the instrument panel center bezel and gently push together until the tabs are securely in place.
2. Connect the switch/module electrical connectors.
3. Install the instrument panel center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, INSTALLATION** .
4. Connect the battery negative cable.
5. Verify system operation.

DESCRIPTION

DESCRIPTION

The 66RFE automatic transmissions is a sophisticated, multi-range, electronically controlled transmission which combines optimized gear ratios for responsive performance, state of the art efficiency features and low NVH. Other features include driver adaptive shifting and three planetary gear sets to provide wide ratio capability with precise ratio steps for optimum driveability.

The hydraulic portion of the transmission consists of the transmission fluid, fluid passages, hydraulic valves, and various line pressure control components.

The primary mechanical components of the transmission consist of the following:

- Larger bell housing with a different bolt pattern and a cutout to accommodate diesel applications.
- Three multiple disc input clutches
- Three multiple disc holding clutches
- Five hydraulic accumulators
- Three planetary gear sets
- Dual Stage Hydraulic oil pump
- Valve body
- Solenoid pack

The Transmission Control Module (TCM) is the "heart" or "brain" of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. Depending on the vehicle configuration, the TCM may be a standalone module or it may be housed along with the Powertrain Control Module (PCM) in a single module. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

TRANSMISSION IDENTIFICATION

Fig. 1: Transmission Identification Numbers
Courtesy of CHRYSLER GROUP, LLC

Transmission identification numbers are stamped (1) on the left side of the case just above the oil pan sealing surface. Refer to this information when ordering replacement parts. A label is attached to the transmission case above the stamped numbers. The label gives additional information which may also be necessary for identification purposes.

GEAR RATIOS

The 66RFE gear ratios are:

1st

3.23:1

2nd

1.83:1

3rd

1.41:1

4th

1.00:1

5th

Reverse

4.44:1

OPERATION

OPERATION

The 66RFE offers full electronic control of all automatic up and downshifts, and features real-time adaptive closed-loop shift and pressure control. Electronic shift and torque converter clutch controls help protect the transmission from damage due to high temperatures, which can occur under severe operating conditions. By altering shift schedules, line pressure, and converter clutch control, these controls reduce heat generation and increase transmission cooling.

To help reduce efficiency-robbing parasitic losses, the transmission includes a dual-stage transmission fluid pump with electronic output pressure control. Under most driving conditions, pump output capacity greatly exceeds that which is needed to keep the clutches applied. The 66RFE pump-pressure control system monitors input torque and adjusts the pump pressure accordingly. The primary stage of the pump works continuously; the second stage is bypassed when demand is low. The control system also monitors input and output speed and, if incipient clutch slip is observed, the pressure control solenoid duty cycle is varied, increasing pressure in proportion to demand.

A high-travel torque converter damper assembly allows earlier torque converter clutch engagement to reduce slippage. Needle-type thrust bearings reduce internal friction. The 66RFE is packaged in a one-piece die-cast aluminum case. To reduce NVH, the case has high lateral, vertical and torsional stiffness. Dual filters protect the pump and other components. A cooler return filter is added to the customary main sump filter. Independent lubrication and cooler circuits assure ample pressure for normal transmission operation even if the cooler is obstructed or the fluid cannot flow due to extremely low temperatures.

NOTE: Vehicles equipped with ERS (Electronic Range Select) do not provide 2nd gear in limp-in, because the shift lever has no "2" or "1" position.

The hydraulic control system design (without electronic assist) provides the transmission with PARK, REVERSE, NEUTRAL, and FOURTH gears, based solely on driver shift lever selection. This design allows the vehicle to be driven (in "limp-in" mode) in the event of a electronic control system failure, or a situation that the Transmission Control Module (TCM) recognizes as potentially damaging to the transmission.

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the scan tool.

DIAGNOSIS AND TESTING

AUTOMATIC TRANSMISSION

NOTE: **Before attempting any repair on a automatic transmission, check for Diagnostic Trouble Codes with the scan tool.**

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary. If the problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

FLUID LEAKAGE

TRANSMISSION OIL LEAK

Begin with a thorough inspection of the transmission, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Clean or degrease the transmission with a water soluble solvent only.
2. Add an oil soluble dye (use as recommended by manufacturer) while the powertrain is at ambient temperature. Start the engine and let idle for approximately 15 minutes. Check the oil dip stick (if equipped) to make sure the dye is thoroughly mixed as indicated with a fluorescent color under a black light.
3. Using a black light, inspect the entire transmission for fluorescent dye, practically at the suspected area of oil leak. If the oil leak is found and identified, repair per service information instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles) and repeat inspection.

5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

When diagnosing converter housing (5) fluid leaks, three actions must be taken before repair:

1. Verify proper transmission fluid level.
2. Verify that the leak originates from the converter housing area and is transmission fluid.
3. Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (7). Refer to **Fig. 2**. The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

The 66RFE uses a one piece pump cover which includes the impeller hub seal. Leaks at the pump cover o-ring or the impeller hub seal usually travel down the inside of the converter housing.

TORQUE CONVERTER LEAKAGE

Fig. 3: Torque Converter Leak Points
Courtesy of CHRYSLER GROUP, LLC

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD
3 - STARTER RING GEAR
4 - LUG

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (1).
- Torque converter hub weld (2).

PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

1. Record all DTCs and the accompanying DTC Event Data.
2. Check for an appropriate Technical Service Bulletin that applies to the customer complaint.
3. Check fluid level and condition.
4. Road test and note how transmission upshifts, downshifts, and engages.
5. If the complaint was related to shift quality, perform the Quick Learn procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** .
6. If the shift complaint still exists, compare actual line pressure (sensor reading, using the scan tool) to the Desired Line Pressure reading, in Park, Drive, and Reverse at 1500 RPM. Check that the LP sensor reads 30 psi (the minimum it should ever display) with key on / engine off.
7. Follow the diagnosis procedure for any DTC's that exist.

VEHICLE IS DISABLED

1. Record all DTCs and the accompanying DTC Event Data.

2. Compare actual line pressure (sensor reading, using the scan tool) to the Desired Line Pressure reading, in Park, Drive, and Reverse at 1500 RPM. Check that the LP sensor reads 30 psi (the minimum it should ever display) with key on / engine off. If line pressure is incorrect, check fluid level and condition.
3. With engine running, place transmission in gear and verify correct PRNDL reading. Observe the Input and Output speeds using the scan tool. If output RPM is greater than zero but vehicle does not move, check for transfer case in Neutral (or failed internally), failed propshaft, or failed / disconnected drive axle. If output RPM is zero and input RPM is greater than zero, internal transmission slippage is indicated. Run clutch slip tests using the scan tool, check oil pan for debris, and air check the various clutch circuits.
4. Shift the transmission into neutral, if both input and output speeds are zero, check flexplate bolts, torque converter, and transmission input shaft.
5. Remove, inspect, and repair the transmission as necessary

ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application charts provide a basis for analyzing road test results.

66RFE CLUTCH APPLICATION CHART

GEAR RANGE	UD	OD	R	2C	4C	L/R	OVERRUNNING
P-PARK						ON	
R-REVERSE			ON			ON	
N-NEUTRAL						ON	
D-FIRST	ON					ON*	ON
D-SECOND	ON			ON			
D-THIRD (SECOND PRIME)	ON				ON		
D-FOURTH	ON	ON					
D-FIFTH		ON			ON		
D-SIXTH		ON		ON			
D-LIMP-IN (FULL)	ON	ON					
*L/R clutch is on only with the output shaft speed below 150 rpm.							

HYDRAULIC PRESSURE TEST

An accurate tachometer and pressure test gauges are required. Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.) has a 300 psi range and is used at all locations where pressures exceed 100 psi.

PRESSURE TEST PORT LOCATIONS

Fig. 4: Pressure Test Port Locations
Courtesy of CHRYSLER GROUP, LLC

Only two pressure ports are supplied on the transmission case. The torque converter clutch apply (3) and release (1) ports are located on the right side of the transmission case.

Fig. 5: Installing Line Pressure Adapter 8259
Courtesy of CHRYSLER GROUP, LLC

To determine the line pressure, there are two available methods. The scan tool can be used to read line pressure from the line pressure sensor. The second method is to install Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) (3) into the transmission case and then install the pressure gauge and the original sensor (2) into the adapter. This will allow a comparison of the scan tool readings and the gauge reading to determine the accuracy of the line pressure sensor. The scan tool line pressure reading should match the gauge reading within ±10 psi.

TEST PROCEDURE

All pressure readings should be taken with the transmission fluid level full, transmission oil at the normal operating temperature, and the engine at 1500 rpm. Check the transmission for proper operation in each gear position that is in question or if a specific element is in question, check the pressure readings in at least two gear positions that employ that element. Refer to **SCHEMATICS AND DIAGRAMS** to determine the correct pressures for each element in a given gear position.

NOTE: **The 66RFE utilizes closed loop control of pump line pressure. The pressure readings may vary greatly, therefore you should always follow the desired line pressure.**

Some common pressures that can be measured to evaluate pump and clutch performance are the upshift/downshift pressures, garage shift pressures, and TCC pressure. For the upshift/downshift pressure for all shifts, refer to **UPSHIFT PRESSURES** and **DOWNSHIFT PRESSURES**. For in-gear maximum pressure for each gear position, refer to **IN-GEAR PRESSURES**.

UPSHIFT PRESSURES

66RFE								
ENGINE	**1-2**	**2-3**	**2prime-3**	**3-4**	**2prime-4**	**2-5**	**3-5**	**4-5**
5.7L	150	125	125	135	135	135	135	135
66RFE								
ENGINE	**1-2**	**2-3**	**3-4**	**4-5**	**5-6**	**2-4**	**3-5**	**4-6**
6.7L	160	150	150	160	160	150	150	160

DOWNSHIFT PRESSURES

66RFE										
ENGINE	**5-4**	**5-3**		**5-2**	**4-3**	**4-2prime**	**3-2**	**3-2prime**	**2prime-1**	**2-1**
5.7L	135	135		135	135	135	135	135	135	135
66RFE										
ENGINE	**6-5**	**6-4**	**5-4**	**5-3**	**4-3**	**4-2**	**3-2**	**3-1**	**2-1**	**-**
6.7L	150	150	150	160	150	160	150	160	160	-

IN-GEAR PRESSURES

66RFE								
ENGINE	**1**	**2**	**2prime**	**3**	**4**	**5**	**NEUTRAL**	**REVERSE**
5.7L	160	135	135	135	135	135	120	250

66RFE								
ENGINE	**1**	**2**	**3**	**4**	**5**	**6**	**NEUTRAL**	**REVERSE**
6.7L	160	150	150	160	160	160	125	250

Actual line-pressure while in-gear will vary based upon minimum learned line-pressure. Minimum line-pressure starts at 40 psi and learns up to the minimum pressure to hold the clutches in an applied state.

AIR CHECKING TRANSMISSION CLUTCH OPERATION

Fig. 6: Air Pressure Test Passages
Courtesy of CHRYSLER GROUP, LLC

1 - LOW REVERSE CLUTCH
2 - 4C CLUTCH
3 - 2C CLUTCH
4 - OVERDRIVE CLUTCH
5 - UNDERDRIVE CLUTCH
6 - REVERSE CLUTCH

NOTE: Each clutch includes a small bleed orifice, so minimal air leakage is normal and expected.

Air-pressure testing can be used to check transmission clutch operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The clutch apply passages are shown in the Air Pressure Test Passages graphic. Refer to **Fig. 6**.

NOTE: The air supply which is used must be free of moisture and dirt. Use a pressure

of 30 psi to test clutch operation.

Apply air pressure at each port. If the clutch is functioning, a soft thump will be heard as the clutch is applied. The clutch application can also be felt by touching the appropriate element while applying air pressure. As the air pressure is released, the clutch should also release.

CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

1. Verify that a leak condition actually exists.
2. Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Torque converter seal leaks tend to move along the drive hub and onto the rear of the converter. Pump cover seal leaks tend to run down the cover and the inside surface of the bellhousing.

Some leaks, or suspected leaks, may be particularly difficult to locate. If necessary, a Mopar® approved dye should be used to locate and confirm a leak.

TORQUE CONVERTER LEAK POINTS

Fig. 7: Cutaway View Of Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE ASSEMBLY	5 - IMPELLER ASSEMBLY
2 - STATOR	6 - CONVERTER CLUTCH PISTON
3 - CONVERTER HUB	7 - TURBINE HUB
4 - O-RING	

Possible sources of converter leaks are:

1. Leaks at the weld joint around the outside diameter weld. Refer to **Fig. 7**.
2. Leaks at the converter hub weld. Refer to **Fig. 7**.

In most cases, a torque converter which is wet from transmission fluid indicates a leak at one of these areas.

STANDARD PROCEDURE

STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

DRIVE LEARN - RFE TRANSMISSIONS

When a transmission is repaired and a Quick Learn procedure has been performed on the Transmission Control Module (TCM), the following Drive Learn procedure can be performed to fine tune any shifts which are particularly objectionable.

NOTE: It is not necessary to perform the complete Drive Learn procedure every time the TCM is Quick Learned. Perform only the portions which target the objectionable shift.

LEARN A SMOOTH 1ST NEUTRAL TO DRIVE SHIFT

Perform this procedure only if the complaint is for a delayed or harsh shift the first time the transmission is put into gear after the vehicle is allowed to set with the engine not running for at least 10 minutes. Use the following steps to have the TCM learn the 1st N-D UD CVI.

NOTE: The transmission oil temperature must be between 80 - 110°F (27 - 43°C).

1. Start the engine only when the engine and ignition have been off for at least ten (10) minutes.
2. With the vehicle at a stop and the service brake applied, record the 1st N-D UD CVI while performing a Neutral to Drive shift. The 1st N-D UD CVI accounts for air entrapment in the UD clutch that may occur after the engine has been off for a period of time.
3. Repeat until the recorded 1st N-D UD CVI value stabilizes. Refer to 1 and 2.

NOTE: It is important that this procedure be performed when the transmission temperature is between 80 - 110°F (27 - 43°C). If this procedure takes too long to complete fully for the allowed transmission oil temperature, the vehicle may be

returned to the customer with an explanation that the shift will improve daily during normal vehicle usage. The TCM also learns at higher oil temperatures, but these values (line pressure correction values) are not available for viewing on the scan tool.

LEARN A SMOOTH NEUTRAL TO DRIVE GARAGE SHIFT

Perform this procedure if the complaint is for a delayed or harsh shift when the transmission is put into gear after the vehicle has had its first shift. Use the following steps to have the TCM learn the Norm N-D UD CVI.

NOTE: The transmission oil temperature must be between 80 - 110°F (27 - 43°C) to learn the UD CVI. Additional learning occurs at temperatures as low as 0°F and as high as 200°F. This procedure may be performed at any temperature that experiences poor shift quality. Although the UD CVI may not change, shift quality should improve.

1. Start the vehicle engine and shift to drive.
2. Move the vehicle forward to a speed of at least 16 km/h (10 MPH) and come to a stop. This ensures no air is present in the UD hydraulic circuit.
3. Perform repeated N-D shifts at a stop while pausing in Neutral for at least 2-3 seconds and monitor Norm N-D UD CVI volume until the value stabilizes. The value will change during the N-D shift. This is normal since the UD value is different for the N-D shift then the normal value shown which is used for 4-3 coastdown and kickdowns. Perform repeated shifts in this temperature range until the Norm N-D UD CVI value stabilizes and the N-D shifts become smooth.

LEARN THE 1ST 2-3 SHIFT AFTER A RESTART OR SHIFT TO REVERSE

Use the following steps to have the TCM learn the 1st 2-3 shift OD CVI.

NOTE: The transmission oil temperature must be above 80°F (27°C).

1. With the vehicle engine running, select reverse gear for over 2 seconds.
2. Shift the transmission to Drive and accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform a 2-3 shift while noting the 1st 2-3 OD CVI.
3. Repeat until the 1st 2-3 upshift becomes smooth and the 1st 2-3 OD CVI stabilizes. Refer to 1 and 2.

LEARN A SMOOTH 2-3 AND 3-4 UPSHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the OD and 4C CVI's.

1. Accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform multiple 1-2, 2-3, and 3-4 upshifts. The 2nd 2-3 shift following a restart or shift to reverse will be shown during the shift as a value between the 1st 2-3 OD CVI and the normal OD CVI. Updates to the normal OD CVI will occur

after the 2nd shift into 3rd gear, following a restart or shift to reverse.

2. Repeat until the 2-3 and 3-4 shifts become smooth and the OD and 4C CVI become stable. Refer to 1.

LEARN A SMOOTH 4-3 COASTDOWN AND PART THROTTLE 4-3 KICKDOWN

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the UD shift volume.

1. At a vehicle speed between 64-97 km/h (40-60 MPH), perform repeated 4-3 kickdown shifts.
2. Repeat until the UD volume becomes somewhat stable and the shift becomes smooth. Refer to 1.

LEARN A SMOOTH 1-2 UPSHIFT AND 3-2 KICKDOWN

Use the following steps to have the TCM learn the 2C shift volume.

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With a vehicle speed below 48 km/h (30 MPH) and the transmission in 3rd gear, perform multiple 3-2 kickdowns.
2. Repeat until the 3-2 kickdowns become smooth and the 2C CVI becomes stable. Refer to 1.

LEARN A SMOOTH MANUAL 2-1 PULLDOWN SHIFT AS WELL AS A NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the LR volume.

1. With the vehicle speed around 40-48 km/h (25-30 MPH) in Manual 2nd, perform manual pulldowns to Low or 1st gear at closed throttle.
2. Repeat until the LR CVI becomes stable and the manual 2-1 becomes smooth. Refer to 1.

LEARN A SMOOTH NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With the vehicle at a stop, perform Neutral to Reverse shifts until the shift is smooth. An unlearned Neutral to Reverse shift may be harsh or exhibit a double bump.
2. If any of the shifts are still not smooth after the clutch volume stabilizes, an internal transmission problem may be present.

LEARN A SMOOTH 4-5 UPSHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the Alt 2C CVI.

1. Accelerate the vehicle through 88 km/h (55mph) at a steady 10-15 degree throttle opening and perform multiple 4-5 upshifts.
2. Repeat until the 4-5 shift become smooth and the Alt 2C CVI become stable. Refer to 1. There is a separate 2C volume used and learned for 4-5 shifts, 2CA. It is independent of the 2C CVI learned on 3-2 kickdowns.

TCM QUICK LEARN - RLE AND RFE TRANSMISSIONS

The quick learn procedure requires the use of the scan tool.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement.
- Transmission Control Module Replacement.
- Solenoid Pack Replacement.
- Clutch Plate and/or Seal Replacement.
- Valve Body Replacement or Recondition.

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied.
- The engine speed must be above 500 rpm.
- The throttle angle (TPS) must be less than 3 degrees.
- The shift lever position must stay in PARK until prompted to shift to overdrive.
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the scan tool indicates the procedure is complete.
- The calculated oil temperature must be above 60° and below 200°.

REMOVAL

REMOVAL

Fig. 26: Engine, Structural Dust Cover & Transmission
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Raise and support the vehicle
3. Remove any necessary skid plates. Refer to **PLATE, SKID, FRONT, REMOVAL** or **PLATE, SKID, TRANSFER CASE, REMOVAL** .
4. Mark propeller shaft and axle companion flanges for assembly alignment.
5. Remove the rear propeller shaft
6. Remove the front propeller shaft, if necessary.
7. Remove the engine (1) to transmission (3) structural dust cover (2).

Fig. 27: Output Speed Sensor

Courtesy of CHRYSLER GROUP, LLC

8. Remove the exhaust support bracket from the rear of the transmission.
9. Disconnect and lower or remove any necessary exhaust components.
10. Remove the starter motor.
11. Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.
12. Disengage the output speed sensor connector from the output speed sensor (2).

Fig. 28: Input Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

13. Disengage the input speed sensor connector from the input speed sensor (2).

Fig. 29: Transmission Solenoid/TRS Assembly
Courtesy of CHRYSLER GROUP, LLC

14. Disengage the transmission solenoid/TRS assembly connector from the transmission solenoid/TRS assembly (2).

Fig. 30: Line Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

15. Disengage the line pressure sensor connector from the line pressure sensor (2).

Fig. 31: Gearshift Cable & Pin
Courtesy of CHRYSLER GROUP, LLC

16. Disconnect gearshift cable (1) from transmission manual valve lever by fully depressing pin (2) until it locks into the release position. Remove cable end by moving upward.

Fig. 32: Identifying Transmission
Courtesy of CHRYSLER GROUP, LLC

17. Disconnect the transmission vent hose from the transmission.
18. Support rear of engine with safety stand or jack.
19. Raise transmission slightly with service jack to relieve load on crossmember and supports.
20. Remove bolts securing rear support and cushion to transmission and crossmember.
21. If equipped, remove transfer case.
22. Disconnect transmission fluid cooler lines at transmission fittings and clips and position aside.

NOTE: When disconnecting the transmission oil cooler lines, it is necessary to replace the line clip that is located on the oil pan stud. The retention force of the clip is severely degraded upon removal.

23. Remove all remaining converter housing bolts.
24. Remove the transmission dipstick tube.
25. Carefully work transmission and torque converter assembly rearward off engine block dowels.
26. Hold torque converter in place during transmission removal.
27. Lower transmission (2) and remove assembly from under the vehicle.
28. To remove torque converter, carefully slide torque converter out of the transmission.

DISASSEMBLY

DISASSEMBLY

CAUTION: Tag all snap rings, thrust washers, washers, spacers and thrust bearings, etc. during disassembly for quick identification and assembly. Failure to follow these instructions will damage and cause transmission failure.

Fig. 33: Manual Shift Lever
Courtesy of CHRYSLER GROUP, LLC

1. Drain fluid from transmission.
2. Clean exterior of transmission with suitable solvent or pressure washer.
3. Remove the torque converter from the transmission.
4. Remove the manual shift lever (1) from the transmission.

Fig. 34: Input, Output & Line Pressure Sensors
Courtesy of CHRYSLER GROUP, LLC

5. Remove the input (3), output (1), and line pressure sensors (2) from the transmission case.
6. Inspect the ends of the sensors for debris, which may indicate the nature of the transmission failure.

Fig. 35: Install Support Stand - Tool 8257
Courtesy of CHRYSLER GROUP, LLC

7. Install (special tool #8257, Support, Transmission) (1) onto the transmission case.

Fig. 36: Measuring Input Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

8. Using (special tool #8266-17, Spline Tool, RFE Output) from (special tool #8266B, End Play Socket Set) (1) and (special tool #C-3339A, Set, Dial Indicator) (2), measure and record the input shaft end-play.

NOTE: **When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be**

included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.

NOTE: (special tool #8266-17, Spline Tool, RFE Output) will fit loosely onto the input shaft, this should not effect the performance of the adapter.

Fig. 37: Measuring Output Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

9. Remove the bolts holding the transmission extension/adapter housing to the transmission case.
10. Remove the extension/adapter housing from the transmission case.
11. Using (special tool #10065, Plate, Alignment), Output Shaft (special tool #8266-20, Spline Tool, AS68RC Output), handle from (special tool #8266B, End Play Socket Set) (2) and (special tool #C-3339A, Set, Dial Indicator) (3), measure and record the output shaft end-play.

Fig. 38: Primary Oil & Cooler Return Filters

Courtesy of CHRYSLER GROUP, LLC

12. Remove the bolts holding the transmission oil pan to the transmission case.
13. Remove the transmission oil pan from the transmission case.
14. Remove the primary oil filter (1) and the oil cooler return filter (2).

Fig. 39: Valve Body Bolts

1 - VALVE BODY TO CASE BOLT (6)

15. Remove the bolts (1) holding the valve body to the transmission case.
16. Remove the valve body from the transmission case.

Fig. 40: Front Cover
Courtesy of CHRYSLER GROUP, LLC

17. Remove the outer snap-ring (3) securing the transmission front cover (1) into the transmission case.
18. Reaching through a case opening in the valve body area with a long blunted tool, remove the transmission front cover (1) from the transmission case.

Fig. 41: Oil Pump & Bolt

Courtesy of CHRYSLER GROUP, LLC

19. Remove the bolts (1) holding the oil pump into the transmission case.
20. Remove the oil pump (2). Hold inward on the input shaft to prevent pulling the input clutch assembly with the oil pump.

CAUTION: If the input shaft is not held during oil pump removal, the input clutch assembly will attempt to move forward with the oil pump and the numbers 2, 3, or 4 bearings inside the input clutch assembly may become dislodged.

34. Remove the snap-ring (1) holding the park sprag gear onto the output shaft.

Fig. 49: Park Sprag Gear
Courtesy of CHRYSLER GROUP, LLC

35. Remove the park sprag gear (1) from the output shaft.

Fig. 50: Input/Reverse Planetary Assembly
Courtesy of CHRYSLER GROUP, LLC

36. Remove the input/reverse planetary assembly (1).
37. Remove thrust bearing number (9) from the input/reverse planetary assembly (2).
38. Remove the number 12 thrust bearing (3) from the input/reverse planetary assembly (2).

Fig. 51: Low/Reverse Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

39. Remove the snap-ring (1) holding the low/reverse clutch retainer (2) into the transmission case.
40. Remove the low/reverse clutch retainer (2) from the transmission case.

Fig. 52: Manual Shaft/Park Lock Components
Courtesy of CHRYSLER GROUP, LLC

41. Remove the park rod (7) and e-clip.
42. Remove the park rod guide snap-ring (2).
43. Remove the park rod guide (1).
44. Remove the park pawl pivot shaft (3), park pawl (5), and spring (4).
45. Remove the manual selector shaft (6).
46. Remove the manual selector shaft seal.
47. Remove the dipstick tube seal.

CLEANING

CLEANING

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF +4, Automatic Transmission Fluid, during overhaul and

assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: **Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

INSPECTION

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

ASSEMBLY

NOTE: **Apply trans jell or petroleum jelly to all slide portions, rolling contacts surfaces, thrust surfaces etc. to prevent burnout during initial operation. Lubricate O-rings and O-ring seals with MOPAR® ATF+4. Soak all friction disks in MOPAR® ATF+4 for at least two hours before assembly of clutch packs.**

NOTE: **Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.**

NOTE: **If the transmission assembly is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .**

Fig. 53: Installing Selector Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

1. Install a new selector shaft seal (1) using (special tool #8253, Installer, Seal) (2).

Fig. 54: Manual Shift Lever
Courtesy of CHRYSLER GROUP, LLC

2. Install the manual selector shaft and retaining screw. Tighten the manual selector shaft retaining screw to 28 N.m (250 in.lbs.).
3. Install the manual shift lever (1) onto the manual selector shaft. Torque the retaining cross-bolt to 16 N.m (140 in.lbs.).

Fig. 55: Manual Shaft/Park Lock Components
Courtesy of CHRYSLER GROUP, LLC

4. Install the park pawl (5), spring (4), and shaft (3).
5. Install the park rod (7) and e-clip.
6. Install the park rod guide (1) and snap-ring (2).

Fig. 56: Installing Fill Tube Seal
Courtesy of CHRYSLER GROUP, LLC

7. Install a new fill tube seal (2) using (special tool #8254, Installer, Grommet) (1).

Fig. 57: Thrust Bearing Orientation
Courtesy of CHRYSLER GROUP, LLC

1 - CORRECT INSTALLATION
2 - INCORRECT INSTALLATION

CAUTION: A thrust bearing must be installed correctly or transmission failure may occur.

When installing a thrust bearing be certain the rolled surface (outer race) of the thrust bearing contacts the rolled surface of the component.

NOTE: The 66RFE transmission does not use a number 7 thrust bearing.

Fig. 58: Thrust Bearings & Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

2 - O/D CLUTCH	5 - 2C CLUTCH
3 - REVERSE CLUTCH	6 - L/R CLUTCH

Fig. 60: 2C Clutch Pack
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before final assembly of transmission centerline, the 2C/4C clutch components should be installed into position and measured as follows:

8. Install the 2C reaction plate (4) with the beveled edge down (rearward) into the transmission case.
9. Install the 2C clutch pack (2, 3) into the transmission case.
10. Install the flat 2C clutch snap-ring (1) into the transmission case.

Fig. 61: 4C Clutch Retainer/Bulkhead & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

11. Install the 4C retainer/bulkhead (2) into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area.
12. Install the 4C retainer/bulkhead tapered snap-ring (1) into the transmission case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.
13. Using a feeler gauge through the opening in the rear of the transmission case, measure the 2C clutch pack clearance between the 2C reaction plate and the transmission case at four different points. The average of these measurements is the 2C clutch pack clearance. The correct clutch clearance is 0.99-1.65 mm (0.039-0.065 in.). The reaction plate is not selective. If the clutch pack clearance is not within specification, the reaction plate, all the friction discs, and steels must be replaced.
14. Remove the 4C retainer/bulkhead and all of the 2C clutch components from the transmission case.

Fig. 62: Low/Reverse Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

1 - SNAP-RING
2 - LOW/REVERSE OVERRUNNING CLUTCH ASSEMBLY

15. Install the low/reverse clutch assembly (2). Make sure that the oil feed hole points toward the valve body area and that the bleed orifice is aligned with the notch in the rear of the transmission case.
16. Install the snap-ring (1) to hold the low/reverse clutch retainer into the transmission case. The snap-ring is tapered and must be installed with the tapered side forward. Once installed, verify that the snap-ring is fully seated in the snap-ring groove.
17. Air check the low/reverse clutch and verify correct overrunning clutch operation. Refer to **AIR CHECKING TRANSMISSION CLUTCH OPERATION**.

Fig. 63: Input/Reverse Planetary Assembly
Courtesy of CHRYSLER GROUP, LLC

18. Install the number 12 thrust bearing (3) over the output shaft and against the rear planetary gear set, the black side with the tabs goes towards the ORC. Install the number nine thrust bearing with the silver side against the reverse carrier and the black side facing towards the front of the transmission.
19. Install the number 9 thrust bearing (1), with the silver side against the reverse carrier and the black side facing out.
20. Install the reverse/input planetary assembly (2) through the low/reverse clutch assembly.

Fig. 64: Park Sprag Gear
Courtesy of CHRYSLER GROUP, LLC

21. Install the park sprag gear (1) onto the output shaft.

Fig. 65: Park Sprag Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

22. Install the snap-ring (1) to hold the park sprag onto the output shaft.

Fig. 66: 2C Clutch Pack
Courtesy of CHRYSLER GROUP, LLC

23. Install the 2C reaction plate (4).
24. Install the 2C clutch pack (2, 3, 4) into the transmission case.
25. Install the flat 2C / 4C clutch retainer snap-ring into the transmission case.

Fig. 67: Reaction Annulus & Carrier
Courtesy of CHRYSLER GROUP, LLC

26. Install the reaction planetary gear set.
27. Install the number 8 thrust bearing (4) into the reaction sun gear with the blue ink stripe against the sun gear with the inner race facing up.

Fig. 68: Aligning Thrust Plate

Courtesy of CHRYSLER GROUP, LLC

28. Install the output shaft selective thrust plate (2) onto the 4C clutch hub with the oil grooves facing the hub and the lugs (1) and notches aligned as shown in illustration.

Fig. 69: Reaction Annulus & Carrier
Courtesy of CHRYSLER GROUP, LLC

29. Install the number 6 thrust bearing (1) against the output shaft selective thrust plate (2) with the flat side against the thrust plate and the raised tabs on the inner race facing the front of the transmission.
30. Install the install the 4C clutch / reaction sun gear (3) into the reaction planetary gear set.

Fig. 70: 4C Clutch Retainer/Bulkhead & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

31. Install the 2C / 4C retainer/bulkhead (2) into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area. Rotate the 4C clutch hub during the installation of the 4C retainer/bulkhead to ease installation.
32. Install the 2C / 4C retainer/bulkhead tapered snap-ring (1) into the transmission case with the taper toward the front of the case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.
33. Air check the 2C and 4C clutch operation. Refer to **AIR CHECKING TRANSMISSION CLUTCH OPERATION**.

Fig. 71: Reaction Annulus & Carrier
Courtesy of CHRYSLER GROUP, LLC

1 - THRUST BEARING NUMBER 6	5 - REACTION PLANETARY CARRIER
2 - OUTPUT END PLAY THRUST PLATE (SELECTIVE)	6 - THRUST BEARING NUMBER 9
3 - 4C CLUTCH HUB / REACTION SUN GEAR	
4 - THRUST BEARING NUMBER 8	

NOTE: **The output shaft end play is adjusted by means of a selectable bearing spacer (2) in front of the 4C clutch hub/reaction sun gear. The selectable bearing spacer thickness is identified by a numeric numeral molded or stamped into the spacer.**

Fig. 72: Measuring Output Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

34. Using (special tool #10065, Plate, Alignment), (special tool #8266-20, Spline Tool, AS68RC Output), handle from (special tool #8266B, End Play Socket Set) (2) and (special tool #C-3339A, Set, Dial Indicator) (3), measure and record the output shaft end-play. The correct output shaft end-play is 0.25-0.52 mm (0.010-0.020 in.). Adjust as necessary. Install the chosen output shaft selective bearing spacer and re-measure end-play to verify selection.

    Output Shaft End Play Selectable Bearing Spacer Thickness

    - 09 = 2.18 mm (0.086 in.)
    - 10 = 2.33 mm (0.092 in.)
    - 11 = 2.48 mm (0.098 in.)
    - 12 = 2.63 mm (0.103 in.)
    - 13 = 2.78 mm (0.109 in.)
    - 14 = 2.69 mm (0.115 in.)
    - 43 = 3.08 mm (0.121 in.)
    - 16 = 3.23 mm (0.127 in.)
    - 17 = 3.38 mm (0.133 in.)
    - 18 = 3.53 mm (0.139 in.)
    - 19 = 3.68 mm (0.145 in.)
35. Apply a bead of RTV silicone and install the extension/adapter housing onto the transmission case.
36. Install and torque the bolts to hold the extension/adapter housing onto the transmission case. The correct torque is 54 N.m (40 ft.lbs.).

Fig. 73: Input Clutch Assembly
Courtesy of CHRYSLER GROUP, LLC

37. Install the number 5 thrust bearing (1) and selective thrust plate (2) onto the input clutch assembly (3). Be sure that the outer race of the bearing is against the thrust plate.
38. Install the input clutch assembly (3) into the transmission case. Make sure that the input clutch assembly is fully installed by performing a visual inspection through the input speed sensor hole. If the tone wheel teeth on the input clutch assembly are centered in the hole, the assembly is fully installed.
39. Install the number 1 thrust bearing (4) with the outer race up in the pocket of the input clutch assembly.

Fig. 74: Oil Pump & Bolt
Courtesy of CHRYSLER GROUP, LLC

40. Install the oil pump (2) into the transmission case making certain the oil pump is flush with the transmission case.
41. Install the bolts (1) to hold the oil pump into the transmission case. Tighten the oil pump bolts to 28 N.m (250 in.lbs.).

NOTE: **When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.**

Fig. 75: Measuring Input Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - TOOL 8266 -17
2 - TOOL C-3339A

NOTE: **If NO input shaft end play is noted, disassemble the input clutch assembly and check for the #2, #3, or #4 thrust bearing fallen out of position or cracked. Replace any cracked thrust bearing and reassemble using trans jell or petroleum jelly to retain the thrust bearings. The selectable bearing spacer thickness is identified by a numeric numeral molded or stamped into the spacer.**

NOTE: **(special tool #8266-17, Spline Tool, RFE Output) will fit loosely onto the input shaft, this should not effect the performance of the adapter.**

42. Using (special tool #8266-17, Spline Tool, RFE Output) from (special tool #8266B, End Play Socket Set) (1) and (special tool #C-3339A, Set, Dial Indicator) (2), measure and record the input shaft end-play. The correct end-play is 0.52-0.74 mm (0.020-0.029 in.). Adjust as necessary. Install the chosen selectable bearing spacer on the number 5 thrust bearing and re-measure end-play to verify selection.

Input Shaft End Play Selectable Bearing Spacer Thickness

- 27 = 1.57 mm (0.062 in.)
- 28 = 1.71 mm (0.067 in.)
- 29 = 1.85 mm (0.073 in.)
- 30 = 1.99 mm (0.078 in.)
- 31 = 2.13 mm (0.084 in.)

- 32 = 2.27 mm (0.089 in.)
- 33 = 2.41 mm (0.095 in.)
- 34 = 2.55 mm (0.100 in.)
- 35 = 2.69 mm (0.106 in.)
- 36 = 2.83 mm (0.111 in.)
- 37 = 2.97 mm (0.117 in.)
- 38 = 3.11 mm (0.122 in.)
- 39 = 3.25 mm (0.128 in.)
- 40 = 3.39 mm (0.133 in.)
- 41 = 3.67 mm (0.144 in.)

Fig. 76: Front Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: To avoid contamination and garter spring dislodgement, do not handle the front cover seal when installing the front cover into the transmission case.

43. Position the new front cover (1) onto transmission case.
44. Using a dead-blow mallet and the (special tool #9955, Installer, Front Cover), install the front cover into the transmission case.
45. Install the snap ring into the transmission case.

Fig. 77: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE BODY TO CASE BOLT (6)

46. Install the valve body. Verify that the pin on the manual lever has properly engaged the TRS selector plate. Tighten the valve body to transmission case bolts (1) to 12 N.m (105 in.lbs.).

Fig. 78: Primary Oil & Cooler Return Filters
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The primary oil filter seal MUST be fully installed flush against the oil pump body. DO NOT install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the

transmission will result.

47. Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.
48. Install the primary oil filter (1) and the oil cooler return filter (2). Tighten the screw to hold the primary oil filter to the valve body to 4.5 N.m (40 in.lbs.). Using (special tool #8321, Wrench, Oil Filter), tighten the cooler return oil filter to the transmission case to 9.5 N.m (84 in. lbs.).
49. Apply RTV silicone to the oil pan and install the transmission oil pan. Tighten the bolts to 12 N.m (105 in.lbs.).

Fig. 79: Input, Output & Line Pressure Sensors
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SPEED SENSOR
2 - LINE PRESSURE SENSOR
3 - INPUT SPEED SENSOR

50. Install the input (3), output (1), and line pressure sensors (2). Tighten the bolts to 12 N.m (105 in.lbs.).

INSTALLATION

INSTALLATION

Fig. 80: Checking Torque Converter Seating
Courtesy of CHRYSLER GROUP, LLC

1. Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper and crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free of any debris. The hub must be smooth to avoid damaging pump seal at installation.
2. If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.
3. Lubricate oil pump seal lip with transmission fluid.
4. Align converter and oil pump.
5. Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.
6. Check converter seating with steel scale (1) and straightedge (2). Surface of converter lugs should be at least 13mm (1/2 in.) to rear of straightedge when converter is fully seated.
7. Temporarily secure converter with C-clamp.

Fig. 81: Identifying Transmission
Courtesy of CHRYSLER GROUP, LLC

8. Position transmission on jack and secure it with chains.
9. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**
10. Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.
11. Raise transmission (2) and align the torque converter with the drive plate and transmission converter housing with the engine block.

Fig. 82: Transmission Solenoid/TRS Assembly
Courtesy of CHRYSLER GROUP, LLC

12. Move transmission forward. Then raise, lower or tilt transmission to align the converter housing with engine block dowels.

13. Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.
14. Install two bolts to attach the transmission to the engine.
15. Install remaining torque converter housing to engine bolts. Tighten to 68 N.m (50 ft.lbs.).
16. If equipped, install transfer case. Tighten transfer case nuts to 35 N.m (26 ft.lbs.).
17. Install rear support to transmission. Tighten bolts specification. Refer to **TORQUE SPECIFICATIONS** . .
18. Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten bolts specification. Refer to **TORQUE SPECIFICATIONS** . .
19. Remove engine support fixture.
20. Connect wires to solenoid and pressure switch assembly (2) connector.

Fig. 83: Gearshift Cable & Pin
Courtesy of CHRYSLER GROUP, LLC

21. Connect gearshift cable to transmission from the top in a downward direction. Cable locking pin (2) will snap outward when cable is fully seated.

Fig. 84: Input Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

22. Connect wires to input speed sensor (2).

Fig. 85: Output Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

23. Connect wires to output speed sensor (2).

Fig. 86: Line Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

24. Connect wires to line pressure sensor (2). Be sure transmission harnesses are properly routed.

Fig. 87: Engine, Structural Dust Cover & Transmission
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is essential that the correct length bolts are used to attach the converter to the flexplate. Bolts that are too long will damage the clutch surface inside the torque converter.

25. Install torque converter-to-driveplate bolts. Tighten bolts to 31 N.m (270 in. lbs.).
26. Install starter motor and cooler line bracket.

NOTE: **When connecting the transmission oil cooler lines, it is necessary to replace the line clip that is located on the oil pan stud. The retention force of the clip is severely degraded upon removal.**

27. Connect cooler lines to transmission.
28. Install transmission fill tube.
29. Install exhaust components, if necessary.
30. Align and connect propeller shaft(s).
31. Install the structural dust cover (2) onto the transmission and the engine. Refer to **COVER, STRUCTURAL DUST, INSTALLATION, 5.7L** .
32. Adjust gearshift cable if necessary.
33. Install any skid plates removed previously. Refer to **PLATE, SKID, FRONT, INSTALLATION** or **PLATE, SKID, TRANSFER CASE, INSTALLATION** .
34. Lower vehicle.
35. Fill transmission with Mopar® ATF +4, Automatic Transmission Fluid.

8 - REVERSE CLUTCH	17 - UD HUB/SHAFT
9 - REVERSE REACTION PLATE	18 - THRUST BEARING NUMBER 2

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly.

The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston

- Overdrive hub
- Underdrive hub

OPERATION

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, third, and fourth (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the input sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in fourth (direct), fifth, and sixth gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the reverse carrier/input annulus assembly.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the reaction sun gear is driven.

DISASSEMBLY

DISASSEMBLY

NOTE: **If the input clutch assembly is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .**

1. Remove the reverse reaction plate selective snap-ring (10) from the input clutch retainer.
2. Remove the reverse reaction plate (9) from the input clutch retainer.
3. Remove the reverse hub (7) and reverse clutch pack (8) from the input clutch retainer.
4. Remove the number 4 thrust bearing (5) from the overdrive hub (2).
5. Remove the overdrive hub (2) from the input clutch retainer.
6. Remove the number 3 thrust bearing (1) from the underdrive hub (17).
7. Remove the OD/reverse pressure plate snap-ring (6) from the from the OD/reverse piston.
8. Remove the OD/reverse pressure plate (4), overdrive clutch (13), and UD hub (17) from the input clutch retainer.
9. Remove the number 2 thrust bearing (18) from the input clutch hub.
10. Remove the overdrive clutch wave snap-ring (3) from the from the OD/reverse piston.
11. Remove the UD/OD reaction plate tapered snap-ring (14) from the input clutch retainer.
12. Remove the UD/OD reaction plate (15) from the input clutch retainer.
13. Remove the UD/OD reaction plate flat snap-ring (16) from the input clutch retainer.
14. Remove the underdrive clutch pack (11) from the input clutch retainer (13).

Fig. 92: Compressing UD/OD Balance Piston
Courtesy of CHRYSLER GROUP, LLC

15. Using Spring Compressor (special tool #8251, Compressor, Spring) (2), compress the UD balance piston (3) and remove the snap-ring from the input clutch hub.

Fig. 93: Input Clutch Assembly - Part 1
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Both the UD balance piston and the underdrive piston have seals molded onto them. If the seal is damaged, do not attempt to install a new seal onto the piston. The piston/seal must be replaced as an assembly.**

16. Remove the UD balance piston (6) and piston return spring (9) from the input clutch retainer (13).
17. Remove the underdrive piston (8) from the input clutch retainer (13).
18. Remove the input clutch retainer tapered snap-ring (5).
19. Separate input clutch retainer (13) from input clutch hub (1).
20. Separate OD/reverse piston (15) from input clutch hub retainer (13).

Fig. 94: Compressing OD/Reverse Belleville Spring
Courtesy of CHRYSLER GROUP, LLC

21. Using Arbor Press (1) and tool (special tool #8349-1, Installer Crank Seal) (2) compress the OD / Reverse belleville spring just enough to remove the snap ring.
22. Remove the belleville spring and snap ring from the OD / Reverse piston (3).
23. Remove all seals and o-rings from the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to make note of which o-ring belongs in which location.

ASSEMBLY

ASSEMBLY

Fig. 95: 66RFE Clutch Orientation
Courtesy of CHRYSLER GROUP, LLC

1 - U/D CLUTCH	4 - 4C CLUTCH
2 - O/D CLUTCH	5 - 2C CLUTCH
3 - REVERSE CLUTCH	6 - L/R CLUTCH

NOTE: **The 66RFE transmission does not use a number 7 thrust bearing.**

Fig. 96: Thrust Bearings & Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - THRUST BEARING NO. 1	8 - THRUST BEARING NO. 8
2 - THRUST BEARING NO. 2	9 - THRUST BEARING NO. 9
3 - THRUST BEARING NO. 3	10 - THRUST BEARING NO. 10
4 - THRUST BEARING NO. 4	11 - THRUST BEARING NO. 11
5 - THRUST BEARING NO. 5	12 - THRUST BEARING NO. 12
6 - THRUST BEARING NO. 6	13 - OUTPUT

NOTE: **When installing the OD / Reverse piston belleville spring, orientate it such that it contacts a new surface on the piston.**

Fig. 97: Compressing OD/Reverse Belleville Spring
Courtesy of CHRYSLER GROUP, LLC

1. Install the belleville spring and snap ring loosely onto the OD / Reverse piston (3).
2. Using an Arbor Press (1) and tool (special tool #8349-1, Installer Crank Seal) (2) compress the belleville spring just enough to install the snap ring.

Fig. 98: Input Clutch Assembly - Part 1
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Install all new seals and o-rings onto the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to install the correct o-ring in the correct location.**

3. Check the transmission lubrication check valve (20) located in the input shaft using shop air. The valve should only allow air flow in one direction. If the valve allows no air flow, or air flow in both directions, the valve will need to be replaced.
4. Lubricate all seals with Mopar® ATF +4, Automatic Transmission Fluid, prior to installation.
5. Assemble the OD/reverse piston (15) onto the input clutch retainer (13).
6. Assemble the input clutch retainer (13) onto the input clutch hub (1).
7. Install the input clutch retainer tapered snap-ring (5) with tapered side up onto the input clutch hub (1).

Fig. 99: Installing Underdrive Piston
Courtesy of CHRYSLER GROUP, LLC

8. Install Piston Installer (special tool #8504-1, Piston Installer (Outer)) (1) into the input clutch retainer and onto the input clutch hub to guide the inner and outer underdrive piston seals into position.
9. Install the underdrive piston into the input clutch retainer and over the input clutch hub.

Fig. 100: Installing Balance Piston Seal
Courtesy of CHRYSLER GROUP, LLC

10. Install the UD balance piston return spring pack into the input clutch retainer.
11. Install Piston Installer (special tool #8252, Installer) (1) into the input clutch retainer to guide the UD balance piston seal into position inside the underdrive piston.

Fig. 101: Compressing Return Spring Pack
Courtesy of CHRYSLER GROUP, LLC

12. Install the UD balance piston (3) into the input clutch retainer and the underdrive piston.
13. Using Spring Compressor (special tool #8251, Compressor, Spring) (2), compress the UD return spring pack and secure the piston in place with the snap-ring.

NOTE: **The 66RFE UD clutch discs (both the internal-and external-toothed discs) can now be identified by the numbers "605/604" which are laser-burned into the friction material facing. Install an outer-toothed disc first then alternate inner and outer discs, ending with an inner-toothed disc on top, install all discs with the friction material facing up.**

14. Install the underdrive clutch pack into the input clutch retainer.

Fig. 102: Input Clutch Assembly - Part 2
Courtesy of CHRYSLER GROUP, LLC

15. Install the UD / OD reaction plate lower flat snap-ring (16). The correct snap-ring can be identified by the two tabbed ears.
16. Install the UD / OD reaction plate (15) into the input clutch retainer. The reaction plate is to be installed with the wide face down, and the narrow face up.
17. Install the UD reaction plate upper tapered snap-ring (14) with tapered side up, and with both tips underneath the retainer lugs.`

Fig. 103: Input Clutch Assembly Mounted On Tool 8260A
Courtesy of CHRYSLER GROUP, LLC

18. Install the input clutch assembly into Input Clutch Pressure Fixture (special tool #8260A, Fixture, Input Clutch) (2).

Fig. 104: Measuring UD Clutch Clearance
Courtesy of CHRYSLER GROUP, LLC

19. Mount a dial indicator (special tool #C-3339A, Set, Dial Indicator) (1) on the input clutch hub. Push down on the UD clutch discs and zero the indicator against the UD clutch discs. Apply 20 psi of air pressure to the UD clutch and record the dial indicator reading. Measure and record UD clutch pack

measurement in four (4) places, 90° apart. Take average of four measurements and compare with UD clutch pack clearance specification. The correct clutch clearance is 1.02-1.72 mm (0.040-0.068 in.). The reaction plate is not selective. If the clutch clearance is not within specification, replace the reaction plate along with all the friction and steel discs.

Fig. 105: Input Clutch Assembly - Part 2
Courtesy of CHRYSLER GROUP, LLC

20. Install the overdrive clutch pack (13) into the input clutch retainer. Install an outer toothed disc (11) first and then alternate inner disc (12) and outer discs, ending with a inner toothed disc (12) on top. Install all discs with the friction material facing up.
21. Install the overdrive clutch wavy snap-ring (3) with the two tabbed ears into the OD/reverse piston.
22. Install the OD/reverse pressure plate (4) into the input clutch retainer, with the stepped face down toward the OD clutch.
23. Install the OD/reverse pressure plate flat snap-ring (6) into the OD/reverse piston.

Fig. 106: Measuring OD Clutch Clearance
Courtesy of CHRYSLER GROUP, LLC

24. Mount a dial indicator (special tool #C-3339A, Set, Dial Indicator) (1) on the input clutch hub and zero the indicator against the OD/reverse pressure plate (2). Apply 20 psi of air pressure to the overdrive clutch and record the dial indicator reading. Measure and record OD clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with OD clutch pack clearance specification. Verify that the clutch clearance is 0.75-1.61 mm (0.030-0.063 in.). The OD / Reverse pressure plate is selective. If the clutch clearance is not within specification, select and install the proper pressure plate.

NOTE: The 66RFE uses three (3) selective OD/Rev pressure plates. Two of the three plates have a numeric identification number and a stepped face.

SELECTABLE END PLAY PRESSURE PLATES

- One stepped face, identification number 1 = 8.90 mm (0.350 in.)
- One stepped face, identification number 2 = 9.34 mm (0.367 in.)
- Both faces flat, no identification number = 9.74 mm (0.383 in.)

Fig. 107: Measuring Reverse Clutch Clearance
Courtesy of CHRYSLER GROUP, LLC

25. Install the reverse clutch pack into the input clutch retainer.
26. Install the reverse reaction plate into the input clutch retainer.
27. Install the reverse reaction plate selective snap-ring into the input clutch retainer.
28. Mount a dial indicator to the assembly, push down on the clutch discs, pull up on the reaction plate to ensure the plate is properly seated and zero the indicator against the reverse clutch discs (2). Apply 20 psi of air pressure to the reverse clutch and record the dial indicator reading. Measure and record Reverse clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with Reverse clutch pack clearance specification. The correct clutch clearance is 0.58-1.47 mm (0.023-0.058 in.). Adjust as necessary. Install the chosen snap-ring and re-measure to verify selection.

NOTE: **The 66RFE uses one of three (3) different selective snap rings. They are identified by the end cuts (either straight [square] cut or "butterfly" [S-curved] cut):**

SELECTABLE END PLAY SNAP RINGS

- One Square End, One Butterfly End = 1.55 mm (0.061 in.)
- Both Ends Square Cut = 1.85 mm (0.073 in)
- Both Ends Butterfly Cut = 2.2 mm (0.087 in.)

Fig. 108: Input Clutch Assembly - Part 2
Courtesy of CHRYSLER GROUP, LLC

29. Remove the reverse clutch pack (8) from the input clutch retainer.
30. Install the number 2 thrust bearing (18) onto the underdrive hub (17) with outer race against the hub with petroleum jelly.
31. Install the underdrive hub (17) into the input clutch retainer.
32. Install the number 3 thrust bearing (1) into the overdrive hub (2) with the outer race against the hub with petroleum jelly.
33. Install the overdrive hub (2) into the input clutch retainer.
34. Install the number 4 thrust bearing (5) into the reverse hub with outer race against the hub with petroleum jelly.
35. Install the reverse hub (7) into the input clutch retainer.
36. Install the complete reverse clutch pack (8).
37. Install the reverse reaction plate (9) and snap-ring (10).
38. Push up on reaction plate to allow reverse clutch to move freely.

ASSEMBLY, TRANSMISSION SOLENOID AND TRS

DESCRIPTION

DESCRIPTION

Fig. 109: Solenoid & Pressure Switch Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - PRESSURE CONTROL SOLENOID
2 - TRANSMISSION RANGE SELECTOR PLATE
3 - 23-WAY CONNECTOR
4 - SOLENOID PACK
5 - TRANSMISSION RANGE SENSOR
6 - VALVE BODY

The transmission solenoid/TRS assembly is internal to the transmission and mounted on the valve body assembly. The assembly consists of five solenoids that control hydraulic pressure to five of the friction elements (transmission clutches), and the torque converter clutch. The pressure control solenoid is located on the side of the solenoid/TRS assembly. The solenoid/TRS assembly also contains the Transmission Range Sensor (TRS) and five pressure switches that feed information to the TCM.

OPERATION

OPERATION

SOLENOIDS

Solenoids are used to control the L/R, 2C, 4C, OD, and UD friction elements. The reverse clutch is controlled by line pressure and the position of the manual valve in the valve body. All the solenoids are contained within the Solenoid and Pressure Switch Assembly. The 2C, 4C, and UD solenoids are dedicated to those specific clutches (respectively). The L/R solenoid controls either the L/R clutch (in 1st gear and Park/Neutral) or the torque converter clutch (TCC), in 2nd and higher gears. The position of the solenoid switch valve (SSV) determines which element the L/R solenoid is controlling. The Multi-Select (MS) solenoid controls either the OD clutch (in Drive gears) or the L/R clutch (in Reverse). The position of the manual valve determines which element the MS solenoid is controlling.

The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid as necessary. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The MS and UD solenoids are normally applied (they supply hydraulic pressure to the clutch when they are de-energized), which provides appropriate transmission limp-in operation in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

PRESSURE SWITCHES

The TCM relies on five pressure switches to monitor fluid pressure in the L/R, 2C, 4C, UD, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The switches close at 23 psi and open at 11 psi, and simply indicate whether or not pressure exists. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following charts.

66RFE PRESSURE SWITCH STATES

GEAR	ERS DISPLAY	L/R	2C	4C	UD	OD
R		OP	OP	OP	OP	OP
P/N		CL	OP	OP	OP	OP
1ST	1	CL*	OP	OP	CL	OP
2ND	2	OP	CL	OP	CL	OP
3RD	3	OP	OP	CL	CL	OP
4TH	4	OP	OP	OP	CL	CL
5TH	5	OP	OP	CL	OP	CL
6TH	6	OP	CL	OP	CL	CL
*L/R is closed if output speed is below 100 rpm in Drive. L/R is always closed in ERS1.						

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

REMOVAL

REMOVAL

NOTE: **If the Transmission Solenoid/TRS Assembly is being replaced, the Quick Learn Procedure must be performed. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .**

Fig. 110: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE BODY TO CASE BOLT (6)

1. Remove the valve body from the transmission. Refer to **VALVE BODY, REMOVAL**.

Fig. 111: Solenoid Pack Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the bolts (1) holding the transmission solenoid/TRS assembly onto the valve body.
3. Separate the transmission solenoid/TRS assembly from the valve body.

INSTALLATION

INSTALLATION

Fig. 112: Solenoid Pack Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - SOLENOID PACK BOLTS (15)

1. Place TRS selector plate in the PARK position.
2. Position the transmission solenoid/TRS assembly onto the valve body. Be sure that both alignment dowels are fully seated in the valve body and that the TRS switch contacts are properly positioned in the selector plate
3. Install the bolts (1) to hold the transmission solenoid/TRS assembly onto the valve body. Refer to **Fig. 112**.
4. Tighten the solenoid assembly screws adjacent to the arrows cast into the bottom of the valve body first. Tighten the screws to 6 N.m (50 in.lbs.).
5. Tighten the remainder of the solenoid assembly screws to 6 N.m (50 in.lbs.).
6. Install the valve body into the transmission.

CABLE, SHIFT

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - GEARSHIFT CABLE

1. Engine starts must be possible with shift lever in PARK or NEUTRAL positions only. Engine starts must not be possible in any other gear position.
2. With the shift lever in the:

1. PARK position - Apply upward force on the shift arm and remove pressure. Engine starts must be possible.
2. PARK position - Apply downward force on the shift arm and remove pressure. Engine starts must be possible.
3. NEUTRAL position - Normal position. Engine starts must be possible.
4. NEUTRAL position - Engine running and brakes applied, apply upward force on the shift arm. Transmission shall not be able to shift from neutral to reverse.

ADJUSTMENTS

ADJUSTMENTS

NOTE: Always run the shift lever test using the scan tool to help diagnose a potential TRS problem

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the transmission range sensor may be faulty.

GEARSHIFT ADJUSTMENT PROCEDURE

Fig. 113: Gearshift Cable At Steering Column
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING COLUMN
2 - GEARSHIFT CABLE
3 - GEARSHIFT CABLE LOCK TAB
4 - BTSI SOLENOID LOCK TAB
5 - BTSI CONNECTOR

1. Shift transmission into PARK.
2. Release cable adjuster lock tab (3) (underneath the steering column) to unlock cable. Refer to **Fig. 113**.
3. Raise vehicle.
4. Disengage the cable eyelet from the transmission manual shift lever.
5. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
6. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
7. Snap the cable eyelet onto the transmission manual shift lever.
8. Lower vehicle.
9. Lock shift cable by pressing cable adjuster lock tab (3) downward until it snaps into place.
10. Check engine starting. Engine should start only in PARK and NEUTRAL.

REMOVAL

REMOVAL

Fig. 114: Gearshift Cable At Transmission
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - RFE TRANSMISSION
3 - MANUAL LEVER

1. Shift transmission into PARK.

2. Raise vehicle.
3. Disengage cable (1) eyelet at transmission manual shift lever (3) and pull cable adjuster out of mounting bracket. Refer to **Fig. 114**.

Fig. 115: Gearshift Cable At Dash Panel
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - GROMMET

4. Lower the vehicle.
5. Remove the dash panel insulation pad as necessary to access the gearshift cable grommet (2). Refer to **Fig. 115**.
6. Remove grommet (2) from the dash panel.

Fig. 116: Gearshift Cable At Steering Column
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING COLUMN
2 - GEARSHIFT CABLE
3 - GEARSHIFT CABLE LOCK TAB
4 - BTSI SOLENOID LOCK TAB
5 - BTSI CONNECTOR

7. Remove any steering column (1) trim necessary to access the gearshift cable (2) and BTSI mechanism.
8. Disconnect the BTSI wiring connector (5).
9. Disconnect cable at lower column bracket and shift lever pin and pull the cable through the dash panel opening into the vehicle. Refer to **Fig. 116**.
10. Remove gearshift cable (2) from vehicle.

INSTALLATION

INSTALLATION

Fig. 117: Gearshift Cable At Dash Panel
Courtesy of CHRYSLER GROUP, LLC

1. Route the transmission end of the gearshift cable (1) through the opening in the dash panel.
2. Seat the cable grommet (2) into the dash panel opening.

Fig. 118: Gearshift Cable At Steering Column
Courtesy of CHRYSLER GROUP, LLC

3. Snap the cable into the steering column (1) bracket so the retaining ears are engaged and snap the cable eyelet onto the shift lever ball stud.
4. Raise the vehicle.
5. Place the transmission manual shift lever in the "PARK" detent (rearmost) position and rotate prop shaft to ensure transmission is in PARK.
6. Route the gearshift cable through the transmission mounting bracket and secure the cable by snapping the cable retaining ears into the transmission bracket and snapping the cable eyelet on the manual shift lever ball stud.
7. Lower vehicle.
8. Lock the shift cable adjustment by pressing the cable adjuster lock tab (3) downward until it snaps into place.
9. Check for proper operation of the transmission range sensor.
10. Adjust the gearshift cable and BTSI mechanism. Refer to **CABLE, SHIFT, ADJUSTMENTS**.

CLUTCH, LOW AND REVERSE

DISASSEMBLY

DISASSEMBLY

4 - SPACER

Fig. 122: Compressing Low/Reverse Belleville Spring
Courtesy of CHRYSLER GROUP, LLC

1 - PRESS
2 - TOOL 8285
3 - BELLEVILLE SPRING

5. Using Spring Compressor (special tool #8285, Compressor, Spring) (2) and a suitable shop press (1), compress the low/reverse Belleville spring (3) and remove the split retaining ring holding the Belleville spring into the low/reverse clutch retainer.
6. Remove the low/reverse Belleville spring (3) and piston from the low/reverse clutch retainer. Use 20 psi of air pressure to remove the piston if necessary.

CLEANING

CLEANING

Clean the overrunning clutch assembly, and low-reverse clutch retainer. Dry them with compressed air after cleaning.

INSPECTION

INSPECTION

Verify that the overrunning clutch assembly turns smoothly in one direction, and locks in the opposite direction. Verify that the oil feed holes in the inner race are not blocked by debris.

Replace the LR clutch retainer if the piston bores or bushing surfaces are badly scored, worn or damaged.

ASSEMBLY

ASSEMBLY

6 - RETAINER	
7 - BELLEVILLE SPRING	

NOTE: **Install an outer-toothed disc first, then alternate inner and outer-toothed discs, ending with an inner-toothed disc. Install all the discs with the friction material facing up.**

6. Assemble and install the low/reverse clutch pack (4, 5) into the low/reverse clutch retainer (9).
7. Install the low/reverse reaction plate (3) into the low/reverse clutch retainer (9). The reaction plate is directional and must be installed with the flat side down.
8. Install the low/reverse clutch pack snap-ring (2). The snap-ring is selectable and should be chosen to give the correct clutch pack clearance.
9. Measure the low/reverse clutch pack clearance and adjust as necessary. The correct clutch clearance is 1.18-2.09 mm (0.046-0.082 in.).

NOTE: **When installing the overrunning clutch be certain the notched end of the external spline teeth faces upward. The ORC is properly seated when the inner spline stepped face is below the face of the LR clutch retainer hub.**

10. Install the overrunning clutch (1) into the low/reverse clutch retainer (9) making sure that the index splines are aligned with the retainer.

COVER, OIL PUMP

REMOVAL

REMOVAL

Fig. 126: Front Cover
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT COVER
2 - O - RING
3 - SNAP RING
4 - FRONT COVER SEAL

1. Remove the bolts holding the transmission oil pan to the transmission case.
2. Remove the transmission oil pan from the transmission case.
3. Remove the snap ring (3) from the transmission case.
4. Reaching through a case opening in the valve body area with a long blunted tool, remove the transmission front cover (1) from the transmission case.

INSTALLATION

INSTALLATION

Fig. 127: Front Cover
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT COVER
2 - O - RING
3 - SNAP RING
4 - FRONT COVER SEAL

NOTE: **To avoid contamination and garter spring dislodgement, do not handle the front cover seal (4) when positioning the front cover into the transmission case.**

1. Position a new front cover (1) into the transmission case.

Fig. 128: Front Cover Installation Tool
Courtesy of CHRYSLER GROUP, LLC

1 - Front Cover installation Tool 9955

2. Using the front cover installation tool (special tool #9955, Installer, Front Cover) (1) and a dead-blow mallet, install the front cover into transmission case.

Fig. 129: Front Cover

Courtesy of CHRYSLER GROUP, LLC

1 - FRONT COVER
2 - O - RING
3 - SNAP RING
4 - FRONT COVER SEAL

3. Install the snap ring (3) into the transmission case.
4. Apply RTV silicone to the oil pan and install the transmission oil pan.
5. Tighten the bolts to 12 N.m (105 in. lbs.).

FLUID AND FILTER

DIAGNOSIS AND TESTING

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has three primary causes.

1. Internal clutch slippage, usually caused by low line pressure, inadequate clutch apply pressure, or clutch seal failure.
2. A result of restricted fluid flow through the main and auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged oil cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
3. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid

- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE

FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P (PARK) and N (NEUTRAL) positions. Place the selector lever in P (PARK) to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature (approximately 82° C. or 180° F), the fluid level is correct if it is in the HOT region (cross-hatched area) on the oil level indicator. The fluid level will be approximately at the upper COLD hole of the dipstick at 21° C (70° F) fluid temperature.

Fig. 130: Transmission Fluid Fill Level Vs. Transmission Fluid Temperature Chart
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Engine and Transmission should be at normal operating temperature before performing this procedure. After the fluid has been checked, seat the dipstick fully to seal out water and dirt.**

1. Start engine and apply parking brake.
2. Shift the transmission into DRIVE for approximately 2 seconds.
3. Shift the transmission into REVERSE for approximately 2 seconds.
4. Shift the transmission into PARK.
5. Hook up scan tool and select transmission.
6. Select sensors.
7. Read the transmission temperature value.
8. Compare the fluid temperature value with the chart.
9. Adjust transmission fluid level shown on the dipstick according to the Transmission Fluid Temperature Chart.

NOTE: **After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.**

10. Check transmission for leaks.

FLUID AND FILTER REPLACEMENT

For proper service intervals, refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

REMOVAL

1. Hoist and support vehicle on safety stands.
2. Place a large diameter shallow drain pan beneath the transmission pan.
3. Remove bolts holding front and sides of pan to transmission.
4. Loosen bolts holding rear of pan to transmission.
5. Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.
6. Hold up pan and remove remaining bolts holding pan to transmission.
7. While holding pan level, lower pan away from transmission.
8. Pour remaining fluid in pan into drain pan.

Fig. 131: Primary Oil Filter & Oil Cooler Return Filter
Courtesy of CHRYSLER GROUP, LLC

1 - PRIMARY OIL FILTER
2 - COOLER RETURN FILTER
3 - COOLER RETURN FILTER BYPASS VALVE
4 - VALVE BODY

9. Remove the screw holding the primary oil filter (1) to valve body. Refer to **Fig. 131**.
10. Separate filter from valve body and oil pump and pour fluid in filter into drain pan.
11. Inspect the oil filter seal in the bottom of the oil pump. If the seal is not installed completely in the oil pump, or is otherwise damaged, then remove and discard the oil filter seal from the bottom of the oil pump. If the seal is installed correctly and is in good condition, it can be reused.
12. If replacing the cooler return filter (2), use Oil Filter Wrench (special tool #8321, Wrench, Oil Filter) to remove the filter from the transmission.

13. Dispose of used trans fluid and filter(s) properly.

INSPECTION

Inspect bottom of pan and magnet for excessive amounts of metal. A light coating of clutch material on the bottom of the pan does not indicate a problem unless accompanied by a slipping condition or shift lag. If fluid and pan are contaminated with excessive amounts of debris, refer to **DIAGNOSIS AND TESTING**.

CLEANING

1. Using a suitable solvent, clean pan and magnet.
2. Using a suitable gasket scraper, clean original sealing material from surface of transmission case and the transmission pan.

INSTALLATION

Fig. 132: Primary Oil Filter & Oil Cooler Return Filter
Courtesy of CHRYSLER GROUP, LLC

1 - PRIMARY OIL FILTER
2 - COOLER RETURN FILTER
3 - COOLER RETURN FILTER BYPASS VALVE
4 - VALVE BODY

CAUTION: The primary oil filter seal MUST be fully installed flush against the oil pump body. DO NOT install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.

1. If necessary, install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with Installer (special tool #6960, Tools, Trac-Lok Axle) or another suitable tool (appropriately sized drift or socket, the butt end of a hammer etc.).

2. Place replacement filter in position on valve body and into the oil pump.
3. Install screw to hold the primary oil filter (1) to valve body. Refer to **Fig. 132**. Tighten screw to 4.5 N.m (40 in. lbs.) torque.
4. Install new cooler return filter (2) onto the transmission, if necessary. Torque the filter to 9.5 N.m (84 in.lbs.).
5. Place bead of Mopar® RTV sealant onto the transmission case sealing surface.
6. Place pan in position on transmission.
7. Install bolts to hold pan to transmission. Tighten bolts to 12 N.m (105 in. lbs.) torque.
8. Lower vehicle and fill transmission with MOPAR® ATF +4.

TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Remove dipstick and insert clean funnel in transmission fill tube.
2. Add following initial quantity of Mopar® ATF +4 to transmission:
    1. If only fluid and filter were changed, add **10 pints (5 quarts)** of ATF +4 to transmission.
    2. If transmission was completely overhauled and the torque converter was replaced or drained, add **24 pints (12 quarts)** of ATF +4 to transmission.
3. Check the transmission fluid and adjust as required. Refer to **STANDARD PROCEDURE**.

GEARTRAIN, PLANETARY

DESCRIPTION

DESCRIPTION

NOTE: The 66RFE transmission does not use a number 7 thrust bearing.

Fig. 133: Thrust Bearings & Output Shaft Bearing

2 - OUTPUT END PLAY THRUST PLATE (SELECTIVE)	6 - THRUST BEARING NUMBER 9
3 - 4C CLUTCH HUB / REACTION SUN GEAR	
4 - THRUST BEARING NUMBER 8	

The planetary geartrain is located behind the 2C/4C retainer/bulkhead, toward the rear of the transmission. The planetary geartrain consists of two primary assemblies:

- Reaction (3, 5).

Fig. 135: Reverse Carrier
Courtesy of CHRYSLER GROUP, LLC

2. NUMBER NINE BEARING	6. NUMBER 11 BEARING (CAPTURED)
3. REVERSE PLANETARY CARRIER	7. INPUT PLANETARY CARRIER
4. THRUST BEARING NUMBER 10	8. INPUT ANNULUS GEAR

- Reverse (3).
- Input (5, 7, 8).

OPERATION

OPERATION

REACTION PLANETARY GEAR SET

The reaction planetary carrier and reverse sun gear are a single component which is held by the 2C clutch when

required. The sun gear is retained on the reaction carrier hub by a hidden snap ring and can not be removed. The reaction sun gear is a stand alone component that can be driven by the reverse clutch or held by the 4C clutch. The reaction annulus is welded to the reverse planetary carrier.

REVERSE PLANETARY GEAR SET

The reverse planetary gear set is the middle of the three planetary sets. The reverse planetary carrier can be driven by the overdrive clutch as required. The reverse planetary carrier is welded to the reaction annulus gear and splined to the input annulus gear, which can be held by the low/reverse clutch. The reverse annulus gear, input planetary carrier, and output shaft are all one piece. The reverse annulus gear is retained on the input carrier flange by a hidden snap ring and can not be disassembled.

INPUT PLANETARY GEAR SET

The input sun gear of the input planetary gear set is driven by the underdrive clutch. The number 11 thrust bearing is captive underneath the pinion gears and therefore cannot be removed.

DISASSEMBLY

DISASSEMBLY

NOTE: The 66RFE transmission does not use a number 7 thrust bearing.

Fig. 136: Thrust Bearings & Output Shaft Bearing

5 - THRUST BEARING NO. 5	12 - THRUST BEARING NO. 12
6 - THRUST BEARING NO. 6	13 - OUTPUT SHAFT BEARING

NOTE: **The number 11 thrust bearing is captured under the input planetary carrier pinion gears and is not serviceable.**

Fig. 137: Reverse Carrier
Courtesy of CHRYSLER GROUP, LLC

1. Remove the snap-ring (1) holding the input annulus (8) onto the input carrier (7).
2. Remove the input annulus (8) from the input carrier (7).
3. Remove the number 9 thrust bearing from the reverse planetary carrier (3).
4. Remove the reverse planetary gear carrier (3).
5. Remove the number 10 thrust bearing (4) from the input sun gear (5).
6. Remove the input sun gear (5) from the input carrier (7).

CLEANING

CLEANING

Clean the planetary components in solvent and dry them with compressed air.

INSPECTION

INSPECTION

Inspect each planetary carrier assembly for damage. Check that each pinion gear rotates freely and smoothly on its shaft. Check that the fixed thrust washer on each side of each pinion gear is in place. Check that the outer ends of the pinion shafts are not discolored from overheating. Replace the carrier assembly if jammed or sticky pinion gears, spun or missing fixed washers, or blackened pinion shafts are found.

Check sun gear and annulus gear condition. Replace components as necessary if damaged or if any bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location.

ASSEMBLY

ASSEMBLY

NOTE: The 66RFE transmission does not use a number 7 thrust bearing.

	13 - OUTPUT SHAFT BEARING

NOTE: **The number 11 thrust bearing is captured under the input planetary carrier pinion gears and is not serviceable.**

Fig. 139: Reverse Carrier
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.**

1. Install the input sun gear (5) into the input planetary carrier (7).

2. Install the number 10 thrust bearing (4) onto the input sun gear (5) with the inner race toward the gear.
3. Install the number nine thrust bearing (2) onto the face of the reverse planetary carrier (3) with the inner race toward the carrier and the tabs facing upward.
4. Install the reverse planetary gear carrier (3) into the input planetary carrier (7).
5. Install the input annulus gear (8) onto the input planetary carrier (7).
6. Install the snap-ring (1) to hold the input annulus gear (8) into the input carrier (7).

HOLDING CLUTCHES

DESCRIPTION

DESCRIPTION

6 - RETAINER	
7 - BELLEVILLE SPRING	

Three hydraulically applied multi-disc clutches are used to hold some planetary geartrain components stationary while the input clutches drive others. The 2C, 4C, and Low/Reverse clutches are considered holding clutches. The 2C and 4C clutches are located in the 4C retainer/bulkhead (12).

The Low/Reverse clutch is located at the rear of the transmission case.

OPERATION

OPERATION

Fig. 143: 66RFE Clutch Orientation

1 - U/D CLUTCH	4 - 4C CLUTCH

2 - O/D CLUTCH	5 - 2C CLUTCH
3 - REVERSE CLUTCH	6 - L/R CLUTCH

2C CLUTCH

The 2C clutch is hydraulically applied in second and sixth gears by pressurized fluid against the 2C piston. When the 2C clutch is applied, the reaction planetary carrier and reverse sun gear are held or grounded to the transmission case.

4C CLUTCH

The 4C clutch is hydraulically applied in third and fifth gears by pressurized fluid against the 4C clutch piston. When the 4C clutch is applied, the reaction sun gear is held or grounded to the transmission case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gear, only at low speeds, by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the input annulus assembly is held or grounded to the transmission case.

HOUSING, TRANSMISSION, REAR EXTENSION

REMOVAL

REMOVAL

1. Remove the rear drive shaft. Refer to **SHAFT, DRIVE, REAR LIGHT DUTY, REMOVAL** or **SHAFT, DRIVE, REAR HEAVY DUTY, REMOVAL** .

2. Install the extension housing (1) on the transmission (3).
3. Install the extension housing bolts (2) and tighten to 54 N.m (40 ft. lbs.).
4. Install rear drive shaft. Refer to **SHAFT, DRIVE, REAR LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR HEAVY DUTY, INSTALLATION** .

MECHANISM, BRAKE TRANSMISSION SHIFT INTERLOCK

DESCRIPTION

DESCRIPTION

Fig. 160: Gearshift Lever Assembly
Courtesy of CHRYSLER GROUP, LLC

The Brake Transmission Shifter Interlock (BTSI), is a solenoid operated system. It consists of a solenoid permanently mounted on the gearshift lever assembly.

OPERATION

OPERATION

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed approximately one-half an inch. A magnetic holding device in line with the park lock cable is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

Fig. 161: Steering Column Lower Shroud
Courtesy of CHRYSLER GROUP, LLC

The system override (3) is located on the bottom of the column shroud (1) and requires a long thin screwdriver to depress the release.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK

1. Verify that the key can only be removed in the PARK position.
2. When the shift lever is in PARK And the shift handle pushbutton is in the "OUT" position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the OFF position.
4. Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key

cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).

5. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

ADJUSTMENTS

ADJUSTMENTS

ADJUSTMENT PROCEDURE

Fig. 162: Gearshift Lever Assembly
Courtesy of CHRYSLER GROUP, LLC

The BTSI is part of the shift lever assembly (2) and is non-adjustable.

BTSI FUNCTION CHECK

1. Verify removal of ignition key allowed in PARK position only.
2. When the shift lever is in PARK, the ignition key cylinder should rotate freely from off to lock. When the shifter is in any other position, the ignition key should not rotate from off to lock.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the off position.
4. Shifting out of PARK should not be possible while applying normal force, and ignition key cylinder is in the run or start positions, unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the accessory or lock position.
6. Shifting between any gear and NEUTRAL, or PARK, may be done without depressing foot brake with ignition switch in run or start positions.

7. Engine starts must be possible with shifter lever in PARK or NEUTRAL positions only. Engine starts must not be possible in any position other than PARK or NEUTRAL.
8. With shifter lever in the:

- PARK position - Apply upward force on the shift arm and remove pressure. Engine starts must be possible.
- PARK position - Apply downward force on the shift arm and remove pressure. Engine starts must be possible.
- NEUTRAL position - Normal position. Engine starts must be possible.
- NEUTRAL position - Engine running and brakes applied, apply upward force on the shift arm. Transmission shall not be able to shift from neutral to reverse.

PUMP, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

Fig. 163: Oil Pump & Bolt
Courtesy of CHRYSLER GROUP, LLC

1 - OIL PUMP TO CASE BOLT (6)
2 - OIL PUMP

The oil pump (2) is located at the front of the transmission inside the bell housing and behind the transmission front cover.

Fig. 164: Oil Pump Gears
Courtesy of CHRYSLER GROUP, LLC

1 - PUMP HOUSING
2 - DRIVE GEAR
3 - DRIVEN GEARS

The oil pump consists of two independent pumps. Refer to **Fig. 164**.

Fig. 165: Identifying Pump Valves

1 - TORQUE CONVERTER CLUTCH ACCUMULATOR VALVE
2 - TORQUE CONVERTER CLUTCH CONTROL VALVE
3 - TORQUE CONVERTER CLUTCH SWITCH VALVE
4 - PUMP VALVE BODY
5 - MAIN REGULATOR VALVE
6 - TORQUE CONVERTER CLUTCH LIMIT VALVE

The oil pump also contains a number of valves. The converter clutch switch (3) and control valves (2), main regulator valve (5), and converter pressure limit valve (6) are all located in the oil pump valve body.

Fig. 166: Oil Pump Reaction Shaft
Courtesy of CHRYSLER GROUP, LLC

1 - PUMP HOUSING	4 - REACTION SHAFT SUPPORT
2 - OIL FILTER SEAL	5 - PUMP VALVE BODY
3 - SEAL RING (5)	

A filter seal (2), and a bolt on reaction shaft (4) complete the oil pump assembly.

OPERATION

OPERATION

As the torque converter rotates, the converter hub rotates the oil pump drive gear. As the drive gear rotates both driven gears, a vacuum is created when the gear teeth come out of mesh. This suction draws fluid through the pump inlet from the oil pan. As the gear teeth come back into mesh, pressurized fluid is forced into the pump outlet and to the oil pump valves.

At low speeds, both sides of the pump supply fluid to the transmission. As the speed of the torque converter increases, the flow from both sides increases until the flow from the primary side alone is sufficient to meet system demands. At this point, the check valve located between the two pumps closes. The secondary side is shut down and the primary side supplies all the fluid to the transmission.

CONVERTER CLUTCH SWITCH VALVE

The converter clutch switch valve is used to control the direction of oil flow to the torque converter. When the converter clutch is released (CC switch valve downshifted), hydraulic pressure is supplied to the front (OFF) side of the torque converter clutch. When the converter clutch is applied (CC switch valve upshifted), regulated oil pressure is supplied to the back (ON) side of the converter clutch.

CONVERTER CLUTCH REGULATOR VALVE

The converter clutch regulator valve is used to control the hydraulic pressure supplied to the back (ON) side of the torque converter clutch.

TORQUE CONVERTER LIMIT VALVE

The torque converter limit valve serves to limit the maximum pressure supplied to the front side of the torque converter clutch.

DISASSEMBLY

DISASSEMBLY

Fig. 167: Oil Pump Reaction Shaft
Courtesy of CHRYSLER GROUP, LLC

1 - PUMP HOUSING	4 - REACTION SHAFT SUPPORT
2 - OIL FILTER SEAL	5 - PUMP VALVE BODY
3 - SEAL RING (5)	

1. Remove the bolts holding the reaction shaft support (4) to the oil pump.
2. Remove the reaction shaft support (4) from the oil pump.
3. Remove all bolts holding the oil pump halves together.
4. Using suitable prying tools, separate the oil pump sections by inserting the tools in the supplied areas and prying the halves apart.

NOTE: **The oil pump halves are aligned to each other through the use of two dowels. Be sure to pry upward evenly to prevent damage to the oil pump components.**

11. Remove the T/C regulator valve (1), T/C limit valve (2), and main regulator valve (3).

CLEANING

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

INSPECTION

INSPECTION

Check condition of the seal rings and bushing sleeve on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn, chipped, or damaged.

Inspect the pump reaction shaft support bushings. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the oil pump valve body. Use a penlight to view the bore interiors. Replace the oil pump if any bores are distorted or scored. Inspect all of the valve springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores. Tip the pump valve body back and forth and check to see that each valve slides freely in its bore under its own weight (without pushing or prying).

ASSEMBLY

ASSEMBLY

NOTE: **Clean and inspect all components. Make sure that all passages are thoroughly cleaned and are free from dirt or debris. Make sure that all valves move freely in their proper bore. Make sure that all gear pockets and bushings are free from excessive wear and scoring. Replace the oil pump if any excessive wear or scoring is found.**

1. Clean the extension housing seal bore in the extension housing of any residue or particles remaining from the original seal.

NOTE: The small weep hole in the dust boot of the seal should face downward when installed in the extension housing.

2. Install new oil seal in the extension housing (1) using (special tool #8896, Installer, Seal) (2) and (special tool #C-4171, Driver Handle, Universal) (3).
3. Install rear drive shaft. Refer to **SHAFT, DRIVE, REAR LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR HEAVY DUTY, INSTALLATION** .

SENSOR, SPEED, INPUT

DESCRIPTION

DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the park gear teeth. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

3. Install the wiring connector onto the output speed sensor (1).
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.

SENSOR, TRANSMISSION OIL TEMPERATURE

DESCRIPTION

DESCRIPTION

The transmission temperature sensor is a thermistor that is integral to the Transmission Range Sensor (TRS).

OPERATION

OPERATION

The transmission temperature sensor is used by the TCM to sense the temperature of the fluid in the sump. Since fluid temperature can affect transmission shift quality and convertor lock up, the TCM requires this information to determine which shift schedule to operate in.

CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

SENSOR, TRANSMISSION RANGE

DESCRIPTION

DESCRIPTION

The Transmission Range Sensor (TRS) is part of the solenoid module, which is mounted to the top of the valve body inside the transmission.

The Transmission Range Sensor (TRS) has five switch contact pins that:

- Determine shift lever position
- Supply ground to the Starter Relay in Park and Neutral only.

The TRS also has an integrated temperature sensor (thermistor) that communicates transmission temperature to the TCM and PCM.

OPERATION

OPERATION

The Transmission Range Sensor (TRS) communicates shift lever position to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that

the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transmission gear position and shift schedule.

There are many possible combinations of open and closed switches (codes). Five of these possible codes correspond to valid gear position, there are two codes for the neutral position and three are recognized as "between gear" codes. This results in many codes which should **never occur** . These are called "invalid" codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

GEAR	C5	C4	C3	C2	C1
Park	CL	OP	OP	CL	CL
Temp 1	CL	OP	OP	CL	OP
Reverse	OP	OP	OP	CL	OP
Temp 2	OP	OP	CL	CL	OP
Neutral 1	OP	OP	CL	CL	CL
Neutral 2	OP	CL	CL	CL	CL
Temp 3	OP	CL	CL	CL	OP
Drive	OP	CL	CL	OP	OP

SENSOR, VARIABLE LINE PRESSURE

DESCRIPTION

DESCRIPTION

The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid, which is part of the pressure switch assembly. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the pump inlet. The system contains a Line Pressure Sensor, which is a direct input to the TCM. The line pressure sensor monitors the transmission line pressure and completes the feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

OPERATION

OPERATION

The TCM calculates the desired line pressure based upon inputs from the transmission and engine. The TCM calculates the torque input to the transmission and uses that information as the primary input to the calculation. The line pressure is set to a predetermined value during shifts, to ensure consistent shift quality. During all other operation, the desired line pressure value is adjusted based on torque level and other transmission requirements.

REMOVAL

REMOVAL

3 - INPUT SPEED SENSOR

1. Install the line pressure sensor (2) into the transmission case. Refer to **Fig. 195**.
2. Install the bolt to hold the line pressure sensor (2) into the transmission case. Tighten the bolt to 12 N.m (105 in.lbs.).
3. Install the wiring connector onto the line pressure sensor (2).
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.

SHIFTER, TRANSMISSION

DESCRIPTION

DESCRIPTION

The gear shift mechanism provides four shift positions which are:

- Park (P)
- Reverse (R)
- Neutral (N)
- Drive (D)

OPERATION

OPERATION

Drive range provides underdrive FIRST, SECOND and THIRD gears, direct FOURTH gear and overdrive FIFTH and SIXTH gears. The shift into overdrive FIFTH and SIXTH gear occurs only after the transmission has completed the shift into FOURTH gear. No other movement of the shift mechanism is required to complete the 4-5 or 5-6 gear shifts.

The FOURTH and FIFTH gear upshift occurs automatically unless the Tow/Haul mode is enabled.

Upshifts into both overdrive gears, FIFTH and SIXTH, will be delayed when the transmission fluid temperature is below 4.5° C (40° F) or above 115.5° C (240° F).

SWITCH, OVERDRIVE LOCKOUT

DESCRIPTION

DESCRIPTION

Fig. 196: Tow/Haul Overdrive Off Switch
Courtesy of CHRYSLER GROUP, LLC

1 - AUTO-6 (ERS)	3 - OVERDRIVE ON/OFF SWITCH
2 - TOW / HAUL	

The Tow/Haul and Auto-6 Electronic Range Select (ERS) switches are located in the shift lever arm. The switches are momentary contact devices that signal the PCM to toggle current status of the Tow/Haul function and adjust the ERS maximum allowed gear range.

OPERATION

OPERATION

At key-on, normal operation is provided. Pressing the switch enables Tow/Haul mode and the Tow/Haul lamp will be illuminated. In Tow/Haul mode, 4-5 upshifts are delayed. Shifts into 5th and 6th gear are still allowed under steady cruise conditions. Closed throttle downshifts (for improved engine braking) may occur during steady braking maneuvers. Pressing the switch a second time restores normal operation. Normal operation is always the default at start-up; the switch must be pressed after each key start if Tow/Haul mode is desired.

The Electronic Range Select (ERS) allows the selection of the desired top gear, when the shifter is in the D (Drive) position. For example, if ERS 3rd is selected, the transmission will never shift above 3rd gear, but can down shift into 2nd or 1st when needed.

TORQUE CONVERTER

DESCRIPTION

DESCRIPTION

Fig. 197: Torque Converter Components
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE ASSEMBLY	5 - IMPELLER ASSEMBLY

2 - STATOR	6 - CONVERTER CLUTCH
3 - CONVERTER HUB	7 - TURBINE HUB
4 - O-RING (IF EQUIPPED)	

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. Refer to **Fig. 197**. The torque converter consists of an outer shell with an internal turbine (1), a stator (2), an overrunning clutch, an impeller (5), and an electronically applied converter clutch (6). The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub (3) drives the transmission oil (fluid) pump and contains an o-ring seal (4) to better control oil flow.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

IMPELLER

Fig. 198: Impeller
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE FLEXPLATE	4 - ENGINE ROTATION
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION	5 - ENGINE ROTATION

3 - IMPELLER VANES AND COVER ARE INTEGRAL	

The impeller is an integral part of the converter housing. Refer to **Fig. 198**. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

Fig. 199: Turbine
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE VANE	4 - PORTION OF TORQUE CONVERTER COVER
2 - ENGINE ROTATION	5 - ENGINE ROTATION
3 - INPUT SHAFT	6 - OIL FLOW WITHIN TURBINE SECTION

The turbine is the output, or driven, member of the converter. Refer to **Fig. 199**. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

Fig. 200: Stator
Courtesy of CHRYSLER GROUP, LLC

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW
4 - TURBINE

The stator assembly is mounted on a stationary shaft which is an integral part of the oil pump. Refer to **Fig. 200**. The stator (1) is located between the impeller (2) and the turbine (4) within the torque converter case.

Fig. 201: Identifying Stator Components
Courtesy of CHRYSLER GROUP, LLC

1 - CAM (OUTER RACE)
2 - ROLLER
3 - SPRING
4 - INNER RACE

The stator contains an over-running clutch (1-4), which allows the stator to rotate only in a clockwise direction. Refer to **Fig. 201**. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

Fig. 202: Identifying Torque Converter Clutch (TCC) Components
Courtesy of CHRYSLER GROUP, LLC

1 - IMPELLER FRONT COVER
2 - THRUST WASHER ASSEMBLY
3 - IMPELLER
4 - STATOR
5 - TURBINE
6 - PISTON
7 - FRICTION DISC

The TCC was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid

coupling. Refer to **Fig. 202**. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller (3) and turbine (5) were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston (6) with friction material (7) was added to the turbine assembly (5) to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the L/R-CC Solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

OPERATION

OPERATION

The converter impeller (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. Refer to **Fig. 203**. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

Fig. 203: Identifying Piston Travel
Courtesy of CHRYSLER GROUP, LLC

1 - APPLY PRESSURE	3 - RELEASE PRESSURE
2 - THE PISTON MOVES SLIGHTLY FORWARD	4 - THE PISTON MOVES SLIGHTLY REARWARD

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Refer to **Fig. 204**. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 1.75:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES
4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction material to the front cover, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in all gear ranges except first depending on the Tow/Haul and ERS status. In normal operation, the clutch will engage after the shift to fourth gear. If the Tow/Haul mode is enabled, the clutch will engage after the shift to third (direct) gear.

The TCM controls the torque converter clutch via the L/R-CC Solenoid. There are four TCC operational modes:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual EMCC Release

NO EMCC

Under No EMCC conditions, the L/R Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

PARTIAL EMCC

Partial EMCC operation modulates the L/R Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

FULL EMCC

During Full EMCC operation, the TCM increases the L/R Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the desired slip range of transmission input speed relative to engine rpm.

GRADUAL EMCC RELEASE

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by slowly decreasing the L/R Solenoid duty cycle.

REMOVAL

REMOVAL

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is

removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

1. Remove transmission and torque converter from vehicle. Refer to **REMOVAL**.
2. Place a suitable drain pan under the converter housing end of the transmission.
3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

INSTALLATION

INSTALLATION

Fig. 205: Checking Converter Seating With Steel Scale & Straightedge
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Check converter hub and drive flats for sharp edges, burrs, scratches, or nicks. Polish the hub and flats with 800/1000 grit paper or crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free from debris. The hub must be smooth to avoid damaging the pump seal at installation.**

1. Lubricate oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or converter hub o-ring while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale (1) and straightedge (2). Surface of converter lugs should be at least 25 mm (1in.) to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle. Refer to **TORQUE CONVERTER, INSTALLATION**.
9. Fill the transmission with the recommended fluid.

VALVE BODY

DESCRIPTION

DESCRIPTION

Fig. 206: Exploded View Of Upper Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1 - LOW/REVERSE ACCUMULATOR	6 - OVERDRIVE ACCUMULATOR
2 - LOW/REVERSE SHUTTLE VALVE AND PLUG	7 - UNDERDRIVE ACCUMULATOR
3 - UPPER VALVE BODY	8 - 4C ACCUMULATOR
4 - MANUAL VALVE	9 - 2C ACCUMULATOR
5 - SOLENOID SWITCH VALVE AND PLUGS	

The valve body consists of a cast aluminum valve body, a separator plate, and a transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch and frictional clutches. The valve body contains the following components:

- Solenoid switch valve
- Manual valve
- Low/reverse shuttle valve
- 5 Accumulators

Fig. 207: Check Ball Locations
Courtesy of CHRYSLER GROUP, LLC

- 5 check balls

OPERATION

OPERATION

NOTE: **Refer to SCHEMATICS AND DIAGRAMS for a visual aid in determining valve location, operation and design.**

SOLENOID SWITCH VALVE

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R-TCC solenoid is energized.

The Solenoid Switch Valve controls line pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In all other gears, the solenoid switch valve will be in the upshifted position and directs the fluid into the torque converter clutch (TCC) circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

MANUAL VALVE

Fig. 208: Identifying TRS Selector Plate, Detent Spring & Passage Seals
Courtesy of CHRYSLER GROUP, LLC

1 - TRS SELECTOR PLATE
2 - DETENT SPRING
3 - CLUTCH PASSAGE SEALS

The manual valve is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the top of the valve body. The valve is connected mechanically to the gearshift mechanism. The valve is held in each of its positions by a roller detent spring (2) that engages the roostercomb of the TRS selector plate (1).

LOW/REVERSE SWITCH VALVE

The low/reverse switch valve allows the low/reverse clutch to be operated by either the LR/CC solenoid or the MS solenoid.

REMOVAL

REMOVAL

NOTE: **The valve body can be removed for service without having to remove the transmission assembly. The valve body can be disassembled for cleaning and inspection of the individual components.**

Fig. 209: Primary Oil Filter & Oil Cooler Return Filter
Courtesy of CHRYSLER GROUP, LLC

1. Shift transmission into PARK.
2. Raise vehicle.
3. Disconnect wires at the solenoid and pressure switch assembly 23 pin electrical connector.
4. Position drain pan under transmission oil pan.
5. Remove transmission oil pan.
6. Remove the primary oil filter (1) from valve body.

Fig. 210: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove bolts (1) attaching valve body to transmission case.
8. Lower the valve body and work the electrical connector out of transmission case.

9. Separate the valve body from the transmission.

DISASSEMBLY

DISASSEMBLY

Fig. 211: Solenoid Pack Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - SOLENOID PACK BOLTS (15)

1. Remove the bolts (1) holding the solenoid and pressure switch assembly to the valve body. Do not remove the screws on the top of the solenoid and pressure switch assembly.
2. Separate the solenoid and pressure switch assembly from the valve body.

Fig. 212: Identifying TRS Selector Plate, Detent Spring & Passage Seals

2 - LOW/REVERSE SHUTTLE VALVE AND PLUG	7 - UNDERDRIVE ACCUMULATOR
3 - UPPER VALVE BODY	8 - 4C ACCUMULATOR
4 - MANUAL VALVE	9 - 2C ACCUMULATOR
5 - SOLENOID SWITCH VALVE AND PLUGS	

13. Remove the retainer securing the solenoid switch valve (5) from the valve body. Remove the solenoid switch valve and plugs (5), the manual valve (4) and low reverse shuttle valve and plug (2). Tag each valve and plug combination with location information to aid in assembly.

CLEANING

CLEANING

Fig. 216: Exploded View Of Upper Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1 - LOW/REVERSE ACCUMULATOR	6 - OVERDRIVE ACCUMULATOR
2 - LOW/REVERSE SHUTTLE VALVE AND PLUG	7 - UNDERDRIVE ACCUMULATOR

3 - UPPER VALVE BODY	8 - 4C ACCUMULATOR
4 - MANUAL VALVE	9 - 2C ACCUMULATOR
5 - SOLENOID SWITCH VALVE AND PLUGS	

Clean the valve housings, valves, plugs, springs, transfer plate and separator plate with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the electrical components by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

INSPECTION

INSPECTION

Fig. 217: Exploded View Of Upper Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1 - LOW/REVERSE ACCUMULATOR	6 - OVERDRIVE ACCUMULATOR
2 - LOW/REVERSE SHUTTLE VALVE AND PLUG	7 - UNDERDRIVE ACCUMULATOR
3 - UPPER VALVE BODY	8 - 4C ACCUMULATOR
4 - MANUAL VALVE	9 - 2C ACCUMULATOR

NOTE: **Only the INNER accumulator seal ring actually seals the pressure in the bore. The outer seal ring only serves to guide the piston in the bore. Gouges which do not extend past the inner seal ring (and have no raised edges, which could damage the guide ring) are acceptable. The machined accumulator bores often have a tiger-striped appearance. This is NORMAL and does NOT require replacement, as long as the bores are smooth in the inner seal ring area.**

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not normally change dimensionally with use. If the valve body functioned correctly when new, it should continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

Inspect all the accumulator bores in the valve body as well as the accumulator piston seal rings, and replace if cut or damaged. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the accumulator springs. The springs must be free of distortion, warpage or broken coils.

Fig. 218: Valve Body Seals
Courtesy of CHRYSLER GROUP, LLC

1 - UNDERDRIVE ACCUMULATOR (2 SPRINGS)
2 - 4TH CLUTCH ACCUMULATOR (2 SPRINGS)
3 - 2ND CLUTCH ACCUMULATOR (2 SPRINGS)
4 - LOW REVERSE ACCUMULATOR (2 SPRINGS)
5 - LOW/REVERSE PASSAGE SEAL
6 - 2ND CLUTCH PASSAGE SEAL
7 - 4TH CLUTCH PASSAGE SEAL
8 - OVERDRIVE ACCUMULATOR (1 SPRING)

Inspect all the fluid seals on the valve body. Refer to **Fig. 218**. Replace any seals that are cracked, distorted, or damaged in any way. These seals pass fluid pressure directly to the clutches. Any pressure leak at these points, may cause transmission performance problems.

ASSEMBLY

ASSEMBLY

Fig. 219: Exploded View Of Upper Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1 - LOW/REVERSE ACCUMULATOR	6 - OVERDRIVE ACCUMULATOR
2 - LOW/REVERSE SHUTTLE VALVE AND PLUG	7 - UNDERDRIVE ACCUMULATOR
3 - UPPER VALVE BODY	8 - 4C ACCUMULATOR
4 - MANUAL VALVE	9 - 2C ACCUMULATOR
5 - SOLENOID SWITCH VALVE AND PLUGS	

1. Lubricate valves, plugs and the housing valve bores with clean transmission fluid.
2. Install solenoid switch valve and plugs and plugs (5) and the retainer into the valve body.

Fig. 220: Check Ball Locations

Courtesy of CHRYSLER GROUP, LLC

3. Install the valve body check balls into their proper locations.
4. Position the separator and transfer plate onto the valve body.
5. Install the screws to hold the transfer plate to the valve body. Tighten the screws to 6 N.m (50 in. lbs.).

Fig. 221: Exploded View Of Upper Valve Body Components

1 - LOW/REVERSE ACCUMULATOR	6 - OVERDRIVE ACCUMULATOR
2 - LOW/REVERSE SHUTTLE VALVE AND PLUG	7 - UNDERDRIVE ACCUMULATOR
3 - UPPER VALVE BODY	8 - 4C ACCUMULATOR
4 - MANUAL VALVE	9 - 2C ACCUMULATOR
5 - SOLENOID SWITCH VALVE AND PLUGS	

6. Install the accumulator piston seal rings onto each accumulator piston.
7. Install the accumulator pistons (1, 6-9) and springs into the valve body in the location from which they were removed. Note that all accumulators except the overdrive have two springs. The overdrive accumulator piston (6) has only one spring.
8. Install the Low / Reverse shuttle valve, plug, and retainer (2) into the valve body housing.
9. Position the accumulator cover onto the valve body.

10. Install the screws to hold the accumulator cover onto the valve body. Tighten the screws to 7 N.m (60 in. lbs.).
11. Install the manual valve (4).

Fig. 222: Identifying TRS Selector Plate, Detent Spring & Passage Seals
Courtesy of CHRYSLER GROUP, LLC

1 - TRS SELECTOR PLATE
2 - DETENT SPRING
3 - CLUTCH PASSAGE SEALS

12. Install the TRS selector plate (1) onto the valve body and the manual valve.
13. Position the detent spring (2) onto the valve body.
14. Install the screw to hold the detent spring (2) onto the valve body. Tighten the screw to 4.5 N.m (40 in. lbs.).
15. Install new clutch passage seals (3) onto the valve body, if necessary.

Fig. 223: Solenoid Pack Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - SOLENOID PACK BOLTS (15)

16. Install the solenoid and pressure switch assembly onto the valve body.
17. Install the bolts (1) to hold the solenoid and pressure switch assembly onto the valve body. Tighten the bolts to 6 N.m (50 in. lbs.). Tighten the bolts adjacent to the arrows cast into the bottom of the transfer plate first.

INSTALLATION

INSTALLATION

Fig. 224: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE BODY TO CASE BOLT (6)

1. Place TRS selector plate in the PARK position.
2. Place the transmission in the PARK position.
3. Lubricate seal on the solenoid and pressure switch assembly connector with petroleum jelly.
4. Position valve body in transmission and align the manual lever on the valve body to the pin on the transmission manual shift lever.
5. Seat valve body in case and install one or two bolts to hold valve body in place.
6. Tighten valve body bolts alternately and evenly to 12 N.m (105 in. lbs.) torque.
7. Operate the external manual shift lever and ensure that the TRS selector plate moves correctly into all gear range positions.

Fig. 225: Primary Oil Filter & Oil Cooler Return Filter
Courtesy of CHRYSLER GROUP, LLC

1 - PRIMARY OIL FILTER
2 - COOLER RETURN FILTER
3 - COOLER RETURN FILTER BYPASS VALVE
4 - VALVE BODY

CAUTION: The primary oil filter seal MUST be fully installed flush against the oil pump body. DO NOT install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.

8. Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.
9. Place replacement filter (1) in position on valve body and into the oil pump.
10. Install screw to hold filter to valve body. Tighten screw to 4.5 N.m (40 in. lbs.) torque.
11. Connect the solenoid and pressure switch 23 pin electrical assembly connector.
12. Install oil pan using silicone gasket sealer. Tighten pan bolts to 12 N.m (105 in. lbs.) torque.
13. Lower vehicle and fill transmission with Mopar® ATF +4.
14. Check and adjust gearshift cable, if necessary.

VALVE, SOLENOID SWITCH

DESCRIPTION

DESCRIPTION

The Solenoid Switch Valve (SSV) is located in the main valve body and directs the output from the L/R-TCC solenoid to either the L/R clutch or the TCC control valves

OPERATION

OPERATION

The Solenoid Switch Valve directs the output pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In all other gears, the solenoid switch valve will be in the upshifted position and directs the fluid to the torque converter clutch (TCC) switch valve and TCC regulator valve.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

DESCRIPTION

DESCRIPTION

The Orion 68RFE automatic transmissions is a sophisticated, multi-range, electronically controlled transmission which combines optimized gear ratios for responsive performance, state of the art efficiency features and low NVH. Other features include driver adaptive shifting and three planetary gear sets to provide wide ratio capability with precise ratio steps for optimum driveability.

The hydraulic portion of the transmission consists of the transmission fluid, fluid passages, hydraulic valves, and various line pressure control components.

The primary mechanical components of the transmission consist of the following:

- Larger bell housing with a different bolt pattern and a cutout to accommodate diesel applications.
- Three multiple disc input clutches
- Three multiple disc holding clutches
- Five hydraulic accumulators
- Three planetary gear sets
- Dual Stage Hydraulic oil pump
- Valve body
- Solenoid pack

The Transmission Control Module (TCM) is the "heart" or "brain" of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. Depending on the vehicle configuration, the TCM may be a standalone module or it may be housed along with the Powertrain Control Module (PCM) in a single module. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

TRANSMISSION IDENTIFICATION

Fig. 1: Transmission Identification Numbers
Courtesy of CHRYSLER GROUP, LLC

1 - IDENTIFICATION NUMBERS (STAMPED)

Transmission identification numbers are stamped (1) on the left side of the case just above the oil pan sealing surface. Refer to this information when ordering replacement parts. A label is attached to the transmission case above the stamped numbers. The label gives additional information which may also be necessary for identification purposes.

GEAR RATIOS

The 68RFE gear ratios are:

1st

3.23:1

2nd

1.83:1

3rd

1.41:1

4th

1.00:1

5th

0.81:1

6th

0.62:1

Reverse

4.44:1

OPERATION

OPERATION

The 68RFE offers full electronic control of all automatic up and downshifts, and features real-time adaptive closed-loop shift and pressure control. Electronic shift and torque converter clutch controls help protect the transmission from damage due to high temperatures, which can occur under severe operating conditions. By altering shift schedules, line pressure, and converter clutch control, these controls reduce heat generation and increase transmission cooling.

To help reduce efficiency-robbing parasitic losses, the transmissions includes a dual-stage transmission fluid pump with electronic output pressure control. Under most driving conditions, pump output capacity greatly exceeds that which is needed to keep the clutches applied. The 68RFE pump-pressure control system monitors input torque and adjusts the pump pressure accordingly. The primary stage of the pump works continuously; the second stage is bypassed when demand is low. The control system also monitors input and output speed and, if incipient clutch slip is observed, the pressure control solenoid duty cycle is varied, increasing pressure in proportion to demand.

A high-travel torque converter damper assembly allows earlier torque converter clutch engagement to reduce slippage. Needle-type thrust bearings reduce internal friction. The 68RFE is packaged in a one-piece die-cast aluminum case. To reduce NVH, the case has high lateral, vertical and torsional stiffness. Dual filters protect the pump and other components. A cooler return filter is added to the customary main sump filter. Independent lubrication and cooler circuits assure ample pressure for normal transmission operation even if the cooler is obstructed or the fluid cannot flow due to extremely low temperatures.

NOTE: Vehicles such as the DH, D1 equipped with ERS (Electronic Range Select) do not provide 2nd gear in limp-in, because the shift lever has no "2" or "1" position.

The hydraulic control system design (without electronic assist) provides the transmission with PARK, REVERSE, NEUTRAL, and FOURTH gears, based solely on driver shift lever selection. This design allows the vehicle to be driven (in "limp-in" mode) in the event of a electronic control system failure, or a situation that the Transmission Control Module (TCM) recognizes as potentially damaging to the transmission.

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the scan tool.

DIAGNOSIS AND TESTING

AUTOMATIC TRANSMISSION

NOTE: Before attempting any repair on a automatic transmission, check for Diagnostic Trouble Codes with the scan tool.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary. If the problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

FLUID LEAKAGE

TRANSMISSION OIL LEAK

Begin with a thorough inspection of the transmission, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Clean or degrease the transmission with a water soluble solvent only.
2. Add an oil soluble dye (use as recommended by manufacturer) while the powertrain is at ambient temperature. Start the engine and let idle for approximately 15 minutes. Check the oil dip stick (if equipped) to make sure the dye is thoroughly mixed as indicated with a fluorescent color under a black light.
3. Using a black light, inspect the entire transmission for fluorescent dye, practically at the suspected area of oil leak. If the oil leak is found and identified, repair per service information instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles) and repeat inspection.

TORQUE CONVERTER HOUSING AREA

Fig. 2: Torque Converter Housing Leak Paths
Courtesy of CHRYSLER GROUP, LLC

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

When diagnosing converter housing (5) fluid leaks, three actions must be taken before repair:

1. Verify proper transmission fluid level.
2. Verify that the leak originates from the converter housing area and is transmission fluid.
3. Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (7). Refer to **Fig. 2**. The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

The 68RFE uses a one piece pump cover which includes the impeller hub seal. Leaks at the pump cover o-ring or the impeller hub seal usually travel down the inside of the converter housing.

TORQUE CONVERTER LEAKAGE

Fig. 3: Torque Converter Leak Points
Courtesy of CHRYSLER GROUP, LLC

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD
3 - STARTER RING GEAR
4 - LUG

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (1).
- Torque converter hub weld (2).

PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

1. Record all DTCs and the accompanying DTC Event Data.
2. Check for an appropriate Technical Service Bulletin that applies to the customer complaint.
3. Check fluid level and condition.
4. Road test and note how transmission upshifts, downshifts, and engages.
5. If the complaint was related to shift quality, perform the Quick Learn procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** .
6. If the shift complaint still exists, compare actual line pressure (sensor reading, using the scan tool) to the Desired Line Pressure reading, in Park, Drive, and Reverse at 1500 RPM. Check that the LP sensor reads 30 psi (the minimum it should ever display) with key on / engine off.
7. Follow the diagnosis procedure for any DTC's that exist.

VEHICLE IS DISABLED

1. Record all DTCs and the accompanying DTC Event Data.

2. Compare actual line pressure (sensor reading, using the scan tool) to the Desired Line Pressure reading, in Park, Drive, and Reverse at 1500 RPM. Check that the LP sensor reads 30 psi (the minimum it should ever display) with key on / engine off. If line pressure is incorrect, check fluid level and condition.
3. With engine running, place transmission in gear and verify correct PRNDL reading. Observe the Input and Output speeds using the scan tool. If output RPM is greater than zero but vehicle does not move, check for transfer case in Neutral (or failed internally), failed propshaft, or failed / disconnected drive axle. If output RPM is zero and input RPM is greater than zero, internal transmission slippage is indicated. Run clutch slip tests using the scan tool, check oil pan for debris, and air check the various clutch circuits.
4. Shift the transmission into neutral, if both input and output speeds are zero, check flexplate bolts, torque converter, and transmission input shaft.
5. Remove, inspect, and repair the transmission as necessary

ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application charts provide a basis for analyzing road test results.

68RFE CLUTCH APPLICATION CHART

GEAR RANGE	UD	OD	R	2C	4C	L/R	OVERRUNNING
P-PARK						ON	
R-REVERSE			ON			ON	
N-NEUTRAL						ON	
D-FIRST	ON					ON*	ON
D-SECOND	ON			ON			
D-THIRD (SECOND PRIME)	ON				ON		
D-FOURTH	ON	ON					
D-FIFTH		ON			ON		
D-SIXTH		ON		ON			
D-LIMP-IN (FULL)	ON	ON					
*L/R clutch is on only with the output shaft speed below 150 rpm.							

HYDRAULIC PRESSURE TEST

An accurate tachometer and pressure test gauges are required. Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.) has a 300 psi range and is used at all locations where pressures exceed 100 psi.

PRESSURE TEST PORT LOCATIONS

Fig. 4: Pressure Test Port Locations
Courtesy of CHRYSLER GROUP, LLC

1 - TCC RELEASE
2 - TO COOLER
3 - TCC APPLY
4 - FROM COOLER
5 - LINE PRESSURE SENSOR

Only two pressure ports are supplied on the transmission case. The torque converter clutch apply (3) and release (1) ports are located on the right side of the transmission case. Refer to **Fig. 4**.

Fig. 5: Line Pressure Adapter 8259
Courtesy of CHRYSLER GROUP, LLC

1 - LINE PRESSURE SENSOR PORT
2 - LINE PRESSURE SENSOR
3 - TOOL 8259
4 - PRESSURE TAP

To determine the line pressure, there are two available methods. The scan tool can be used to read line pressure from the line pressure sensor. The second method is to install Line Pressure Adapter (special tool #8259, Adapter, Pressure Test) (3) into the transmission case and then install the pressure gauge and the original sensor (2) into the adapter. Refer to **Fig. 5**. This will allow a comparison of the scan tool readings and the gauge reading to determine the accuracy of the line pressure sensor. The scan tool line pressure reading should match the gauge reading within ±10 psi.

TEST PROCEDURE

All pressure readings should be taken with the transmission fluid level full, transmission oil at the normal operating temperature, and the engine at 1500 rpm. Check the transmission for proper operation in each gear position that is in question or if a specific element is in question, check the pressure readings in at least two gear positions that employ that element. Refer to **SCHEMATICS AND DIAGRAMS** to determine the correct pressures for each element in a given gear position.

NOTE: **The 68RFE utilizes closed loop control of pump line pressure. The pressure readings may therefore vary greatly but should always follow line the desired pressure.**

Some common pressures that can be measured to evaluate pump and clutch performance are the upshift/downshift pressures, garage shift pressures, and TCC pressure. For the upshift/downshift pressure for all shifts, refer to **UPSHIFT PRESSURES** and **DOWNSHIFT PRESSURES**. For in-gear maximum pressure for each gear position, refer to **IN-GEAR PRESSURES**.

UPSHIFT PRESSURES

545RFE								
ENGINE	**1-2**	**2-3**	**2prime-3**	**3-4**	**2prime-4**	**2-5**	**3-5**	**4-5**

ENGINE	**1-2**	**2-3**	**3-4**	**4-5**	**5-6**	**2-4**	**3-5**	**4-6**
6.7L	160	150	150	160	160	150	150	160

DOWNSHIFT PRESSURES

545RFE										
ENGINE	**5-4**	**5-3**		**5-2**	**4-3**	**4-2prime**	**3-2**	**3-2prime**	**2prime-1**	**2-1**
5.7L	135	135		135	135	135	135	135	135	135
68RFE										
ENGINE	**6-5**	**6-4**	**5-4**	**5-3**	**4-3**	**4-2**	**3-2**	**3-1**	**2-1**	-
6.7L	150	150	150	160	150	160	150	160	160	-

IN-GEAR PRESSURES

545RFE								
ENGINE	**1**	**2**	**2prime**	**3**	**4**	**5**	**NEUTRAL**	**REVERSE**
5.7L	160	135	135	135	135	135	120	250
68RFE								
ENGINE	**1**	**2**	**3**	**4**	**5**	**6**	**NEUTRAL**	**REVERSE**
6.7L	160	150	150	160	160	160	125	250

Actual line-pressure while in-gear will vary based upon minimum learned line-pressure. Minimum line-pressure starts at 40 psi and learns up to the minimum pressure to hold the clutches in an applied state.

AIR CHECKING TRANSMISSION CLUTCH OPERATION

Fig. 6: Air Pressure Test Passages
Courtesy of CHRYSLER GROUP, LLC

1 - LOW REVERSE CLUTCH
2 - 4C CLUTCH
3 - 2C CLUTCH
4 - OVERDRIVE CLUTCH
5 - UNDERDRIVE CLUTCH
6 - REVERSE CLUTCH

NOTE: **Each clutch includes a small bleed orifice, so minimal air leakage is normal and expected.**

Air-pressure testing can be used to check transmission clutch operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The clutch apply passages are shown in the Air Pressure Test Passages graphic. Refer to **Fig. 6**.

NOTE: **The air supply which is used must be free of moisture and dirt. Use a pressure of 30 psi to test clutch operation.**

Apply air pressure at each port. If the clutch is functioning, a soft thump will be heard as the clutch is applied. The clutch application can also be felt by touching the appropriate element while applying air pressure. As the air pressure is released, the clutch should also release.

CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

1. Verify that a leak condition actually exists.
2. Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Torque converter seal leaks tend to move along the drive hub and onto the rear of the converter. Pump cover seal leaks tend to run down the cover and the inside surface of the bellhousing.

Some leaks, or suspected leaks, may be particularly difficult to locate. If necessary, a Mopar® approved dye should be used to locate and confirm a leak.

TORQUE CONVERTER LEAK POINTS

Fig. 7: Cutaway View Of Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE ASSEMBLY	5 - IMPELLER ASSEMBLY
2 - STATOR	6 - CONVERTER CLUTCH PISTON
3 - CONVERTER HUB	7 - TURBINE HUB
4 - O-RING	

Possible sources of converter leaks are:

1. Leaks at the weld joint around the outside diameter weld. Refer to **Fig. 7**.
2. Leaks at the converter hub weld. Refer to **Fig. 7**.

In most cases, a torque converter which is wet from transmission fluid indicates a leak at one of these areas.

STANDARD PROCEDURE

STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

DRIVE LEARN - RFE TRANSMISSIONS

When a transmission is repaired and a Quick Learn procedure has been performed on the Transmission Control Module (TCM), the following Drive Learn procedure can be performed to fine tune any shifts which are particularly objectionable.

NOTE: It is not necessary to perform the complete Drive Learn procedure every time the TCM is Quick Learned. Perform only the portions which target the objectionable shift.

LEARN A SMOOTH 1ST NEUTRAL TO DRIVE SHIFT

Perform this procedure only if the complaint is for a delayed or harsh shift the first time the transmission is put into gear after the vehicle is allowed to set with the engine not running for at least 10 minutes. Use the following steps to have the TCM learn the 1st N-D UD CVI.

NOTE: The transmission oil temperature must be between 80 - 110°F (27 - 43°C).

1. Start the engine only when the engine and ignition have been off for at least ten (10) minutes.
2. With the vehicle at a stop and the service brake applied, record the 1st N-D UD CVI while performing a Neutral to Drive shift. The 1st N-D UD CVI accounts for air entrapment in the UD clutch that may occur after the engine has been off for a period of time.
3. Repeat until the recorded 1st N-D UD CVI value stabilizes. Refer to 1 and 2.

NOTE: It is important that this procedure be performed when the transmission temperature is between 80 - 110°F (27 - 43°C). If this procedure takes too long to complete fully for the allowed transmission oil temperature, the vehicle may be returned to the customer with an explanation that the shift will improve daily during normal vehicle usage. The TCM also learns at higher oil temperatures, but these values (line pressure correction values) are not available for viewing on the scan tool.

LEARN A SMOOTH NEUTRAL TO DRIVE GARAGE SHIFT

Perform this procedure if the complaint is for a delayed or harsh shift when the transmission is put into gear after the vehicle has had its first shift. Use the following steps to have the TCM learn the Norm N-D UD CVI.

NOTE: **The transmission oil temperature must be between 80 - 110°F (27 - 43°C) to learn the UD CVI. Additional learning occurs at temperatures as low as 0°F and as high as 200°F. This procedure may be performed at any temperature that experiences poor shift quality. Although the UD CVI may not change, shift quality should improve.**

1. Start the vehicle engine and shift to drive.
2. Move the vehicle forward to a speed of at least 16 km/h (10 MPH) and come to a stop. This ensures no air is present in the UD hydraulic circuit.
3. Perform repeated N-D shifts at a stop while pausing in Neutral for at least 2-3 seconds and monitor Norm N-D UD CVI volume until the value stabilizes. The value will change during the N-D shift. This is normal since the UD value is different for the N-D shift then the normal value shown which is used for 4-3 coastdown and kickdowns. Perform repeated shifts in this temperature range until the Norm N-D UD CVI value stabilizes and the N-D shifts become smooth.

LEARN THE 1ST 2-3 SHIFT AFTER A RESTART OR SHIFT TO REVERSE

Use the following steps to have the TCM learn the 1st 2-3 shift OD CVI.

NOTE: **The transmission oil temperature must be above 80°F (27°C).**

1. With the vehicle engine running, select reverse gear for over 2 seconds.
2. Shift the transmission to Drive and accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform a 2-3 shift while noting the 1st 2-3 OD CVI.
3. Repeat until the 1st 2-3 upshift becomes smooth and the 1st 2-3 OD CVI stabilizes. Refer to 1 and 2.

LEARN A SMOOTH 2-3 AND 3-4 UPSHIFT

NOTE: **The transmission oil temperature must be above 110°F (43°C).**

Use the following steps to have the TCM learn the OD and 4C CVI's.

1. Accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform multiple 1-2, 2-3, and 3-4 upshifts. The 2nd 2-3 shift following a restart or shift to reverse will be shown during the shift as a value between the 1st 2-3 OD CVI and the normal OD CVI. Updates to the normal OD CVI will occur after the 2nd shift into 3rd gear, following a restart or shift to reverse.
2. Repeat until the 2-3 and 3-4 shifts become smooth and the OD and 4C CVI become stable. Refer to 1.

LEARN A SMOOTH 4-3 COASTDOWN AND PART THROTTLE 4-3 KICKDOWN

NOTE: **The transmission oil temperature must be above 110°F (43°C).**

Use the following steps to have the TCM learn the UD shift volume.

1. At a vehicle speed between 64-97 km/h (40-60 MPH), perform repeated 4-3 kickdown shifts.

2. Repeat until the UD volume becomes somewhat stable and the shift becomes smooth. Refer to 1.

LEARN A SMOOTH 1-2 UPSHIFT AND 3-2 KICKDOWN

Use the following steps to have the TCM learn the 2C shift volume.

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With a vehicle speed below 48 km/h (30 MPH) and the transmission in 3rd gear, perform multiple 3-2 kickdowns.
2. Repeat until the 3-2 kickdowns become smooth and the 2C CVI becomes stable. Refer to 1.

LEARN A SMOOTH MANUAL 2-1 PULLDOWN SHIFT AS WELL AS A NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the LR volume.

1. With the vehicle speed around 40-48 km/h (25-30 MPH) in Manual 2nd, perform manual pulldowns to Low or 1st gear at closed throttle.
2. Repeat until the LR CVI becomes stable and the manual 2-1 becomes smooth. Refer to 1.

LEARN A SMOOTH NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With the vehicle at a stop, perform Neutral to Reverse shifts until the shift is smooth. An unlearned Neutral to Reverse shift may be harsh or exhibit a double bump.
2. If any of the shifts are still not smooth after the clutch volume stabilizes, an internal transmission problem may be present.

LEARN A SMOOTH 4-5 UPSHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the Alt 2C CVI.

1. Accelerate the vehicle through 88 km/h (55mph) at a steady 10-15 degree throttle opening and perform multiple 4-5 upshifts.
2. Repeat until the 4-5 shift become smooth and the Alt 2C CVI become stable. Refer to 1. There is a separate 2C volume used and learned for 4-5 shifts, 2CA. It is independent of the 2C CVI learned on 3-2 kickdowns.

TCM QUICK LEARN - RLE AND RFE TRANSMISSIONS

The quick learn procedure requires the use of the scan tool.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement.
- Transmission Control Module Replacement.
- Solenoid Pack Replacement.
- Clutch Plate and/or Seal Replacement.
- Valve Body Replacement or Recondition.

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied.
- The engine speed must be above 500 rpm.
- The throttle angle (TPS) must be less than 3 degrees.
- The shift lever position must stay in PARK until prompted to shift to overdrive.
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the scan tool indicates the procedure is complete.
- The calculated oil temperature must be above 60° and below 200°.

SPECIFICATIONS

SPECIFICATIONS

REMOVAL

REMOVAL

Fig. 26: Dust Shield
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Raise and support the vehicle
3. Remove any necessary skid plates. Refer to **PLATE, SKID, FRONT, REMOVAL** or **PLATE, SKID, TRANSFER CASE, REMOVAL** .

NOTE: Mark propeller shaft and axle companion flanges for assembly alignment.

4. Remove the rear propeller shaft
5. Remove the front propeller shaft, if necessary.
6. Remove the exhaust support bracket from the front and rear of the transmission (if equipped).
7. Disconnect and lower or remove any necessary exhaust components.
8. Remove the bolts securing the power bending bracket to the engine block and the transmission case.
9. Remove the power bending bracket.
10. Loosen the inspection cover bolts and remove the inspection cover.
11. Remove the transmission dust shield (1).

Fig. 27: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Rotate the fly wheel and remove the torque converter bolts one at a time.

Fig. 28: Output Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - BOLT

18. Disconnect electrical connector from the differential pressure sensor.
19. Remove bolt (1) securing differential pressure sensor to the transmission case and position differential pressure sensor aside.

Fig. 34: 68RFE Fill Tube, Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

1 - FILL TUBE BOLT
2 - FILL TUBE NUT

Remove the bolt (1) securing the fill tube at the transmission (if equipped).

20. Disconnect the cooler lines from the transmission using cooler line disconnect tool (special tool #9546, Disconnect Tool).

Fig. 35: Engine & Transmission
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE
2 - TRANSMISSION

21. Disconnect the transmission vent hose from the transmission.
22. Support rear of engine with safety stand or jack.
23. Raise transmission slightly with service jack to relieve load on crossmember and supports.
24. Remove bolts securing rear support and cushion to transmission and crossmember.
25. Remove transfer case, if necessary.
26. Remove all remaining converter housing bolts.
27. Carefully work transmission and torque converter assembly rearward off engine block dowels while removing the fill tube from the fill tube bore.
28. Hold torque converter in place during transmission removal.
29. Lower transmission (2) and remove assembly from under the vehicle.
30. To remove torque converter, carefully slide torque converter out of the transmission.

DISASSEMBLY

DISASSEMBLY

CAUTION: Tag all snap rings, thrust washers, washers, spacers and thrust bearings, etc. during disassembly for quick identification and assembly. Failure to follow these instructions will damage and cause transmission failure.

Fig. 36: Manual Shift Lever
Courtesy of CHRYSLER GROUP, LLC

1 - MANUAL SHAFT LEVER

1. Drain fluid from transmission.
2. Clean exterior of transmission with suitable solvent or pressure washer.
3. Remove the torque converter from the transmission.
4. Remove the manual shift lever (1) from the transmission.

Fig. 37: Input, Output & Line Pressure Sensors
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SPEED SENSOR
2 - LINE PRESSURE SENSOR
3 - INPUT SPEED SENSOR

5. Remove the input (3), output (1), and line pressure sensors (2) from the transmission case.
6. Inspect the ends of the sensors for debris, which may indicate the nature of the transmission failure.

Fig. 38: Installing Support Stand 8257
Courtesy of CHRYSLER GROUP, LLC

1 - TOOL 8257

7. Install Support Stand (special tool #8257, Support, Transmission) (1) onto the transmission case.

Fig. 39: Measuring Input Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - TOOL 8266 -17
2 - TOOL C-3339A

8. Using Adapter (special tool #8266-17, Spline Tool, RFE Output) from End-Play Tool Set (special tool #8266B, End Play Socket Set) (1) and Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (2),

measure and record the input shaft end-play.

NOTE: **When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.**

NOTE: **Adapter (special tool #8266-17, Spline Tool, RFE Output) will fit loosely onto the input shaft, this should not effect the performance of the adapter.**

Fig. 40: Measuring Output Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - TOOL 10065
2 - TOOL 8266-20
3 - TOOL C-3339A

9. Remove the bolts holding the transmission extension/adapter housing to the transmission case.
10. Remove the extension/adapter housing from the transmission case.
11. Using Alignment Plate (special tool #10065, Plate, Alignment), Output Shaft Endplay Socket (special tool #8266-20, Spline Tool, AS68RC Output), handle from End-Play Tool Set (special tool #8266B, End Play Socket Set) (2) and Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (3), measure and record the output shaft end-play.

Fig. 41: Primary Oil & Cooler Return Filters
Courtesy of CHRYSLER GROUP, LLC

1 - PRIMARY OIL FILTER
2 - COOLER RETURN FILTER
3 - COOLER RETURN FILTER BYPASS VALVE
4 - VALVE BODY

12. Remove the bolts holding the transmission oil pan to the transmission case.
13. Remove the transmission oil pan from the transmission case.
14. Remove the primary oil filter (1) and the oil cooler return filter (2).

Fig. 42: Valve Body Bolts

Courtesy of CHRYSLER GROUP, LLC

1 - VALVE BODY TO CASE BOLT (6)

15. Remove the bolts (1) holding the valve body to the transmission case.
16. Remove the valve body from the transmission case.

Fig. 43: Front Cover
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT COVER
2 - O - RING
3 - SNAP RING
4 - FRONT COVER SEAL

17. Remove the outer snap-ring (3) securing the transmission front cover (1) into the transmission case.
18. Reaching through a case opening in the valve body area with a long blunted tool, remove the transmission front cover (1) from the transmission case.

Fig. 44: Oil Pump & Bolt
Courtesy of CHRYSLER GROUP, LLC

1 - OIL PUMP TO CASE BOLT (6)
2 - OIL PUMP

19. Remove the bolts (1) holding the oil pump into the transmission case.
20. Remove the oil pump (2). Hold inward on the input shaft to prevent pulling the input clutch assembly with the oil pump.

CAUTION: If the input shaft is not held during oil pump removal, the input clutch assembly will attempt to move forward with the oil pump and the numbers 2, 3, or 4 bearings inside the input clutch assembly may become dislodged.

1 - GUIDE
2 - SNAP-RING
3 - SHAFT
4 - SPRING
5 - PARK PAWL
6 - MANUAL SHAFT/LEVER
7 - PARK ROD

41. Remove the park rod (7) and e-clip.
42. Remove the park rod guide snap-ring (2).
43. Remove the park rod guide (1).
44. Remove the park pawl pivot shaft (3), park pawl (5), and spring (4).
45. Remove the manual selector shaft (6).
46. Remove the manual selector shaft seal.
47. Remove the dipstick tube seal.

CLEANING

CLEANING

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF +4, Automatic Transmission Fluid, during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: **Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

INSPECTION

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

ASSEMBLY

NOTE: **Apply trans jell or petroleum jelly to all slide portions, rolling contacts surfaces, thrust surfaces etc. to prevent burnout during initial operation. Lubricate O-rings and O-ring seals with MOPAR® ATF+4. Soak all friction disks in MOPAR® ATF+4 for at least two hours before assembly of clutch packs.**

NOTE: **Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.**

NOTE: **If the transmission assembly is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .**

Fig. 56: Installing Selector Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

1 - SEAL
2 - TOOL 8253

1. Install a new selector shaft seal (1) using Seal Installer (special tool #8253, Installer, Seal) (2).

Fig. 57: Manual Shift Lever
Courtesy of CHRYSLER GROUP, LLC

1 - MANUAL SHAFT LEVER

2. Install the manual selector shaft and retaining screw. Tighten the manual selector shaft retaining screw to 28 N.m (250 in.lbs.).
3. Install the manual shift lever (1) onto the manual selector shaft. Torque the retaining cross-bolt to 16 N.m (140 in.lbs.).

Fig. 60: Thrust Bearing Orientation
Courtesy of CHRYSLER GROUP, LLC

1 - CORRECT INSTALLATION
2 - INCORRECT INSTALLATION

CAUTION: A thrust bearing must be installed correctly or transmission failure may occur.

When installing a thrust bearing be certain the rolled surface (outer race) of the thrust bearing contacts the rolled surface of the component.

NOTE: The 68RFE transmission does not use a number 7 thrust bearing.

Fig. 61: 68RFE Bearing Orientation

1 - SNAP-RING
2 - PLATE
3 - DISC
4 - REACTION PLATE

NOTE: **Before final assembly of transmission centerline, the 2C/4C clutch components should be installed into position and measured as follows:**

8. Install the 2C reaction plate (4) with the beveled edge down (rearward) into the transmission case.
9. Install the 2C clutch pack (2, 3) into the transmission case.
10. Install the flat 2C clutch snap-ring (1) into the transmission case.

Fig. 64: 4C Clutch Retainer/Bulkhead & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

1 - SNAP-RING
2 - 2C/4C CLUTCH RETAINER/BULKHEAD

11. Install the 4C retainer/bulkhead (2) into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area.
12. Install the 4C retainer/bulkhead tapered snap-ring (1) into the transmission case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.
13. Using a feeler gauge through the opening in the rear of the transmission case, measure the 2C clutch pack clearance between the 2C reaction plate and the transmission case at four different points. The average of these measurements is the 2C clutch pack clearance. The correct clutch clearance is 0.99-1.65 mm (0.039-0.065 in.). The reaction plate is not selective. If the clutch pack clearance is not within specification, the reaction plate, all the friction discs, and steels must be replaced.
14. Remove the 4C retainer/bulkhead and all of the 2C clutch components from the transmission case.

Fig. 65: Low/Reverse Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

1 - SNAP-RING
2 - LOW/REVERSE OVERRUNNING CLUTCH ASSEMBLY

15. Install the low/reverse clutch assembly (2). Make sure that the oil feed hole points toward the valve body area and that the bleed orifice is aligned with the notch in the rear of the transmission case.
16. Install the snap-ring (1) to hold the low/reverse clutch retainer into the transmission case. The snap-ring is tapered and must be installed with the tapered side forward. Once installed, verify that the snap-ring is fully seated in the snap-ring groove.
17. Air check the low/reverse clutch and verify correct overrunning clutch operation. Refer to **DIAGNOSIS AND TESTING**.

Fig. 66: Input/Reverse Planetary Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - THRUST BEARING NUMBER 9
2 - INPUT/REVERSE PLANETARY ASSEMBLY
3 - THRUST BEARING NUMBER 12

18. Install the number 12 thrust bearing (3) over the output shaft and against the rear planetary gear set, the black side with the tabs goes towards the ORC. Install the number nine thrust bearing with the silver side against the reverse carrier and the black side facing towards the front of the transmission.
19. Install the number 9 thrust bearing (1), with the silver side against the reverse carrier and the black side facing out.
20. Install the reverse/input planetary assembly (2) through the low/reverse clutch assembly.

Fig. 67: Park Sprag Gear

1 - THRUST BEARING NUMBER 6	5 - REACTION PLANETARY CARRIER
2 - OUTPUT END PLAY THRUST PLATE (SELECTIVE)	6 - THRUST BEARING NUMBER 9
3 - 4C CLUTCH HUB / REACTION SUN GEAR	
4 - THRUST BEARING NUMBER 8	

29. Install the number 6 thrust bearing (1) against the output shaft selective thrust plate (2) with the flat side against the thrust plate and the raised tabs on the inner race facing the front of the transmission.
30. Install the install the 4C clutch / reaction sun gear (3) into the reaction planetary gear set.

Fig. 73: 4C Clutch Retainer/Bulkhead & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

1 - SNAP-RING
2 - 2C/4C CLUTCH RETAINER/BULKHEAD

31. Install the 2C / 4C retainer/bulkhead (2) into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area. Rotate the 4C clutch hub during the installation of the 4C retainer/bulkhead to ease installation.
32. Install the 2C / 4C retainer/bulkhead tapered snap-ring (1) into the transmission case with the taper toward the front of the case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.
33. Air check the 2C and 4C clutch operation. Refer to **DIAGNOSIS AND TESTING**.

Fig. 74: Reaction Annulus & Carrier
Courtesy of CHRYSLER GROUP, LLC

1 - THRUST BEARING NUMBER 6	5 - REACTION PLANETARY CARRIER
2 - OUTPUT END PLAY THRUST PLATE (SELECTIVE)	6 - THRUST BEARING NUMBER 9
3 - 4C CLUTCH HUB / REACTION SUN GEAR	
4 - THRUST BEARING NUMBER 8	

NOTE: **The output shaft end play is adjusted by means of a selectable bearing spacer (2) in front of the 4C clutch hub/reaction sun gear. The selectable bearing spacer thickness is identified by a numeric numeral molded or stamped into the spacer.**

Fig. 75: Measuring Output Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - TOOL 10065
2 - TOOL 8266-20
3 - TOOL C-3339A

34. Using Alignment Plate (special tool #10065, Plate, Alignment), Output Shaft Endplay Socket (special tool #8266-20, Spline Tool, AS68RC Output), handle from End-Play Tool Set (special tool #8266B, End Play Socket Set) (2) and Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (3), measure and record the output shaft end-play. The correct output shaft end-play is 0.25-0.52 mm (0.010-0.020 in.). Adjust as necessary. Install the chosen output shaft selective bearing spacer and re-measure end-play to verify selection.

Output Shaft End Play Selectable Bearing Spacer Thickness

- 09 = 2.18 mm (0.086 in.)
- 10 = 2.33 mm (0.092 in.)
- 11 = 2.48 mm (0.098 in.)
- 12 = 2.63 mm (0.103 in.)
- 13 = 2.78 mm (0.109 in.)
- 14 = 2.69 mm (0.115 in.)
- 43 = 3.08 mm (0.121 in.)
- 16 = 3.23 mm (0.127 in.)
- 17 = 3.38 mm (0.133 in.)
- 18 = 3.53 mm (0.139 in.)
- 19 = 3.68 mm (0.145 in.)

35. Apply a bead of RTV silicone and install the extension/adapter housing onto the transmission case.
36. Install and torque the bolts to hold the extension/adapter housing onto the transmission case. The correct torque is 54 N.m (40 ft.lbs.).

Fig. 76: Input Clutch Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - THRUST BEARING NUMBER 5
2 - THRUST PLATE (SELECT)
3 - INPUT CLUTCH ASSEMBLY
4 - THRUST BEARING NUMBER 1

37. Install the number 5 thrust bearing (1) and selective thrust plate (2) onto the input clutch assembly (3). Be sure that the outer race of the bearing is against the thrust plate.
38. Install the input clutch assembly (3) into the transmission case. Make sure that the input clutch assembly is fully installed by performing a visual inspection through the input speed sensor hole. If the tone wheel teeth on the input clutch assembly are centered in the hole, the assembly is fully installed.
39. Install the number 1 thrust bearing (4) with the outer race up in the pocket of the input clutch assembly.

Fig. 77: Oil Pump & Bolt
Courtesy of CHRYSLER GROUP, LLC

1 - OIL PUMP TO CASE BOLT (6)
2 - OIL PUMP

40. Install the oil pump (2) into the transmission case making certain the oil pump is flush with the transmission case.
41. Install the bolts (1) to hold the oil pump into the transmission case. Tighten the oil pump bolts to 28 N.m (250 in.lbs.).

NOTE: **When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.**

Fig. 78: Measuring Input Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - TOOL 8266 -17
2 - TOOL C-3339A

NOTE: **If NO input shaft end play is noted, disassemble the input clutch assembly and check for the #2, #3, or #4 thrust bearing fallen out of position or cracked. Replace any cracked thrust bearing and reassemble using trans jell or petroleum jelly to retain the thrust bearings. The selectable bearing spacer thickness is identified by a numeric numeral molded or stamped into the spacer.**

NOTE: **Adapter (special tool #8266-17, Spline Tool, RFE Output) will fit loosely onto the input shaft, this should not effect the performance of the adapter.**

42. Using Adapter (special tool #8266-17, Spline Tool, RFE Output) from End-Play Tool Set (special tool #8266B, End Play Socket Set) (1) and Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (2), measure and record the input shaft end-play. The correct end-play is 0.52-0.74 mm (0.020-0.029 in.). Adjust as necessary. Install the chosen selectable bearing spacer on the number 5 thrust bearing and re-measure end-play to verify selection.

Input Shaft End Play Selectable Bearing Spacer Thickness

- 27 = 1.57 mm (0.062 in.)
- 28 = 1.71 mm (0.067 in.)
- 29 = 1.85 mm (0.073 in.)
- 30 = 1.99 mm (0.078 in.)

- 31 = 2.13 mm (0.084 in.)
- 32 = 2.27 mm (0.089 in.)
- 33 = 2.41 mm (0.095 in.)
- 34 = 2.55 mm (0.100 in.)
- 35 = 2.69 mm (0.106 in.)
- 36 = 2.83 mm (0.111 in.)
- 37 = 2.97 mm (0.117 in.)
- 38 = 3.11 mm (0.122 in.)
- 39 = 3.25 mm (0.128 in.)
- 40 = 3.39 mm (0.133 in.)
- 41 = 3.67 mm (0.144 in.)
-

Fig. 79: Front Cover
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT COVER
2 - O - RING
3 - SNAP RING
4 - FRONT COVER SEAL

NOTE: **To avoid contamination and garter spring dislodgement, do not handle the front cover seal when installing the front cover into the transmission case.**

43. Position the new front cover (1) onto transmission case.
44. Using a dead-blow mallet and the front cover installation tool (special tool #9955, Installer, Front Cover), install the front cover into the transmission case.
45. Install the snap ring into the transmission case.

Fig. 80: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE BODY TO CASE BOLT (6)

46. Install the valve body. Verify that the pin on the manual lever has properly engaged the TRS selector plate. Tighten the valve body to transmission case bolts (1) to 12 N.m (105 in.lbs.).

Fig. 81: Primary Oil & Cooler Return Filters
Courtesy of CHRYSLER GROUP, LLC

1 - PRIMARY OIL FILTER
2 - COOLER RETURN FILTER
3 - COOLER RETURN FILTER BYPASS VALVE
4 - VALVE BODY

CAUTION: The primary oil filter seal MUST be fully installed flush against the oil pump body. DO NOT install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.

47. Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.
48. Install the primary oil filter (1) and the oil cooler return filter (2). Tighten the screw to hold the primary oil filter to the valve body to 4.5 N.m (40 in.lbs.). Using Filter Wrench (special tool #8321, Wrench, Oil Filter), tighten the cooler return oil filter to the transmission case to 9.5 N.m (84 in. lbs.).
49. Apply RTV silicone to the oil pan and install the transmission oil pan. Tighten the bolts to 12 N.m (105 in.lbs.).

Fig. 82: Input, Output & Line Pressure Sensors
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SPEED SENSOR
2 - LINE PRESSURE SENSOR
3 - INPUT SPEED SENSOR

50. Install the input (3), output (1), and line pressure sensors (2). Tighten the bolts to 12 N.m (105 in.lbs.).

INSTALLATION

INSTALLATION

Fig. 83: Checking Torque Converter Clearance
Courtesy of CHRYSLER GROUP, LLC

1 - SCALE
2 - STRAIGHTEDGE

1. Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 800/1000 grit paper and crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free of any debris. The hub must be smooth to avoid damaging pump seal at installation.
2. If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.
3. Lubricate oil pump seal lip with transmission fluid.
4. Align converter and oil pump.
5. Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.
6. Check converter seating with steel scale and straightedge. Surface of converter lugs should be in front of the bell housing face about 25 mm, (1 in.).
7. Temporarily secure converter with C-clamp.

Fig. 84: Engine & Transmission
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE
2 - TRANSMISSION

8. Position transmission on jack and secure it with chains.
9. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**
10. Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.
11. Raise transmission (2) and align the torque converter with the drive plate and transmission converter housing with the engine block.
12. Move transmission forward. Then raise, lower or tilt transmission to align the converter housing with engine block dowels while positioning filler tube into the filler tube bore.
13. Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.
14. Install two bolts to attach the transmission to the engine.
15. Install remaining torque converter housing to engine bolts. Tighten to 68 N.m (50 ft.lbs.).
16. Install transfer case, if equipped. Tighten transfer case nuts to 35 N.m (26 ft.lbs.).
17. Install rear support to transmission. Tighten bolts specification. Refer to **TORQUE SPECIFICATIONS** . .
18. Lower transmission onto crossmember and install nuts attaching transmission mount to crossmember. Tighten bolts specification. Refer to **TORQUE SPECIFICATIONS** . .
19. Remove engine support fixture.
20. Install the transmission inspection cover. Tighten the bolts to 10 N.m (88 in. lbs.)
21. Install the power bending bracket.

Fig. 85: Dust Shield
Courtesy of CHRYSLER GROUP, LLC

22. Install the transmission dust shield.

Fig. 86: Gearshift Cable & Transmission Manual Valve Lever

2 - OUTPUT SPEED SENSOR

26. Connect wires to output speed sensor (2).

Fig. 90: Line Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSMISSION
2 - LINE PRESSURE SENSOR

27. Connect wires to line pressure sensor (2). Be sure transmission harnesses are properly routed.

Fig. 91: Differential Pressure Sensor Bolt
Courtesy of CHRYSLER GROUP, LLC

1 - BOLT

28. Install the differential pressure sensor bolt (if equipped). Tighten bolt to 10 N.m (88 in. lbs.).

Fig. 92: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is essential that the correct length bolts are used to attach the converter to the flexplate. Bolts that are too long will damage the clutch surface inside the torque converter.

29. Install torque converter-to-driveplate bolts. Tighten bolts to 88 N.m (65 ft. lbs.).
30. Connect cooler lines to transmission.

Fig. 93: 68RFE Fill Tube, Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

1 - FILL TUBE BOLT
2 - FILL TUBE NUT

31. Install transmission fill tube bolt (1). Tighten bolt to 10 N.m (88 in. lbs.)
32. Install exhaust components, if necessary.
33. Align and connect propeller shaft(s).
34. Adjust gearshift cable if necessary.
35. Install any skid plates removed previously. Refer to **PLATE, SKID, FRONT, INSTALLATION** or **PLATE, SKID, TRANSFER CASE, INSTALLATION** .
36. Lower vehicle.
37. Fill transmission with Mopar® ATF +4, Automatic Transmission Fluid.

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly.

The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

OPERATION

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, third, and fourth (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the input sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in fourth (direct), fifth, and sixth gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the reverse carrier/input annulus assembly.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the reaction sun gear is driven.

1. Remove the reverse reaction plate selective snap-ring (10) from the input clutch retainer.
2. Remove the reverse reaction plate (9) from the input clutch retainer.
3. Remove the reverse hub (7) and reverse clutch pack (8) from the input clutch retainer.
4. Remove the number 4 thrust bearing (5) from the overdrive hub (2).
5. Remove the overdrive hub (2) from the input clutch retainer.
6. Remove the number 3 thrust bearing (1) from the underdrive hub (17).
7. Remove the OD/reverse pressure plate snap-ring (6) from the from the OD/reverse piston.
8. Remove the OD/reverse pressure plate (4), overdrive clutch (13), and UD hub (17) from the input clutch retainer.

9. Remove the number 2 thrust bearing (18) from the input clutch hub.
10. Remove the overdrive clutch wave snap-ring (3) from the from the OD/reverse piston.
11. Remove the UD/OD reaction plate tapered snap-ring (14) from the input clutch retainer.
12. Remove the UD/OD reaction plate (15) from the input clutch retainer.
13. Remove the UD/OD reaction plate flat snap-ring (16) from the input clutch retainer.

16. Remove the UD balance piston (6) and piston return spring (9) from the input clutch retainer (13).
17. Remove the underdrive piston (8) from the input clutch retainer (13).

NOTE: **Both the UD balance piston and the underdrive piston have seals molded onto them. If the seal is damaged, do not attempt to install a new seal onto the piston. The piston/seal must be replaced as an assembly.**

18. Remove the input clutch retainer tapered snap-ring (5).
19. Separate input clutch retainer (13) from input clutch hub (1).
20. Separate OD/reverse piston (15) from input clutch hub retainer (13).

8 - UD PISTON	18 - SEAL RINGS
9 - UD SPRING PACK	19 - INPUT SHAFT
10 - UD INNER DISC	20 - LUBRICATION CHECK VALVE AND SNAP-RING

NOTE: **Install all new seals and o-rings onto the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to install the correct o-ring in the correct location.**

3. Check the transmission lubrication check valve (20) located in the input shaft using shop air. The valve should only allow air flow in one direction. If the valve allows no air flow, or air flow in both directions, the valve will need to be replaced.

4. Lubricate all seals with Mopar® ATF +4, Automatic Transmission Fluid, prior to installation.
5. Assemble the OD/reverse piston (15) onto the input clutch retainer (13).
6. Assemble the input clutch retainer (13) onto the input clutch hub (1).
7. Install the input clutch retainer tapered snap-ring (5) with tapered side up onto the input clutch hub (1).

Fig. 106: Installing Underdrive Piston
Courtesy of CHRYSLER GROUP, LLC

1 - PISTON GUIDES 8504

8. Install Piston Installer (special tool #8504-1, Piston Installer (Outer)) (1) into the input clutch retainer and onto the input clutch hub to guide the inner and outer underdrive piston seals into position.
9. Install the underdrive piston into the input clutch retainer and over the input clutch hub.

2 - UNDERDRIVE CLUTCH PACK	

19. Mount a dial indicator (special tool #C-3339A, Set, Dial Indicator) (1) on the input clutch hub. Push down on the UD clutch discs and zero the indicator against the UD clutch discs. Apply 20 psi of air pressure to the UD clutch and record the dial indicator reading. Measure and record UD clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with UD clutch pack clearance specification. The correct clutch clearance is 1.02-1.72 mm (0.040-0.068 in.). The reaction plate is not selective. If the clutch clearance is not within specification, replace the reaction plate along with all the friction and steel discs.

9 - REVERSE REACTION PLATE	18 - THRUST BEARING NUMBER 2

20. Install the overdrive clutch pack (13) into the input clutch retainer. Install an outer toothed disc (11) first and then alternate inner disc (12) and outer discs, ending with a inner toothed disc (12) on top. Install all discs with the friction material facing up.
21. Install the overdrive clutch wavy snap-ring (3) with the two tabbed ears into the OD/reverse piston.
22. Install the OD/reverse pressure plate (4) into the input clutch retainer, with the stepped face down toward the OD clutch.
23. Install the OD/reverse pressure plate flat snap-ring (6) into the OD/reverse piston.

Fig. 113: Measuring OD Clutch Clearance
Courtesy of CHRYSLER GROUP, LLC

1 - TOOL C-3339
2 - OD/REV REACTION PLATE

24. Mount a dial indicator (special tool #C-3339A, Set, Dial Indicator) (1) on the input clutch hub and zero the indicator against the OD/reverse pressure plate (2). Apply 20 psi of air pressure to the overdrive clutch and record the dial indicator reading. Measure and record OD clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with OD clutch pack clearance specification. Verify that the clutch clearance is 0.75-1.61 mm (0.030-0.063 in.). The OD / Reverse pressure plate is selective. If the clutch clearance is not within specification, select and install the proper pressure plate.

NOTE: The 68RFE uses three (3) selective OD/Rev pressure plates. Two of the

three plates have a numeric identification number and a stepped face.

SELECTABLE END PLAY PRESSURE PLATES

- One stepped face, identification number 1 = 8.90 mm (0.350 in.)
- One stepped face, identification number 2 = 9.34 mm (0.367 in.)
- Both faces flat, no identification number = 9.74 mm (0.383 in.)

Fig. 114: Measuring Reverse Clutch Clearance
Courtesy of CHRYSLER GROUP, LLC

1 - TOOL C-3339
2 - REVERSE CLUTCH PACK

25. Install the reverse clutch pack into the input clutch retainer.
26. Install the reverse reaction plate into the input clutch retainer.
27. Install the reverse reaction plate selective snap-ring into the input clutch retainer.
28. Mount a dial indicator to the assembly, push down on the clutch discs, pull up on the reaction plate to ensure the plate is properly seated and zero the indicator against the reverse clutch discs (2). Apply 20 psi of air pressure to the reverse clutch and record the dial indicator reading. Measure and record Reverse clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with Reverse clutch pack clearance specification. The correct clutch clearance is 0.58-1.47 mm (0.023-0.058 in.). Adjust as necessary. Install the chosen snap-ring and re-measure to verify selection.

NOTE: The 68RFE uses one of three (3) different selective snap rings. They are identified by the end cuts (either straight [square] cut or "butterfly" [S-curved] cut):

SELECTABLE END PLAY SNAP RINGS

- One Square End, One Buttery Fly End = 1.55 mm (0.061 in.)
- Both Ends Square Cut = 1.85 mm (0.073 in)
- Both Ends Buttery Fly Cut = 2.2 mm (0.087 in.)

Fig. 115: Input Clutch Assembly - Part 2

29. Remove the reverse clutch pack (8) from the input clutch retainer.
30. Install the number 2 thrust bearing (18) onto the underdrive hub (17) with outer race against the hub with petroleum jelly.
31. Install the underdrive hub (17) into the input clutch retainer.
32. Install the number 3 thrust bearing (1) into the overdrive hub (2) with the outer race against the hub with petroleum jelly.
33. Install the overdrive hub (2) into the input clutch retainer.
34. Install the number 4 thrust bearing (5) into the reverse hub with outer race against the hub with petroleum jelly.
35. Install the reverse hub (7) into the input clutch retainer.
36. Install the complete reverse clutch pack (8).
37. Install the reverse reaction plate (9) and snap-ring (10).
38. Push up on reaction plate to allow reverse clutch to move freely.

ASSEMBLY, TRANSMISSION SOLENOID AND TRS

DESCRIPTION

DESCRIPTION

Fig. 116: Locating Transmission Solenoid/TRS Assembly, Transmission Range Sensor & Pressure Control Solenoid
Courtesy of CHRYSLER GROUP, LLC

1 - PRESSURE CONTROL SOLENOID
2 - TRANSMISSION RANGE SELECTOR PLATE
3 - 23-WAY CONNECTOR

4 - SOLENOID PACK
5 - TRANSMISSION RANGE SENSOR
6 - VALVE BODY

The transmission solenoid/TRS assembly is internal to the transmission and mounted on the valve body assembly. The assembly consists of five solenoids that control hydraulic pressure to five of the friction elements (transmission clutches), and the torque converter clutch. The pressure control solenoid is located on the side of the solenoid/TRS assembly. The solenoid/TRS assembly also contains the Transmission Range Sensor (TRS) and five pressure switches that feed information to the TCM.

OPERATION

OPERATION

SOLENOIDS

Solenoids are used to control the L/R, 2C, 4C, OD, and UD friction elements. The reverse clutch is controlled by line pressure and the position of the manual valve in the valve body. All the solenoids are contained within the Solenoid and Pressure Switch Assembly. The 2C, 4C, and UD solenoids are dedicated to those specific clutches (respectively). The L/R solenoid controls either the L/R clutch (in 1st gear and Park/Neutral) or the torque converter clutch (TCC), in 2nd and higher gears. The position of the solenoid switch valve (SSV) determines which element the L/R solenoid is controlling. The Multi-Select (MS) solenoid controls either the OD clutch (in Drive gears) or the L/R clutch (in Reverse). The position of the manual valve determines which element the MS solenoid is controlling.

The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid as necessary. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The MS and UD solenoids are normally applied (they supply hydraulic pressure to the clutch when they are electrically "off"), which provides appropriate transmission limp-in operation in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

PRESSURE SWITCHES

The TCM relies on five pressure switches to monitor fluid pressure in the L/R, 2C, 4C, UD, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The switches close at 23 psi and open at 11 psi, and simply indicate whether or not pressure exists. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following chart.

68RFE PRESSURE SWITCH STATES

GEAR	ERS DISPLAY	L/R	2C	4C	UD	OD
R		OP	OP	OP	OP	OP
P/N		CL	OP	OP	OP	OP
1ST	1	CL*	OP	OP	CL	OP
2ND	2	OP	CL	OP	CL	OP
3RD	3	OP	OP	CL	CL	OP
4TH	4	OP	OP	OP	CL	CL
5TH	5	OP	OP	CL	OP	CL
6TH	6	OP	CL	OP	CL	CL
*L/R is closed if output speed is below 100 rpm in Drive. L/R is always closed in ERS1.						

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

REMOVAL

REMOVAL

NOTE: **If the Transmission Solenoid/TRS Assembly is being replaced, the Quick Learn Procedure must be performed. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .**

1 - SOLENOID PACK BOLTS (15)

1. Place TRS selector plate in the PARK position.
2. Position the transmission solenoid/TRS assembly onto the valve body. Be sure that both alignment dowels are fully seated in the valve body and that the TRS switch contacts are properly positioned in the selector plate
3. Install the bolts (1) to hold the transmission solenoid/TRS assembly onto the valve body.
4. Tighten the solenoid assembly screws adjacent to the arrows cast into the bottom of the valve body first. Tighten the screws to 6 N.m (50 in.lbs.).
5. Tighten the remainder of the solenoid assembly screws to 6 N.m (50 in.lbs.).
6. Install the valve body into the transmission.

CABLE, SHIFT

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - GEARSHIFT CABLE

1. Engine starts must be possible with shift lever in PARK or NEUTRAL positions only. Engine starts must not be possible in any other gear position.
2. With the shift lever in the:
    1. PARK position - Apply upward force on the shift arm and remove pressure. Engine starts must be possible.
    2. PARK position - Apply downward force on the shift arm and remove pressure. Engine starts must be possible.

3. NEUTRAL position - Normal position. Engine starts must be possible.
4. NEUTRAL position - Engine running and brakes applied, apply upward force on the shift arm. Transmission shall not be able to shift from neutral to reverse.

ADJUSTMENTS

ADJUSTMENTS

NOTE: Always run the shift lever test using the scan tool to help diagnose a potential TRS problem

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the transmission range sensor may be faulty.

GEARSHIFT ADJUSTMENT PROCEDURE

Fig. 120: Gearshift Cable At Steering Column
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING COLUMN
2 - GEARSHIFT CABLE
3 - GEARSHIFT CABLE LOCK TAB
4 - BTSI SOLENOID LOCK TAB
5 - BTSI CONNECTOR

1. Shift transmission into PARK.
2. Release cable adjuster lock tab (3) (underneath the steering column) to unlock cable. Refer to **Fig. 120**.
3. Raise vehicle.
4. Disengage the cable eyelet from the transmission manual shift lever.

5. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
6. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
7. Snap the cable eyelet onto the transmission manual shift lever.
8. Lower vehicle.
9. Lock shift cable by pressing cable adjuster lock tab (3) downward until it snaps into place.
10. Check engine starting. Engine should start only in PARK and NEUTRAL.

REMOVAL

REMOVAL

Fig. 121: Gearshift Cable At Transmission
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - RFE TRANSMISSION
3 - MANUAL LEVER

1. Shift transmission into PARK.
2. Raise vehicle.
3. Disengage cable (1) eyelet at transmission manual shift lever (3) and pull cable adjuster out of mounting bracket. Refer to **Fig. 121**.

Fig. 122: Gearshift Cable At Dash Panel
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - GROMMET

4. Lower the vehicle.
5. Remove the dash panel insulation pad as necessary to access the gearshift cable grommet (2). Refer to **Fig. 122**.
6. Remove grommet (2) from the dash panel.

Fig. 123: Gearshift Cable At Steering Column
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING COLUMN
2 - GEARSHIFT CABLE
3 - GEARSHIFT CABLE LOCK TAB

4 - BTSI SOLENOID LOCK TAB
5 - BTSI CONNECTOR

7. Remove any steering column (1) trim necessary to access the gearshift cable (2) and BTSI mechanism.
8. Disconnect the BTSI wiring connector (5).
9. Disconnect cable at lower column bracket and shift lever pin and pull the cable through the dash panel opening into the vehicle. Refer to **Fig. 123**.
10. Remove gearshift cable (2) from vehicle.

INSTALLATION

INSTALLATION

Fig. 124: Gearshift Cable At Dash Panel
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - GROMMET

1. Route the transmission end of the gearshift cable (1) through the opening in the dash panel. Refer to **Fig. 124**.
2. Seat the cable grommet (2) into the dash panel opening.

Fig. 125: Gearshift Cable At Steering Column
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING COLUMN
2 - GEARSHIFT CABLE
3 - GEARSHIFT CABLE LOCK TAB
4 - BTSI SOLENOID LOCK TAB
5 - BTSI CONNECTOR

3. Snap the cable into the steering column (1) bracket so the retaining ears are engaged and snap the cable eyelet onto the shift lever ball stud. Refer to **Fig. 125**.
4. Raise the vehicle.
5. Place the transmission manual shift lever in the "PARK" detent (rearmost) position and rotate prop shaft to ensure transmission is in PARK.
6. Route the gearshift cable through the transmission mounting bracket and secure the cable by snapping the cable retaining ears into the transmission bracket and snapping the cable eyelet on the manual shift lever ball stud.
7. Lower vehicle.
8. Lock the shift cable adjustment by pressing the cable adjuster lock tab (3) downward until it snaps into place.
9. Check for proper operation of the transmission range sensor.
10. Adjust the gearshift cable and BTSI mechanism. Refer to **CABLE, SHIFT, ADJUSTMENTS** and **SYSTEM, SHIFT INTERLOCK, ADJUSTMENTS**.

CLUTCH

DISASSEMBLY

DISASSEMBLY

Fig. 126: 68RFE Clutch Orientation
Courtesy of CHRYSLER GROUP, LLC

1 - U/D CLUTCH	4 - 4C CLUTCH
2 - O/D CLUTCH	5 - 2C CLUTCH
3 - REVERSE CLUTCH	6 - L/R CLUTCH

2 - SNAP RING (SELECTIVE)	9 - L/R CLUTCH RETAINER
3 - REACTION PLATE	10 - BLEED ORIFICE
4 - DISC	
5 - PLATE	
6 - RETAINER	
7 - BELLEVILLE SPRING	

1. Remove the low/reverse reaction plate flat snap-ring (2).
2. Remove the reaction plate (3).
3. Remove the low/reverse clutch (4, 5) and the overrunning clutch (1) from the low/reverse clutch retainer (9).
4. Separate the low/reverse clutch (4, 5) from the overrunning clutch (1).

NOTE: **The ORC is no longer serviced, it is sold as an assembly only. Be certain that the outer race will rotate in one direction but not both relative to the inner race**

Fig. 128: 68RFE Overrunning Clutch
Courtesy of CHRYSLER GROUP, LLC

1 - SNAP-RING
2 - OUTER RACE
3 - OVERRUNNING CLUTCH
4 - SPACER

Fig. 129: Compressing Low/Reverse Belleville Spring
Courtesy of CHRYSLER GROUP, LLC

1 - PRESS
2 - TOOL 8285
3 - BELLEVILLE SPRING

5. Using Spring Compressor (special tool #8285, Compressor, Spring) (2) and a suitable shop press (1), compress the low/reverse Belleville spring (3) and remove the split retaining ring holding the Belleville spring into the low/reverse clutch retainer. Refer to **Fig. 129**.
6. Remove the low/reverse Belleville spring (3) and piston from the low/reverse clutch retainer. Use 20 psi of air pressure to remove the piston if necessary.

CLEANING

CLEANING

Clean the overrunning clutch assembly, and low-reverse clutch retainer. Dry them with compressed air after cleaning.

INSPECTION

INSPECTION

Verify that the overrunning clutch assembly turns smoothly in one direction, and locks in the opposite direction. Verify that the oil feed holes in the inner race are not blocked by debris.

Replace the LR clutch retainer if the piston bores or bushing surfaces are badly scored, worn or damaged.

ASSEMBLY

ASSEMBLY

Fig. 130: 68RFE Clutch Orientation
Courtesy of CHRYSLER GROUP, LLC

1 - U/D CLUTCH	4 - 4C CLUTCH
2 - O/D CLUTCH	5 - 2C CLUTCH
3 - REVERSE CLUTCH	6 - L/R CLUTCH

Fig. 131: Compressing Low/Reverse Belleville Spring
Courtesy of CHRYSLER GROUP, LLC

1 - PRESS
2 - TOOL 8285
3 - BELLEVILLE SPRING

1. Check the bleed orifice to ensure that it is not plugged or restricted.
2. Lubricate the seals with Mopar® ATF +4, Automatic Transmission Fluid, prior to installation.
3. Install the low/reverse piston into the low/reverse clutch retainer.
4. Position the low/reverse Belleville spring (3) on the low/reverse piston.
5. Using Spring Compressor (special tool #8285, Compressor, Spring) (2) and a suitable shop press (1), compress the low/reverse Belleville spring (3) and install the split retaining ring to hold the Belleville spring into the low/reverse clutch retainer.

Fig. 132: Low/Reverse Clutch

Courtesy of CHRYSLER GROUP, LLC

1 - OVERRUNNING CLUTCH	8 - PISTON
2 - SNAP RING (SELECTIVE)	9 - L/R CLUTCH RETAINER
3 - REACTION PLATE	10 - BLEED ORIFICE
4 - DISC	
5 - PLATE	
6 - RETAINER	
7 - BELLEVILLE SPRING	

NOTE: **Install an outer-toothed disc first, then alternate inner and outer-toothed discs, ending with an inner-toothed disc. Install all the discs with the friction material facing up.**

6. Assemble and install the low/reverse clutch pack (4, 5) into the low/reverse clutch retainer (9).
7. Install the low/reverse reaction plate (3) into the low/reverse clutch retainer (9). The reaction plate is directional and must be installed with the flat side down.
8. Install the low/reverse clutch pack snap-ring (2). The snap-ring is selectable and should be chosen to give the correct clutch pack clearance.
9. Measure the low/reverse clutch pack clearance and adjust as necessary. The correct clutch clearance is 1.18-2.09 mm (0.046-0.082 in.).

NOTE: **When installing the overrunning clutch be certain the notched end of the external spline teeth faces upward. The ORC is properly seated when the inner spline stepped face is below the face of the LR clutch retainer hub.**

10. Install the overrunning clutch (1) into the low/reverse clutch retainer (9) making sure that the index splines are aligned with the retainer.

COVER, OIL PUMP

REMOVAL

REMOVAL

Fig. 133: Front Cover
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT COVER
2 - O - RING
3 - SNAP RING
4 - FRONT COVER SEAL

1. Remove the bolts holding the transmission oil pan to the transmission case.
2. Remove the transmission oil pan from the transmission case.
3. Remove the snap ring (3) from the transmission case.
4. Reaching through a case opening in the valve body area with a long blunted tool, remove the transmission front cover (1) from the transmission case.

INSTALLATION

INSTALLATION

Fig. 134: Front Cover
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT COVER
2 - O - RING
3 - SNAP RING
4 - FRONT COVER SEAL

NOTE: **To avoid contamination and garter spring dislodgement, do not handle the front cover seal (4) when positioning the front cover into the transmission case.**

1. Position a new front cover (1) into the transmission case.

Fig. 135: Front Cover Installation Tool
Courtesy of CHRYSLER GROUP, LLC

1 - Front Cover installation Tool 9955

2. Using the front cover installation tool (special tool #9955, Installer, Front Cover) (1) and a dead-blow mallet, install the front cover into transmission case.

Fig. 136: Front Cover

Courtesy of CHRYSLER GROUP, LLC

1 - FRONT COVER
2 - O - RING
3 - SNAP RING
4 - FRONT COVER SEAL

3. Install the snap ring (3) into the transmission case.
4. Apply RTV silicone to the oil pan and install the transmission oil pan.
5. Tighten the bolts to 12 N.m (105 in. lbs.).

FLUID

DIAGNOSIS AND TESTING

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has three primary causes.

1. Internal clutch slippage, usually caused by low line pressure, inadequate clutch apply pressure, or clutch seal failure.
2. A result of restricted fluid flow through the main and auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged oil cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
3. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid

- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE

FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P (PARK) and N (NEUTRAL) positions. Place the selector lever in P (PARK) to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature (approximately 82° C. or 180° F), the fluid level is correct if it is in the HOT region (cross-hatched area) on the oil level indicator. The fluid level will be approximately at the upper COLD hole of the dipstick at 21° C (70° F) fluid temperature.

Fig. 137: Transmission Fluid Fill Level Temperature Chart
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Engine and Transmission should be at normal operating temperature before performing this procedure. After the fluid has been checked, seat the dipstick fully to seal out water and dirt.**

1. Start engine and apply parking brake.
2. Shift the transmission into DRIVE for approximately 2 seconds.
3. Shift the transmission into REVERSE for approximately 2 seconds.
4. Shift the transmission into PARK.
5. Hook up scan tool and select transmission.
6. Select sensors.
7. Read the transmission temperature value.
8. Compare the fluid temperature value with the chart.
9. Adjust transmission fluid level shown on the dipstick according to the Transmission Fluid Temperature Chart.

NOTE: **After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.**

10. Check transmission for leaks.

FLUID AND FILTER REPLACEMENT

For proper service intervals. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

REMOVAL

1. Hoist and support vehicle on safety stands.
2. Place a large diameter shallow drain pan beneath the transmission pan.
3. Remove bolts holding front and sides of pan to transmission.
4. Loosen bolts holding rear of pan to transmission.
5. Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.
6. Hold up pan and remove remaining bolts holding pan to transmission.
7. While holding pan level, lower pan away from transmission.
8. Pour remaining fluid in pan into drain pan.

Fig. 138: Primary Oil Filter & Oil Cooler Return Filter
Courtesy of CHRYSLER GROUP, LLC

1 - PRIMARY OIL FILTER
2 - COOLER RETURN FILTER
3 - COOLER RETURN FILTER BYPASS VALVE
4 - VALVE BODY

9. Remove the screw holding the primary oil filter (1) to valve body. Refer to **Fig. 138**.
10. Separate filter from valve body and oil pump and pour fluid in filter into drain pan.
11. Inspect the oil filter seal in the bottom of the oil pump. If the seal is not installed completely in the oil pump, or is otherwise damaged, then remove and discard the oil filter seal from the bottom of the oil pump. If the seal is installed correctly and is in good condition, it can be reused.
12. If replacing the cooler return filter (2), use Oil Filter Wrench (special tool #8321, Wrench, Oil Filter) to remove the filter from the transmission.

13. Dispose of used trans fluid and filter(s) properly.

INSPECTION

Inspect bottom of pan and magnet for excessive amounts of metal. A light coating of clutch material on the bottom of the pan does not indicate a problem unless accompanied by a slipping condition or shift lag. If fluid and pan are contaminated with excessive amounts of debris, refer to **DIAGNOSIS AND TESTING**.

CLEANING

1. Using a suitable solvent, clean pan and magnet.
2. Using a suitable gasket scraper, clean original sealing material from surface of transmission case and the transmission pan.

INSTALLATION

Fig. 139: Primary Oil Filter & Oil Cooler Return Filter
Courtesy of CHRYSLER GROUP, LLC

1 - PRIMARY OIL FILTER
2 - COOLER RETURN FILTER
3 - COOLER RETURN FILTER BYPASS VALVE
4 - VALVE BODY

CAUTION: The primary oil filter seal MUST be fully installed flush against the oil pump body. DO NOT install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.

1. If necessary, install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with Installer (special tool #6960, Tools, Trac-Lok Axle) or another suitable tool (appropriately sized drift or socket, the butt end of a hammer etc.).

2. Place replacement filter in position on valve body and into the oil pump.
3. Install screw to hold the primary oil filter (1) to valve body. Refer to **Fig. 139**. Tighten screw to 4.5 N.m (40 in. lbs.) torque.
4. Install new cooler return filter (2) onto the transmission, if necessary. Torque the filter to 9.5 N.m (84 in.lbs.).
5. Place bead of Mopar® RTV sealant onto the transmission case sealing surface.
6. Place pan in position on transmission.
7. Install bolts to hold pan to transmission. Tighten bolts to 12 N.m (105 in. lbs.) torque.
8. Lower vehicle and fill transmission with MOPAR® ATF +4.

TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Remove dipstick and insert clean funnel in transmission fill tube.
2. Add following initial quantity of Mopar® ATF +4 to transmission:
    1. If only fluid and filter were changed, add **10 pints (5 quarts)** of ATF +4 to transmission.
    2. If transmission was completely overhauled and the torque converter was replaced or drained, add **24 pints (12 quarts)** of ATF +4 to transmission.
3. Check the transmission fluid and adjust as required. Refer to **FLUID LEVEL CHECK**.

GEARTRAIN, PLANETARY

DESCRIPTION

DESCRIPTION

NOTE: The 68RFE transmission does not use a number 7 thrust bearing.

Fig. 140: 68RFE Bearing Orientation

2 - OUTPUT END PLAY THRUST PLATE (SELECTIVE)	6 - THRUST BEARING NUMBER 9
3 - 4C CLUTCH HUB / REACTION SUN GEAR	
4 - THRUST BEARING NUMBER 8	

The planetary geartrain is located behind the 2C/4C retainer/bulkhead, toward the rear of the transmission. The planetary geartrain consists of two primary assemblies:

- Reaction (3, 5).

Fig. 142: Reverse Carrier
Courtesy of CHRYSLER GROUP, LLC

1. SNAP RING	5. INPUT SUN GEAR
2. NUMBER NINE BEARING	6. NUMBER 11 BEARING (CAPTURED)
3. REVERSE PLANETARY CARRIER	7. INPUT PLANETARY CARRIER
4. THRUST BEARING NUMBER 10	8. INPUT ANNULUS GEAR

- Reverse (3).
- Input (5, 7, 8).

OPERATION

OPERATION

REACTION PLANETARY GEAR SET

The reaction planetary carrier and reverse sun gear are a single component which is held by the 2C clutch when

required. The sun gear is retained on the reaction carrier hub by a hidden snap ring and can not be removed. The reaction sun gear is a stand alone component that can be driven by the reverse clutch or held by the 4C clutch. The reaction annulus is welded to the reverse planetary carrier.

REVERSE PLANETARY GEAR SET

The reverse planetary gear set is the middle of the three planetary sets. The reverse planetary carrier can be driven by the overdrive clutch as required. The reverse planetary carrier is welded to the reaction annulus gear and splined to the input annulus gear, which can be held by the low/reverse clutch. The reverse annulus gear, input planetary carrier, and output shaft are all one piece. The reverse annulus gear is retained on the input carrier flange by a hidden snap ring and can not be disassembled.

INPUT PLANETARY GEAR SET

The input sun gear of the input planetary gear set is driven by the underdrive clutch. The number 11 thrust bearing is captive underneath the pinion gears and therefore cannot be removed.

DISASSEMBLY

DISASSEMBLY

NOTE: The 68RFE transmission does not use a number 7 thrust bearing.

Fig. 143: 68RFE Bearing Orientation
Courtesy of CHRYSLER GROUP, LLC

1 - THRUST BEARING NO. 1	8 - THRUST BEARING NO. 8

2. NUMBER NINE BEARING	6. NUMBER 11 BEARING (CAPTURED)
3. REVERSE PLANETARY CARRIER	7. INPUT PLANETARY CARRIER
4. THRUST BEARING NUMBER 10	8. INPUT ANNULUS GEAR

1. Remove the snap-ring (1) holding the input annulus (6) onto the input carrier (5).
2. Remove the input annulus (8) from the input carrier (7).
3. Remove the number 9 thrust bearing from the reverse planetary carrier (6).
4. Remove the reverse planetary gear carrier (2).
5. Remove the number 10 thrust bearing (3) from the input sun gear (4).
6. Remove the input sun gear (4) from the input carrier (5).

CLEANING

CLEANING

Clean the planetary components in solvent and dry them with compressed air.

INSPECTION

INSPECTION

Inspect each planetary carrier assembly for damage. Check that each pinion gear rotates freely and smoothly on its shaft. Check that the fixed thrust washer on each side of each pinion gear is in place. Check that the outer ends of the pinion shafts are not discolored from overheating. Replace the carrier assembly if jammed or sticky pinion gears, spun or missing fixed washers, or blackened pinion shafts are found.

Check sun gear and annulus gear condition. Replace components as necessary if damaged or if any bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location.

ASSEMBLY

ASSEMBLY

NOTE: The 68RFE transmission does not use a number 7 thrust bearing.

Fig. 145: 68RFE Bearing Orientation

7 - BELLEVILLE SPRING	

Three hydraulically applied multi-disc clutches are used to hold some planetary geartrain components stationary while the input clutches drive others. The 2C, 4C, and Low/Reverse clutches are considered holding clutches. The 2C and 4C clutches are located in the 4C retainer/bulkhead (12).

The Low/Reverse clutch is located at the rear of the transmission case.

OPERATION

OPERATION

Fig. 150: 68RFE Clutch Orientation
Courtesy of CHRYSLER GROUP, LLC

1 - U/D CLUTCH	4 - 4C CLUTCH

2 - O/D CLUTCH	5 - 2C CLUTCH
3 - REVERSE CLUTCH	6 - L/R CLUTCH

2C CLUTCH

The 2C clutch is hydraulically applied in second and sixth gears by pressurized fluid against the 2C piston. When the 2C clutch is applied, the reaction planetary carrier and reverse sun gear are held or grounded to the transmission case.

4C CLUTCH

The 4C clutch is hydraulically applied in third and fifth gears by pressurized fluid against the 4C clutch piston. When the 4C clutch is applied, the reaction sun gear is held or grounded to the transmission case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gear, only at low speeds, by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the input annulus assembly is held or grounded to the transmission case.

HOUSING, TRANSMISSION, REAR EXTENSION

REMOVAL

REMOVAL

1. Remove the rear drive shaft. Refer to **SHAFT, DRIVE, REAR LIGHT DUTY, REMOVAL** or **SHAFT, DRIVE, REAR HEAVY DUTY, REMOVAL** .

Fig. 151: Extension Housing & Bolts

Courtesy of CHRYSLER GROUP, LLC

2. Remove extension housing bolts (2).
3. Remove extension housing (1) from the transmission (3).

DISASSEMBLY

DISASSEMBLY

1. Apply a bead of RTV silicone to the extension housing.

Fig. 166: Extension Housing & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the extension housing (1) on the transmission (3).
3. Install the extension housing bolts (2) and tighten to 54 N.m (40 ft. lbs.).
4. Install rear drive shaft. Refer to **SHAFT, DRIVE, REAR LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR HEAVY DUTY, INSTALLATION** .

PUMP, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

Fig. 167: Oil Pump & Bolt
Courtesy of CHRYSLER GROUP, LLC

1 - OIL PUMP TO CASE BOLT (6)
2 - OIL PUMP

The oil pump (2) is located at the front of the transmission inside the bell housing and behind the transmission front cover.

Fig. 168: Oil Pump Gears
Courtesy of CHRYSLER GROUP, LLC

1 - PUMP HOUSING

2 - DRIVE GEAR
3 - DRIVEN GEARS

The oil pump consists of two independent pumps. Refer to **Fig. 168**.

Fig. 169: Oil Pump Valves
Courtesy of CHRYSLER GROUP, LLC

1 - TORQUE CONVERTER CLUTCH ACCUMULATOR VALVE
2 - TORQUE CONVERTER CLUTCH CONTROL VALVE
3 - TORQUE CONVERTER CLUTCH SWITCH VALVE
4 - PUMP VALVE BODY
5 - MAIN REGULATOR VALVE
6 - TORQUE CONVERTER CLUTCH LIMIT VALVE

The oil pump also contains a number of valves. The converter clutch switch (3) and control valves (2), main regulator valve (5), and converter pressure limit valve (6) are all located in the oil pump valve body.

Fig. 170: Oil Pump Reaction Shaft
Courtesy of CHRYSLER GROUP, LLC

1 - PUMP HOUSING	4 - REACTION SHAFT SUPPORT
2 - OIL FILTER SEAL	5 - PUMP VALVE BODY
3 - SEAL RING (5)	

A filter seal (2), and a bolt on reaction shaft (4) complete the oil pump assembly.

OPERATION

OPERATION

As the torque converter rotates, the converter hub rotates the oil pump drive gear. As the drive gear rotates both driven gears, a vacuum is created when the gear teeth come out of mesh. This suction draws fluid through the pump inlet from the oil pan. As the gear teeth come back into mesh, pressurized fluid is forced into the pump outlet and to the oil pump valves.

At low speeds, both sides of the pump supply fluid to the transmission. As the speed of the torque converter increases, the flow from both sides increases until the flow from the primary side alone is sufficient to meet system demands. At this point, the check valve located between the two pumps closes. The secondary side is shut down and the primary side supplies all the fluid to the transmission.

CONVERTER CLUTCH SWITCH VALVE

The converter clutch switch valve is used to control the direction of oil flow to the torque converter. When the converter clutch is released (CC switch valve downshifted), hydraulic pressure is supplied to the front (OFF) side of the torque converter clutch. When the converter clutch is applied (CC switch valve upshifted), regulated oil pressure is supplied to the back (ON) side of the converter clutch.

CONVERTER CLUTCH REGULATOR VALVE

The converter clutch regulator valve is used to control the hydraulic pressure supplied to the back (ON) side of the torque converter clutch.

TORQUE CONVERTER LIMIT VALVE

The torque converter limit valve serves to limit the maximum pressure supplied to the front side of the torque converter clutch.

DISASSEMBLY

DISASSEMBLY

Fig. 171: Oil Pump Reaction Shaft
Courtesy of CHRYSLER GROUP, LLC

1 - PUMP HOUSING	4 - REACTION SHAFT SUPPORT
2 - OIL FILTER SEAL	5 - PUMP VALVE BODY
3 - SEAL RING (5)	

1. Remove the bolts holding the reaction shaft support (4) to the oil pump.
2. Remove the reaction shaft support (4) from the oil pump.
3. Remove all bolts holding the oil pump halves together.
4. Using suitable prying tools, separate the oil pump sections by inserting the tools in the supplied areas and prying the halves apart.

NOTE: The oil pump halves are aligned to each other through the use of two

dowels. Be sure to pry upward evenly to prevent damage to the oil pump components.

Fig. 172: Oil Pump Housing & Gears

1 - RETAINER
2 - T/C SWITCH VALVE
3 - OIL PUMP VALVE BODY

10. Remove the oil pump valve retainers (1) and TCC Switch Valve (2) and spring one at a time. Mark the combination of components as a group and tag them as to the location from which they were removed.

Fig. 174: T/C Regulator Valve, T/C Limit Valve & Regulator Valve
Courtesy of CHRYSLER GROUP, LLC

1 - T/C REGULATOR VALVE
2 - T/C LIMIT VALVE
3 - MAIN REGULATOR VALVE
4 - OIL PUMP VALVE BODY

11. Remove the T/C regulator valve (1), T/C limit valve (2), and main regulator valve (3).

CLEANING

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

INSPECTION

INSPECTION

Check condition of the seal rings and bushing sleeve on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn, chipped, or damaged.

Inspect the pump reaction shaft support bushings. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the oil pump valve body. Use a penlight to view the bore interiors. Replace the oil pump if any bores are distorted or scored. Inspect all of the valve springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores. Tip the pump valve body back and forth and check to see that each valve slides freely in its bore under its own weight (without pushing or prying).

ASSEMBLY

ASSEMBLY

NOTE: **Clean and inspect all components. Make sure that all passages are thoroughly cleaned and are free from dirt or debris. Make sure that all valves move freely in their proper bore. Make sure that all gear pockets and bushings are free from excessive wear and scoring. Replace the oil pump if any excessive wear or scoring is found.**

Fig. 175: Oil Pump Valve Body, T/C Switch Valve & Retainers

1 - 2C PISTON	8 - SNAP-RING
2 - PLATE	9 - RETURN SPRING
3 - DISC	10 - 4C PISTON
4 - 2C BELLEVILLE SPRING	11 - 4C RETAINER/BULKHEAD
5 - SNAP-RING	
6 - SNAP-RING (SELECT)	
7 - REACTION PLATE	

9. Assemble and install the 4C clutch pack (2, 3) into the retainer/bulkhead (11) with a steel separator plate against the piston.
10. Install the 4C reaction plate (7) and snap-ring (6) into the retainer/bulkhead (11). The 4C reaction plate is non-directional.
11. Measure the 4C clutch clearance. The correct clutch clearance is 0.770-1.390 mm (0.030-0.055 in.). The snap-ring (6) is selectable. Install the chosen snap-ring and re-measure to verify the selection.

    The 4C selectable snap ring thickness are as follows:

    4C SELECTABLE SNAP RING THICKNESS

    - One Butterfly End, One Square End = 1.79 mm (0.070 in.).
    - Both Ends Buttery Fly Cut = 2.20 mm (0.087 in.).
    - One Butterfly End, One Inverted Butterfly End = 2.61 mm (0.103 in.).
12. Install the 2C piston (1) into the retainer/bulkhead (11).
13. Position the 2C Belleville spring (5) onto the 2C piston (2).
14. Position the 2C Belleville spring snap-ring (6) onto the 2C Belleville spring (5).

Fig. 191: Compressing 2C Belleville Spring
Courtesy of CHRYSLER GROUP, LLC

1 - PRESS
2 - TOOL 8249

15. Using Spring Compressor (special tool #8249, Compressor, Spring) (2) and a suitable shop press (1), compress the Belleville spring until the snap-ring is engaged with the snap-ring groove in the retainer/bulkhead.

SEAL, ADAPTER HOUSING

REMOVAL

REMOVAL

1. On 4WD vehicles remove the transfer case from the transmission, on 2WD vehicles remove the propeller shaft.
2. Using a pry tool, remove the output shaft seal.

INSTALLATION

INSTALLATION

NOTE: **On the 2WD models use Seal Installer (special tool #8154, Installer, Seal) with Handle (special tool #C-4171, Driver Handle, Universal).**

Fig. 192: Installing Oil Seal
Courtesy of CHRYSLER GROUP, LLC

1 - HANDLE C-4171
2 - SEAL INSTALLER 10020

1. Clean the seal bore in the extension housing of any residue or particles remaining from the original seal.
2. Install new oil seal in the extension housing using Handle (special tool #C-4171, Driver Handle, Universal) (1) and Seal Installer (special tool #10020, Installer, Seal) (2).

SEAL, OUTPUT SHAFT

REMOVAL

REMOVAL

1. Remove the rear drive shaft. Refer to **SHAFT, DRIVE, REAR LIGHT DUTY, REMOVAL** or **SHAFT, DRIVE, REAR HEAVY DUTY, REMOVAL** .
2. Using a seal removal tool, remove rear extension housing output shaft seal.

INSTALLATION

INSTALLATION

1. Clean the extension housing seal bore in the extension housing of any residue or particles remaining from the original seal.

NOTE: The small weep hole in the dust boot of the seal should face downward when installed in the extension housing.

2. Install new oil seal in the extension housing (1) using (special tool #8896, Installer, Seal) (2) and (special tool #C-4171, Driver Handle, Universal) (3).
3. Install rear drive shaft. Refer to **SHAFT, DRIVE, REAR LIGHT DUTY, INSTALLATION** or **SHAFT, DRIVE, REAR HEAVY DUTY, INSTALLATION** .

SENSOR, SPEED, INPUT

DESCRIPTION

DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the park gear teeth. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

REMOVAL

1. Install the output speed sensor (1) into the transmission case. Refer to **Fig. 197**.
2. Install the bolt to hold the output speed sensor (1) into the transmission case. Tighten the bolt to 12 N.m (105 in.lbs.).
3. Install the wiring connector onto the output speed sensor (1).
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.

SENSOR, TRANSMISSION OIL TEMPERATURE

DESCRIPTION

DESCRIPTION

The transmission temperature sensor is a thermistor that is integral to the Transmission Range Sensor (TRS).

OPERATION

OPERATION

The transmission temperature sensor is used by the TCM to sense the temperature of the fluid in the sump. Since fluid temperature can affect transmission shift quality and convertor lock up, the TCM requires this information to determine which shift schedule to operate in.

CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

SENSOR, TRANSMISSION RANGE

DESCRIPTION

DESCRIPTION

The Transmission Range Sensor (TRS) is part of the solenoid module, which is mounted to the top of the valve body inside the transmission.

The Transmission Range Sensor (TRS) has five switch contact pins that:

- Determine shift lever position
- Supply ground to the Starter Relay in Park and Neutral only.

The TRS also has an integrated temperature sensor (thermistor) that communicates transmission temperature to the TCM and PCM.

OPERATION

OPERATION

The Transmission Range Sensor (TRS) communicates shift lever position to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that

the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transmission gear position and shift schedule.

There are many possible combinations of open and closed switches (codes). Five of these possible codes correspond to valid gear position, there are two codes for the neutral position and three are recognized as "between gear" codes. This results in many codes which should **never occur** . These are called "invalid" codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

GEAR	C5	C4	C3	C2	C1
Park	CL	OP	OP	CL	CL
Temp 1	CL	OP	OP	CL	OP
Reverse	OP	OP	OP	CL	OP
Temp 2	OP	OP	CL	CL	OP
Neutral 1	OP	OP	CL	CL	CL
Neutral 2	OP	CL	CL	CL	CL
Temp 3	OP	CL	CL	CL	OP
Drive	OP	CL	CL	OP	OP

SENSOR, VARIABLE LINE PRESSURE

DESCRIPTION

DESCRIPTION

The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid, which is part of the pressure switch assembly. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the pump inlet. The system contains a Line Pressure Sensor, which is a direct input to the TCM. The line pressure sensor monitors the transmission line pressure and completes the feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

OPERATION

OPERATION

The TCM calculates the desired line pressure based upon inputs from the transmission and engine. The TCM calculates the torque input to the transmission and uses that information as the primary input to the calculation. The line pressure is set to a predetermined value during shifts, to ensure consistent shift quality. During all other operation, the desired line pressure value is adjusted based on torque level and other transmission requirements.

REMOVAL

REMOVAL

Fig. 198: Input, Output, & Line Pressure Sensors
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SPEED SENSOR
2 - LINE PRESSURE SENSOR
3 - INPUT SPEED SENSOR

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the line pressure sensor (2). Refer to **Fig. 198**.
4. Remove the bolt holding the line pressure sensor (2) to the transmission case.
5. Remove the line pressure sensor (2) from the transmission case.

INSTALLATION

INSTALLATION

1 - OUTPUT SPEED SENSOR
2 - LINE PRESSURE SENSOR
3 - INPUT SPEED SENSOR

1. Install the line pressure sensor (2) into the transmission case. Refer to **Fig. 199**.
2. Install the bolt to hold the line pressure sensor (2) into the transmission case. Tighten the bolt to 12 N.m (105 in.lbs.).
3. Install the wiring connector onto the line pressure sensor (2).
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.

SHIFTER, TRANSMISSION

DESCRIPTION

DESCRIPTION

The gear shift mechanism provides four shift positions which are:

- Park (P)
- Reverse (R)
- Neutral (N)
- Drive (D)

OPERATION

OPERATION

Drive range provides underdrive FIRST, SECOND and THIRD gears, direct FOURTH gear and overdrive FIFTH and SIXTH gears. The shift into overdrive FIFTH and SIXTH gear occurs only after the transmission has completed the shift into FOURTH gear. No other movement of the shift mechanism is required to complete the 4-5 or 5-6 gear shifts.

The FOURTH and FIFTH gear upshift occurs automatically unless the Tow/Haul mode is enabled.

Upshifts into both overdrive gears, FIFTH and SIXTH, will be delayed when the transmission fluid temperature is below 4.5° C (40° F) or above 115.5° C (240° F).

SWITCH, OVERDRIVE LOCKOUT

DESCRIPTION

Fig. 200: Tow/Haul Overdrive Off Switch
Courtesy of CHRYSLER GROUP, LLC

1 - AUTO-6 (ERS)	3 - OVERDRIVE ON/OFF SWITCH
2 - TOW / HAUL	

The Tow/Haul and Auto-6 Electronic Range Select (ERS) switches are located in the shift lever arm. The switches are momentary contact devices that signal the PCM to toggle current status of the Tow/Haul function and adjust the ERS maximum allowed gear range.

OPERATION

OPERATION

At key-on, normal operation is provided. Pressing the switch enables Tow/Haul mode and the Tow/Haul lamp will be illuminated. In Tow/Haul mode, 4-5 upshifts are delayed. Shifts into 5th and 6th gear are still allowed under steady cruise conditions. Closed throttle downshifts (for improved engine braking) may occur during steady braking maneuvers. Pressing the switch a second time restores normal operation. Normal operation is always the default at start-up; the switch must be pressed after each key start if Tow/Haul mode is desired.

The Electronic Range Select (ERS) allows the selection of the desired top gear, when the shifter is in the D (Drive) position. For example, if ERS 3rd is selected, the transmission will never shift above 3rd gear, but can down shift into 2nd or 1st when needed.

SYSTEM, SHIFT INTERLOCK

DESCRIPTION

DESCRIPTION

Fig. 201: Gearshift Lever Assembly
Courtesy of CHRYSLER GROUP, LLC

The Brake Transmission Shifter Interlock (BTSI), is a solenoid operated system. It consists of a solenoid permanently mounted on the gearshift lever assembly.

OPERATION

OPERATION

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed approximately one-half an inch. A magnetic holding device in line with the park lock cable is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK

1. Verify that the key can only be removed in the PARK position.
2. When the shift lever is in PARK And the shift handle pushbutton is in the "OUT" position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the OFF position.
4. Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

ADJUSTMENTS

ADJUSTMENTS

ADJUSTMENT PROCEDURE

Fig. 202: Gearshift Lever Assembly
Courtesy of CHRYSLER GROUP, LLC

The BTSI is part of the shift lever assembly (2) and is non-adjustable.

BTSI FUNCTION CHECK

1. Verify removal of ignition key allowed in PARK position only.
2. When the shift lever is in PARK, the ignition key cylinder should rotate freely from off to lock. When the shifter is in any other position, the ignition key should not rotate from off to lock.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the off position.
4. Shifting out of PARK should not be possible while applying normal force, and ignition key cylinder is in the run or start positions, unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the accessory or lock position.
6. Shifting between any gear and NEUTRAL, or PARK, may be done without depressing foot brake with ignition switch in run or start positions.
7. Engine starts must be possible with shifter lever in PARK or NEUTRAL positions only. Engine starts must not be possible in any position other than PARK or NEUTRAL.
8. With shifter lever in the:

- PARK position - Apply upward force on the shift arm and remove pressure. Engine starts must be possible.
- PARK position - Apply downward force on the shift arm and remove pressure. Engine starts must be possible.
- NEUTRAL position - Normal position. Engine starts must be possible.
- NEUTRAL position - Engine running and brakes applied, apply upward force on the shift arm. Transmission shall not be able to shift from neutral to reverse.

TORQUE CONVERTER

DESCRIPTION

DESCRIPTION

Fig. 203: Torque Converter Components
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE ASSEMBLY	5 - IMPELLER ASSEMBLY
2 - STATOR	6 - CONVERTER CLUTCH
3 - CONVERTER HUB	7 - TURBINE HUB
4 - O-RING (IF EQUIPPED)	

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. Refer to **Fig. 203**. The torque converter consists of an outer shell with an internal turbine (1), a stator (2), an overrunning clutch, an impeller (5), and an electronically applied converter clutch (6). The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub (3) drives the transmission oil (fluid) pump and contains an o-ring seal (4) to better control oil flow.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

IMPELLER

Fig. 204: Impeller
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE FLEXPLATE	4 - ENGINE ROTATION
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION	5 - ENGINE ROTATION
3 - IMPELLER VANES AND COVER ARE INTEGRAL	

The impeller is an integral part of the converter housing. Refer to **Fig. 204**. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

Fig. 205: Turbine
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE VANE	4 - PORTION OF TORQUE CONVERTER COVER
2 - ENGINE ROTATION	5 - ENGINE ROTATION
3 - INPUT SHAFT	6 - OIL FLOW WITHIN TURBINE SECTION

The turbine is the output, or driven, member of the converter. Refer to **Fig. 205**. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

Fig. 206: Stator
Courtesy of CHRYSLER GROUP, LLC

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW
4 - TURBINE

The stator assembly is mounted on a stationary shaft which is an integral part of the oil pump. Refer to **Fig. 206**. The stator (1) is located between the impeller (2) and the turbine (4) within the torque converter case.

Fig. 207: Stator Components
Courtesy of CHRYSLER GROUP, LLC

1 - CAM (OUTER RACE)
2 - ROLLER
3 - SPRING
4 - INNER RACE

The stator contains an over-running clutch (1-4), which allows the stator to rotate only in a clockwise direction. Refer to **Fig. 207**. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

Fig. 208: Torque Converter Clutch (TCC)
Courtesy of CHRYSLER GROUP, LLC

1 - IMPELLER FRONT COVER
2 - THRUST WASHER ASSEMBLY
3 - IMPELLER
4 - STATOR
5 - TURBINE
6 - PISTON
7 - FRICTION DISC

The TCC was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Refer to **Fig. 208**. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller (3) and turbine (5) were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston (6) with friction material (7) was added to the

turbine assembly (5) to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the L/R-CC Solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

OPERATION

OPERATION

The converter impeller (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. Refer to **Fig. 209**. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

Fig. 209: Identifying Torque Converter Fluid Operation
Courtesy of CHRYSLER GROUP, LLC

1 - APPLY PRESSURE	3 - RELEASE PRESSURE
2 - THE PISTON MOVES SLIGHTLY FORWARD	4 - THE PISTON MOVES SLIGHTLY REARWARD

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Refer to **Fig. 210**. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 1.75:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

Fig. 210: Stator Operation
Courtesy of CHRYSLER GROUP, LLC

1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES
4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction material to the front cover, a total converter engagement can be obtained. The result of this engagement is a direct 1:1

mechanical link between the engine and the transmission.

The clutch can be engaged in all gear ranges except first depending on the Tow/Haul and ERS status. In normal operation, the clutch will engage after the shift to fourth gear. If the Tow/Haul mode is enabled, the clutch will engage after the shift to third (direct) gear.

The TCM controls the torque converter clutch via the L/R-CC Solenoid. There are four TCC operational modes:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual EMCC Release

NO EMCC

Under No EMCC conditions, the L/R Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

PARTIAL EMCC

Partial EMCC operation modulates the L/R Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

FULL EMCC

During Full EMCC operation, the TCM increases the L/R Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the desired slip range of transmission input speed relative to engine rpm.

GRADUAL EMCC RELEASE

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by slowly decreasing the L/R Solenoid duty cycle.

REMOVAL

REMOVAL

1. Remove transmission and torque converter from vehicle. Refer to **REMOVAL**.
2. Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the

torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

INSTALLATION

INSTALLATION

Fig. 211: Checking Torque Converter Clearance
Courtesy of CHRYSLER GROUP, LLC

1 - SCALE
2 - STRAIGHTEDGE

NOTE: **Check converter hub and drive flats for sharp edges, burrs, scratches, or nicks. Polish the hub and flats with 800/1000 grit paper or crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free from debris. The hub must be smooth to avoid damaging the pump seal at installation.**

1. Lubricate oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or converter hub o-ring while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.

4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale (1) and straightedge (2). Surface of converter lugs should be at least 25 mm (1in.) to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle. Refer to **INSTALLATION**.
9. Fill the transmission with the recommended fluid.

VALVE BODY

DESCRIPTION

DESCRIPTION

Fig. 212: Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1 - LOW/REVERSE ACCUMULATOR	6 - OVERDRIVE ACCUMULATOR
2 - LOW/REVERSE SHUTTLE VALVE AND PLUG	7 - UNDERDRIVE ACCUMULATOR
3 - UPPER VALVE BODY	8 - 4C ACCUMULATOR
4 - MANUAL VALVE	9 - 2C ACCUMULATOR
5 - SOLENOID SWITCH VALVE AND PLUGS	

The valve body consists of a cast aluminum valve body, a separator plate, and a transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch and frictional clutches. The valve body contains the following components:

- Solenoid switch valve
- Manual valve
- Low/reverse shuttle valve
- 5 Accumulators

Fig. 213: Check Ball Locations
Courtesy of CHRYSLER GROUP, LLC

- 5 check balls

OPERATION

OPERATION

NOTE: **Refer to SCHEMATICS AND DIAGRAMS for a visual aid in determining valve location, operation and design.**

SOLENOID SWITCH VALVE

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R-TCC solenoid is energized.

The Solenoid Switch Valve controls line pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In all other gears, the solenoid switch valve will be in the upshifted position and directs the fluid into the torque converter clutch (TCC) circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

MANUAL VALVE

Fig. 214: TRS Selector Plate, Detent Spring & Clutch Passage Seals
Courtesy of CHRYSLER GROUP, LLC

1 - TRS SELECTOR PLATE
2 - DETENT SPRING
3 - CLUTCH PASSAGE SEALS

The manual valve is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the top of the valve body. The valve is connected mechanically to the gearshift mechanism. The valve is held in each of its positions by a roller detent spring (2) that engages the roostercomb of the TRS selector plate (1).

LOW/REVERSE SWITCH VALVE

The low/reverse switch valve allows the low/reverse clutch to be operated by either the LR/CC solenoid or the MS solenoid.

REMOVAL

REMOVAL

NOTE: **The valve body can be removed for service without having to remove the transmission assembly. The valve body can be disassembled for cleaning and inspection of the individual components.**

Fig. 215: Primary Oil Filter & Oil Cooler Return Filter

1 - PRIMARY OIL FILTER
2 - COOLER RETURN FILTER
3 - COOLER RETURN FILTER BYPASS VALVE
4 - VALVE BODY

1. Shift transmission into PARK.
2. Raise vehicle.
3. Disconnect wires at the solenoid and pressure switch assembly 23 pin electrical connector.
4. Position drain pan under transmission oil pan.
5. Remove transmission oil pan.
6. Remove the primary oil filter (1) from valve body.

Fig. 216: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove bolts (1) attaching valve body to transmission case.
8. Lower the valve body and work the electrical connector out of transmission case.
9. Separate the valve body from the transmission.

DISASSEMBLY

DISASSEMBLY

Fig. 217: Solenoid Pack Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - SOLENOID PACK BOLTS (15)

1. Remove the bolts (1) holding the solenoid and pressure switch assembly to the valve body. Do not remove the screws on the top of the solenoid and pressure switch assembly.
2. Separate the solenoid and pressure switch assembly from the valve body.

Fig. 218: TRS Selector Plate, Detent Spring & Clutch Passage Seals

4 - MANUAL VALVE	9 - 2C ACCUMULATOR
5 - SOLENOID SWITCH VALVE AND PLUGS	

7. Remove the screws holding the accumulator cover onto the valve body.
8. Remove the accumulator springs and pistons (1, 6-9) from the valve body. Note which accumulator piston and spring belong in each location.

Fig. 220: Check Ball Locations
Courtesy of CHRYSLER GROUP, LLC

9. Place the valve body on the bench with the transfer plate upward.

NOTE: **The valve body contains five check balls. The transfer plate must be placed upward to prevent losing the check balls when the transfer plate is removed from the valve body.**

10. Remove the screws holding the valve body to the valve body transfer plate.
11. Remove the transfer plate from the valve body. Note the location of all check balls.
12. Remove the check balls from the valve body.

Fig. 221: Valve Body Components

Courtesy of CHRYSLER GROUP, LLC

1 - LOW/REVERSE ACCUMULATOR	6 - OVERDRIVE ACCUMULATOR
2 - LOW/REVERSE SHUTTLE VALVE AND PLUG	7 - UNDERDRIVE ACCUMULATOR
3 - UPPER VALVE BODY	8 - 4C ACCUMULATOR
4 - MANUAL VALVE	9 - 2C ACCUMULATOR
5 - SOLENOID SWITCH VALVE AND PLUGS	

13. Remove the retainer securing the solenoid switch valve (5) from the valve body. Remove the solenoid switch valve and plugs (5), the manual valve (4) and low reverse shuttle valve and plug (2). Tag each valve and plug combination with location information to aid in assembly.

CLEANING

CLEANING

Fig. 222: Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1 - LOW/REVERSE ACCUMULATOR	6 - OVERDRIVE ACCUMULATOR
2 - LOW/REVERSE SHUTTLE VALVE AND PLUG	7 - UNDERDRIVE ACCUMULATOR

3 - UPPER VALVE BODY	8 - 4C ACCUMULATOR
4 - MANUAL VALVE	9 - 2C ACCUMULATOR
5 - SOLENOID SWITCH VALVE AND PLUGS	

Clean the valve housings, valves, plugs, springs, transfer plate and separator plate with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the electrical components by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

INSPECTION

INSPECTION

Fig. 223: Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1 - LOW/REVERSE ACCUMULATOR	6 - OVERDRIVE ACCUMULATOR
2 - LOW/REVERSE SHUTTLE VALVE AND PLUG	7 - UNDERDRIVE ACCUMULATOR
3 - UPPER VALVE BODY	8 - 4C ACCUMULATOR
4 - MANUAL VALVE	9 - 2C ACCUMULATOR

NOTE: **Only the INNER accumulator seal ring actually seals the pressure in the bore. The outer seal ring only serves to guide the piston in the bore. Gouges which do not extend past the inner seal ring (and have no raised edges, which could damage the guide ring) are acceptable. The machined accumulator bores often have a tiger-striped appearance. This is NORMAL and does NOT require replacement, as long as the bores are smooth in the inner seal ring area.**

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not normally change dimensionally with use. If the valve body functioned correctly when new, it should continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

Inspect all the accumulator bores in the valve body as well as the accumulator piston seal rings, and replace if cut or damaged. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the accumulator springs. The springs must be free of distortion, warpage or broken coils.

Fig. 224: Valve Body Seals
Courtesy of CHRYSLER GROUP, LLC

1 - UNDERDRIVE ACCUMULATOR (2 SPRINGS)
2 - 4TH CLUTCH ACCUMULATOR (2 SPRINGS)
3 - 2ND CLUTCH ACCUMULATOR (2 SPRINGS)
4 - LOW REVERSE ACCUMULATOR (2 SPRINGS)
5 - LOW/REVERSE PASSAGE SEAL
6 - 2ND CLUTCH PASSAGE SEAL
7 - 4TH CLUTCH PASSAGE SEAL
8 - OVERDRIVE ACCUMULATOR (1 SPRING)

Inspect all the fluid seals on the valve body. Refer to **Fig. 224**. Replace any seals that are cracked, distorted, or damaged in any way. These seals pass fluid pressure directly to the clutches. Any pressure leak at these points, may cause transmission performance problems.

ASSEMBLY

ASSEMBLY

Fig. 225: Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1 - LOW/REVERSE ACCUMULATOR	6 - OVERDRIVE ACCUMULATOR
2 - LOW/REVERSE SHUTTLE VALVE AND PLUG	7 - UNDERDRIVE ACCUMULATOR
3 - UPPER VALVE BODY	8 - 4C ACCUMULATOR
4 - MANUAL VALVE	9 - 2C ACCUMULATOR
5 - SOLENOID SWITCH VALVE AND PLUGS	

1. Lubricate valves, plugs and the housing valve bores with clean transmission fluid.
2. Install solenoid switch valve and plugs and plugs (5) and the retainer into the valve body.

Fig. 226: Check Ball Locations

Courtesy of CHRYSLER GROUP, LLC

3. Install the valve body check balls into their proper locations.
4. Position the separator and transfer plate onto the valve body.
5. Install the screws to hold the transfer plate to the valve body. Tighten the screws to 6 N.m (50 in. lbs.).

Fig. 227: Valve Body Components

5 - SOLENOID SWITCH VALVE AND PLUGS	

6. Install the accumulator piston seal rings onto each accumulator piston.
7. Install the accumulator pistons (1, 6-9) and springs into the valve body in the location from which they were removed. Note that all accumulators except the overdrive have two springs. The overdrive accumulator piston (6) has only one spring.
8. Install the Low / Reverse shuttle valve, plug, and retainer (2) into the valve body housing.
9. Position the accumulator cover onto the valve body.

10. Install the screws to hold the accumulator cover onto the valve body. Tighten the screws to 7 N.m (60 in. lbs.).
11. Install the manual valve (4).

Fig. 228: TRS Selector Plate, Detent Spring & Clutch Passage Seals
Courtesy of CHRYSLER GROUP, LLC

1 - TRS SELECTOR PLATE
2 - DETENT SPRING
3 - CLUTCH PASSAGE SEALS

12. Install the TRS selector plate (1) onto the valve body and the manual valve.
13. Position the detent spring (2) onto the valve body.
14. Install the screw to hold the detent spring (2) onto the valve body. Tighten the screw to 4.5 N.m (40 in. lbs.).
15. Install new clutch passage seals (3) onto the valve body, if necessary.

Fig. 229: Solenoid Pack Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - SOLENOID PACK BOLTS (15)

16. Install the solenoid and pressure switch assembly onto the valve body.
17. Install the bolts (1) to hold the solenoid and pressure switch assembly onto the valve body. Tighten the bolts to 6 N.m (50 in. lbs.). Tighten the bolts adjacent to the arrows cast into the bottom of the transfer plate first.

INSTALLATION

INSTALLATION

Fig. 230: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE BODY TO CASE BOLT (6)

1. Place TRS selector plate in the PARK position.
2. Place the transmission in the PARK position.
3. Lubricate seal on the solenoid and pressure switch assembly connector with petroleum jelly.
4. Position valve body in transmission and align the manual lever on the valve body to the pin on the transmission manual shift lever.
5. Seat valve body in case and install one or two bolts to hold valve body in place.
6. Tighten valve body bolts alternately and evenly to 12 N.m (105 in. lbs.) torque.
7. Operate the external manual shift lever and ensure that the TRS selector plate moves correctly into all gear range positions.

Fig. 231: Primary Oil Filter & Oil Cooler Return Filter
Courtesy of CHRYSLER GROUP, LLC

1 - PRIMARY OIL FILTER
2 - COOLER RETURN FILTER
3 - COOLER RETURN FILTER BYPASS VALVE
4 - VALVE BODY

CAUTION: The primary oil filter seal MUST be fully installed flush against the oil pump body. DO NOT install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.

8. Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.
9. Place replacement filter (1) in position on valve body and into the oil pump.
10. Install screw to hold filter to valve body. Tighten screw to 4.5 N.m (40 in. lbs.) torque.
11. Connect the solenoid and pressure switch 23 pin electrical assembly connector.
12. Install oil pan using silicone gasket sealer. Tighten pan bolts to 12 N.m (105 in. lbs.) torque.
13. Lower vehicle and fill transmission with Mopar® ATF +4.
14. Check and adjust gearshift cable, if necessary.

VALVE, SOLENOID SWITCH

DESCRIPTION

DESCRIPTION

The Solenoid Switch Valve (SSV) is located in the main valve body and directs the output from the L/R-TCC solenoid to either the L/R clutch or the TCC control valves

OPERATION

OPERATION

The Solenoid Switch Valve directs the output pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In all other gears, the solenoid switch valve will be in the upshifted position and directs the fluid to the torque converter clutch (TCC) switch valve and TCC regulator valve.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

DESCRIPTION

DESCRIPTION

CAUTION: The AS68RC Transmission uses a unique automatic transmission fluid. MOPAR® AS68RC ATF is the only recommended fluid. Failure to follow this caution will result in damage to the transmission.

The AS68RC six speed automatic transmission displays durability characteristics required in the truck and bus industries, while serving fundamental roles in improving vehicle performance through a new gear train and a multi disc lock up clutch. Other features include better braking performance, higher torque capacity with less weight, smoother shift quality while attaining high reliability.

The hydraulic control mechanism utilizes direct control of main pressure by use of a linear solenoid.

The primary mechanical components of the transmission consist of the following:

- Three sets of clutch packs
- Two sets of brake packs
- A one way clutch
- Three planetary gear sets
- Single stage, three element, two phase type torque converter.
- Valve body
- Linear solenoids
- Shift solenoids
- Oil Pump

The Transmission Control Module (TCM) is the "heart" or "brain" of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. Depending on the vehicle configuration, the TCM may be a standalone module or it may be housed along with the Powertrain Control Module (PCM) in a single module. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices.

TRANSMISSION IDENTIFICATION

Fig. 2: AS68RC Identification Tag
Courtesy of CHRYSLER GROUP, LLC

NOTE: Some transmissions may have the ID. Tag located on the either side of the transmission case.

Transmission identification numbers are located on top of the torque converter housing. Refer to this information when ordering replacement parts. The label gives additional information which may also be necessary for identification purposes.

GEAR RATIOS

THRUST BEARING ORIENTATION

Fig. 3: Thrust Bearing Orientation
Courtesy of CHRYSLER GROUP, LLC

1 - CORRECT INSTALLATION
2 - INCORRECT INSTALLATION

CAUTION: A thrust bearing must be installed correctly. Failure to heed this caution

will result in transmission failure.

When installing a thrust bearing, be certain the rolled surface (outer race) of the thrust bearing contacts the rolled surface of the component.

OPERATION

OPERATION

The AS68RC offers full electronic control of all automatic up and downshifts, and features real-time adaptive closed-loop shift and pressure control. Electronic shift and torque converter clutch controls help protect the transmission from damage due to high temperatures, which can occur under severe operating conditions. By altering shift schedules, line pressure, and converter clutch control, these controls reduce heat generation and increase transmission cooling.

Wide gear range and close ratio was implemented in order to improve both operational and fuel performance. The first gear ratio was lowered by 18% with respect to conventional four speed automatics to improve launch capabilities.

The hydraulic control system design (without electronic assist) provides the transmission with REVERSE, FIFTH and THIRD. This design allows the vehicle to be driven (in "limp-in" mode) in the event of a electronic control system failure, or a situation that the Transmission Control Module (TCM) recognizes as potentially damaging to the transmission.

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. Additionally, the ability to calibrate the TCM with the StarScan® allows for the transmission to deliver optimum shift quality to customers with diverse vehicle applications.

6 - B2 BRAKE	12 - SUN GEAR SHAFT

FIRST GEAR

	K1	K2	K3	B1	B2	F1	GEAR RATIO
FIRST GEAR	X				X	X	3.74:1
X = in operation							

When oil pressure is applied to K1 clutch (2) and the input shaft (1) and sun gear shaft (12) which are directly connected; as a result of the clockwise turning effect of the input shaft (1), the sun gear shaft (12) rotates clockwise.

The rotation of the sun gear shaft (12) is transmitted as counterclockwise turning effect to the P3 planetary pinion gear as it attempts to rotate the P3 planetary annulus gear counterclockwise.

The counterclockwise rotation is checked by the action of the F1 one-way clutch (6), the P3 planetary pinion gear rotates clockwise (revolves centering on the sun gear shaft (12), while rotating clockwise on its own axis.

This conveys a clockwise turning effect to the P3 planetary annulus (9) and the output shaft (8) connected to it.

SECOND GEAR POWER FLOW

Fig. 8: Second Gear Sequence
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT SHAFT	7 -F1 ONE WAY CLUTCH
2 - K1 CLUTCH	8 - OUTPUT SHAFT
3 - K2 CLUTCH	9 - P3 PLANETARY ANNULUS
4 - K3 CLUTCH	10 - P2 PLANETARY ANNULUS
5 - B1 BRAKE	11 - P1 PLANETARY ANNULUS
6 - B2 BRAKE	12 - SUN GEAR SHAFT

SECOND GEAR

	K1	K2	K3	B1	B2	F1	GEAR RATIO
SECOND GEAR	X			X			2.00:1
X = in operation							

When oil pressure is applied to K1 clutch (2) and the input shaft (1) and the sun gear shaft (12) which are directly connected ; the sun gear shaft (12) rotates clockwise.

The clockwise rotation of the sun gear shaft (12) is transmitted as counterclockwise turning effect to the P2 planetary pinion gear and attempts to rotate the P2 planetary annulus gear counterclockwise.

Since the P2 planetary annulus gear is fixed by the B1 brake (5), the P2 planetary pinion gear rotates counterclockwise, and the clockwise turning effect is conveyed to the P2 planetary annulus (10).

As a result, a clockwise turning effect is given to the P3 planetary annulus gear that is connected to the P2 planetary annulus (10).

The clockwise turning effect of the sun gear shaft (12) is also conveyed to the P3 planetary pinion gear, the P3 planetary annulus gear is also decelerated and is rotating clockwise.

The P3 planetary pinion gear revolves clockwise while rotating counterclockwise on its own axis, and the clockwise turning effect is conveyed to the output shaft (8) that is connected to the P3 planetary annulus (9).

THIRD GEAR POWER FLOW

Fig. 9: Third Gear Sequence
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT SHAFT	7 - F1 ONE WAY CLUTCH
2 - K1 CLUTCH	8 - OUTPUT SHAFT
3 - K2 CLUTCH	9 - P3 PLANETARY ANNULUS
4 - K3 CLUTCH	10 - P2 PLANETARY ANNULUS
5 - B1 BRAKE	11 - P1 PLANETARY ANNULUS
6 - B2 BRAKE	12 - SUN GEAR SHAFT

THIRD GEAR

	K1	K2	K3	B1	B2	F1	GEAR RATIO
THIRD GEAR	X		X				1.34:1
X = in operation							

When oil pressure is applied to the K3 clutch (4), the clockwise turning effect of the P1 planetary annulus gear is conveyed and the P2 planetary annulus gear rotates clockwise.

When oil pressure is applied to the K1 clutch (2), the input shaft (1) and the sun gear shaft (12) are directly connected, the sun gear shaft (12) rotates clockwise.

As a result, the P2 planetary pinion gear revolves clockwise while rotating clockwise on its own axis, thus a clockwise turning effect is given to the P3 planetary annulus gear that is connected to the P2 planetary annulus (10).

This rotation and clockwise turning effect of the sun gear shaft (12) gives turning effect to the P3 planetary pinion gear to revolve clockwise while rotating clockwise on its own axis, and a clockwise turning effect then given to the P3 planetary annulus (9) and also to the output shaft (8).

FOURTH GEAR POWER FLOW

Fig. 10: Forth Gear Sequence
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT SHAFT	7 - F1 ONE WAY CLUTCH
2 - K1 CLUTCH	8 - OUTPUT SHAFT
3 - K2 CLUTCH	9 - P3 PLANETARY ANNULUS
4 - K3 CLUTCH	10 - P2 PLANETARY ANNULUS
5 - B1 BRAKE	11 - P1 PLANETARY ANNULUS
6 - B2 BRAKE	12 - SUN GEAR SHAFT

FOURTH GEAR

	K1	K2	K3	B1	B2	F1	GEAR RATIO
FOURTH GEAR	X	X					1.00:1
X = in operation							

When oil pressure is applied to K1 clutch (2), and the input shaft (1) and the sun gear shaft (12) are directly connected, the sun gear shaft (12) rotates clockwise.

When oil pressure is applied to K2 clutch, then the P3 planetary gear rotates clockwise via the P2 planetary gear (10).

This action gives a clockwise turning effect to the P3 planetary annulus (9) and the clockwise turning effect is given to the output shaft (8).

FIFTH GEAR POWER FLOW

Fig. 11: Fifth Gear Sequence
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT SHAFT	7 - F1 ONE WAY CLUTCH
2 - K1 CLUTCH	8 - OUTPUT SHAFT
3 - K2 CLUTCH	9 - P3 PLANETARY ANNULUS
4 - K3 CLUTCH	10 - P2 PLANETARY ANNULUS
5 - B1 BRAKE	11 - P1 PLANETARY ANNULUS
6 - B2 BRAKE	12 - SUN GEAR SHAFT

FIFTH GEAR

	K1	K2	K3	B1	B2	F1	GEAR RATIO
FIFTH GEAR		X	X				0.77:1
X = in operation							

When oil pressure is applied to the K3 clutch (4), a clockwise turning effect of the P1 planetary annulus gear is transmitted and the P2 planetary annulus gear rotates clockwise.

When oil pressure is applied to the K2 clutch (3), a clockwise turning effect is given to the P2 planetary annulus (10).

As the P2 planetary annulus gear rotates, the clockwise turning effect of the sun gear shaft (12) is obtained.

Then, a clockwise turning effect of the P3 planetary annulus gear that is connected to the P2 planetary annulus (10) and a clockwise turning effect of the sun gear shaft gives a clockwise turning effect to the P3 planetary annulus (9), and a clockwise turning effect is also given to the output shaft (8).

SIXTH GEAR POWER FLOW

Fig. 12: Sixth Gear Sequence
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT SHAFT	7 - F1 ONE WAY CLUTCH
2 - K1 CLUTCH	8 - OUTPUT SHAFT
3 - K2 CLUTCH	9 - P3 PLANETARY ANNULUS
4 - K3 CLUTCH	10 - P2 PLANETARY ANNULUS
5 - B1 BRAKE	11 - P1 PLANETARY ANNULUS
6 - B2 BRAKE	12 - SUN GEAR SHAFT

SIXTH GEAR

	K1	K2	K3	B1	B2	F1	GEAR RATIO
SIXTH GEAR		X		X			0.63:1
X = in operation							

Oil pressure is applied to the K2 clutch (3), and a clockwise turning effect is given to the P2 planetary annulus (10).

Oil pressure is applied to the B1 brake, and since the P2 planetary annulus gear is fixed, the P2 planetary pinion gear rotates counterclockwise on it's own axis while revolving clockwise.

As a result, the sun gear shaft (12) obtains a clockwise turning effect.

The clockwise turning effect of the sun gear shaft (12) and the P3 planetary annulus gear connected to the P2 planetary annulus (10) gives a clockwise turning effect to the P3 planetary annulus, and the clockwise turning effect is then also given to the output shaft.

REVERSE GEAR POWER FLOW

Fig. 13: Reverse Gear Power Flow
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT SHAFT	7 - F1 ONE WAY CLUTCH
2 - K1 CLUTCH	8 - OUTPUT SHAFT
3 - K2 CLUTCH	9 - P3 PLANETARY ANNULUS
4 - K3 CLUTCH	10 - P2 PLANETARY ANNULUS
5 - B1 BRAKE	11 - P1 PLANETARY ANNULUS
6 - B2 BRAKE	12 - SUN GEAR SHAFT

REVERSE GEAR

	K1	K2	K3	B1	B2	F1	GEAR RATIO
REVERSE GEAR			X		X		- 3.54:1
X = in operation							

When oil pressure is applied to the K3 clutch (4) and a clockwise turning effect of the P1 planetary annulus gear is transmitted; the P2 planetary annulus gear rotates clockwise.

Oil pressure is then applied to the B2 brake to fix the P3 planetary annulus gear and P2 planetary annulus (10) that is connected to it.

As a result the P2 planetary pinion gear rotates clockwise with it's position fixed giving a counterclockwise turning effect to the sun gear shaft (12).

As a result of the clockwise turning effect given to the sun gear shaft (12), and the fixed P3 planetary annulus gear, the P3 planetary pinion gear revolves counterclockwise while rotating clockwise on it's own axis, and the counterclockwise turning effect is then given to the P3 planetary annulus (9) and also to the output shaft (8).

Schedule	Sump Temperature	Transmission Operation
TEMPERATURE - BASED SHIFT SCHEDULING		
Extreme Cold	Below -20 C (-4 F)	P / R / N, 3rd Only (limp in), No Lock Up

Super Cold	Below -10 C (-14 F)	P / R / N / 4 / 3/ 2 / 1, No OD, No Lock Up (less down shifts)
Cold	Below 5 C (41 F)	P / R / N / 4 / 3/ 2 / 1, No OD, No Lock Up
Warm	Below 25 C (77 F)	All Gear Ratios, No Lock Up
Hot	Between 25-140 C (77-284 F)	Normal Operation
Overheat	Above 140 C (284 F)	Allow second gear lockup to reduce heat generation

DIAGNOSIS AND TESTING

AUTOMATIC TRANSMISSION

NOTE: Before attempting any repair on a automatic transmission, check for Diagnostic Trouble Codes with the scan tool.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary. If the problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

FLUID LEAKAGE

FLUID LEAKAGE - TRANSMISSION OIL LEAK

Begin with a thorough inspection of the transmission, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Clean or degrease the transmission with a water soluble solvent only.
2. Add an oil soluble dye (use as recommended by manufacturer) while the powertrain is at ambient temperature. Start the engine and let idle for approximately 15 minutes. Check the oil dip stick (if equipped) to make sure the dye is thoroughly mixed as indicated with a fluorescent color under a black light.
3. Using a black light, inspect the entire transmission for fluorescent dye, mostly at the suspected area of oil leak. If the oil leak is found and identified, repair per service information instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles) and repeat inspection.

TORQUE CONVERTER HOUSING AREA

Fig. 14: Converter Housing Leak Paths
Courtesy of CHRYSLER GROUP, LLC

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

When diagnosing converter housing (5) fluid leaks, three actions must be taken before repair:

1. Verify proper transmission fluid level.
2. Verify that the leak originates from the converter housing area and is transmission fluid.
3. Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (7). The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal (1) leaks tend to move along the drive hub and onto the rear of the converter. Pump o-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt (3) leaks are generally deposited on the inside of the converter housing (5) and not on the converter itself. Pump seal (1) or gasket (4) leaks usually travel down the inside of the converter housing.

TORQUE CONVERTER LEAKAGE

Fig. 15: Converter Leak Points-Typical
Courtesy of CHRYSLER GROUP, LLC

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD
3 - STARTER RING GEAR
4 - LUG

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (1).
- Torque converter hub weld (2).

PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

1. Record all DTCs and the accompanying DTC Event Data.
2. Check for an appropriate Technical Service Bulletin that applies to the customer complaint.
3. Check fluid level and condition.
4. Road test and note how transmission upshifts, downshifts, and engages.
5. If the complaint was related to shift quality, perform the Quick Learn procedure and the Drive Learn Procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** . .
6. If the complaint still exists, remove, inspect, and repair the transmission as necessary

VEHICLE IS DISABLED

1. Record all DTCs and the accompanying DTC Event Data.
2. With engine running, place transmission in gear and verify correct PRNDL reading. Observe the Input

and Output speeds using the scan tool. If output RPM is greater than zero but vehicle does not move, check for transfer case in Neutral (or failed internally), failed propshaft, or failed / disconnected drive axle. If output RPM is zero and input RPM is greater than zero, internal transmission slippage is indicated. Run clutch slip tests using the scan tool, check oil pan for debris, and air check the various clutch circuits.

3. Shift the transmission into neutral, if both input and output speeds are zero, check drive plate bolts, torque converter, and transmission input shaft.
4. Remove, inspect, and repair the transmission as necessary

ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application charts provide a basis for analyzing road test results.

HYDRAULIC PRESSURE TEST

An accurate tachometer and pressure test gauge are required. Test Gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.) has a 300 psi range and is used at all locations where pressures exceed 100 psi.

PRESSURE TEST PORT LOCATION

NOTE: The AS68RC pressure port plugs are 1/2 x 20 UNF thread, with O-ring.

Fig. 16: Line Pressure Port
Courtesy of CHRYSLER GROUP, LLC

1 - PLANT USE 2 - LINE PRESSURE PORT 3 - PLANT USE

Only one line pressure port (2) is supplied on the transmission case.

A line pressure test is performed to check the performance of the oil pump, to check the functionality of the control valves, and to check parts for oil leakage.

LINE PRESSURES

At Idling Speed	P Range	560 - 870 kpa (81 - 125 psi)
	N Range	
At Stalling Speed	D Range	1660 - 2010 kpa (240 - 290 psi)
	R Range	

TEST PROCEDURE

Fig. 17: Line Pressure Reading
Courtesy of CHRYSLER GROUP, LLC

1 - LINE PRESSURE ADAPTER 100009-1
2 - OIL PRESSURE GAUGE C-3293SP

NOTE: **The AS68RC utilizes closed loop control of pump line pressure. The pressure readings may therefore vary greatly but should always follow line pressure.**

All pressure readings should be taken with the transmission fluid level full, transmission oil at the normal operating temperature. Check the transmission for proper operation in each gear position that is in question or if a specific element is in question.

WARNING: **The line pressure test should be performed by two people. One person moves away from the vehicle and checks the condition of the tires and wheel chocks. The other person performs the test. Failure to follow these instruction may result in personal injury or may be fatal.**

1. Fully apply the parking brake.
2. Apply wheel chocks.
3. Remove the line pressure sensing plug and install adapter fitting (special tool #10009, Adapters, Line Pressure) (1) and the oil pressure gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.) (2).
4. Start the engine and allow it to warm up until the ATF reaches a temperature of 50 - 80° C (120 - 175° F).
5. Depress the brake pedal firmly. While holding down the brake pedal firmly shift into the D range, measure and record the oil pressure at idle.

WARNING: **If the engine speed does not reach the stall level and the rear wheel**

start to turn, ease off the accelerator and stop the test. Failure to follow these instruction may result in personal injury or may be fatal.

6. Fully depress the accelerator pedal. Quickly measure and record the oil pressure at stall speed.

   Take measurements in a similar manner for the R range.

7. Remove adapter fitting (special tool #10009, Adapters, Line Pressure) (1) and the oil pressure gauge (special tool #C-3293-SP, Gauge, Pressure 0-300 P.S.I.) (2).
8. Install the line pressure sensing plug and tighten to 27 N.m (20 ft.lbs.)

POSSIBLE CAUSES

NOTE: **If the measured values do not conform to the standard values, locate the possible cause by referring to the following table and inspect the component.**

TEST RESULT	CONCEIVABLE CAUSE	
Measured value is higher than standard value in all ranges.	Regulator valve is sticking.	
Measured value is lower than standard value in all ranges.	Regulator valve is sticking.	
	Oil pump is worn or clogged filter.	
Measured value is lower than standard value in D range only.	Oil leak exists in D range system.	
	K1 clutch is abnormal.	
Measured value is lower than	K3 clutch is abnormal.	

standard value in R range only.	B2 clutch is abnormal.	

AIR CHECKING TRANSMISSION CLUTCH OPERATION

Fig. 18: Air Check Port Locations
Courtesy of CHRYSLER GROUP, LLC

1 - K1 CLUTCH	4 - B1 BRAKE
2 - K2 CLUTCH	5 - B2 BRAKE
3 - K3 CLUTCH	

Air-pressure testing can be used to check transmission clutch and brake operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission.

NOTE: **The air supply which is used must be free of moisture and dirt. Use a pressure of 400 - 500 kPa (58 - 72 psi) to test clutch operation.**

Apply air pressure at each port. If the clutch or brake is functioning, a soft thump will be heard as the clutch or

brake is applied. The clutch or brake application can also be felt by touching the appropriate element while applying air pressure. As the air pressure is released, the clutch or brake should also release.

CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

1. Verify that a leak condition actually exists.
2. Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Torque converter seal leaks tend to move along the drive hub and onto the rear of the converter. Pump cover seal leaks tend to run down the cover and the inside surface of the bellhousing.

Some leaks, or suspected leaks, may be particularly difficult to locate. If necessary, a Mopar® approved dye should be used to locate and confirm a leak.

TORQUE CONVERTER LEAK POINTS

Fig. 19: Cut Away View Of Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1 - LOCK - UP DAMPER	5 - TURBINE RUNNER
2 - CONVERTER FRONT COVER	6 - STATOR
3 - LOCK - UP PISTON	7 - ONE - WAY CLUTCH
4 - PUMP IMPELLER	

Possible sources of converter leaks are:

1. Leaks at the weld joint around the outside diameter weld.
2. Leaks at the converter hub weld.

In most cases, a torque converter which is wet from transmission fluid indicates a leak at one of these areas.

STANDARD PROCEDURE

STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

SPECIFICATIONS

SPECIFICATIONS

GENERAL SPECIFICATIONS

Transmission Type	Six-Speed Automatic, Electronically Controlled, Fully Adaptive, Electronically Modulated Torque Converter
Lubrication Method	Pump (internal - external gear-type)
Cooling Method	Water Heat Exchanger and/or Air-to-Oil Heat Exchanger
Recommended Fluid	Mopar® AS68RC
Overhaul Capacity	13 L (13.74 Quarts)
Service Fill	6.8 L (7.2 Quarts)

TORQUE SPECIFICATIONS

DESCRIPTION	**N.m**	**Ft. Lbs.**	**In. Lbs.**
Fitting, cooler line at trans	44	32	-
Fitting, Jiffy Tite	25	18	-
Bolt, torque convertor	50	37	-
Bolt / nut, crossmember	68	50	-
Bolt, differential pressure sensor	10		88
Bolt, flexplate to crankshaft	75	55	-
Bolt, oil pan drain	22	16	-
Bolt, fluid filter	10	-	88
Bolt, extension housing	37	27	-
Bolt, oil pump	21	15.5	-
Bolt, oil pump body to cover	21	15.49	-

Plug, pressure sensing	27	20	-
Bolt, PTO cover	15	11	-
Bolt, P1 planetary carrier to transmission case	28	21	-
Bolt, torque converter housing	64	47	-
Bolt, oil pan	7	-	62
Bolt, filler tube	12.5	9	-
Bolt, transmission range	12.5	-	106
Electrical harness connectors to case (valve body)	8	-	71
Bolt, 4WD Extension housing seal plate at output shaft	17	12.5	-
Nut, transmission range	7	-	62
Bolt, input speed sensor	8	-	70
Bolt, output speed sensor	8	-	70
External temperature sensor (at cooler line fitting)	34	25	-
Nut, output shaft	210	155	-
Nuts, manual shift lever	12.5	9	-

VALVE BODY TORQUE SPECIFICATIONS

VALVE BODY TORQUE

DESCRIPTION	N.m	In. Lbs.
Bolt, upper valve body to lower valve body (M5)	5.5	49
Bolts, separator plate to lower valve body (M6)	10	88
(2) 58 mm (2.28 in.)	10	88
(3) 31.2 mm (1.23 in.)	10	88
(4) 42.5 mm (1.67 in.)	10	88
(5) 43 mm (1.69 in.)	10	88
(6) 51 mm (2.00 in.)	10	88
(7) 57.2 mm (2.25 in.)	10	88
(8) 41.5 mm (1.63 in.)	5.5	49
(15) 32.2 mm (1.27 in.)	10	88

Refer to valve body installation. Refer to **VALVE BODY, INSTALLATION**.

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Raise and support the vehicle.
3. Remove any necessary skid plates. Refer to **PLATE, SKID, FRONT, REMOVAL** or **PLATE, SKID, TRANSFER CASE, REMOVAL** .
4. Mark propeller shaft and axle companion flanges for assembly alignment.
5. Remove the rear propeller shaft.
6. Remove the front propeller shaft, if necessary.
7. Remove the engine to transmission inspection cover.
8. Remove the exhaust support bracket from the rear of the transmission.
9. Remove the exhaust particulate filter.

Fig. 20: Drive Plate & Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1 - OPENING	3 - TORQUE CONVERTER
2 - DRIVE PLATE	4 - TORQUE CONVERTER BOLT

10. Rotate crankshaft in clockwise direction until torque converter bolts (4) are accessible. Then remove the 6 bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

CAUTION: Tag the orientation of all electrical connectors. Some electrical

connectors may be interchangeable, damage to the electrical system may occur if the connectors are reversed.

Fig. 21: Input & Output Speed Sensors
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT SPEED SENSOR
2 - OUTPUT SPEED SENSOR

11. Disconnect the input speed sensor (1), output speed sensor (2), electrical connectors and position the harness aside.
12. Disconnect the transmission valve body solenoid and pressure switch electrical connectors and position harness aside.
13. Disconnect the cooler line temperature sensor electrical connector and position harness aside.

Fig. 22: Shift Cable At Transmission
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT CABLE BRACKET	4 - MANUAL SHIFT LEVER
2 - SHIFT CABLE	5 - SHIFT CABLE BRACKET BOLT
3 - SHIFT CABLE BALL SOCKET	

14. Disconnect gearshift cable ball socket (3) from transmission manual valve lever (4).
15. Remove the shift cable (2) from the shift cable bracket (1).
16. Remove the shift cable bracket bolt (5) and shift cable bracket (1).

Fig. 23: Differential Pressure Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

1 - BOLT

17. Remove the bolt (1) securing the differential pressure sensor to the transmission case, if equipped.

Fig. 24: Identifying Transmission & Engine
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE
2 - TRANSMISSION

18. Disconnect the transmission vent hose from the transmission.

19. Support rear of engine with safety stand or jack.

NOTE: Support the transmission where the transmission oil pan meets the transmission case.

20. Raise transmission slightly with service jack to relieve load on crossmember and supports.
21. Remove bolts securing rear support and cushion to transmission and crossmember.
22. Remove transfer case, if necessary. Refer to appropriate Transmission and Transfer Case article.

Fig. 25: Power Bending Bracket Nuts
Courtesy of CHRYSLER GROUP, LLC

23. Remove the nuts (1) securing the power bending bracket to extension housing, if equipped.

Fig. 26: Temperature Sensor & Line Fittings
Courtesy of CHRYSLER GROUP, LLC

1 - TEMPERATURE SENSOR
2 - JIFFY TITE FITTINGS
3 - COOLER LINE FITTINGS

24. Disconnect transmission fluid cooler lines at transmission Jiffy Tite fittings (2) with quick connect tool (special tool #9546, Disconnect Tool).
25. Remove all remaining converter housing bolts.
26. Carefully work transmission and torque converter assembly rearward off engine block dowels.
27. Hold torque converter in place during transmission removal.
28. Lower transmission (2) and remove assembly from under the vehicle.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

29. To remove torque converter, carefully slide torque converter out of the transmission.

DISASSEMBLY

DISASSEMBLY

CAUTION: Tag all snap rings, thrust washers, washers, spacers and thrust bearings, etc. during disassembly for quick identification and assembly. Failure to follow these instructions will damage and cause transmission failure.

Fig. 27: AS68RC Transmission Components
Courtesy of CHRYSLER GROUP, LLC

1 - CONVERTER HOUSING	11 - F1 ONE WAY CLUTCH
2 - TRANSMISSION CASE	12 - OUTPUT SHAFT
3 - K2 CLUTCH	13 - PARKING LOCK GEAR
4 - K1 CLUTCH	14 - EXTENSION HOUSING
5 - P1 PLANETARY GEAR	15 - SUN GEAR SHAFT
6 - K3 CLUTCH	16 - VALVE BODY
7 - P2 PLANETARY GEAR	17 - OIL PAN
	18 - OIL

8 - B1 BRAKE	PUMP
9 - B2 BRAKE	19 - TORQUE CONVERTER
10 - P3 PLANETARY GEAR	20 - INPUT SHAFT

Fig. 28: Drain Plug
Courtesy of CHRYSLER GROUP, LLC

1 - DRAIN PLUG

1. Place the transmission manual shift lever into the park lock position.
2. Plug all openings and clean exterior of transmission with water soluble solvent or a pressure washer.
3. Remove oil pan drain plug (1) and drain fluid from transmission.

Fig. 29: Removing/Installing Torque Converter From Transmission
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Be certain the transmission is secure when removing the torque converter, the torque converter is very heavy. Failure to follow these instructions may result in personal injury or may be fatal.**

4. Remove the torque converter from the transmission.

NOTE: **Gear train end play is a critical pre-disassembly check to help determine the condition of the transmission. End play reading greater than specification (larger gap) indicate that a bearing or thrust plate is either missing, worn or has disintegrated, in which case there will be debris in the oil pan.**

Fig. 30: Measuring Input Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - Socket 8266-19
2 - Dial Indicator C-3339A
3 - Handle 8266-A

5. Using Adapter (special tool #8266-19, Spline Tool, AS68RC Input) (1) and the handle from End-Play Tool Set (special tool #8266B, End Play Socket Set) (2) and Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (3), measure and record the input shaft end-play.

Fig. 31: Removing/Installing Output Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

1 - FLANGE HOLDER TOOL C-3281

6. Using a small chisel pry open the stakes on the output shaft flange nut and install Flange Holder tool (special tool #C-3281, Holder, Flange) (1) to assist in removing the output flange nut. Remove the output shaft flange nut.

Fig. 32: Output Shaft Flange & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT FLANGE
2 - O-RING SEAL

7. Remove the output flange (1) and o-ring seal (2).
8. Using a pry tool, remove the output shaft seal.

Fig. 33: Measuring 2WD Output Shaft End-Play
Courtesy of CHRYSLER GROUP, LLC

1 - PRY TOOL
2 - C-3339A DIAL INDICATOR

9. Install a **NEW** nut on the output shaft and install the Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (2).
10. With the transmission in a vertical position, and using a pry tool (1) on the output shaft nut measure and record the output shaft end-play. The output shaft end-play clearance is 0.50-0.90 mm (0.019-0.035 in.)

NOTE: **The 4WD extension housing has two output shaft end-play shims fore and aft of the output shaft bearing, therefor the output shaft end-play checking procedure must be performed twice. The external shim and snap ring is in place to prevent excess forward pressure on the NO. 9 thrust bearing while the 4WD transfer case is bolted to the extension housing.**

4WD OUTPUT SHAFT END PLAY CHECK

Fig. 34: Measuring 4WD Output Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT END PLAY TOOL 8266-20
2 - DIAL INDICATOR SET C-3339A

1. **With the 4WD extension housing installed onto the transmission case,** install Adapter (special tool #8266-20, Spline Tool, AS68RC Output) (1) and the handle from End-Play Tool Set (special tool #8266B, End Play Socket Set) and Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (2).
2. With the transmission in a vertical position, measure and record the output shaft end-play. The output shaft end-play clearance is 0.00 - 0.24 mm (0.000-0.009 in.)

Fig. 35: 4WD Output Shaft Seal Retainer
Courtesy of CHRYSLER GROUP, LLC

1 - 4WD OUTPUT SHAFT SEAL RETAINER

3. Using a pry tool, remove the output shaft seal.
4. Remove seal retainer (1).

Fig. 36: 4WD Output Shaft & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

1 - 4WD OUTPUT SHAFT SNAP RING
2 - 4WD OUTPUT SHAFT

5. Remove the external snap ring (1) and selectable output shaft end-play washer.
6. Using Adapter (special tool #8266-20, Spline Tool, AS68RC Output) (1) and the handle from End-Play Tool Set (special tool #8266B, End Play Socket Set) and Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (2), measure and record the output shaft end-play. The output shaft end-play clearance is 0.50-0.90 mm (0.019-0.035 in.)

Fig. 37: Torque Converter Housing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Support the bottom of the transmission case before removing the torque converter housing.

11. Remove the bolts securing the torque converter housing to the transmission case and remove the housing.

Fig. 38: Input Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

12. Remove the input speed sensor.

Fig. 39: Output Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

13. Remove the output speed sensor

Fig. 40: Fill Tube & O-Ring
Courtesy of CHRYSLER GROUP, LLC

1 - FILL TUBE O-RING

14. Remove the bolt (if equipped) securing the transmission fill tube to the transmission case and remove the fill tube.
15. Remove the manual shift lever from the transmission.
16. Remove the transmission range sensor. Refer to **SENSOR, TRANSMISSION RANGE, REMOVAL**.
17. Using a pry tool remove the manual shift lever seals (one each side of the transmission).

Fig. 41: Breather Fitting
Courtesy of CHRYSLER GROUP, LLC

18. Remove the breather hose and fitting, if necessary.

Fig. 42: PTO Dust Cover
Courtesy of CHRYSLER GROUP, LLC

19. Remove the PTO dust cover bolts and dust cover.

Fig. 43: Temperature Sensor & Line Fittings
Courtesy of CHRYSLER GROUP, LLC

1 - TEMPERATURE SENSOR
2 - JIFFY TITE FITTINGS
3 - COOLER LINE FITTINGS

20. Remove the temperature sensor (1) from the ATF output cooler line fitting.
21. Remove the Jiffy Tite fittings (2) from both cooler line fittings.
22. Loosen both cooler line fittings (3).
23. Remove both cooler line fittings (3).

Fig. 44: Accumulator Valves
Courtesy of CHRYSLER GROUP, LLC

24. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.
25. Remove the three accumulator valves (1), (2), (3) and then the accumulator springs.

	ACCUMULATORS		SPRING COLOR
	DIAMETER	**HEIGHT**	
ACCUMULATOR NO. ONE (1)	16 mm (0.63 in.)	40.18 mm (1.58 in.)	PURPLE
ACCUMULATOR NO. TWO (2)	20 mm (0.79 in.)	38.18 mm (1.50 in.)	PINK
ACCUMULATOR NO. THREE (3)	20 mm (0.79 in.)	39.18 mm (1.54 in.)	BLUE

26. Air check the transmission. Refer to **AIR CHECKING TRANSMISSION CLUTCH OPERATION**.

Fig. 45: Removing Oil Pump
Courtesy of CHRYSLER GROUP, LLC

NOTE: Using a marker or paint pen, tag the orientation of the oil pump to the transmission case.

27. Remove the bolts securing the oil pump to the transmission case and use tool (special tool #C-3752, Slide Hammers) and adapters (special tool #9981, Adapters, Puller) to remove the oil pump.

Fig. 46: Input Shaft With K1 & K2 Clutch Assemblies
Courtesy of CHRYSLER GROUP, LLC

28. Remove the input shaft assembly with the K1 and K2 clutch assemblies attached.

Fig. 47: K1 & K2 Clutches
Courtesy of CHRYSLER GROUP, LLC

1 - K1 CLUTCH ASSEMBLIES 2 - NO. 1 BEARING RACE (SELECT)
3 - THRUST WASHER
4 - K2 CLUTCH ASSEMBLIES

NOTE: **The input shaft end-play clearance is adjusted by means of a selectable thrust bearing race located between the K1 and the K2 clutch pack retainers.**

29. Remove the K2 clutch assembly (4) and the selectable input shaft end-play thrust bearing number one (2) and thrust washer (3) from the K1 clutch / input shaft assembly (1).

Fig. 48: K1 Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

30. Remove the K1 clutch hub.

Fig. 49: K1 Thrust Bearing No 2
Courtesy of CHRYSLER GROUP, LLC

1 - K1 THRUST BEARING No. 2

31. Remove the K1 thrust bearing number 2.

Fig. 50: K2 Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

32. Remove the K2 clutch hub.

Fig. 51: K2 Hub Thrust Bearing No. 3
Courtesy of CHRYSLER GROUP, LLC

1 - K2 THRUST BEARING No. 3

33. Remove the K2 thrust bearing number three.

35. Remove the front sun / PTO drive gear.

Fig. 54: Front Sun / PTO Rear Thrust Bearing No. 5

Courtesy of CHRYSLER GROUP, LLC

36. Remove the front sun/PTO rear thrust bearing number five.

Fig. 55: Carrier Snap Ring
Courtesy of CHRYSLER GROUP, LLC

NOTE: The beveled edge of the snap ring is facing outward.

37. Remove the snap ring from the transmission case.

Fig. 56: P1 Carrier Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - BOLTS

38. Remove the two bolts (1) securing the P1 carrier to the transmission case.

Fig. 57: Removing P1 Carrier

Courtesy of CHRYSLER GROUP, LLC

39. Remove the P1 carrier using tool (special tool #C-3752, Slide Hammers) and adapters (special tool #9980, Adapters, Puller).

Fig. 58: P1 Thrust Bearing No. 6
Courtesy of CHRYSLER GROUP, LLC

1 - THRUST BEARING NO. 6

40. Remove the P1 thrust bearing number six.

Fig. 59: P1 Annulus Gear
Courtesy of CHRYSLER GROUP, LLC

41. Remove the P1 annulus gear and thrust bearing.

Fig. 60: P1 Annulus Thrust Washer No. 7
Courtesy of CHRYSLER GROUP, LLC

1 - P1 ANNULUS THRUST BEARING NO. 7

42. Remove the P1 annulus thrust bearing number seven.

Fig. 61: K3 Clutch
Courtesy of CHRYSLER GROUP, LLC

43. Remove the K3 clutch assembly.

Fig. 62: K3 Hub Rear Thrust Bearing No. 8
Courtesy of CHRYSLER GROUP, LLC

44. Remove the K3 hub rear thrust bearing number eight.

81b39fbe

Fig. 63: K3 Support Seal Rings
Courtesy of CHRYSLER GROUP, LLC

1 - K3 SUPPORT SEAL RINGS

45. Remove the K3 support seal rings if necessary.

819b97cb

Fig. 64: Extension Housing
Courtesy of CHRYSLER GROUP, LLC

46. Remove the bolts securing the 2WD or the 4WD extension housing to the transmission case and remove the housing.

Fig. 65: Compressing B2 Piston With Special Tools
Courtesy of CHRYSLER GROUP, LLC

1 - BOLT 8622
2 - COMPRESSOR PLATE MB991790
3 - WASHER 9982-2

47. Install tools (special tool #8622, Screw, Clutch Spring Compressor) (1), (special tool #9982-2, Plate, Back Up) (3), (special tool #MB991790, Compressor, Spring) (2) onto the B2 clutch piston assembly in the extension housing and compress the piston.

Fig. 66: B2 Piston Snap Ring
Courtesy of CHRYSLER GROUP, LLC

1 - SNAP RING

48. Remove the B2 piston snap ring (1).

Fig. 67: B2 Piston Return Spring

Courtesy of CHRYSLER GROUP, LLC

49. Remove the B2 piston return spring assembly.

Fig. 68: B2 Brake Piston
Courtesy of CHRYSLER GROUP, LLC

50. Remove the B2 piston.

Fig. 69: Output Shaft End Play Selectable Washer & Spacer

Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT END PLAY SELECTABLE WASHER
2 - SPACER

51. Remove the output shaft end play selectable washer (1) and the spacer (2)

Fig. 70: Output Shaft Lock Gear
Courtesy of CHRYSLER GROUP, LLC

NOTE: **On 4WD models remove the snap ring from the output shaft in order to remove the output shaft park lock gear from the 4WD extension housing.**

52. Remove the output shaft and the park lock gear.

Fig. 71: F1 Clutch Thrust Bearing No. 14
Courtesy of CHRYSLER GROUP, LLC

1 - F1 CLUTCH THRUST BEARING NO. 14

53. Remove the F1 clutch thrust bearing number fourteen.

Fig. 72: One Way Clutch Snap Ring
Courtesy of CHRYSLER GROUP, LLC

54. Remove the F1 one way clutch rear snap ring.

Fig. 73: F1 One Way Clutch
Courtesy of CHRYSLER GROUP, LLC

55. Scribe the orientation of the F1 one way clutch to the transmission case.
56. Remove the F1 one way clutch and front snap ring.

Fig. 74: Park Pawl Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - PARK PAWL
2 - PARK PAWL WASHER
3 - PARK PAWL SPRING

57. Remove the park pawl assembly from the transmission case.

Fig. 75: P3 Annulus Gear
Courtesy of CHRYSLER GROUP, LLC

58. Remove the P3 annulus gear.

Fig. 76: Thrust Bearing & Washer No. 13
Courtesy of CHRYSLER GROUP, LLC

59. Remove the thrust bearing and washer number thirteen.

Fig. 77: P3 Planetary Gear Carrier
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Be certain that the P3 carrier thrust bearing race is in position while removing the P3 carrier.**

60. Remove the P3 planetary gear carrier.

Fig. 78: P3 Planetary Front Thrust Bearing No. 12
Courtesy of CHRYSLER GROUP, LLC

61. Remove the P3 planetary gear carrier front thrust bearing number twelve.

Fig. 79: Sun Gear Shaft, Thrust Bearing No. 11 & Thrust Bearing Race/Washer
Courtesy of CHRYSLER GROUP, LLC

1 - SUN GEAR SHAFT
2 - THRUST BEARING NO. 11
3 - THRUST BEARING RACE / WASHER

62. Remove the sun gear shaft (1) thrust bearing number eleven (2) and thrust bearing race / washer (3).

NOTE: **The selectable clutch pack reaction plates are identified by an alpha numeric numeral stamped into the face of the plate.**

Fig. 80: B2 Brake Clutches
Courtesy of CHRYSLER GROUP, LLC

63. Remove the snap ring and B2 brake clutch assembly.

Fig. 81: P2 Planetary Gear Carrier
Courtesy of CHRYSLER GROUP, LLC

64. Remove the P2 planetary gear carrier.

Fig. 82: P2 Planetary Gear Thrust Bearing No. 10
Courtesy of CHRYSLER GROUP, LLC

65. Remove the P2 planetary gear thrust bearing number ten.

Fig. 83: P2 Planetary Annulus Gear
Courtesy of CHRYSLER GROUP, LLC

66. Remove the P2 planetary annulus gear.

Fig. 84: P2 Planetary Annulus Gear Thrust Bearing No. 9
Courtesy of CHRYSLER GROUP, LLC

67. Remove the P2 planetary annulus gear thrust bearing number nine.

Fig. 85: Two Snap Rings

Courtesy of CHRYSLER GROUP, LLC

1 - SNAP RINGS

68. Remove the two snap rings (1).

Fig. 86: B1 Brake Clutch Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The selectable clutch pack reaction plates are identified by an alpha numeric numeral stamped onto the face of the plate.**

69. Remove the B1 brake clutch assembly.

Fig. 87: Compressing B1 Brake Piston
Courtesy of CHRYSLER GROUP, LLC

70. Install tools (special tool #8622, Screw, Clutch Spring Compressor), (special tool #9982, Compressor, Spring) and MB 991790, onto the B1 brake piston assembly and compress the piston.

Fig. 88: B1 Brake Piston Snap Ring & Return Spring Assembly
Courtesy of CHRYSLER GROUP, LLC

71. Remove the B1 brake piston snap ring and the B1 piston return spring assembly.

Fig. 89: B1 Piston Groove
Courtesy of CHRYSLER GROUP, LLC

NOTE: The orientation of the groove on the B1 piston is at the 12:00 o'clock position to the transmission case.

72. Remove the B1 brake piston.

CLEANING

CLEANING

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® AS68RC, Automatic Transmission Fluid, during overhaul and assembly. Use petroleum jelly to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid

passages are clear.

NOTE: **Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

INSPECTION

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

ASSEMBLY

NOTE: **If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .**

NOTE: **Apply trans jell or petroleum jelly to all slide portions, rolling contacts surfaces, thrust surfaces etc. to prevent burnout during initial operation. Lubricate O-rings and O-ring seals with MOPAR® AS68RC ATF. Soak all friction discs in MOPAR® AS68RC ATF for at least two hours before assembly of clutch packs.**

	20 - INPUT

Fig. 91: Thrust Bearing Orientation
Courtesy of CHRYSLER GROUP, LLC

1 - CORRECT INSTALLATION
2 - INCORRECT INSTALLATION

CAUTION: A thrust bearing must be installed correctly or transmission failure may occur.

When installing a thrust bearing be certain the rolled surface (outer race) of the thrust bearing contacts the rolled surface of the component.

NOTE: There five snap ring in the back half of the transmission case, three wide and two narrow snap rings.

Fig. 92: Snap Ring Orientation
Courtesy of CHRYSLER GROUP, LLC

1 - WIDE B1 SNAP RING
2 - WIDE B1 CLUTCH SNAP RING
3 - WIDE B2 CLUTCH SNAP RING
4 - NARROW F1 CLUTCH INNER SNAP RING
5 - NARROW F1 CLUTCH OUTER SNAP RING

NOTE: **Before final assembly of the transmission a B1 and B2 piston and clutch pack clearance check must be performed.**

Fig. 93: B2 Brake Piston
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the B2 brake piston seals with MOPAR® AS68RC ATF and install the B2 brake piston into the extension housing.

Fig. 94: B2 Piston Return Spring
Courtesy of CHRYSLER GROUP, LLC

2. Install the B2 brake piston return spring assembly.

Fig. 95: Compressing B2 Piston With Special Tools
Courtesy of CHRYSLER GROUP, LLC

1 - BOLT 8622
2 - COMPRESSOR PLATE MB991790
3 - WASHER 9982-2

3. Install Bolt (special tool #8622, Screw, Clutch Spring Compressor) (1), Washer (special tool #9982-2, Plate, Back Up) (3) and Compressor (special tool #MB991790, Compressor, Spring) (2) onto the B2 brake piston assembly and compress the B2 brake piston assembly.

Fig. 96: B2 Piston Snap Ring
Courtesy of CHRYSLER GROUP, LLC

1 - SNAP RING

4. Install the B2 brake piston snap ring (1).

Fig. 97: B2 Clutch Snap Ring

Courtesy of CHRYSLER GROUP, LLC

1 - SNAP RING

5. Install the B2 wide snap ring (1).

Fig. 98: B2 Brake Clutches
Courtesy of CHRYSLER GROUP, LLC

NOTE: **For the B2 brake, only the rear most plate (towards the piston) is selectable. However, the front most pressure plate (towards snap ring), always uses the plate marked "D".**

6. Install the (special tool #9982-1, Compressor) compressor plate into the transmission case in order to check the clutch pack clearance.
7. Install the B2 brake clutch pack into the transmission case.

CLUTCH CLEARANCE AND PISTON TRAVEL COMBINATIONS

	MEASUREMENT ITEM	CONDITION	SUSPECTED CAUSE	ACTION
	Clutch Clearance	Normal	Discs/Plates are worn thin and warped,	Replace the discs and plates and recheck clearances. If not OK-

	Piston Travel	High	snap ring and groove height, piston wear.	Check the piston, snap ring and snap ring groove
LOW PROBABILITY	Clutch Clearance	Normal	Piston travel issue (interference, obstruction from broken part) or Discs/Plates are too thick (above specs.) and snap ring grove at wrong height (high).	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove
	Piston Travel	Low		
LOW PROBABILITY	Clutch Clearance	High	Low possibility, piston height, snap-ring groove, snap-ring thickness, disk and plates thickness and flatness.	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove.
	Piston Travel	Normal		
	Clutch Clearance	High	Discs/Plates are worn (thin) or snap ring thickness groove height, piston height.	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove.
	Piston Travel	High		
			Piston travel issue	Replace

LOW PROBABILITY	Clutch Clearance	High	(interference, obstruction from broken part combined with improper piston height, snap ring groove wear or height, or snap ring thickness) or piston does not fully return.	the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove.
	Piston Travel	Low		
	Clutch Clearance	Low	Discs/Plates are not flat or combination of high piston height and low snap ring groove height.	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove.
	Piston Travel	Normal		
	Clutch Clearance	Low	Discs/Plates are worn (thin) and warped.	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove
	Piston Travel	High		
	Clutch Clearance	Low	Discs/Plates are too thick/extra discs or snap	Replace the discs and plates and recheck clearances. If not OK-

	Piston Travel	Low	ring height too low or piston too tall.	Check the piston, snap ring and snap ring groove

Fig. 99: Dial Indicator On B2 Brake Piston
Courtesy of CHRYSLER GROUP, LLC

1 - 9524 90° DIAL INDICATOR
2 - 9982-1 CLUTCH COMPRESSOR PLATE

NOTE: **If the B2 brake piston assembly stroke is not within tolerance, check the B2 brake piston seals and the hydraulic fluid circuit path.**

8. Using two bolts, temporarily install the extension housing onto the transmission case.
9. Install the (special tool #9524, Indicator, Dial) 90° Dial Indicator and mounts from the Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) and Extension Tip MLR- (special tool #6268, Tip, Dial Indicator) so that the extension tip passes through one of the two smaller holes in the transmission case bulk head and through a void in the (special tool #9982-1, Compressor) compressor plate in order to contact the B2 brake piston.

Fig. 100: Applying Air To Check B2 Brake Piston Stroke
Courtesy of CHRYSLER GROUP, LLC

10. Apply 400-500 kPa (58 - 72 psi) of air to check the B2 brake piston stroke. Refer to **AIR CHECKING TRANSMISSION CLUTCH OPERATION**.

    The B2 brake piston stroke clearance is 1.84 - 2.28 mm (0.072 - 0.090 in.).

    NOTE: The selectable clutch pack reaction plates are identified by an alpha numeric numeral stamped into the face of the plate.

Fig. 101: Dial Indicator On Compressor Plate
Courtesy of CHRYSLER GROUP, LLC

1 - 9524 90° DIAL INDICATOR
2 -9982 CLUTCH COMPRESSOR PLATE

11. Move the 90° Dial Indicator (special tool #9524, Indicator, Dial) and mounts from Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) and extension tip MLR- (special tool #6268, Tip, Dial Indicator) so that it makes contact with the (special tool #9982-1, Compressor) compressor plate (2).

Fig. 102: Applying Air To Check B2 Brake Clutch Clearance
Courtesy of CHRYSLER GROUP, LLC

12. Apply 400 - 500 kPa(58 - 72 psi) of air to check the B2 brake clutch clearance. Refer to **AIR CHECKING TRANSMISSION CLUTCH OPERATION**.

    The B2 brake clutch pack clearance is 1.60 - 2.04 mm (0.063 - 0.080 in.). If the clearance is not within tolerance choose the correct selectable reaction plate.

    - A = 5.40 mm (0.212 in.)
    - B = 5.60 mm (0.220 in.)
    - C = 5.80 mm (0.228 in.)
    - D = 6.00 mm (0.236 in.)
13. Assemble and disassemble as necessary to achieve the correct B2 brake clearance.
14. Remove the dial indicator set.
15. Remove the extension housing and set aside.
16. Remove the B2 clutch pack and snap ring.
17. Remove the (special tool #9982-1, Compressor) compressor plate.

Fig. 103: B1 Piston Groove
Courtesy of CHRYSLER GROUP, LLC

NOTE: The orientation of the groove on the B1 piston is at the 12:00 o'clock position to the transmission case.

18. Apply MOPAR® AS68RC ATF to the seals of the B1 piston and install the piston into the transmission case.

Fig. 104: Compressing B1 Brake Piston
Courtesy of CHRYSLER GROUP, LLC

19. Install the B1 piston return spring and a wide snap ring into the transmission case using tools (special tool #8622, Screw, Clutch Spring Compressor) and (special tool #9982-2, Plate, Back Up).

Fig. 105: B1 Brake Clutch Assembly
Courtesy of CHRYSLER GROUP, LLC

20. Install the B1 clutch assembly, into the deeper grooves of the transmission case with the thickest pressure plate to the inside and install a wide snap ring.

819fc756

Fig. 106: Checking B1 Brake Piston Assembly Stroke
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the B1 brake piston assembly stroke is not within tolerance, check the B1 brake piston seals and the hydraulic fluid circuit path.

21. Install the Dial Indicator set (special tool #C-3339A, Set, Dial Indicator) and extension tip MLR- (special tool #6268, Tip, Dial Indicator) so the dial indicator tip contacts the B1 brake piston and check the B1 brake piston assembly stroke.

Fig. 107: Applying Air To Check B1 Brake Piston Stroke
Courtesy of CHRYSLER GROUP, LLC

1 - DIAL INDICATOR
2 - AIR APPLY

22. Apply 400-500 kPa (58 - 72 psi) of air to check the B1 brake piston stroke. Refer to **AIR CHECKING TRANSMISSION CLUTCH OPERATION**.

    The B1 brake piston stroke clearance is 1.55 - 1.80 mm (0.061 - 0.071 in.)

Fig. 108: Applying Air To Check B1 Brake Clutch Pack Clearance
Courtesy of CHRYSLER GROUP, LLC

1 - DIAL INDICATOR
2 - AIR APPLY

NOTE: **The selectable clutch pack reaction plates are identified by an alpha numeric numeral stamped into the face of the plate.**

23. Move the Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) and extension tip MLR- (special tool #6268, Tip, Dial Indicator) so the tip makes contact with the B1 brake clutch pack apply 400 - 500 kPa(58 - 72 psi) of air (2) to check the B1 brake clutch pack clearance. Refer to **AIR CHECKING TRANSMISSION CLUTCH OPERATION**.

    The B1 brake clutch pack clearance is 1.25 - 1.50 mm (0.049 - 0.059 in.). If the clearance is not within tolerance, choose the correct selectable reaction plate.

    - A = 5.40 mm (0.212 in.)
    - B = 5.55 mm (0.218 in.)
    - C = 5.70 mm (0.224 in.)
    - D = 5.85 mm (0.230 in.)
    - E = 6.0 mm (0.236 in.)
24. Remove the dial indicator set (special tool #C-3339A, Set, Dial Indicator) and extension tip MLR- (special tool #6268, Tip, Dial Indicator).

CAUTION: While installing the trust washers and bearings be certain they are orientated correctly to the transmission component. A thrust bearing must be installed correctly or transmission failure may occur.

Courtesy of CHRYSLER GROUP, LLC

1 - SUN GEAR SHAFT
2 - THRUST BEARING NO. 11
3 - THRUST BEARING RACE / WASHER

30. Lubricate with trans jell or petroleum jelly and install the number eleven thrust bearing (2) and thrust bearing race / washer (3) and the sun gear shaft (1) into the transmission case.

Fig. 115: P3 Planetary Front Thrust Bearing No. 12
Courtesy of CHRYSLER GROUP, LLC

31. Lubricate with trans jell or petroleum jelly and install the number twelve thrust bearing.

Fig. 116: P3 Planetary Gear Carrier
Courtesy of CHRYSLER GROUP, LLC

32. Install the P3 planetary gear carrier the transmission case.

Fig. 117: Thrust Bearing & Washer No. 13
Courtesy of CHRYSLER GROUP, LLC

33. Lubricate with trans jell or petroleum jelly and install the number thirteen thrust bearing and washer.

Fig. 118: P3 Annulus Gear
Courtesy of CHRYSLER GROUP, LLC

34. Install the P3 planetary annulus gear into the transmission case.

Fig. 119: F1 One Way Clutch

Courtesy of CHRYSLER GROUP, LLC

35. Install a narrow inner F1 one way clutch snap ring into the transmission case.
36. Align the F1 one way clutch to the scribe marks and install the F1 one way clutch into the transmission case.
37. Install a narrow F1 one way clutch outer snap ring into the transmission case.

Fig. 120: Park Pawl Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - PARK PAWL
2 - PARK PAWL WASHER
3 - PARK PAWL SPRING

NOTE: **Install the park brake pawl with spring to pull pawl away from the park brake gear.**

38. Install the park brake pawl assembly.

Fig. 121: F1 Clutch Thrust Bearing No. 14
Courtesy of CHRYSLER GROUP, LLC

1 - F1 CLUTCH THRUST BEARING NO. 14

39. Lubricate with trans jell or petroleum jelly and install the number fourteen thrust bearing.

Fig. 122: Output Shaft/Park Lock Gear Assembly
Courtesy of CHRYSLER GROUP, LLC

40. Install the output shaft / park lock gear assembly into the transmission case.

Fig. 123: Output Shaft End Play Selectable Washer & Spacer
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT END PLAY SELECTABLE WASHER
2 - SPACER

41. Install the spacer (2), so that the spacer covers the lower splines of the output shaft, and install the selectable end play washer (1) onto the output shaft and park lock gear assembly.
42. Install the extension housing with a new gasket, while aligning park brake shaft and the transmission range selector shaft, onto the transmission case.
43. Install and tighten the extension housing bolts. Tighten bolts to 37 N.m (27 ft.lbs.)

NOTE: **End- play readings that are below specification (smaller gap) may indicate that a bearing is out of position or that the transmission might have been set-up incorrectly.**

NOTE: **The selectable output shaft end-play washers are identified by an alpha numeric numeral stamped onto the face of the washer.**

Fig. 124: Measuring 2WD Output Shaft End-Play
Courtesy of CHRYSLER GROUP, LLC

1 - PRY TOOL
2 - C-3339A DIAL INDICATOR

44. Install a **NEW** nut on the output shaft and install the Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (2).
45. With the transmission in a vertical position, and using a pry tool (1) on the output shaft nut measure and record the output shaft end-play. The output shaft end-play clearance is 0.50-0.90 mm (0.019-0.035 in.). Assemble and disassemble as necessary to achieve the correct output shaft end-play clearance.

2WD and 4WD EXTENSION HOUSING INTERNAL SELECTABLE END-PLAY WASHERS

- I = 1.00mm (0.039 in.)
- J = 1.20 mm (0.047 in.)
- K = 1.40 mm (0.055 in.)
- L = 1.60 mm (0.063 in.)
- M = 1.80 mm (0.071 in.)
- N = 2.00 mm (0.079 in.)

46. Remove the Dial Indicator (2) set up.

4WD OUTPUT SHAFT END PLAY CHECK

NOTE: The 4WD extension housing has two selectable output shaft end-play

washers, fore and aft of the output shaft bearing, therefore the output shaft end-play checking procedure must be performed twice. The external selectable end-play washer and snap ring is in place to prevent excess forward pressure on the NO. 9 thrust bearing while the 4WD transfer case is bolted to the extension housing.

Fig. 125: Extension Housing
Courtesy of CHRYSLER GROUP, LLC

1. Install the 4WD extension housing with a new gasket, while aligning park brake shaft and the transmission range selector shaft, onto the transmission case. Tighten bolts to 37 N.m (27 ft.lbs.)

Fig. 126: Measuring 4WD Output Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT END PLAY TOOL 8266-20
2 - DIAL INDICATOR SET C-3339A

2. Install Adapter (special tool #8266-20, Spline Tool, AS68RC Output) (1) and the handle from End-Play Tool Set (special tool #8266B, End Play Socket Set) and Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (2).
3. With the transmission in a vertical position, measure and record the output shaft end-play. The output shaft end-play clearance is 0.50-0.90 mm (0.019-0.035 in.), Assemble and disassemble as necessary to achieve the correct output shaft end-play clearance.

Fig. 127: 4WD Output Shaft & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

1 - 4WD OUTPUT SHAFT SNAP RING
2 - 4WD OUTPUT SHAFT

4. Install the selectable output shaft end-play washer and the external snap ring (1).

Fig. 128: Measuring 4WD Output Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT END PLAY TOOL 8266-20
2 - DIAL INDICATOR SET C-3339A

5. Using Adapter (special tool #8266-20, Spline Tool, AS68RC Output) (1) and the handle from End-Play Tool Set (special tool #8266B, End Play Socket Set) and Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (2), while the transmission is still in a vertical position measure and record the output shaft end-play. The output shaft end-play clearance is 0.00 - 0.24 mm (0.000-0.009 in.). Assemble and disassemble as necessary to achieve the correct output shaft end-play clearance.

Fig. 129: 4WD Output Shaft Seal Retainer
Courtesy of CHRYSLER GROUP, LLC

1 - 4WD OUTPUT SHAFT SEAL RETAINER

4WD EXTERNAL EXTENSION HOUSING SELECTABLE END PLAY WASHERS

- I = 1.0 mm (0.039 in.)
- J = 1.20 mm (0.047 in.)
- K = 1.40 mm (0.055 in.)
- L = 1.60 mm (0.063 in.)
- M = 1.80 mm (0.071 in.)
- N = 2.0. mm (0.079 in.)
- O = 2.20 mm (0.087 in.)
- P = 2.40 mm (0.094 in.)

6. Remove the Dial Indicator set up.

7. Install the output shaft seal retainer (1) and the bolts. Tighten the bolts to 17 N.m (12.5 ft.lbs.).
8. Install a new output shaft seal using Installer tool (special tool #9984, Installer, Seal).

Fig. 130: Output Shaft Flange & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

1 - OUTPUT SHAFT FLANGE
2 - O-RING SEAL

47. Install a new output shaft seal into the 2WD extension housing using Installer tool (special tool #9985, Installer, Seal).
48. Install the output shaft flange (1) and O-ring seal (2).

Fig. 131: Removing/Installing Output Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

1 - FLANGE HOLDER TOOL C-3281

NOTE: Do not exceed the specified torque value on the output shaft nut.

49. Install the **NEW** output shaft flange nut and tighten to 210 N.m (155 ft.lbs.).
50. Using a small chisel, stake the output shaft flange nut into the void on the output shaft.

CAUTION: While installing the trust washers and bearings be certain they are orientated correctly to the transmission component. A thrust bearing must be installed correctly or transmission failure may occur.

1 - K1 CLUTCH ASSEMBLIES 2 - NO. 1 BEARING RACE (SELECT)
3 - THRUST WASHER
4 - K2 CLUTCH ASSEMBLIES

67. Apply trans jell or petroleum jelly onto the input shaft seal rings and install the K2 clutch assembly (3) onto the K1 clutch / input shaft assembly (1) with selectable input shaft end-play thrust bearing number one (2) and thrust washer (3) in place.

Fig. 150: Input Shaft With K1 & K2 Clutch Assemblies
Courtesy of CHRYSLER GROUP, LLC

68. Install the K2 clutch assembly and the K1 clutch / input shaft assembly into the transmission case.

CAUTION: If the oil pump is being replaced, the valve body must also be replaced. Failure to follow these instructions will damage the transmission.

NOTE: Be certain the input shaft seal rings are in place as well as the seal ring on the oil pump hub.

Fig. 151: Oil Pump Nylon Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

1 - NYLON THRUST WASHER

69. Lubricate with trans jell or petroleum jelly and install the nylon thrust washer (1) onto the oil pump.

NOTE: **Two pin punches inserted through the oil pump mounting holes will aid in the installation of the oil pump.**

Fig. 152: Installing Oil Pump
Courtesy of CHRYSLER GROUP, LLC

70. Install a new torque converter hub seal into the oil pump using Installation tool (special tool #9987, Installer, Seal).
71. Lubricate the oil pump o-ring with MOPAR® AS68RC ATF.
72. Install the oil pump with a new gasket onto the transmission case.
73. Apply a light coating of MOPAR® thread sealant onto the oil pump bolts and install the bolts. Tighten bolts in a crisscross fashion to 21 N.m (15.5 ft.lbs.).

Fig. 153: Measuring Input Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - Socket 8266-19
2 - Dial Indicator C-3339A
3 - Handle 8266-A

Fig. 154: K1 & K2 Clutches

Courtesy of CHRYSLER GROUP, LLC

1 - K1 CLUTCH ASSEMBLIES 2 - NO. 1 BEARING RACE (SELECT)
3 - THRUST WASHER
4 - K2 CLUTCH ASSEMBLIES

NOTE: **The input shaft end-play clearance may be checked with or without the torque converter housing in place.**

NOTE: **The input shaft end-play clearance is adjusted by means of the selectable NO. 1 thrust bearing race (2). The Thrust Washer (3) is non selectable.**

74. Install the Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) and Input Shaft Spline Socket (special tool #8266-19, Spline Tool, AS68RC Input) to check the input shaft end-play clearance.

    The input shaft end-play clearance for both 2WD and 4WD is 0.50-0.90 mm (0.019-0.035 in.). If the clearance is not within tolerance choose the correct selectable thrust bearing race.

    - Bearing race number one = 0.81 mm (0.031 in.)
    - Bearing race number two = 1.10 mm (0.043 in.)
    - Bearing race number three = 1.60 mm (0.063 in.)
75. Assemble and disassemble as necessary to achieve the input shaft end-play clearance.
76. Remove the Dial Indicator (2) set up.

Fig. 155: Accumulator Valves
Courtesy of CHRYSLER GROUP, LLC

NOTE: These dimensions are at time of production.

	ACCUMULATORS		SPRING COLOR
	DIAMETER	**HEIGHT**	
ACCUMULATOR NO. ONE (1)	16 mm (0.63 in.)	40.18 mm (1.58 in.)	PURPLE
ACCUMULATOR NO. TWO (2)	20 mm (0.79 in.)	38.18 mm (1.50 in.)	PINK
ACCUMULATOR NO. THREE (3)	20 mm (0.79 in.)	39.18 mm (1.54 in.)	BLUE

77. Install the three accumulator springs first and then the three accumulator valves (1), (2),(3).
78. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.

Fig. 156: Torque Converter Housing
Courtesy of CHRYSLER GROUP, LLC

79. Install the torque converter housing to the transmission case.
80. Install the torque converter housing bolts and tighten to 64 N.m (47 ft.lbs.)

Fig. 157: Temperature Sensor & Line Fittings
Courtesy of CHRYSLER GROUP, LLC

1 - TEMPERATURE SENSOR
2 - JIFFY TITE FITTINGS
3 - COOLER LINE FITTINGS

81. Apply trans jell or petroleum jelly onto the cooler line seals and install the cooler line fittings (3) into the transmission case.
82. Tighten the cooler line fittings (3) to 44 N.m (32 in.lbs.)
83. Apply trans jell or petroleum jelly onto the Jiffy Tite fitting seals and install the Jiffy Tite fittings (2) onto the cooler line fittings.
84. Tighten Jiffy Tite fittings (2) to 25 N.m (18 ft.lbs.)
85. Install the ATF output temperature sensor (1) onto the output cooler line fitting.
86. Tighten the ATF output temperature sensor (1) to 34 N.m (25 ft.lbs.)

Fig. 158: PTO Dust Cover
Courtesy of CHRYSLER GROUP, LLC

87. Install a new gasket onto the PTO cover and apply a light coating of MOPAR® thread sealant onto the PTO cover bolts, install the bolts. Tighten the PTO cover bolts to 15 N.m (11 ft.lbs.).

Fig. 159: Breather Fitting
Courtesy of CHRYSLER GROUP, LLC

88. Lubricate the o-ring with AS68RC ATF and install a new breather hose fitting into the transmission case.

Fig. 160: Manual Shift Lever Seal Installation
Courtesy of CHRYSLER GROUP, LLC

89. Lubricate the manual shift lever seals (one on each side of the transmission) with trans jell or petroleum jelly and install the seal into the transmission case.

Fig. 161: Fill Tube & O-Ring
Courtesy of CHRYSLER GROUP, LLC

1 - FILL TUBE O-RING

90. Lubricate the transmission fill tube O-ring (1) with trans jell or petroleum jelly and install the fill tube into the transmission case.
91. Install the transmission fill tube to case bolt (if equipped) and tighten bolt to 12.5 N.m (9 ft.lbs.).
92. Install the transmission range sensor. Refer to **SENSOR, TRANSMISSION RANGE, INSTALLATION**.
93. Install the manual shift lever onto the transmission manual shift lever shaft. Tighten the inside nut to 12.5 N.m (9 ft.lbs.). While holding the inside nut tighten the outside nut to 12.5 N.m (9 ft.lbs.).

Fig. 162: Output Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

94. Apply trans jell or petroleum jelly onto the output speed sensor seal and install the output speed sensor into the transmission case.
95. Install the output speed sensor bolt. Tighten the output speed sensor bolt to 8 N.m (70 in.lbs.).

Fig. 163: Input Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

96. Apply trans jell or petroleum jelly onto the input speed sensor seal and install the input speed sensor into the transmission case.
97. Install the input speed sensor bolt. Tighten the input speed sensor bolt to 8 N.m (70 in.lbs.).

WARNING: Be certain the transmission is secure when installing the torque converter, the torque converter is very heavy. Failure to follow these instructions may result in personal injury or may be fatal.

Fig. 164: Removing/Installing Torque Converter From Transmission
Courtesy of CHRYSLER GROUP, LLC

98. Apply trans jell or petroleum jelly onto the input shaft ring seals and torque converter hub seal.
99. Install the torque converter onto the input shaft while applying inward pressure and rotating back and forth at the same time in order to align the input shaft splines and the two teeth on the oil pump drive gear.
100. Install a C-clamp or similar devise to secure the torque converter into the torque converter housing.

INSTALLATION

INSTALLATION

NOTE: **After the installation of the transmission, a quick learn must be performed using the scan tool. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .**

Fig. 165: Checking Torque Converter Seating
Courtesy of CHRYSLER GROUP, LLC

1 - SCALE
2 - STRAIGHTEDGE

NOTE: If the torque converter hub is severely scored or gouged it must be replaced.

1. Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.
2. If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.
3. Lubricate oil pump seal lip with trans jell or petroleum jelly.
4. Align converter and oil pump.
5. Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.
6. Check converter seating with steel scale (1) and straightedge (2). Surface of converter lugs should be at least 28.2 mm (1.12 in.) to rear of straightedge when converter is fully seated.
7. Temporarily secure converter with C-clamp.

Fig. 166: Identifying Transmission & Engine
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE
2 - TRANSMISSION

8. Position transmission on jack and secure it with chains.
9. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**
10. Apply a light coating of MOPAR® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.
11. Raise transmission (2) and align the torque converter with the drive plate and transmission converter housing with the engine block.
12. Move transmission forward. Then raise, lower or tilt transmission to align the converter housing with engine block dowels.
13. Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.
14. Install the bolts to attach the transmission to the engine. Tighten the bolts to 64 N.m (47 in. lbs.)

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Failure to follow this caution may result in transmission damage.

15. Rotate crankshaft with socket wrench on dampener bolt in clockwise direction and install **NEW** torque converter to driveplate bolts. Tighten bolts to 31 N.m (270 in. lbs.).

CAUTION: If replacing a engine mount / bracket, be certain to inspect all other engine mounts in the system. Failure to follow this caution may result in damage to the vehicle.

Fig. 167: Power Bending Bracket Nuts
Courtesy of CHRYSLER GROUP, LLC

16. Install the power bending bracket onto the extension housing, if equipped. Tighten the power bending bracket nuts (1) to 30 N.m (22 ft.lbs.). Refer to **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION, 6.7L** .
17. Install transfer case, if equipped. Tighten transfer case nuts to 35 N.m (26 ft.lbs.). Refer to appropriate Transmission and Transfer Case article.
18. Install rear support to transmission. Tighten bolts to 47 N.m (35 ft.lbs.).
19. Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts to 47 N.m (35 ft.lbs.). Tighten the clevis bracket to rear support bolt to 68 N.m (50 ft.lbs.).
20. Remove engine support fixture.

Fig. 168: Connector Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - CONNECTOR BOLTS

CAUTION: Install the electrical connectors correctly. Some electrical connectors may be interchangeable, damage to the electrical system may occur if the connectors are reversed.

21. Connect wire harnesses to solenoids and transmission range sensor assembly.

Fig. 169: Shift Cable At Transmission
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT CABLE BRACKET	4 - MANUAL SHIFT LEVER
2 - SHIFT CABLE	5 - SHIFT CABLE BRACKET BOLT
3 - SHIFT CABLE BALL SOCKET	

22. Install shift cable bracket (1) and the shift cable bracket bolt (5). Tighten bolt to 27 N.m (20 ft.lbs.).
23. Install the shift cable (2) into the shift cable bracket (1).
24. Connect gearshift cable ball socket (3) from transmission manual valve lever (4).

Fig. 170: Input & Output Speed Sensors
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT SPEED SENSOR
2 - OUTPUT SPEED SENSOR

25. Connect the wire harness to the input speed sensor (1) and the output speed sensor (2).

Fig. 171: Temperature Sensor & Line Fittings

Courtesy of CHRYSLER GROUP, LLC

1 - TEMPERATURE SENSOR 2 - JIFFY TITE FITTINGS 3 - COOLER LINE FITTINGS

26. Connect the electrical harness to torque converter temperature sensor (1) and be certain transmission harnesses are properly routed.
27. Connect cooler lines to transmission (2).
28. Install transmission fill tube.

Fig. 172: Differential Pressure Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

1 - BOLT

29. Install bolt (1) securing the differential pressure sensor onto the transmission case. Tighten the bolt to 10N.m (88 in. lbs.).
30. Install exhaust particulate filter.
31. Align and connect propeller shaft(s).
32. Adjust gearshift cable if necessary.
33. Install any skid plates removed previously. Refer to **PLATE, SKID, FRONT, INSTALLATION** or **PLATE, SKID, TRANSFER CASE, INSTALLATION** .
34. Lower vehicle.
35. Fill transmission with MOPAR® AS68RC Automatic Transmission Fluid. Refer to **FLUID, STANDARD PROCEDURE**.

CABLE, SHIFT

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - GEARSHIFT CABLE

1. Engine starts must be possible with shift lever in PARK or NEUTRAL positions only. Engine starts must not be possible in any other gear position.
2. With the shift lever in the:
    1. PARK position - Apply upward force on the shift arm and remove pressure. Engine starts must be possible.
    2. PARK position - Apply downward force on the shift arm and remove pressure. Engine starts must be possible.
    3. NEUTRAL position - Normal position. Engine starts must be possible.
    4. NEUTRAL position - Engine running and brakes applied, apply upward force on the shift arm. Transmission shall not be able to shift from neutral to reverse.

ADJUSTMENTS

ADJUSTMENTS

NOTE: **Always run the shift lever test using the scan tool to help diagnose a potential TRS problem**

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the transmission range sensor may be faulty.

GEARSHIFT ADJUSTMENT PROCEDURE

Fig. 173: Gearshift Cable & Steering Column
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING COLUMN
2 - GEARSHIFT CABLE
3 - GEARSHIFT CABLE LOCK TAB
4 - BTSI SOLENOID LOCK TAB
5 - BTSI CONNECTOR

1. Shift transmission into PARK.
2. Release cable adjuster lock tab (3) (underneath the steering column) to unlock cable. Refer to **Fig. 173**.
3. Raise vehicle.
4. Disengage the cable eyelet from the transmission manual shift lever.
5. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
6. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
7. Snap the cable eyelet onto the transmission manual shift lever.
8. Lower vehicle.
9. Lock shift cable by pressing cable adjuster lock tab (3) downward until it snaps into place.
10. Check engine starting. Engine should start only in PARK and NEUTRAL.

REMOVAL

REMOVAL

Fig. 174: Shift Cable At Transmission
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT CABLE BRACKET	4 - MANUAL SHIFT LEVER
2 - SHIFT CABLE	5 - SHIFT CABLE BRACKET BOLT
3 - SHIFT CABLE BALL SOCKET	

1. Shift transmission into PARK.
2. Raise vehicle.
3. Disconnect the shift cable ball socket (3) at transmission manual shift lever (4) and pull shift cable out of mounting bracket (1).

Fig. 175: Gearshift Cable At Dash Panel
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - GROMMET

4. Lower the vehicle.
5. Remove the dash panel insulation pad as necessary to access the gearshift cable grommet (2). Refer to **Fig. 175**.
6. Remove grommet (2) from the dash panel.

Fig. 176: Gearshift Cable & Steering Column
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING COLUMN
2 - GEARSHIFT CABLE
3 - GEARSHIFT CABLE LOCK TAB

4 - BTSI SOLENOID LOCK TAB
5 - BTSI CONNECTOR

7. Remove any steering column (1) trim necessary to access the gearshift cable (2) and BTSI mechanism.
8. Disconnect the BTSI wiring connector (5).
9. Disconnect cable at lower column bracket and shift lever pin and pull the cable through the dash panel opening into the vehicle. Refer to **Fig. 176**.
10. Remove gearshift cable (2) from vehicle.

INSTALLATION

INSTALLATION

Fig. 177: Gearshift Cable At Dash Panel
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - GROMMET

1. Route the transmission end of the gearshift cable (1) through the opening in the dash panel. Refer to **Fig. 177**.
2. Seat the cable grommet (2) into the dash panel opening.

Fig. 178: Gearshift Cable & Steering Column
Courtesy of CHRYSLER GROUP, LLC

1 - STEERING COLUMN
2 - GEARSHIFT CABLE
3 - GEARSHIFT CABLE LOCK TAB
4 - BTSI SOLENOID LOCK TAB
5 - BTSI CONNECTOR

3. Snap the cable into the steering column (1) bracket so the retaining ears are engaged and snap the cable eyelet onto the shift lever ball stud.

Fig. 179: Shift Cable At Transmission
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT CABLE BRACKET	4 - MANUAL SHIFT LEVER
2 - SHIFT CABLE	5 - SHIFT CABLE BRACKET BOLT
3 - SHIFT CABLE BALL SOCKET	

4. Raise the vehicle.
5. Place the transmission manual shift lever in the "PARK" detent (rearmost) position and rotate prop shaft to ensure transmission is in PARK.
6. Route the gearshift cable through the shift cable mounting bracket (1) and secure the cable by snapping the cable retaining ears into the bracket and by snapping the shift cable ball socket (3) onto the manual shift lever (4) ball stud.
7. Lower vehicle.
8. Lock the shift cable adjustment by pressing the cable adjuster lock tab (3) downward until it snaps into place.
9. Check for proper operation of the transmission range sensor.
10. Adjust the gearshift cable and BTSI mechanism. Refer to **CABLE, SHIFT, ADJUSTMENTS** and **SYSTEM, SHIFT INTERLOCK, ADJUSTMENTS**.

CLUTCH CLEARANCE AND PISTON TRAVEL COMBINATIONS

	Measurement Item	Condition	Suspected Cause	Action
	Clutch Clearance	Normal	Discs/Plates are worn thin and warped, snap ring and groove height, piston wear.	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove
	Piston Travel	High		
LOW PROBABILITY	Clutch Clearance	Normal	Piston travel issue (interference, obstruction from broken part) or Discs/Plates are too thick (above specs.) and snap ring grove at wrong height (high).	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove
	Piston Travel	Low		
LOW PROBABILITY	Clutch Clearance	High	Low possibility, piston height, snap-ring groove, snap-ring thickness, disk and plates thickness and flatness.	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring
	Piston Travel	Normal		

				groove.
	Clutch Clearance	High	Discs/Plates are worn (thin) or snap ring thickness groove height, piston height.	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove.
	Piston Travel	High		
LOW PROBABILITY	Clutch Clearance	High	Piston travel issue (interference, obstruction from broken part combined with improper piston height, snap ring groove wear or height, or snap ring thickness) or piston does not fully return.	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove.
	Piston Travel	Low		
	Clutch Clearance	Low	Discs/Plates are not flat or combination of high piston height and low snap ring groove height.	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove.
	Piston Travel	Normal		
				Replace

	Clutch Clearance	Low	Discs/Plates are worn (thin) and warped.	the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove
	Piston Travel	High		
	Clutch Clearance	Low	Discs/Plates are too thick/extra discs or snap ring height too low or piston too tall.	Replace the discs and plates and recheck clearances. If not OK- Check the piston, snap ring and snap ring groove
	Piston Travel	Low		

Fig. 193: K1 Piston Stroke
Courtesy of CHRYSLER GROUP, LLC

1 - AIR APPLY
2 - 90° DIAL INDICATOR 9524
3 - K3 CLUTCH PACK

10. Install the K3 clutch pack assembly into the transmission case.

NOTE: **The selectable clutch pack reaction plates are identified by an alpha numeric numeral stamped into the face of the plate.**

11. Install the 90° Dial Indicator (special tool #9524, Indicator, Dial) and mounts from Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) and apply 400 - 500 kPa (58 - 72 psi) of air to check the K3 clutch pack clearance. Refer to **AIR CHECKING TRANSMISSION CLUTCH OPERATION**.

    The K3 clutch pack clearance is 1.25 - 1.50 mm (0.049 - 0.059 in.). If the clearance is not within tolerance, choose the correct selectable reaction plate.

- A = 6.30 mm (0.248 in.)
- B = 6.45 mm (0.254 in.)
- C = 6.60 mm (0.260 in.)
- D = 6.75 mm (0.266 in.)
- E = 6.90 mm (0.272 in.)

CLUTCH, OVERRUNNING

DESCRIPTION

DESCRIPTION

The function of a one-way mechanical clutch is that it allows the clutch to freewheel in one direction during certain operating conditions of the transmission.

OPERATION

OPERATION

The F1 one way clutch locks the front planetary carrier and rear planetary ring gear against counterclockwise rotation, only allowing them to rotate clockwise.

DISASSEMBLY

DISASSEMBLY

NOTE: **Apply trans jell or petroleum jelly to all slide portions, rolling contacts surfaces, thrust surfaces etc. to prevent burnout during initial operation. Lubricate O-rings and O-ring seals with MOPAR® AS68RC ATF. Soak all friction discs in MOPAR® AS68RC ATF for at least two hours before assembly of clutch packs.**

NOTE: **The F1 one way clutch should be assembled so that it will idle clockwise as seen from the transmission case side.**

1. Install the F1 one way clutch (2), with the tab openings facing the rear, into the F1 one way clutch outer race (3).
2. Install the snap rings (2), (5) into the F1 one way clutch assembly.

FLUID

DIAGNOSIS AND TESTING

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has three primary causes.

1. Internal clutch slippage, usually caused by low line pressure, inadequate clutch apply pressure, or clutch seal failure.
2. A result of restricted fluid flow through the main and/or auxiliary cooler.
3. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid.
- failure to clean dipstick and fill tube when checking level.
- engine coolant entering the fluid.
- internal failure that generates debris.
- overheat that generates sludge (fluid breakdown).
- failure to replace contaminated converter after repair.

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE

FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the gear train churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P (PARK) and N (NEUTRAL) positions. Place the selector lever in P (PARK) to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature (approximately 82° C. or 180° F), the fluid level is correct if it is in the HOT region (cross-hatched area) on the oil level indicator. The fluid level will be approximately at the upper COLD hole of the dipstick at 21° C (70° F) fluid temperature.

Fig. 234: Transmission Fluid Fill Level Vs. Transmission Fluid Temperature Chart

Courtesy of CHRYSLER GROUP, LLC

NOTE: The engine and transmission should be at normal operating temperature before performing this procedure. Optimum fluid temperature for checking the level should be between 70°C (158°F) and 80°C (176°F).

1. Start engine and apply parking brake.
2. Shift the transmission into DRIVE for approximately 2 seconds.
3. Shift the transmission into REVERSE for approximately 2 seconds.
4. Shift the transmission into PARK.
5. Connect the scan tool and select transmission.
6. Select sensors.
7. Read the transmission temperature value.
8. Compare the fluid temperature value with the chart.
9. Adjust transmission fluid level shown on the dipstick according to the Transmission Fluid Temperature Chart.

NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.

10. Check transmission for leaks.

FLUID AND FILTER REPLACEMENT

REMOVAL

Fig. 235: Drain Plug
Courtesy of CHRYSLER GROUP, LLC

1 - DRAIN PLUG

1. Raise vehicle.
2. Place a large diameter drain pan beneath the transmission pan.
3. Remove the drain plug bolt (1) and allow the oil to drain from the transmission pan.
4. Remove the drain pan bolts from the transmission case.
5. Remove the drain pan.

Fig. 236: Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE BODY
2 - TRANSMISSION OIL FILTER
3 - 19.8 MILLIMETER FLANGE BOLTS

6. Remove the transmission oil filter bolts (3).
7. Remove the transmission oil filter and o-ring seal from the valve body (1).

INSPECTION

Fig. 237: Oil Pan Magnets
Courtesy of CHRYSLER GROUP, LLC

1 - PICK-UP MAGNETS
2 - MAGNETIC DRAIN PLUG

Inspect bottom of pan, pick-up magnets (1) and magnetic drain plug (2) and fluid filter for excessive amounts of metal. A light coating of clutch material on the bottom of the pan does not indicate a problem unless accompanied by a slipping condition or shift lag. If fluid and pan are contaminated with excessive amounts of debris, refer to **DIAGNOSIS AND TESTING**.

CLEANING

1. Using a suitable solvent, clean pan and magnet.
2. Using a suitable gasket scraper, clean original sealing material from surface of transmission case and the transmission pan.

INSTALLATION

Fig. 238: Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE BODY
2 - TRANSMISSION OIL FILTER
3 - 19.8 MILLIMETER FLANGE BOLTS

1. Lubricate the transmission oil filter seal with MOPAR® AS68RC ATF.
2. Install the new transmission oil filter (2) in position on valve body (1) and into the oil pump.
3. Install the transmission oil filter bolts (3).
4. Tighten bolts to 10 N.m (88 in.lbs.) torque.
5. Install a new transmission oil pan gasket.
6. Place pan in position on transmission.
7. Install bolts to hold pan to transmission. Tighten bolts to 7 N.m (62 in. lbs.) torque.

Fig. 239: Drain Plug
Courtesy of CHRYSLER GROUP, LLC

1 - DRAIN PLUG

8. Install transmission drain plug bolt (1).
9. Tighten oil pan drain plug to 22 N?m (16 ft. lbs.) torque.
10. Lower vehicle and fill transmission with MOPAR® AS68RC ATF. Refer to **FLUID, STANDARD PROCEDURE**.

TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Remove dipstick and insert clean funnel in transmission fill tube.
2. Add following initial quantity of Mopar® AS68RC ATF to transmission:
    1. If only fluid and filter were changed, add **6.8L (7.2 quarts)** of AS68RC to transmission.
    2. If transmission was completely overhauled and the torque converter was replaced or drained, add **13L (13.75 quarts)** of Mopar® AS68RC ATF to transmission.
3. Check the transmission fluid and adjust as required.

GEARTRAIN, PLANETARY

DESCRIPTION

DESCRIPTION

NOTE: **The 68RFE transmission does not use a number 7 thrust bearing.**

The P2 planetary gear set is first gear set located behind the transmission case bulkhead. The P2 planetary gear set works in conjunction with the B1 brake clutch.

P3 PLANETARY GEAR SET

Fig. 243: P3 Planetary Gear Set Components
Courtesy of CHRYSLER GROUP, LLC

1 - P3 PLANETARY GEAR	4 - ANNULUS GEAR
2 - THRUST BEARING RACE	5 - P3 hub
3 - THRUST BEARING	6 - SNAP RING

The P3 planetary gear set is located behind the P2 planetary gear set in front of the F1 one-way clutch. The P3 planetary gear set works in conjunction with the B2 brake clutch.

OPERATION

OPERATION

Planetary gear sets are so named because of their physical arrangement. All planetary gear sets contain at least

three main components.

- A sun gear at the center of the gear set.
- A carrier assembly with planetary pinion gears that rotate around the sun gear.
- An internal annulus that encompasses the entire gear set.

This arrangement provides both strength and efficiency and also evenly distributes the energy forces flowing through the gear set. Another benefit of planetary gears is that gear clash, a common occurrence in manual transmissions, is eliminated because the gear teeth are always in mesh.

DISASSEMBLY

DISASSEMBLY

2. Remove the snap ring (6) from the ring gear assembly.
3. Remove the P2 hub (5) from the ring gear (4).

CLEANING

CLEANING

Clean the planetary components in solvent and dry them with compressed air.

INSPECTION

INSPECTION

Inspect each planetary carrier assembly for damage. Check that each pinion gear rotates freely and smoothly on its shaft. Check that the tabbed thrust washer on each side of each pinion gear is in place. Check that the outer ends of the pinion shafts are not discolored from overheating. Replace the carrier assembly if jammed or sticky pinion gears, spun or missing tabbed washers, or blackened pinion shafts are found.

Check sun gear and driving shell condition. Replace the gear if damaged or if the bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace planetary gear sets if gears, pinion pins, or carrier are damaged in any way. Replace the annulus gears and supports if either component is worn or damaged.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location.

ASSEMBLY

ASSEMBLY

NOTE: **Apply trans jell or petroleum jelly to all slide portions, rolling contacts surfaces, thrust surfaces etc. to prevent burnout during initial operation. Lubricate O-rings and O-ring seals with MOPAR® AS68RC ATF. Soak all friction disks in MOPAR® AS68RC ATF for at least two hours before assembly of clutch packs.**

B1 BRAKE CLUTCH

The B1 brake clutch is hydraulically applied in second and sixth gear by pressurized fluid. When the B1 brake clutch is applied it locks the P2 planetary ring gear. Since the P2 planetary ring gear is fixed by the B1 brake, the P2 planetary pinion gear rotates counterclockwise, and the clockwise turning effect is conveyed to the P2 planetary carrier.

Fig. 254: B2 Brake Clutch & Components

1. The Oil Pump is mounted in the transmission converter housing.
2. The Oil Pump can only be serviced by disassembling the transmission.
3. The Oil Pump is a high-performance gear type pump with a small number of specially designed gear teeth. The drive gear is fitted into the extension sleeve of the torque converter, so it turns in the same

direction as engine output. Oil drawn into the pump is compressed then expelled.

OPERATION

OPERATION

Fig. 256: Oil Pump Components
Courtesy of CHRYSLER GROUP, LLC

1 - OUTLET TO TRANSMISSION	4 - OIL PUMP BODY
2 - DRIVEN GEAR	5 - INLET FROM OIL PAN
3 - DRIVE GEAR	

As the torque converter rotates, the converter hub rotates the oil pump drive gear. As the drive gear rotates both driven gears, a vacuum is created when the gear teeth come out of mesh. This suction draws fluid through the pump inlet from the oil pan. As the gear teeth come back into mesh, pressurized fluid is forced into the pump outlet and to the oil pump valves.

OIL PUMP COVER REGULATOR VALVES

CLEANING

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

INSPECTION

INSPECTION

Check condition of the seal rings and thrust washer. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the oil pump cover. Use a penlight to view the bore interiors. Replace the oil pump if any bores are distorted or scored. Inspect all of the valve springs. The springs must be free of distortion, warped or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

SIDE CLEARANCE

Fig. 266: Checking Oil Pump Side Clearance
Courtesy of CHRYSLER GROUP, LLC

1 - MEASURE AT THESE POINTS

Check the side clearance with Plastigauge®. Measure the clearance at more than three arbitrary points (1). The minimum dimension of these measurements should be the clearance, if the difference between the maximum and minimum clearance is greater than 0.02-0.055 mm (0.0008-0.002 in.), the part is considered defective or worn and should be replaced.

ASSEMBLY

ASSEMBLY

RELAY, TRANSMISSION CONTROL

DESCRIPTION

DESCRIPTION

The relay is supplied fused B+ voltage, energized by the TIPM, and is used to supply power to the TCM when the transmission is in normal operating mode.

OPERATION

OPERATION

The TIPM energizes the transmission control relay. When the relay is "off", no power is supplied to the TCM

and the transmission will not operate.

SEAL

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Remove the torque converter from the transmission torque converter housing. Refer to **TORQUE CONVERTER, REMOVAL**.
3. Use a pry tool to remove oil pump seal.

INSTALLATION

INSTALLATION

NOTE: Apply trans jell or petroleum jelly to all slide portions, rolling contacts surfaces, thrust surfaces etc. to prevent burnout during initial operation. Lubricate O-rings and O-ring seals with MOPAR® AS68RC ATF. Soak all friction disks in MOPAR® AS68RC ATF for at least two hours before assembly of clutch packs.

1. Clean and inspect oil pump seal seat. Then install seal using Converter Hub Seal Installer (special tool #9987, Installer, Seal).
2. Clean and inspect torque converter hub. If nicks, scratches or hub wear are found, torque converter replacement will be required.

CAUTION: If the torque converter is being replaced, apply a light coating of grease to the crankshaft pilot hole. Also inspect the engine drive plate for cracks. If any cracks are found replace the drive plate. Do not attempt to repair a cracked drive plate. Always use new torque converter to drive plate bolts.

3. Apply a light film of MOPAR® AS68RC ATF oil to the torque converter hub and oil seal lips. Then install torque converter into transmission. Be sure that the hub lugs mesh with the front pump lugs when installing. Refer to **TORQUE CONVERTER, INSTALLATION**.
4. Install the transmission into the vehicle. Refer to **INSTALLATION**.

SENSOR, SPEED

DESCRIPTION

DESCRIPTION

Fig. 275: Input & Output Speed Sensors
Courtesy of CHRYSLER GROUP, LLC

1 - INPUT SPEED SENSOR
2 - OUTPUT SPEED SENSOR

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate DC square wave signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the "teeth" of the gear pass by the sensor coil, an DC square wave is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an DC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

OUTPUT SPEED SENSOR

Fig. 276: Output Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the output speed sensor.
4. Remove the bolt holding the output speed sensor to the transmission case.
5. Remove the output speed sensor from the transmission case.

INPUT SPEED SENSOR

Fig. 277: Input Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the input speed sensor.
4. Remove the bolt holding the input speed sensor to the transmission case.
5. Remove the input speed sensor from the transmission case.

INSTALLATION

OUTPUT SPEED SENSOR

NOTE: **Apply trans jell to all slide portions, rolling contacts surfaces, thrust surfaces etc. to prevent burnout during initial operation. Lubricate O-rings and O-ring seals with MOPAR® AS68RC ATF. Soak all friction disks in MOPAR® AS68RC ATF for at least two hours before assembly of clutch packs.**

Fig. 278: Output Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the output speed sensor o-ring with MOPAR® AS68RC ATF.
2. Install the output speed sensor into the transmission case.
3. Tighten the bolt to 8 N.m (70 in.lbs.).
4. Install the wiring connector onto the output speed sensor.
5. Lower vehicle.
6. Verify the transmission fluid level. Add MOPAR® AS68RC ATF as necessary.

INPUT SPEED SENSOR

NOTE: **Apply trans jell to all slide portions, rolling contacts surfaces, thrust surfaces etc. to prevent burnout during initial operation. Lubricate O-rings and O-ring seals with MOPAR® AS68RC ATF. Soak all friction disks in MOPAR® AS68RC ATF for at least two hours before assembly of clutch packs.**

Fig. 279: Input Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the output speed sensor o-ring with MOPAR® AS68RC ATF.
2. Install the input speed sensor into the transmission case.
3. Tighten the bolt to 8 N.m (70 in.lbs.).
4. Install the electrical wiring connector onto the input speed sensor.
5. Lower vehicle.
6. Verify the transmission fluid level. Add MOPAR® AS68RC as necessary.

SENSOR, TRANSMISSION RANGE

DESCRIPTION

DESCRIPTION

Fig. 280: Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSMISSION RANGE SENSOR
2 - MANUAL SHIFT LEVER
3 - CONTROL SHAFT NUTS

The transmission range sensor (1) is mounted externally on the left side of the transmission case.

OPERATION

OPERATION

The transmission range sensor prohibits the vehicle from starting in any gear other than park and neutral.

REMOVAL

REMOVAL

NOTE: Be certain the transmission is in the park lock position.

Fig. 281: Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSMISSION RANGE SENSOR
2 - MANUAL SHIFT LEVER
3 - CONTROL SHAFT NUTS

1. Remove the shift cable from the manual shift lever (2).
2. Disconnect the wire harness from the transmission range sensor.
3. Remove the two nuts (3) from the control shaft.

Courtesy of CHRYSLER GROUP, LLC

1 - TRANSMISSION RANGE SENSOR	4 - CONTROL SHAFT
2 - BOLTS	5 - STAKE WASHER
3 - NUT	

4. Pry open the tabs on the stake washer (5), remove the nut (3) and the stake washer (5).
5. Remove the bolts (2).
6. Remove the transmission range sensor (1) from the transmission control shaft (4).

INSTALLATION

INSTALLATION

Fig. 283: Transmission Range Sensor Installation & Alignment
Courtesy of CHRYSLER GROUP, LLC

1 - ALIGNMENT HOLE	4 - STAKE WASHER AND NUT
2 - BOLT	5 - CONTROL SHAFT
3 - TRANSMISSION RANGE SENSOR	6 - ALIGNMENT TOOL 9983

1. Install the transmission range sensor (3) onto the control shaft (5).
2. Install the stake washer and the nut (4) and hand tighten.
3. With the transmission in neutral install the alignment tool (special tool #9983, Alignment Tool, TRS) (6) onto the control shaft (5) and into the alignment hole (1).
4. Install the bolts (2).
5. After aligning the transmission range sensor, tighten the bolts (2) 12.5 N.m (9 ft.lbs.)
6. Remove the alignment tool (special tool #9983, Alignment Tool, TRS) (6)
7. Tighten the control shaft nut to 7 N.m (62 in.lbs.)
8. Bend the tabs on the stake washer and nut (4) in at least two places to lock in position.

Fig. 284: Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSMISSION RANGE SENSOR
2 - MANUAL SHIFT LEVER
3 - CONTROL SHAFT NUTS

9. Install the manual shift lever (2) onto the control shaft.
10. Install the inner nut (3) onto the control shaft. Tighten the inner nut to 12.5 N.m (9 ft.lbs).
11. Install the outer nut (3) onto the control shaft. While holding the inner nut, tighten the outer not to 12.5 N.m (9 ft.lbs)

SHIFTER, TRANSMISSION

DESCRIPTION

DESCRIPTION

The gear shift mechanism provides four shift positions which are:

- Park (P)
- Reverse (R)
- Neutral (N)
- Drive (D)

OPERATION

OPERATION

DRIVE range provides FIRST, SECOND, THIRD, FOURTH, OVERDRIVE FIFTH, OVERDRIVE SIXTH gear ranges. The shift into OVERDRIVE FOURTH and FIFTH gear ranges occurs only after the transmission has completed the shift into D THIRD gear range.

The SIXTH gear upshifts occur automatically unless the Tow/Haul or OD Off mode is enabled. No upshift to FIFTH or SIXTH gears will occur if any of the following are true:

- The transmission fluid temperature is below 5° C (41° F).
- The shift to Fourth is not yet complete.
- Vehicle speed is too low for the 4-5 or 5-6 shifts to occur.
- Transfer case is in low range.

Upshifts into FOURTH or FIFTH will be delayed when the transmission fluid temperature is below 4.5° C (40° F) or above 115.5° C (240° F).

SWITCH, TOW\HAUL

DESCRIPTION

DESCRIPTION

The tow/haul overdrive OFF (control) switch is located in the instrument panel switch pod. The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function. Refer to **POD, SWITCH, DESCRIPTION** .

OPERATION

OPERATION

At key-on, overdrive operation is allowed. Pressing the switch once enables Tow/Haul mode and the Tow/Haul lamp will be illuminated. In Tow/Haul mode, 6th gear is disabled and 4-5 upshifts are delayed. Shifts into 5th gear are still allowed under steady cruise conditions. Closed throttle downshifts (for improved engine braking) may occur during steady braking maneuvers. Pressing the switch a second time enables OD Off mode, where all 5th and 6th gear operation is inhibited. Pressing the switch a third time restores normal operation. Normal operation is always the default at start-up; the switch must be pressed after each key start if Tow/Haul mode is desired.

SYSTEM, SHIFT INTERLOCK

DESCRIPTION

DESCRIPTION

Fig. 285: Gearshift Lever Assembly
Courtesy of CHRYSLER GROUP, LLC

The Brake Transmission Shifter Interlock (BTSI), is a solenoid operated system. It consists of a solenoid permanently mounted on the gearshift lever assembly.

OPERATION

OPERATION

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed approximately one-half an inch. A magnetic holding device in line with the park lock cable is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

Fig. 286: Steering Column Lower Shroud
Courtesy of CHRYSLER GROUP, LLC

The system override (3) is located on the bottom of the column shroud (1) and requires a long thin screwdriver to depress the release.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK

1. Verify that the key can only be removed in the PARK position.
2. When the shift lever is in PARK And the shift handle pushbutton is in the "OUT" position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the OFF position.
4. Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

ADJUSTMENTS

ADJUSTMENTS

ADJUSTMENT PROCEDURE

Fig. 287: Gearshift Lever Assembly
Courtesy of CHRYSLER GROUP, LLC

The BTSI is part of the shift lever assembly (2) and is non-adjustable.

BTSI FUNCTION CHECK

1. Verify removal of ignition key allowed in PARK position only.
2. When the shift lever is in PARK, the ignition key cylinder should rotate freely from off to lock. When the shifter is in any other position, the ignition key should not rotate from off to lock.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the off position.
4. Shifting out of PARK should not be possible while applying normal force, and ignition key cylinder is in the run or start positions, unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the accessory or lock position.
6. Shifting between any gear and NEUTRAL, or PARK, may be done without depressing foot brake with ignition switch in run or start positions.
7. Engine starts must be possible with shifter lever in PARK or NEUTRAL positions only. Engine starts must not be possible in any position other than PARK or NEUTRAL.
8. With shifter lever in the:

- PARK position - Apply upward force on the shift arm and remove pressure. Engine starts must be possible.
- PARK position - Apply downward force on the shift arm and remove pressure. Engine starts must be possible.
- NEUTRAL position - Normal position. Engine starts must be possible.
- NEUTRAL position - Engine running and brakes applied, apply upward force on the shift arm. Transmission shall not be able to shift from neutral to reverse.

TORQUE CONVERTER

DESCRIPTION

DESCRIPTION

Fig. 288: Cut Away View Of Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1 - LOCK - UP DAMPER	5 - TURBINE RUNNER
2 - CONVERTER FRONT COVER	6 - STATOR
3 - LOCK - UP PISTON	7 - ONE - WAY CLUTCH
4 - PUMP IMPELLER	

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an lock-up damper (1), lock-up piston (3), pump impeller (4), turbine runner (5), stator (6), and one-way clutch (7). The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

IMPELLER

Fig. 289: Impeller
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE FLEXPLATE	4 - ENGINE ROTATION
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION	5 - ENGINE ROTATION
3 - IMPELLER VANES AND COVER ARE INTEGRAL	

The impeller is an integral part of the converter housing. Refer to **Fig. 289**. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

Fig. 290: Turbine
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE VANE	4 - PORTION OF TORQUE CONVERTER COVER
2 - ENGINE ROTATION	5 - ENGINE ROTATION
3 - INPUT SHAFT	6 - OIL FLOW WITHIN TURBINE SECTION

The turbine is the output, or driven, member of the converter. Refer to **Fig. 290**. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

Fig. 291: Stator
Courtesy of CHRYSLER GROUP, LLC

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW
4 - TURBINE

The stator assembly is mounted on a stationary shaft which is an integral part of the oil pump. Refer to **Fig. 291**. The stator (1) is located between the impeller (2) and the turbine (4) within the torque converter case.

The stator contains an one-way clutch (1-4), which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER SOLENOID

In order to reduce heat build-up in the transmission, the TCM can turn on or off the Torque Converter Solenoid as needed. This function can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Input speed
- Throttle angle
- Engine speed

OPERATION

OPERATION

The torque converter transmits engine torque to the transmission. When it is not locked up, it transmits the torque by means of oil. When it is locked up, it transmits the torque by means of the lockup piston.

The lockup damper is designed to soften the impact as the torque converter locks up.

The torque converter is a 3-element, single-stage, 2-phase type.

The term 'single-stage' indicates that there is 1 turbine runner (output element). The term '2-phase' indicates that the mechanism works as a torque converter when the turbine runner is turning slowly relative to the pump impeller and as a fluid coupling when the turbine runner is turning quickly relative to the pump impeller.

Fig. 292: Cut Away View Of Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1 - LOCK - UP DAMPER	5 - TURBINE RUNNER
2 - CONVERTER FRONT COVER	6 - STATOR
3 - LOCK - UP PISTON	7 - ONE - WAY

CLUTCH
4 - PUMP IMPELLER

TORQUE CONVERTER NOT LOCKED UP

Fig. 293: Torque Converter Not Locked Up
Courtesy of CHRYSLER GROUP, LLC

1 - LOCKUP CLUTCH
2 - PLATE
3 - PASSAGE

The torque converter activation pressure is not supplied between the converter front cover and lockup piston via passage (3). The lockup clutch (1) and the plate (2) are therefore disengaged and the lockup function is inactive.

TORQUE CONVERTER LOCKED UP

Fig. 294: Torque Converter Locked Up
Courtesy of CHRYSLER GROUP, LLC

1 - LOCKUP CLUTCH 2 - PLATE 3 - PASSAGE

The torque converter activation pressure is supplied between the converter front cover and lockup piston via passage (3). The lockup clutch (1) and the plate (2) are therefore engaged and the lockup function is active.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's one-way clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the one-way clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

Fig. 295: Stator Operation
Courtesy of CHRYSLER GROUP, LLC

1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES
4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the lockup clutch, the turbine and impeller rotate together removing any slip. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in second, third, fourth, fifth and, sixth gear ranges.

REMOVAL

REMOVAL

1. Remove transmission from vehicle. Refer to **REMOVAL**.
2. Place a suitable drain pan under the converter housing end of the transmission.

WARNING: **Be certain the transmission is secure when removing the torque converter, the torque converter is very heavy. Failure to follow these instructions may result in personal injury or may be fatal.**

Fig. 296: Removing/Installing Torque Converter From Transmission
Courtesy of CHRYSLER GROUP, LLC

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

INSTALLATION

INSTALLATION

NOTE: **Check converter hub and drive flats for sharp edges, burrs, scratches, or nicks. Polish the hub and flats with 800/10000 grit paper or crocus cloth if necessary. Verify that the oil pump seal is properly installed and is free from debris. The hub must be smooth to avoid damaging the pump seal at installation.**

Fig. 297: Removing/Installing Torque Converter From Transmission
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate oil pump seal lip and input shaft seal rings with MOPAR® AS68RC ATF.

WARNING: Be certain the transmission is secure when installing the torque converter, the torque converter is very heavy. Failure to follow these instructions may result in personal injury or may be fatal.

2. Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or input shaft seal rings while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Install the transmission into the vehicle. Refer to **INSTALLATION**.

Fig. 298: Checking Torque Converter Seating
Courtesy of CHRYSLER GROUP, LLC

1 - SCALE
2 - STRAIGHTEDGE

7. Check converter seating with a scale (1) and straightedge (2). Surface of converter lugs should be at least 28.2 mm (1.12 in.) to rear of straightedge when converter is fully seated.
8. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
9. Install the transmission in the vehicle. Refer to **INSTALLATION**.
10. Fill the transmission with the recommended fluid. Refer to **FLUID, STANDARD PROCEDURE**.

VALVE BODY

DESCRIPTION

DESCRIPTION

The valve body consists of a two piece aluminum valve body. Extensive electronic control effected by a microcomputer (the automatic transmission electronic control unit) over the hydraulic circuitry enables precise control over gearshifts. The valve body contains valves and pressure sensors that control fluid delivery to the torque converter clutch, forward clutches, and brake clutches.

UPPER VALVE BODY

7 - ON/OFF SOLENOID NUMBER 1	15 - CLAMP
8 - ON/OFF SOLENOID NUMBER 4	

There are eight pressure switches and one ATF temperature switch used to inform the Transmission Control Module (TCM) when there is pressure in various hydraulic circuits. Six of them are located on the bottom of the valve body. The remainder are located on the top of the valve body.

SWITCHES AND SOLENOIDS

Fig. 302: Valve Body Solenoid Harness
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE BODY	6 - OIL PRESSURE SWITCH NUMBER 8
2 - SOLENOID HARNESS	7 - OIL TEMPERATURE SENSOR
3 - LINEAR SOLENOID NUMBER 3	8 - CLAMP

4 - LINEAR SOLENOID NUMBER 1	9 - CLAMP
5 - OIL PRESSURE SWITCH NUMBER 7	10 - UPPER VALVE BODY JUMPER HARNESS

Eight solenoids are used to control various shift functions in the transmission. Four are located on the top of the valve body (3, 4) and the remainder are located on the bottom of the valve body.

OPERATION

OPERATION

LOWER VALVE BODY

Fig. 303: Lower Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1 - CONTROL VALVE NO. 3	4 - CONTROL VALVE NO. 1
2 - SHIFT VALVE NO. 4	5 - CONTROL VALVE

3 - LOCKUP CONTROL VALVE	NO. 2

Valve	Function
Lockup control valve	Controls lockup pressure fed to torque converter.
Linear solenoid valve number 1	Controls pressure fed to clutches number 1, 2 and brake number 1
Linear solenoid valve number 2	Controls pressure fed to clutch number 3 and brake number 2.
Linear solenoid valve number 3	Controls pressure fed to clutch number 1, 3.
Shift solenoid valve number 4	Directs line pressure and control pressure for clutch and brake engagement.

UPPER VALVE BODY

Fig. 304: Upper Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1 - COMBINED DRAIN	5 - SHIFT SOLENOID VALVE NO. 3
2 - GAIN CHANGE SOLENOID VALVE	6 - SHIFT

3 - MANUAL VALVE 4 - MODULATOR VALVE	SOLENOID VALVE NO. 2 7 - SHIFT VALVE NO. 1

Valve	Function
Manual valve	Selects N, R, and D passages in accordance with drivers movement of the shift lever
Modulator valve	Regulates line pressure and supplies it to the linear and shift solenoids.
Shift solenoid valve number 2	Directs line pressure and control pressure for clutch and brake engagement.
Shift solenoid valve number 3	Directs line pressure and control pressure for clutch and brake engagement.
Gain change solenoid valve	Changes pressure from control pressure to line pressure.
Combined drain	Enables fluid emerging from clutch passages and brake passages to drain away.

SWITCHES AND SOLENOIDS

REMOVAL

REMOVAL

NOTE: **The valve body can be removed for service without having to remove the transmission assembly. The valve body can be disassembled for cleaning and inspection of the individual components.**

CAUTION: If replacing the valve body an oil pump must be replaced as these are a matched set. Failure to follow these instructions may result in transmission failure and permanent damage.

Fig. 307: Drain Plug
Courtesy of CHRYSLER GROUP, LLC

1 - DRAIN PLUG

1. Shift transmission into PARK.

2. Raise vehicle.
3. Position drain pan under transmission oil pan.
4. Remove transmission oil pan drain plug (1) and drain oil.

Fig. 308: Disconnecting Valve Body Harness
Courtesy of CHRYSLER GROUP, LLC

5. Remove transmission oil pan.
6. Remove the transmission filter.
7. Disconnect electrical harness connectors from valve body and position harness aside.

1 - CONTROL VALVE NO. 3	4 - CONTROL VALVE NO. 1
2 - SHIFT VALVE NO. 4	5 - CONTROL VALVE NO. 2
3 - LOCKUP CONTROL VALVE	

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the electrical components by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Fig. 324: Solenoid Filter Screen
Courtesy of CHRYSLER GROUP, LLC

1 - SOLENOID FILTER SCREEN

Clean the solenoid filter screen (1), (if equipped).

INSPECTION

INSPECTION

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

Fig. 325: Solenoid Filter Screen
Courtesy of CHRYSLER GROUP, LLC

1 - SOLENOID FILTER SCREEN

Inspect all solenoid filter screens (1).

Fig. 326: Fluid Seal Inspection
Courtesy of CHRYSLER GROUP, LLC

Inspect all the fluid seals in the transmission case. Replace any seals that are cracked, distorted, or damaged in any way. These seals pass fluid pressure directly to the clutches. Any pressure leak at these points, may cause transmission performance problems.

ASSEMBLY

ASSEMBLY

NOTE: **Apply petroleum grease to all slide portions, rolling contacts surfaces, thrust surfaces etc. to prevent burnout during initial operation. Lubricate O-rings and O-ring seals with MOPAR® AS68RC ATF. Soak all friction disks in MOPAR® AS68RC ATF for at least two hours before assembly of clutch packs.**

4 - CLAMP

5 - JUMPER HARNESS

NOTE: **When installing the jumper harness, fix the harness portion that is protected with the clamp.**

23. Install the jumper harness (5) into the clamp (4).

NOTE: **Install the oil pressure switch connector (2) so that the orientation of the connector will be in a range of 0-90 degrees downward.**

24. Connect the green wire of the jumper harness to the oil pressure switch (2).

NOTE: **Install the oil pressure switch connector (3) so that the orientation of the connector will be in a range of 0-45 degrees downward.**

25. Connect the orange wire of the jumper harness to the oil pressure switch (3).

Oil Pressure Switch	Color of Wire	Name of Connector	FUNCTION
(2)	Green	PSW5	Shift No. 3
(3)	Orange	PSW4	Shift No. 2

INSTALLATION

INSTALLATION

CAUTION: **If the valve body is being replaced the oil pump must also be replaced. Failure to follow these instructions will damage the transmission.**

NOTE: **If the valve body is being replaced, a quick learn must be performed using the scan tool. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .**

NOTE: **Apply petroleum grease to all slide portions, rolling contacts surfaces, thrust surfaces etc. to prevent burnout during initial operation. Lubricate O-rings and O-ring seals with MOPAR® AS68RC ATF. Soak all friction disks in MOPAR® AS68RC ATF for at least two hours before assembly of clutch packs.**

Fig. 335: Valve Body Electrical Harnesses
Courtesy of CHRYSLER GROUP, LLC

1 - HARNESSES

1. Lubricate the seals on the electrical connectors with MOPAR® AS68RC ATF and install the valve body electrical harnesses (1) into the transmission case.

Fig. 336: Connector Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - CONNECTOR BOLTS

2. Install the valve body electrical harness connector bolts. Tighten the bolts to 8 N.m (71 in.lbs.).

Fig. 337: Accumulator Valves
Courtesy of CHRYSLER GROUP, LLC

	ACCUMULATORS		SPRING COLOR
	DIAMETER	**HEIGHT**	
ACCUMULATOR NO. ONE (1)	16 mm (0.63 in.)	40.18 mm (1.58 in.)	PURPLE
ACCUMULATOR NO. TWO (2)	20 mm (0.79 in.)	38.18 mm (1.50 in.)	PINK
ACCUMULATOR NO. THREE (3)	20 mm (0.79 in.)	39.18 mm (1.54 in.)	BLUE

3. Install the three accumulator springs first and then the three accumulator valves (1), (2),(3).

6 - 51 MILLIMETER (2.00 in.) FLANGE BOLT	14 - TRANSMISSION CASE
7 - 57.2 MILLIMETER (2.25 in.) FLANGE BOLT	15 - 32.2 MILLIMETER (1.27 in.) FLANGE BOLT
8 - 41.5 MILLIMETER (1.63 in.) FLANGE BOLT	
* = temporary hand tighten bolts.	

NOTE: **Install valve body on a slight angle and verify that the shaft on the manual shift valve and the roller detent spring (11) has properly engaged the manual valve lever (13).**

NOTE: **Bolts with conical washers are not reusable.**

4. Install the valve body onto the transmission case.
5. Install and then tighten the bolts in the following order:
    1. Install bolts (2*) and (3*) and tighten by hand in order to hold valve body onto transmission case.
    2. Install detent spring, (10), (11) and bolts (5), (8) with wave washer (9), and tighten by hand.
    3. Install clamp (12) along with bolt (15) on the prescribed position and tighten by hand.
    4. Install bolts (15), (4), (6) and (7) on each correct position and tighten by hand.
    5. Tighten bolts (2*) and (3*) to 10 N.m (88 in.lbs.).
    6. Tighten bolts (4), (5), (6),(7), (15) to 10 N.m (88 in.lbs.) and (8) to 5.5 N.m (49 in. lbs.).

Courtesy of CHRYSLER GROUP, LLC

1 - DRAIN PLUG

29. Install oil pan drain plug bolt (1).
30. Tighten oil pan drain plug to 22 N?m (16 ft. lbs.) torque.
31. Lower vehicle and fill transmission with MOPAR® AS68RC ATF.
32. Check and adjust gearshift cable, if necessary.

2012 CLUTCH

Clutch System - Ram Pickup

WARNING

WARNING

WARNING: Chrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information. Whether the product contains asbestos or not, dust and dirt can accumulate on manual clutch parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CLUTCH

Road test and inspect components to determine a clutch problem. Road test the vehicle at normal speeds. Shift the transmission through all gear ranges and observe clutch action. If clutch chatters, grabs, slips or does not release properly, remove and inspect clutch components. If problem is noise or hard shifting, further diagnosis may be needed to the transmission and driveline component.

CLUTCH CONTAMINATION

Contamination is a frequent cause of clutch malfunctions. Oil, water or clutch fluid on the clutch disc and pressure plate surfaces will cause chatter, slip and grab. Oil contamination indicates a leak at either the rear main seal or transmission input shaft. Clutch fluid leaks are usually from damaged slave cylinder push rod seals. Heat buildup caused by slippage between the pressure plate, disc and flywheel can bake the oil residue onto the components. The glaze-like residue ranges in color from amber to black.

Road splash contamination is dirt/water entering the clutch housing due to loose bolts, housing cracks. Driving through deep water puddles can force water/road splash into the housing through such openings.

IMPROPER RELEASE OR CLUTCH ENGAGEMENT

Clutch release or engagement problems can be caused by worn or damaged clutch components.

Release problems can cause hard shifting and noise. Look for leaks at clutch cylinders, connecting line and loose slave cylinder bolts. Also worn/loose release fork, pivot stud, clutch disc, pressure plate or release bearing.

Engagement problems can cause slip, chatter/shudder and noisy operation. The causes may be clutch disc contamination, wear, distortion or flywheel damage.

CLUTCH MISALIGNMENT

Clutch components must be in proper alignment with the crankshaft and transmission input shaft. Misalignment caused by excessive runout or warpage of any clutch component will cause grab, chatter and improper clutch release.

CLUTCH COVER AND DISC RUNOUT

Check the clutch disc before installation. Axial (face) runout of a **new** disc should not exceed 0.50 mm (0.020 in.). Measure runout about 6 mm (1/4 in.) from the outer edge of the disc facing. Obtain another disc if runout is excessive.

Check condition of the clutch before installation. A warped cover or diaphragm spring will cause grab and incomplete release or engagement. Be careful when handling the cover and disc. Impact can distort the cover, diaphragm spring, release fingers and the hub of the clutch disc.

Use an alignment tool when positioning the disc on the flywheel. The tool prevents accidental misalignment which could result in cover distortion and disc damage.

A frequent cause of clutch cover distortion (and consequent misalignment) is improper bolt tightening.

FLYWHEEL RUNOUT

Check flywheel runout whenever misalignment is suspected. Flywheel runout should not exceed 0.08 mm (0.003 in.). Measure runout at the outer edge of the flywheel face with a dial indicator.

Common causes of runout are:

- heat warpage
- improper machining
- incorrect bolt tightening
- improper seating on crankshaft flange shoulder
- foreign material on crankshaft flange

Minor flywheel scoring can be cleaned up by hand with 180 grit emery or with turning equipment. Remove only enough material to reduce scoring (approximately 0.001 - 0.003 in.). Heavy stock removal is **not recommended.** Replace the flywheel if scoring is severe and deeper than 0.076 mm (0.003 in.).

Clean the crankshaft flange before mounting the flywheel. Dirt and grease on the flange surface may cock the flywheel causing excessive runout. Use new bolts when remounting a flywheel and secure the bolts with Mopar™ Lock And Seal or equivalent. Overtightening can distort the flywheel hub causing runout.

DIAGNOSIS CHART

The diagnosis charts describe common clutch problems, causes and correction. Refer to **DIAGNOSIS CHART**.

DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
Disc facing worn out	1. Normal wear.	1. Replace cover and disc.
	2. Driver frequently rides (slips) the clutch. Results in rapid overheating and wear.	2. Replace cover and disc.
	3. Insufficient clutch cover diaphragm spring tension.	3. Replace cover and disc.
Clutch disc facing contaminated with oil, grease, or clutch fluid.	1. Leak at rear main engine seal or transmission input shaft seal.	1. Replace appropriate seal.
	2. Excessive amount of grease applied to the input shaft splines.	2. Remove grease and apply the correct amount of grease.
	3. Road splash, water entering housing.	3. Replace clutch disc. Clean clutch cover and reuse if in good condition.
	4. Slave cylinder leaking.	4. Replace hydraulic clutch linkage.
Clutch is running partially disengaged.	1. Release bearing sticking or binding and does not return to the normal running position. 2. Release lever installed incorrectly. 3. Automatic wear adjustment incorrect.	1. Verify failure. Replace the release bearing and transmission front bearing retainer as necessary.
Flywheel below minimum thickness specification.	1. Improper flywheel machining. Flywheel has excessive taper or excessive material removal.	1. Replace flywheel.
Clutch disc, cover or diaphragm spring warped or distorted.	1. Rough handling. Impact bent cover, spring, or disc.	1. Replace disc or cover as necessary.
	2. Improper bolt tightening procedure.	2. Tighten clutch cover using proper procedure.
Facing on flywheel side of disc torn, gouged or worn.	1. Flywheel surface scored or nicked.	1. Correct surface condition if possible. Replace flywheel and disc as necessary.
	2. Clutch disc sticking or binding on transmission input shaft.	2. Inspect components and correct/replace as necessary.
Clutch disc facing burnt. Flywheel and cover pressure plate surfaces heavily glazed.	1. Frequent operation under high loads or hard acceleration conditions.	1. Correct condition of flywheel and pressure plate surface. Replace clutch cover and disc. Alert driver to problem cause.
	2. Driver frequently rides (slips) clutch. Results in rapid wear and overheating of disc and cover.	2. Correct condition of flywheel and pressure plate surface. Replace clutch cover and disc. Alert driver to problem cause.
Clutch disc binds on input shaft	1. Clutch disc hub splines	1. Clean, smooth and lubricate hub

splines.	damaged during installation.	splines if possible. Replace disc if necessary.
	2. Input shaft splines rough, damaged, or corroded.	2. Clean, smooth, and lubricate shaft splines if possible. Replace input shaft if necessary.
Clutch disc rusted to flywheel or pressure plate.	1. Clutch not used for an extended period of time (e.g. long term vehicle storage).	1. Sand rusted surfaces with 180 grit sanding paper. Replace clutch cover and flywheel if necessary.
Pilot bearing seized, loose or rollers are worn.	1. Bearing cocked during installation.	1. Install a new bearing.
	2. Bearing defective.	2. Install a new bearing.
	3. Bearing not lubricated.	3. Install a new bearing.
	4. Clutch misalignment.	4. Inspect clutch and correct as necessary. Install and lubricate a new bearing.
Clutch will not disengage properly.	1. Low hydraulic linkage fluid level.	1. Add hydraulic linkage fluid.
	2. Clutch cover loose.	2. Follow proper bolt tightening procedure.
	3. Clutch disc bent or distorted.	3. Replace clutch disc.
	4. Clutch cover diaphragm spring bent or warped.	4. Replace clutch cover.
	5. Clutch disc installed backwards.	5. Remove and install clutch disc correctly.
	6. Release fork bent or fork pivot loose or damaged.	6. Replace fork or pivot as necessary.
	7. Clutch master or slave cylinder failure. 8. Incorrect slave cylinder installed.	7. Replace hydraulic linkage assembly.
Clutch pedal squeak.	1. Pivot pin loose.	1. Tighten pivot pin if possible. Replace clutch pedal if necessary.
	2. Master cylinder bushing not lubricated.	2. Lubricate master cylinder bushing.
	3. Pedal bushings worn out or cracked.	3. Replace and lubricate bushings.
	4. Rough surface on front bearing retainer.	4. Replace front bearing retainer.
Clutch master or slave cylinder plunger dragging or binding	1. Master or slave cylinder components worn or corroded.	1. Replace clutch hydraulic linkage assembly.
Release bearing is noisy.	1. Release bearing defective or damaged.	1. Replace release bearing.
Contact surface of release bearing damaged.	1. Clutch cover incorrect or release fingers bent or distorted.	1. Replace clutch cover and release bearing.

	2. Release bearing defective or damaged.	2. Replace the release bearing.
	3. Release bearing misaligned.	3. Check and correct runout of clutch components. Check front bearing sleeve for damage/alignment. Repair as necessary.
Partial engagement of clutch disc. One side of disc is worn and the other side is glazed and lightly worn.	1. Clutch pressure plate position incorrect.	1. Replace clutch disc and cover.
	2. Clutch cover, spring, or release fingers bent or distorted.	2. Replace clutch disc and cover.
	3. Clutch disc damaged or distorted.	2. Replace clutch disc.
	4. Clutch misalignment.	4. Check alignment and runout of flywheel, disc, pressure plate and clutch housing. Correct as necessary.

SPECIAL TOOLS

SPECIAL TOOLS

	7471B - Barring Tool (Originally Shipped In Kit Number(s) 6860.)

BEARING, CLUTCH RELEASE

REMOVAL

REMOVAL

Fig. 1: Clutch Release Components
Courtesy of CHRYSLER GROUP, LLC

1. Remove transmission and transfer case, if equipped.
2. Remove spring clip (6).
3. Disconnect release bearing (4) from release lever (3) and remove bearing.

INSTALLATION

INSTALLATION

Fig. 2: Release Lever & Pivot Stud
Courtesy of CHRYSLER GROUP, LLC

1. Inspect bearing slide surface on transmission front bearing retainer. Replace retainer if slide surface is

scored, worn, or cracked.

2. Inspect release lever (2) and pivot stud (1). Verify stud is secure and in good condition and lever is not distorted or worn. Replace fork spring clips if bent or damaged.
3. Lubricate input shaft splines, bearing retainer slide surface, pivot stud (1) and release lever pivot surface with Mopar™ high temperature bearing grease.

CAUTION: The release fork is not symmetrical and must be installed with the slots and part number stamping toward the ball stud side. Part number stamping will be right side up when installed correctly. Failure to install the release fork correctly will result in clutch slippage and damage.

4. Install release fork and release bearing. Verify fork and bearing are properly secured by spring clips and release lever is installed properly. Rear side of release lever has one end with a raised area, which goes toward the slave cylinder side of the transmission.
5. Install transmission and transfer case.

DISC, CLUTCH

ADJUSTMENTS

ADJUSTMENTS

Fig. 3: Compressing Diaphragm Until Tension Is Released
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Improper adjustment will shorten clutch disc life.

NOTE: **Perform the following procedure, when replacing only the clutch disc on Diesel vehicles with Dual Mass Flywheel and the original self-adjusting pressure plate. The pressure plate must be reset before installing a new disc.**

NOTE: **It is recommended that the cover and disc be replaced as a unit. New units sold are pre-adjusted.**

1. Support pressure plate flange with press blocks (3) on a press.
2. Center press ram (2) on the pressure plate diaphragm spring fingers (1).
3. Compress the diaphragm spring fingers (1), until tension is released from the stepped adjusting ring.

Fig. 4: Stepped Adjusting Rings & Pressure Plate
Courtesy of CHRYSLER GROUP, LLC

4. Place two screwdrivers against two of the three stepped adjusting rings (1) tension spring stops, just ahead of the adjusting ring tension springs on the pressure plate (2).

Fig. 5: Stepped Adjust Ring & Pressure Plate
Courtesy of CHRYSLER GROUP, LLC

5. Rotate stepped adjusting ring (1) on the pressure plate (2) counterclockwise until the coil springs are fully compressed. Then hold adjusting ring while releasing the press pressure.
6. Remove the screwdrivers. The pressure plate is know adjusted for a new clutch disc.

REMOVAL

REMOVAL

Fig. 6: Marks On Pressure Plate & Flywheel
Courtesy of CHRYSLER GROUP, LLC

1. Support engine with wood block and adjustable jack stand, to prevent strain on engine mounts.
2. Remove transmission and transfer case, if equipped.

Fig. 7: Alignment Tool & Pressure Plate
Courtesy of CHRYSLER GROUP, LLC

3. Insert clutch alignment tool (3) through pressure plate (2) and into pilot bushing, to hold disc in place while removing bolts.
4. Loosen pressure plate bolts evenly, a few threads at a time and in a diagonal pattern to prevent warping the plate.
5. Remove bolts completely and remove pressure plate, disc and alignment tool.

INSTALLATION

INSTALLATION

Fig. 8: Alignment Tool & Pressure Plate
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before installing a new clutch disc on the Diesel engine with Dual Mass Flywheel and the original self-adjusting pressure plate, the pressure plate must be reset. Refer to ADJUSTMENTS. Failure to reset the pressure will result in damage to the clutch disc and loss of function.

NOTE: It is recommended that the cover and disc be replaced as a unit. New units sold are pre-adjusted.

1. Check runout and free operation of new clutch disc.
2. Lubricate crankshaft pilot bearing with a NLGI - 2 rated grease.
3. Install clutch alignment tool in clutch disc hub with the raised side of hub is facing away from the flywheel.

   NOTE: Flywheel side is imprinted on the disc face.

4. Install alignment tool (3) in pilot bearing and position disc on the flywheel (1).
5. Position pressure plate over disc (2) and onto the flywheel.

   NOTE: Over the wear life of a clutch disc the pressure plate will lose some of it's clamp load. It is recommended when replacing a worn clutch, the pressure plate is replaced at the same time.

6. Align and hold pressure plate in position and install bolts finger tight.
7. Tighten bolts evenly and a few threads at a time in a diagonal pattern.

CAUTION: Bolts must be tightened evenly in a star pattern and to specified torque to avoid warping pressure plate cover.

8. Tighten pressure plate bolts to 30 N.m (22 ft. lbs.).

Fig. 9: Identifying Lubrication Points
Courtesy of CHRYSLER GROUP, LLC

9. Remove release lever (3) and release bearing from clutch housing (1). Apply Mopar™ high temperature bearing grease to bore (4) of release bearing, release lever (5) contact surfaces and release lever pivot stud (2).

Fig. 10: Input Shaft Lubrication Points
Courtesy of CHRYSLER GROUP, LLC

10. Apply light coat of Mopar™ high temperature bearing grease to splines (3) of transmission input shaft (1) and to release bearing slide surface of the transmission front bearing retainer (2).

CAUTION: Do not over lubricate shaft splines. This can result in grease contamination of the disc.

11. Wipe pilot bearing surface clean.

Fig. 11: Pivot Ball, Release Bearing & Spring Clips
Courtesy of CHRYSLER GROUP, LLC

12. Install release lever and bearing in clutch housing. Verify spring clips (2) that retain lever on pivot ball (4) and release bearing (3) are installed properly.

NOTE: If release lever is installed correctly, the lever part number will be toward the bottom of the transmission and right side up. There is also a stamped

"I" in the lever which goes to the pivot ball side of the transmission.

13. Install transmission and transfer case if equipped.
14. Check fluid level in clutch master cylinder and depress clutch pedal several time.

FLYWHEEL

DESCRIPTION

DESCRIPTION

DUAL MASS FLYWHEEL

Fig. 12: Dual Mass Flywheel
Courtesy of CHRYSLER GROUP, LLC

The Dual Mass Flywheel (1) is used on the Diesel engine with G56 transmission. The flywheel incorporates the ring gear around the outer circumference to mesh with the starter to permit engine cranking. The primary flywheel side is bolted to an adapter plate which is bolted to the crankshaft. The secondary flywheel side (2) serves as the driving member to the clutch disc. Internal springs (3) are used to dampen energy. The Dual Mass Flywheel is serviced as an assembly only and should never be taken apart.

Fig. 13: Internal Springs & Retainer
Courtesy of CHRYSLER GROUP, LLC

The internal springs (2) and retainer (3) will be visible through the sight window (1). A visible retainer is not an indication of a broken spring. It is also normal to have play up to 30 mm (1.18 inches).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - FLYWHEEL

Fig. 14: Flywheel
Courtesy of CHRYSLER GROUP, LLC

Check flywheel (3) runout whenever misalignment is suspected. Flywheel runout should not exceed 0.08 mm (0.003 in.). Measure runout at the outer edge of the flywheel face with a dial indicator. Mount the indicator on a stud installed in place of one of the flywheel bolts.

Common causes of runout are:

- heat warpage
- improper machining
- incorrect bolt tightening
- improper seating on crankshaft flange shoulder
- foreign material on crankshaft flange

Flywheel machining is not recommended. The flywheel clutch surface is machined to a unique contour and machining will negate this feature. Minor flywheel scoring can be cleaned up by hand with 180 grit emery or with surface grinding equipment. Remove only enough material to reduce scoring (approximately 0.001 - 0.003 in.). Heavy stock removal is **not recommended.** Replace the flywheel if scoring is severe and deeper than 0.076 mm (0.003 in.). Excessive stock removal can result in flywheel cracking or warpage after installation; it can also weaken the flywheel and interfere with proper clutch release.

Clean the crankshaft flange before mounting the flywheel. Dirt and grease on the flange surface may cock the flywheel causing excessive runout. Use new bolts when remounting a flywheel and secure the bolts with Mopar™ Lock And Seal or equivalent. Tighten flywheel bolts to specified torque only. Overtightening can distort the flywheel hub causing runout.

Fig. 15: Dual Mass Flywheel & Springs
Courtesy of CHRYSLER GROUP, LLC

On a Dual Mass Flywheel (1) inspect all springs (2) for damage.

REMOVAL

REMOVAL

Fig. 16: Pressure Plate Bolts Loosening Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission. Refer to **REMOVAL** .

NOTE: **Vehicles with Dual Mass Flywheel use an adapter plate between the flywheel and crank. This plate does not need to be removed.**

2. Loosen pressure plate bolts (1-8) evenly, a few threads at a time and in a diagonal pattern to prevent warping the plate.
3. Remove the eight pressure plate bolts (1-8) completely and remove pressure plate and disc.

Fig. 17: Dust Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the dust cover bolts (1) and the dust cover (2).

Fig. 18: Identifying Flexplate-To-Flywheel Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Using the access hole, remove each flexplate-to-flywheel bolt (1). Use Barring Tool (special tool #7471B, Barring Tool) to rotate the engine and flywheel.
6. Remove the flywheel.

INSTALLATION

INSTALLATION

Fig. 19: Pressure Plate Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Install adapter plate.
2. Install adapter plate bolts and tighten evenly in sequence to 55 N•m (40 ft. lbs.).
3. Install clutch.
4. Install transmission.

LINKAGE

REMOVAL

REMOVAL

Fig. 20: Slave Cylinder & Nuts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The hydraulic linkage has a quick disconnect at the slave cylinder. This fitting should never be disconnected or tampered with. Once the hydraulic line is connected to the slave cylinder, it should never be disconnected.

1. Raise and support vehicle.
2. Remove heat shield over hydraulic line.
3. Remove slave cylinder (2) nuts (1) on clutch housing.
4. Remove slave cylinder from clutch housing.

CAUTION: Do not allow release lever plunger to pivot more than 2° in either direction in the slave cylinder bore. Allowing the plunger to pivot more than 2° in the bore will cause fluid to bypass the seal and result in fluid leakage.

5. Remove plastic clip securing the hydraulic line to the dash panel from the lower dash panel flange.
6. Remove plastic clip securing hydraulic line to the dash panel from the upper dash panel stud.
7. Lower vehicle.

Fig. 21: Clutch Master Cylinder, Rod Pin & Pedal Interlock Switch Connector
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect clutch pedal interlock switch connector (2).
9. Remove clutch master cylinder (1) rod pin (3).
10. Ensure cap on clutch cylinder reservoir is tight.
11. Remove clutch master cylinder nuts holding cylinder to the dash panel.
12. Remove clutch cylinders, reservoir and connecting lines from vehicle.

INSTALLATION

INSTALLATION

Fig. 22: Clutch Master Cylinder, Rod Pin & Pedal Interlock Switch Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position cylinders and connecting line in vehicle engine compartment. Position clutch hydraulic line against the dash panel and behind all engine hoses and wiring.

2. Apply a light coating of grease to the inside diameter of the master cylinder push rod eye.
3. Install clutch master cylinder (1) on dash panel and tighten clutch master cylinder nuts to 28 N.m (21 ft. lbs.).
4. Install clutch master cylinder push rod pin (3).
5. Connect clutch pedal position interlock switch connector (2).
6. Install plastic clip securing hydraulic line to the dash panel into the lower dash panel flange.
7. Install plastic clip securing hydraulic line to the dash panel onto the upper dash panel stud.
8. Raise vehicle.

Fig. 23: Slave Cylinder & Nuts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not allow release lever plunger to pivot more than 2° in either direction in the slave cylinder bore. Allowing the plunger to pivot more than 2° in the bore will cause fluid to bypass the seal and result in fluid leakage.

NOTE: Pull the clutch release lever toward the slave cylinder opening to insure proper seating of the slave cylinder plunger to the release lever pocket.

9. Install slave cylinder (2) and verify cylinder rod is properly seated in release lever.
10. Install and tighten slave cylinder nuts (1) to 23 N.m (17 ft. lbs.).
11. If **new** clutch linkage is being installed, connect the clutch hydraulic line to the clutch slave cylinder.

CAUTION: Once the clutch hydraulic line is connected to the slave cylinder, it should never be disconnected.

12. Install heat shield over hydraulic line.
13. Operate linkage several times to verify proper operation.

SWITCH, CLUTCH STARTER INTERLOCK

DIAGNOSIS AND TESTING

SWITCH - CLUTCH STARTER INTERLOCK

Fig. 24: Clutch Switch Test Point
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect switch 2-wire connector (2) attached to pedal support bracket (1), under instrument panel to left of clutch pedal.
2. Check switch continuity with an ohmmeter while operating clutch pedal.
   - Pedal Depressed - Continuity
   - Pedal Released - No Continuity
3. If continuity is not present or always present, replace clutch master cylinder. Switch is not serviced separately.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MANUAL TRANSMISSION - G56

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill or incorrect lubricant level check.

Rear transmission leaks will be from the oil seals or component mating surfaces.

Front transmission leaks will be from the front input shaft retainer seal. Lubricant may drip from the clutch housing after extended operation. If leak is severe, it may contaminate the clutch disc.

Lubricant level check can only be made when the vehicle is level and allowing the lubricant to settle for a minute before checking. This will ensure an accurate check and avoid an under or overfill condition.

HARD SHIFTING

Hard shifting is usually caused by low lubricant level, improper or contaminated lubricants. This will cause noise, excessive wear, internal bind, and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. The first indications of component damage is usually hard shifting and noise.

Shift component damage, clutch adjustment, worn pressure plate or disc are also causes of increased shift effort. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchronizer rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases, this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds.

Severe, highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchronizer rings, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear and bearing damage.

STANDARD PROCEDURE

STANDARD PROCEDURE - DRAIN AND FILL

Fig. 1: Drain Plug
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle.
2. Remove drain plug (1) on transmission (2) and drain fluid.
3. Install drain plug and tighten to 57 N.m (42 ft. lbs.).

Fig. 2: Fill Plug

Courtesy of CHRYSLER GROUP, LLC

4. Remove fill plug (1) on right side of the transmission (2).
5. Fill transmission to approximately 16 mm (0.625 inch) from the bottom of the fill hole.
6. Install fill plug and tighten to 57 N.m (42 ft. lbs.).

ADJUSTMENTS

ADJUSTMENTS

CAUTION: This procedure must be performed any time a mainshaft, countershaft or input shaft bearing or shaft is replaced. Failure to follow these instructions will result in damaging the transmission.

MAINSHAFT

Fig. 3: Identifying Mainshaft Case Measurement
Courtesy of CHRYSLER GROUP, LLC

1. Set mainshaft, input shaft and countershaft into the rear housing. Rotate the shafts to seat bearing in rear housing.
2. Remove mainshaft bearing cup, shims and oiler washer from the front housing.
3. Position Measurement Fixture (special tool #9592, Fixture, End Play) (1) on front housing over the mainshaft bearing cup bore.
4. Loosen the knob (2) on the fixture and lower the shaft onto the mainshaft bearing cup (3) bore shoulder. Then tighten the knob to hold the shaft.
5. Remove the fixture from the front housing.

Fig. 4: Identifying Fixture, Knob & Mainshaft Bearing
Courtesy of CHRYSLER GROUP, LLC

6. Place mainshaft shaft bearing cup on mainshaft bearing.
7. Position Fixture (special tool #9592, Fixture, End Play) (1) on rear housing over the mainshaft bearing (2).
8. Loosen the knob (3) on the fixture (1). This will allow the rod plunger to drop down on the bearing cup.

Fig. 5: Measuring Gap Between Fixture Shaft & Fixture Plunger
Courtesy of CHRYSLER GROUP, LLC

9. Measure the gap (1) between the fixture shaft (2) and the fixture plunger (3). Repeat measurement on the opposite side of the mainshaft cup and bearing. The average of the two measurement, will be the size of

the mainshaft select shim.

10. Install new oil supply washer and select shim in front housing mainshaft bearing cup bore and install bearing cup.

COUNTERSHAFT

Fig. 6: Countershaft Case Measurement
Courtesy of CHRYSLER GROUP, LLC

1. Remove countershaft bearing cup and shims from the rear housing.
2. Position Fixture (special tool #9592, Fixture, End Play) (1) on rear housing over the countershaft bearing cup bore.
3. Loosen the knob (2) on the fixture and lower the shaft onto the countershaft bearing cup (3) bore shoulder. Then tighten the knob to hold the shaft.
4. Remove the fixture from the front housing.

Fig. 7: Positioning Fixture 9592 On Rear Housing Over The Countershaft Bearing
Courtesy of CHRYSLER GROUP, LLC

5. Place countershaft bearing cup on countershaft bearing.
6. Position Fixture (special tool #9592, Fixture, End Play) (1) on rear housing over the countershaft bearing (2).
7. Loosen the knob (3) on the fixture (1). This will allow the rod plunger to drop down on the bearing cup.

Fig. 8: Measuring Gap Between Fixture Shaft & Fixture Plunger
Courtesy of CHRYSLER GROUP, LLC

8. Measure the gap (1) between the fixture shaft (2) and the fixture plunger (3). Repeat measurement on the opposite side of the countershaft cup and bearing. The average of the two measurements, will be the size

of the countershaft select shim.

9. Install select shim in front housing countershaft bearing cup bore and install bearing cup.

REMOVAL

REMOVAL

Fig. 9: Identifying Inner Boot, Shift Tower & Transmission
Courtesy of CHRYSLER GROUP, LLC

1. With vehicle in neutral, position vehicle on hoist.
2. Disconnect battery negative cable.
3. Remove shift boot bezel and slide boot upward on shift lever extension.
4. Remove inner boot (1) from floor pan and remove shift tower (2) from transmission (3).
5. Remove 4WD shift boot if equipped.

Fig. 10: Drain Plug
Courtesy of CHRYSLER GROUP, LLC

6. Remove skid plate, if equipped.
7. Remove drain plug (1) from transmission (2) and drain fluid.

Fig. 11: Marking Manual Transmission Flange & Propeller Shaft Flange
Courtesy of CHRYSLER GROUP, LLC

8. Mark transmission flange (1) and propeller shaft (2) for installation reference before removing propeller shaft. If 4x4 equipped mark transfer case and front propeller shaft before removing shaft.

Fig. 12: Slave Cylinder & Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect harness from clips on transmission housing.
10. Remove transfer case linkage 4x4 equipped.
11. Remove transfer case mounting nuts and remove transfer case 4x4 equipped.
12. Remove slave cylinder (1) mounting nuts (2) and remove cylinder.

Fig. 13: Exhaust Bracket
Courtesy of CHRYSLER GROUP, LLC

13. Remove exhaust bracket (1) bolts and remove bracket on diesel engine.
14. Remove exhaust pipe. Refer to **PIPE, EXHAUST, REMOVAL** .

Fig. 14: Securing Transmission To Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

15. Support engine with adjustable jack stand and wood block.
16. Support and secure transmission (1) to a transmission jack (2) with safety chains.

Fig. 15: Transmission Mount Nuts
Courtesy of CHRYSLER GROUP, LLC

17. Remove transmission mount nuts (1) from crossmember (2).

Fig. 16: Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

18. Remove rear crossmember bolts (2) and remove crossmember with transmission mount.
19. Remove bolts attaching transmission to the engine.
20. Move transmission rearward until input shaft is clear of clutch disc and pressure plate. Then lower jack and remove transmission from under vehicle.

DISASSEMBLY

DISASSEMBLY

Fig. 17: Shift Tower & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Set transmission on rear housing.
2. Remove shift tower bolts (1) and shift tower (2).

Fig. 18: Shifter Boot
Courtesy of CHRYSLER GROUP, LLC

3. Pry off shift tower boot (1) with a screw driver (2).

Fig. 19: Flange Bolt
Courtesy of CHRYSLER GROUP, LLC

4. On 4x2 transmissions shift two shift rails to lock the transmission in two gears. Then remove output shaft flange (1) bolt (2). Remove flange from output shaft with a two jaw puller if necessary.

Fig. 20: Aligning Shift Rails In Neutral Position
Courtesy of CHRYSLER GROUP, LLC

5. Through shift tower opening (1) align shift rails in neutral position (2) and install tie strap to shift rails.

Fig. 21: 5-6 Shift Fork Pivot Pin
Courtesy of CHRYSLER GROUP, LLC

6. Remove 5-6 shift fork pivot pin (1) from both sides of the case.

Fig. 22: Reverse Idler Shaft Pin

9. Remove fourth gear (1) snap ring (2).

Fig. 39: 4th Gear Thrust Washer & Synchronizer Stop Ring
Courtesy of CHRYSLER GROUP, LLC

10. Remove fourth gear thrust washer (1) with Puller (special tool #9594, Remover, Gear & Synchro). Position puller under fourth gear synchronizer stop ring (2).

Fig. 40: Removing 4th Gear Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

11. Install Bridge (special tool #938, Bridge) (1) into Puller (special tool #9594, Remover, Gear & Synchro) (2) and remove fourth gear thrust washer (3).

Fig. 41: Fourth Gear & Bearing
Courtesy of CHRYSLER GROUP, LLC

12. Remove fourth gear (1) and bearing (2).

Fig. 42: Fourth Gear Synchronizer Rings
Courtesy of CHRYSLER GROUP, LLC

13. Remove fourth gear synchronizer rings (1) from 3-4 synchronizer hub (2) and mark installation reference.

Fig. 43: 3-4 Synchronizer Sleeve & Springs
Courtesy of CHRYSLER GROUP, LLC

14. Slowly pull 3-4 synchronizer sleeve (1) up on hub enough to remove detents and springs (2).
15. Remove 3-4 synchronizer sleeve (1) from hub.

Fig. 44: 3-4 Synchronizer Hub Snap Ring
Courtesy of CHRYSLER GROUP, LLC

16. Remove 3-4 synchronizer hub (1) snap ring (2).

Fig. 45: 3-4 Synchronizer Hub & Third Gear Synchronizer Rings
Courtesy of CHRYSLER GROUP, LLC

17. Remove 3-4 synchronizer hub (1) and third gear synchronizer rings (2). Mark components for installation reference.

Fig. 46: Third Gear & Bearing
Courtesy of CHRYSLER GROUP, LLC

18. Remove third gear (1) and bearing (2).

Fig. 47: Reverse Gear & Synchronizer Sleeve
Courtesy of CHRYSLER GROUP, LLC

19. Turn mainshaft and Fixture (special tool #9605, Fixture) and secured in vise.
20. Remove 4x4 mainshaft snap ring.
21. Remove reverse gear synchronizer sleeve (1) from reverse gear (2) synchronizer hub.

Fig. 48: Reverse Gear Synchronizer Hub & Detents
Courtesy of CHRYSLER GROUP, LLC

22. Remove reverse gear synchronizer hub (1) detents (2).

Fig. 49: Removing Mainshaft Bearing
Courtesy of CHRYSLER GROUP, LLC

23. Remove mainshaft bearing (1) with Bridge (special tool #938, Bridge) (2) and bearing Puller (special tool #9647, Puller) (3).

Fig. 50: Positioning Puller Behind Reverse Synchronizer Hub & Outer Blocker Ring
Courtesy of CHRYSLER GROUP, LLC

24. Position puller (1) behind reverse synchronizer hub and outer blocker ring (2).

Fig. 51: Reverse Gear & Bearing
Courtesy of CHRYSLER GROUP, LLC

25. Remove reverse gear (1) and bearing (2).

Fig. 52: Reverse Bearing Race & Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

26. Remove reverse gear bearing race (1) and thrust washer (2). Use Puller (special tool #9646, Puller, Gear) and Bridge (special tool #938, Bridge) on first gear (3) to pull off reverse gear bearing race (1) and thrust washer (2).

Fig. 53: First Gear & Bearing
Courtesy of CHRYSLER GROUP, LLC

27. Remove first gear (1) and bearing (2).

Fig. 54: First Gear Synchronizer Rings & 1-2 Synchronizer Hub
Courtesy of CHRYSLER GROUP, LLC

28. Remove first gear synchronizer rings (1) from 1-2 synchronizer hub (2) and mark for installation reference.

Fig. 55: 1-2 Synchronizer Sleeve & Springs
Courtesy of CHRYSLER GROUP, LLC

29. Slowly pull 1-2 synchronizer sleeve (1) up on hub (2) enough to remove detents and springs (3).

Fig. 56: 1-2 Synchronizer Hub Snap Ring
Courtesy of CHRYSLER GROUP, LLC

30. Remove 1-2 synchronizer hub (1) snap ring (2) and remove hub with second gear synchronizer rings. Mark components for installation reference.

Fig. 57: 2nd Gear
Courtesy of CHRYSLER GROUP, LLC

31. Remove second gear (1) from mainshaft (2).

Fig. 58: 2nd Gear Bearing
Courtesy of CHRYSLER GROUP, LLC

32. Remove second gear bearing (1) from mainshaft (2).

COUNTERSHAFT

Fig. 59: Removing Countershaft Rear Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Bearings are the only component serviced on the countershaft.

1. Remove countershaft rear housing bearing with Puller (special tool #6444, Puller, Bearing/Gear) (1), Plug (special tool #8513A, Insert, Crankshaft) (2), Puller Jaws (special tool #9597, Remover, Bearing) (3),

Puller Collar (special tool #6444-8, Sleeve) (4), Puller Rods (special tool #6444-3, Rod, Long) and Puller Flange (special tool #6444-1, Puller, Base). Position Puller Jaws (special tool #9597, Remover, Bearing) around bearing and puller flange. Position puller collar around the puller jaws. Tighten the puller bolt and remove countershaft bearing.

2. Remove countershaft first/reverse gear bearing oil slinger from countershaft.

Fig. 60: Removing Countershaft Front Housing Bearing
Courtesy of CHRYSLER GROUP, LLC

3. Remove countershaft front housing bearing with Puller (special tool #6444, Puller, Bearing/Gear) (1), Puller Collar (special tool #6444-8, Sleeve) (2), Puller Jaws (special tool #9597, Remover, Bearing) (3), Puller Rods (special tool #6444-3, Rod, Long) and Puller Flange (special tool #6444-1, Puller, Base). Position puller jaws around bearing and puller flange. Position puller collar around the puller jaws. Tighten the puller bolt and remove countershaft bearing.

INPUT SHAFT

Fig. 61: Input Shaft & Mainshaft Bearing Seal
Courtesy of CHRYSLER GROUP, LLC

1. Position input shaft (1) mainshaft bearing seal (2) in a vice then twist input shaft (1) out of the seal (2).

Fig. 62: Removing Input Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

2. Remove input shaft (1) bearing with Puller (special tool #C-293-PA, Puller, Press) (2) and Adapters (special tool #C-293-47, Block Set, Puller) (3).
3. Remove input shaft mainshaft bearing gasket.

REAR HOUSING

Fig. 63: Removing Countershaft & Mainshaft Bearing Cups
Courtesy of CHRYSLER GROUP, LLC

1. Remove countershaft bearing cup and mainshaft bearing cup with Puller (special tool #9593, Remover, Bearing Cup) (1) installed in cup (2).

Fig. 64: Identifying Remover, Puller & Remover Nut
Courtesy of CHRYSLER GROUP, LLC

2. Install Remover (special tool #8915, Brace) (1) on puller (2) and tighten remover nut (3) to pull cups out of the housing.

Fig. 65: Output Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

3. Remove output shaft seal (1) from housing (2) with seal pick.

FRONT HOUSING

Fig. 66: Front Housing Cup Remover
Courtesy of CHRYSLER GROUP, LLC

1. Remove countershaft bearing cup and mainshaft bearing cup with Puller (special tool #9593, Remover, Bearing Cup) (1) installed in cup (2).

Fig. 67: Pulling Front Housing Cups
Courtesy of CHRYSLER GROUP, LLC

2. Install Remover (special tool #8915, Brace) (1) on puller (2) and tighten remover nut (3) to pull cups out of the housing. Then remove end-play shims from bearing bores and oil supply washer from mainshaft bearing bore.

Fig. 68: Input Shaft Seal Retainer & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove input shaft retainer (1) bolts (2) and remove retainer.

Fig. 69: Input Shaft Seal & Retainer Bore
Courtesy of CHRYSLER GROUP, LLC

4. Remove input shaft seal (1) from retainer bore (2) with a seal pick.

CLEANING

CLEANING

Clean gears, shafts, shift components and transmission housings with a standard parts cleaning solvent. Do not use acid or corrosive base solvents. Dry all parts except bearings with compressed air.

Clean shaft bearings with a mild solvent such as MOPAR® degreasing solvent, Gunk® or similar solvents. Do not dry the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

INSPECTION

Fig. 70: Identifying Countershaft Teeth & Bearings
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth.**

Bearings: Inspect for worn, chipped, cracked, flat-spotted or brinnelled.

Gears: Inspect for worn, chipped or cracked teeth. Inspect bearing surfaces for wear or flat-spotted.

Mainshaft: Inspect for worn splines, snap ring grooves and threads.

Countershaft: Inspect all gears for worn, chipped or cracked teeth (1). Inspect all bearings (2) and bearing surfaces for ware or flat-spotted. **The countershaft is serviced as an assembly, except for bearings.**

Oil slinger: Inspect first/reverse oil slinger for cracks.

Fig. 71: Identifying Input Shaft, Bearing, Fifth Gear & Splines
Courtesy of CHRYSLER GROUP, LLC

Synchronizer components: Inspect for worn, chipped or cracked teeth and burned or flaking off friction material. **Synchronizer are serviced as an assembly.**

Input Shaft: Inspect shaft (1), bearing (2) surfaces for wear or flat-spotted. Inspect fifth gear (3) for worn, chipped or cracked teeth. Inspect splines (4) for wear and chips.

Fig. 72: Identifying Shift Forks & Rails
Courtesy of CHRYSLER GROUP, LLC

Shift forks and Rails: Inspect shift forks (1) and shoes for wear and distortion. Check fit of fork shoes in synchronizer sleeve to ensure parts fit and work smoothly. Inspect shift rails (2), for wear and distortion. **5-6**

shift fork shoes (3) are serviced separately. Inspect 5-6 shift fork pivot pin O-rings.

Fig. 73: Identifying Front Shift Rail Guide & Bearing Oil Baffle
Courtesy of CHRYSLER GROUP, LLC

Front Housing: Inspect sealing and mating surfaces are free of burrs and nicks. Inspect alignment dowels are tight and in good condition. Inspect shift rail guide (1) for wear and verify bearing oil baffle (2) is not bent or damaged.

Fig. 74: Identifying Rear Shift Rail Guide & Bearing Oil Baffle
Courtesy of CHRYSLER GROUP, LLC

Rear Housing: Inspect sealing and mating surfaces are free of burrs and nicks. Inspect shift rail guide (1) for wear and verify bearing oil baffle (2) is not bent or damaged.

Fig. 75: Identifying Bearing Slide Surface & Sealing Surface
Courtesy of CHRYSLER GROUP, LLC

Input Retainer: Inspect release bearing slide surface (2) and sealing surface.

ASSEMBLY

ASSEMBLY

WARNING: Use welding gloves or tongs when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: A bearing heater is used to assembly some components. Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100° - 150° Celsius (212° Min. - 300° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for and extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

INPUT SHAFT

Fig. 76: Heating Bearing
Courtesy of CHRYSLER GROUP, LLC

1. Heat input shaft bearing (1) on bearing heater (2) to a maximum of 150 Celsius (300° Fahrenheit).

Fig. 77: Input Shaft & Bearing
Courtesy of CHRYSLER GROUP, LLC

2. Using welding gloves or tongs, install bearing (2) on input shaft (1).

Fig. 78: Input Shaft Mainshaft Bearing Seal
Courtesy of CHRYSLER GROUP, LLC

3. Push input shaft mainshaft bearing seal (1) on the end of fifth gear (2).

COUNTERSHAFT

Fig. 79: Heating Bearing
Courtesy of CHRYSLER GROUP, LLC

1. Install first/reverse gear bearing oil slinger on the rear housing end of the countershaft.
2. Heat rear housing countershaft bearing (1) on bearing heater (2) to a maximum of 150 Celsius (300° Fahrenheit).

Fig. 80: Installing Countershaft Bearing On Countershaft
Courtesy of CHRYSLER GROUP, LLC

3. Using welding gloves or tongs, install countershaft bearing (1) on countershaft (2).

Fig. 81: Heating Bearing
Courtesy of CHRYSLER GROUP, LLC

4. Heat front housing countershaft bearing (1) on bearing heater (2) to a maximum of 150 Celsius (300° Fahrenheit).

Fig. 82: Installing Front Housing Countershaft Bearing On Countershaft
Courtesy of CHRYSLER GROUP, LLC

5. Using welding gloves or tongs, install front housing countershaft bearing (1) on countershaft (2).

MAINSHAFT

Fig. 83: 2nd Gear Bearing
Courtesy of CHRYSLER GROUP, LLC

1. Position mainshaft in Fixture (special tool #9605, Fixture) mounted in vise.
2. Install second gear bearing (1) on mainshaft (2).

Fig. 84: 2nd Gear
Courtesy of CHRYSLER GROUP, LLC

3. Install second gear (1) on mainshaft (2).

Fig. 85: Installing Second Gear Stop Ring
Courtesy of CHRYSLER GROUP, LLC

4. Install second gear stop ring (1) with teeth pointing up on second gear (2).

Fig. 86: Installing Second Gear Inner Friction Ring

5. Install second gear inner friction ring (1) on stop ring (2).

Fig. 87: Installing Second Gear Outer Friction Ring
Courtesy of CHRYSLER GROUP, LLC

6. Install second gear outer friction ring (1) on stop ring (2).

Fig. 88: Installing Second Gear Blocker Ring
Courtesy of CHRYSLER GROUP, LLC

7. Install second gear blocker ring (1) on stop ring (2).

Fig. 89: Installing 1-2 Synchronizer Hub
Courtesy of CHRYSLER GROUP, LLC

8. Install 1-2 synchronizer hub (1) on mainshaft and synchronizer rings (2).

Fig. 90: Installing 1-2 Synchronizer Hub Snap Ring
Courtesy of CHRYSLER GROUP, LLC

9. Install 1-2 synchronizer hub (1) and hub snap ring (2).

Fig. 91: Synchronizer Detent & Spring
Courtesy of CHRYSLER GROUP, LLC

10. Install 1-2 synchronizer sleeve (3) on the hub (2) and push sleeve to the bottom of the hub.

NOTE: **1-2 synchronizer sleeve (3) and hub (2) have one small tooth. They must be aligned to install synchronizer sleeve (3) on hub (2).**

11. Install 1-2 synchronizer detents and springs (1) into synchronizer hub (2) slots. Then push detents behind synchronizer sleeve (3).

Fig. 92: Installing First Gear Blocker Ring
Courtesy of CHRYSLER GROUP, LLC

12. Install first gear blocker ring (1) on synchronizer hub (2).

Fig. 93: Installing First Gear Outer Friction Ring
Courtesy of CHRYSLER GROUP, LLC

13. Install first gear outer friction ring (1) on synchronizer hub (2).

Fig. 94: Installing First Gear Inner Friction Ring
Courtesy of CHRYSLER GROUP, LLC

14. Install first gear inner friction ring (1) on synchronizer hub (2).

Fig. 95: Installing First Gear Stop Ring
Courtesy of CHRYSLER GROUP, LLC

15. Install first gear stop ring (1) with teeth pointing down on synchronizer rings and hub (2).
16. Hold first gear stop ring (1) on synchronizer rings (2) and center 1-2 synchronizer sleeve on the hub.

Fig. 96: First Gear & Bearing
Courtesy of CHRYSLER GROUP, LLC

17. Install first gear (1) and bearing (2).

Fig. 97: Heating Thrust Washer & Reverse Gear Bearing Race
Courtesy of CHRYSLER GROUP, LLC

18. Heat thrust washer (1) and reverse gear bearing race (2) on bearing heater to a maximum of 150 Celsius (300° Fahrenheit).

Fig. 98: Reverse Bearing Race & Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

19. Using welding gloves or tongs, install thrust washer (2) and reverse gear bearing race (1) on mainshaft.

Fig. 99: Reverse Gear & Bearing
Courtesy of CHRYSLER GROUP, LLC

20. Install reverse gear (1) and bearing (2).

Fig. 100: Installing Reverse Inner Blocker Ring
Courtesy of CHRYSLER GROUP, LLC

21. Install reverse gear inner friction ring (1) on reverse gear (2).

Fig. 101: Installing Reverse Gear Outer Friction Ring

22. Install reverse gear outer friction ring (1) on inner blocker ring (2).

Fig. 102: Installing Reverse Gear Outer Blocker Ring
Courtesy of CHRYSLER GROUP, LLC

23. Install reverse gear blocker ring (1) on friction ring (2).

Fig. 103: Installing Reverse Gear Synchronizer Hub & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

24. Install reverse gear synchronizer hub (1) with snap ring (2) on the top on mainshaft.

Fig. 104: Heating Bearing
Courtesy of CHRYSLER GROUP, LLC

25. Heat mainshaft bearing (1) on bearing heater (2) to a maximum of 150 Celsius (300° Fahrenheit).

Fig. 105: Installing Mainshaft Bearing On Mainshaft
Courtesy of CHRYSLER GROUP, LLC

26. Using welding gloves or tongs, install mainshaft (1) bearing (2) on mainshaft.
27. On 4x4 transmission install mainshaft (1) bearing (2) snap ring.

Fig. 106: Reverse Gear Synchronizer Hub & Detents
Courtesy of CHRYSLER GROUP, LLC

28. Install reverse synchronizer hub (1) detents (2).

Fig. 107: Reverse Gear & Synchronizer Sleeve
Courtesy of CHRYSLER GROUP, LLC

29. Install reverse gear (2) synchronizer sleeve (1) on hub and center sleeve on hub.

Fig. 108: Installing Third Gear Bearing On Mainshaft
Courtesy of CHRYSLER GROUP, LLC

30. Turn mainshaft and Fixture (special tool #9605, Fixture) over and secure in vise.
31. Install third gear bearing (1) on mainshaft (2).

Fig. 109: Installing Third Gear On Mainshaft
Courtesy of CHRYSLER GROUP, LLC

32. Install third gear (1) on mainshaft (2).

Fig. 110: Installing Third Gear Stop Ring
Courtesy of CHRYSLER GROUP, LLC

33. Install third gear stop ring (1) with teeth pointing up on third gear (2).

Fig. 111: 3rd Gear Inner Friction Ring
Courtesy of CHRYSLER GROUP, LLC

34. Install third gear inner friction ring (1) on stop ring (2).

Fig. 112: 3rd Gear Outer Friction Ring
Courtesy of CHRYSLER GROUP, LLC

35. Install third gear outer friction ring (1) on stop ring (2).

Fig. 113: 3rd Gear Blocker Ring
Courtesy of CHRYSLER GROUP, LLC

36. Install third gear blocker ring (1) on stop ring (2).

Fig. 114: Installing 3-4 Synchronizer Hub & Third Gear Synchronizer Rings
Courtesy of CHRYSLER GROUP, LLC

37. Install 3-4 synchronizer hub (1) on third gear synchronizer rings (2).

Fig. 115: 3-4 Synchronizer Hub Snap Ring
Courtesy of CHRYSLER GROUP, LLC

38. Install third gear synchronizer hub (1) snap ring (2).

Fig. 116: Synchronizer Detent & Spring
Courtesy of CHRYSLER GROUP, LLC

39. Install 3-4 synchronizer sleeve (3) on hub (2) and push sleeve to the bottom of the hub.

NOTE: **3-4 synchronizer sleeve (3) and hub (2) have one small tooth. They must be aligned to install synchronizer sleeve (3).**

40. Install 3-4 synchronizer detents and springs (1) into synchronizer hub (2) slots. Then push detents (1) behind synchronizer sleeve (3).

Fig. 117: Installing Fourth Gear Outer Blocker Ring
Courtesy of CHRYSLER GROUP, LLC

41. Install fourth gear blocker ring (1) on synchronizer hub (2).

Fig. 118: 4th Outer Friction Ring
Courtesy of CHRYSLER GROUP, LLC

42. Install fourth gear outer friction ring (1) on synchronizer hub (2).

Fig. 119: Installing Fourth Gear Inner Friction Ring
Courtesy of CHRYSLER GROUP, LLC

43. Install fourth gear inner friction ring (1) on synchronizer hub (2).

Fig. 120: Installing Fourth Gear Stop Ring
Courtesy of CHRYSLER GROUP, LLC

44. Install fourth gear stop ring (1) with teeth pointing down on synchronizer hub (2).
45. Hold fourth gear stop ring (1) on synchronizer hub (2) and center 3-4 synchronizer sleeve on hub.

Fig. 121: Fourth Gear & Bearing
Courtesy of CHRYSLER GROUP, LLC

46. Install fourth gear (1) and bearing (2).

Fig. 122: Heating Fourth Gear Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

47. Heat fourth gear thrust washer (1) on bearing heater (2) to a maximum of 150 Celsius (300° Fahrenheit).

Fig. 123: Installing Fourth Gear Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

48. Using welding gloves or tongs, install fourth gear (1) thrust washer (2).

Fig. 124: Fourth Gear Snap Ring
Courtesy of CHRYSLER GROUP, LLC

49. Install fourth gear (1) snap ring (2).

Fig. 125: Sixth Gear & Bearing
Courtesy of CHRYSLER GROUP, LLC

50. Install sixth gear (1) and bearing (2) on mainshaft (3).

Fig. 126: Installing Sixth Gear Stop Ring
Courtesy of CHRYSLER GROUP, LLC

51. Install sixth gear stop ring (1) on sixth gear (2).

Fig. 127: Installing Sixth Gear Friction Ring
Courtesy of CHRYSLER GROUP, LLC

52. Install sixth gear friction ring (1) on stop ring (2).

Fig. 128: Installing 5-6 Synchronizer Hub
Courtesy of CHRYSLER GROUP, LLC

53. Install 5-6 synchronizer hub (1) on sixth gear synchronizer rings (2).

Fig. 129: Heating Bearing
Courtesy of CHRYSLER GROUP, LLC

54. Heat mainshaft bearing (1) on bearing heater to a maximum of 150 Celsius (300° Fahrenheit).

Fig. 130: Mainshaft Bearing Snap Ring
Courtesy of CHRYSLER GROUP, LLC

55. Using welding gloves or tongs, install mainshaft bearing (1) on mainshaft.
56. Install mainshaft bearing (1) snap ring (2).

Fig. 131: 5-6 Synchronizer Sleeve
Courtesy of CHRYSLER GROUP, LLC

57. Install 5-6 synchronizer sleeve (1) on hub (2) and push sleeve to the bottom of the hub.

Fig. 132: Synchronizer Detent & Spring
Courtesy of CHRYSLER GROUP, LLC

58. Install 5-6 synchronizer detents and springs (1) into synchronizer hub (2) slots. Then push detents behind synchronizer sleeve (3).

Fig. 133: Installing Fifth Gear Friction Ring
Courtesy of CHRYSLER GROUP, LLC

59. Install fifth gear friction ring (1) onto hub (2).

Fig. 134: Installing Fifth Gear Blocker Ring
Courtesy of CHRYSLER GROUP, LLC

60. Install fifth gear blocker ring with teeth pointing down (1) onto hub (2).
61. Hold fifth gear blocker ring (1) onto hub (2) and center 5-6 synchronizer sleeve on hub (2).

REAR HOUSING

Fig. 135: Installing Countershaft Cup
Courtesy of CHRYSLER GROUP, LLC

1. Install countershaft bearing cup with Installer (special tool #9589, Installer, Bearing Cup) (1) and Handle (special tool #C-4171, Driver Handle, Universal) (2).

Fig. 136: Installing Mainshaft Cup
Courtesy of CHRYSLER GROUP, LLC

2. Install mainshaft bearing cup with Installer (special tool #9588, Installer, Bearing Cup) (1) and Handle (special tool #C-4171, Driver Handle, Universal) (2).
3. Install output shaft seal with Installer (special tool #9598, Installer, Seal).

Fig. 137: Installing Reverse Idler Bearing Into Idler Gear
Courtesy of CHRYSLER GROUP, LLC

4. Install reverse idler bearing (1) into idler gear (2).

Fig. 138: Reverse Idle Gear
Courtesy of CHRYSLER GROUP, LLC

5. Install idler gear (1) with **taller thrust face up** into rear housing (2) and off to the side. For mainshaft/countershaft installation clearance.

Fig. 139: Identifying Strap & Shift Rails
Courtesy of CHRYSLER GROUP, LLC

6. Tie strap (2) shift rails (1) together.

Fig. 140: Identifying Shift Forks
Courtesy of CHRYSLER GROUP, LLC

7. Install reverse (1), 1-2 (2) and 3-4 (3) shift rails and forks as and assembly on synchronizer sleeves.

Fig. 141: Countershaft, Mainshaft & Shift Rails
Courtesy of CHRYSLER GROUP, LLC

8. Install mainshaft with shift rails (2) into the rear housing. Tilt the mainshaft then tilt the countershaft (1) into the housing.

Fig. 142: Identifying Oil Slinger & Mainshaft Gears
Courtesy of CHRYSLER GROUP, LLC

9. Position first/reverse oil slinger (1) between the mainshaft first (2) and reverse gears, then straighten the shafts in the housing.

CAUTION: Oil slinger is fragile and can crack during installation. Failure to follow these instructions will result in cracking the oil slinger and lack of oil to first/reverse bearing.

NOTE: The transmission may or not be equipped with the oil slinger. Service replacement parts will come with an oil slinger. It is not necessary to remove the oil slinger if the original part was not equipped with an oil slinger.

Fig. 143: Reverse Idler Shaft
Courtesy of CHRYSLER GROUP, LLC

10. Position reverse idler gear and install idler shaft (2) with bolt (1).

Fig. 144: Reverse Idler Shaft Pin
Courtesy of CHRYSLER GROUP, LLC

11. Install reverse idler gear shaft bolt (1) into rear housing (2) and tighten to 58 N.m (43 ft. lbs.).

Fig. 145: Installing 5-6 Shift Fork Shoe Narrow Ends
Courtesy of CHRYSLER GROUP, LLC

12. Install 5-6 shift shoe narrow ends (1) into the 5-6 synchronizer sleeves (2).

Fig. 146: 5-6 Shift Fork
Courtesy of CHRYSLER GROUP, LLC

13. Install 5-6 shift fork (1) into the shift rail.

FRONT HOUSING

Fig. 147: Installing Input Shaft Seal Front Housing Bore
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If mainshaft/bearings or countershaft/bearings are replaced, end-play measurements must taken to ensure proper bearing preload. Failure to follow these instructions will result in bearing damage.

1. Install input shaft seal front housing bore (1) with Installer (special tool #9595, Installer, Seal) (2).

Fig. 148: Input Shaft Seal Retainer & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install input shaft retainer (1) and tighten bolts (2) to 23 N.m (17 ft. lbs.).

Fig. 149: Installing Countershaft Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

3. Install select end play shims into the countershaft bearing cup bore.
4. Install countershaft bearing cup with Installer (special tool #9589, Installer, Bearing Cup) (1) and Handle (special tool #C-4171, Driver Handle, Universal) (2).

Fig. 150: Installing Mainshaft Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

5. Install input shaft bearing oil supply washer and select end play shims into mainshaft bearing cup bore.
6. Install mainshaft bearing cup with Installer (special tool #9588, Installer, Bearing Cup) (1) and Handle (special tool #C-4171, Driver Handle, Universal) (2).

Fig. 151: Front & Rear Housing
Courtesy of CHRYSLER GROUP, LLC

7. Apply Mopar™ Gasket Maker to the rear housing sealing surface.
8. Install front housing (1) onto the rear housing (2).
9. Install housing bolts and tighten to 58 N.m (43 ft. lbs.).

Fig. 152: 5-6 Shift Fork Pivot Pin
Courtesy of CHRYSLER GROUP, LLC

10. Install 5-6 shift fork pin bolts (1) into housing and tighten to 58 N.m (43 ft. lbs.).

Fig. 153: Aligning Shift Rails In Neutral Position
Courtesy of CHRYSLER GROUP, LLC

11. Remove shift rail (2) tie strap.

Fig. 154: Flange
Courtesy of CHRYSLER GROUP, LLC

12. On a 4x2 transmission shift two shift rails to lock the transmission in two gears. Then install flange (1) on output shaft (2) and tighten bolt to 260 N.m (190 ft. lbs.). Return shift rails to neutral position.

Fig. 155: Shifter Boot & Shift Tower
Courtesy of CHRYSLER GROUP, LLC

13. Push shift tower boot (1) onto shift tower (2).

Fig. 156: Shift Tower & Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Apply Mopar™ Gasket Maker to the shift tower opening.
15. Install shift tower (2) and tighten bolts (1) to 23 N.m (17 ft. lbs.).

Fig. 157: Back-Up Lamp Switch
Courtesy of CHRYSLER GROUP, LLC

16. Install back up lamp switch (1) and bolt (2).

INSTALLATION

INSTALLATION

Fig. 158: Identifying Lubrication Points
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The release fork is not symmetrical and must be installed with the slots and part number stamping toward the ball stud side. Part number stamping will be right side up when installed correctly. Failure to install the release fork correctly will result in clutch slippage and damage.

1. Clean transmission front housing mounting surface.
2. Apply light coat of Mopar high temperature bearing grease or equivalent to contact surfaces of following components:
    - Release fork (1) ball stud (2)
    - Release bearing slide surface (3)
    - Input shaft splines (4)
    - Release bearing bore (5)
    - Propeller shaft slip yoke.

Fig. 159: Transmission Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Support and secure transmission to jack.
4. Raise and align transmission input shaft with clutch disc, then slide transmission into place.
5. Install exhaust bracket diesel engine.
6. Verify front housing is fully seated.
    - Diesel Engine: Install transmission bolts (1, 2) and tighten to 41 N.m (30 ft. lbs.). Tighten the bolts with washers (2) into the transmission to 68 N.m (50 ft. lbs.).

Fig. 160: Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Install crossmember and tighten nuts (2) to 102 N.m (75 ft. lbs.).
8. Install transmission mount bolts (1) and tighten to 68 N.m (50 ft. lbs.).

Fig. 161: Slave Cylinder & Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

9. Connect transmission harnesses to clips on case and connect switches.
10. Install slave cylinder and tighten cylinder nuts to 23 N.m (200 in. lbs.).
11. Install transfer case and transfer case linkage 4x4 equipped.
12. Remove transmission jack.

Fig. 162: Marking Manual Transmission Flange & Propeller Shaft Flange
Courtesy of CHRYSLER GROUP, LLC

13. Install propeller shaft/shafts with reference marks aligned.

Fig. 163: Exhaust Bracket
Courtesy of CHRYSLER GROUP, LLC

14. Install exhaust pipe. Refer to **PIPE, EXHAUST, INSTALLATION** .
15. Install exhaust bracket (1) and bolts.

Fig. 164: Fill Plug
Courtesy of CHRYSLER GROUP, LLC

16. Remove fill plug (1) on transmission (2) and fill to approximately 16 mm (0.625 inch) from the bottom of the fill hole.
17. Install fill plug and tighten to 57 N.m (42 ft. lbs.).
18. Connect battery negative cable.
19. Install shift lever extension on shift tower and lever assembly.
20. Slide boot down on shift lever extension and install shift boot bezel and screws.
21. Install skid plate, if equipped.

DIAGNOSIS AND TESTING

P0122-TPS/APP CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The three wire (Throttle Position Sensor (TPS) provides the Powertrain Control Module (PCM) with an input signal voltage that represents the throttle blade position of the throttle body. The Throttle Position Sensor (TPS) is connected to the throttle blade shaft. As the position of the throttle blade changes, the output voltage of the TPS changes.

The PCM supplies approximately 5.0 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range from 0.26 of a volt at minimum throttle opening (idle), to 4.49 volts at maximum opening (wide open throttle).

The Accelerator Pedal Position Sensor (APPS) is a linear potentiometer. It provides the PCM/ECM with a voltage signal proportional to the angle, or position of the accelerator pedal. The APPS signal along with inputs from other sensors is used by the PCM/ECM to calculate the throttle plate position.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC will set if the monitored TPS voltage drops below.078 of a volt for the period of 0.48 of a second.

POSSIBLE CAUSES

Possible Causes
RELATED ENGINE TPS/APPS DTCS PRESENT POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF RELATED ENGINE TPS/APPS DTCS ARE PRESENT**
    1. With the scan tool, read Engine DTCs.

Are there any Engine TPS/APPS DTCs present?

Yes

- Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 2.

2. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.
   2. With the scan tool, erase PCM DTCs and the Event Data.

      NOTE: Clearing DTCs does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults and may cause poor shift quality until those values are relearned.

   3. Using the Event Data recorded earlier, test drive the vehicle while trying to duplicate the operating conditions in which the DTC originally set.
   4. With the scan tool, read DTCs.

      Did this DTC reset during the road test?

      Yes

      - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

      - Go To 3.

3. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wiring and connectors while checking for shorted and open circuits.

4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0123-TPS/APP CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The three wire Throttle Position Sensor (TPS) provides the PCM with an input signal voltage that represents the throttle blade position of the throttle body. The Throttle Position Sensor (TPS) is connected to the throttle blade shaft. As the position of the throttle blade changes, the output voltage of the TPS changes.

The PCM supplies approximately 5.0 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range from 0.26 of a volt at minimum throttle opening (idle), to 4.49 volts at maximum opening (wide open throttle).

The Accelerator Pedal Position Sensor (APPS) is a linear potentiometer. It provides the PCM/ECM with a voltage signal proportional to the angle, or position of the accelerator pedal. The APPS signal along with inputs from other sensors is used by the PCM/ECM to calculate the throttle plate position.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC will set if the monitored TPS voltage rises above 4.94 volts for the period of 0.48 of a second.

POSSIBLE CAUSES

Possible Causes
RELATED ENGINE TPS/APPS DTCS PRESENT POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINING IF RELATED ENGINE TPS/APPS DTCS ARE PRESENT**
   1. With the scan tool, check Engine DTCs, this includes all one trip failures.

      Are there any Engine TPS/APPS DTCs present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
   1. With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.
   2. With the scan tool, erase PCM DTCs and the Event Data.

      NOTE: Clearing DTCs does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults and may cause poor shift quality until those values are relearned.

   3. Using the Event Data recorded earlier, test drive the vehicle while trying to duplicate the operating conditions in which the DTC originally set.
   4. With the scan tool, read DTCs.

      Did this DTC reset during the road test?

      Yes

      - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
      - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

      No

- Go To 3.

3. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wiring and connectors while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Test Complete.

P0124-TPS/APP INTERMITTENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The three wire Throttle Position Sensor (TPS) provides the Powertrain Control Module (PCM) with an input signal voltage that represents the throttle blade position of the throttle body. The Throttle Position Sensor (TPS) is connected to the throttle blade shaft. As the position of the throttle blade changes, the output voltage of the TPS changes.

The PCM supplies approximately 5.0 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range from 0.26 of a volt at minimum throttle opening (idle), to 4.49 volts at maximum opening (wide open throttle).

The Accelerator Pedal Position Sensor (APPS) is a linear potentiometer. It provides the PCM/ECM with a voltage signal proportional to the angle, or position of the accelerator pedal. The APPS signal along with inputs from other sensors is used by the PCM/ECM to calculate the throttle plate position.

WHEN MONITORED:

Continuously with the ignition on and engine running.

SET CONDITION:

This DTC will set if the monitored TPS throttle angle between the angles of 6° and 120° and the degree change

is greater than 5° within a period of less than 7.0 msec.

POSSIBLE CAUSES

Possible Causes
RELATED TPS ENGINE DTCS PRESENT
THROTTLE POSITION SENSOR (TPS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINING IF RELATED ENGINE TPS DTCS ARE PRESENT**
    1. With the scan tool, read Engine DTCs.

       Are there any Engine TPS/APPS DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **CHECK IF THE DTC IS CURRENT**
    1. With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.
    2. With the scan tool, erase PCM DTCs and the Event Data.

       NOTE: Clearing DTCs does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults and may cause poor shift quality until those values are relearned.

    3. Using the Event Data recorded earlier, test drive the vehicle while trying to duplicate the operating conditions in which the DTC originally set.
    4. With the scan tool, read DTCs.

       Did this DTC reset during the road test?

       Yes

- Go To 3.

No

- Go To 4.

3. **CHECK THROTTLE POSITION SENSOR OPERATION**
    1. Ignition On, Engine Not Running.
    2. With the scan tool, under Transmission Sensors, monitor the TPS voltage in the following step.
    3. Slowly open and close the throttle while checking for erratic voltage changes.
    4. If equipped with ETC, use the ETC Throttle Follower test in the scan tool to check for erratic voltage changes.

    Was the TPS voltage change smooth and consistent?

    Yes

    - Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** and **MODULE, POWERTRAIN CONTROL, 6.7L DIESEL [ETJ], REMOVAL** .
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

    No

    - Replace the Throttle Position Sensor in accordance with the Service Information.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

4. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wiring and connectors while checking for shorted and open circuits.
    4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Test Complete.

P0218-HIGH TEMPERATURE OPERATION ACTIVATED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The DTC is intended as an informational DTC to aid the technician in determining the root cause of a customer driveability issue. The DTC is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler is needed to support the customers driving behavior.

WHEN MONITORED:

Whenever the engine is running.

SET CONDITION:

Immediately after a Overheat shift schedule is activated when the Transmission temperature exceeds 116° C or 240° F.

POSSIBLE CAUSES

Possible Causes
HIGH TEMPERATURE OPERATION ACTIVATED
TORQUE CONVERTER CLUTCH SLIPPING / NOT ACTIVATING
OPERATING VEHICLE WITH TRANSMISSION IN LIMP-IN MODE FOR AN EXTENDED PERIOD OF TIME
EXCESSIVE TIME IDLING IN GEAR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **HIGH TEMPERATURE OPERATION**
    1. This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints.
    2. This DTC indicates that the transmission has been operating in the "Overheat" shift schedule which may generate a customer complaint.
    3. The customer driving patterns may indicate the need for an additional transmission oil cooler.
    4. Verify proper Engine cooling system operation which would affect proper transmission operation.
    5. Verify proper torque converter clutch operation.

6. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Repair

- Repair the cause of transmission overheating. Refer to the Service Information for the proper repair procedure. Make sure to check for any Service Bulletins pertaining to this problem. Refer to **DIAGNOSIS AND TESTING** .
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

P0562-BATTERY VOLTAGE LOW

Fig. 1: TCM Power Control Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Friction element distress could result from an insufficient supply voltage to properly control the solenoids. To prevent this possibility, the battery voltage is monitored and the system is placed in logical limp-in if the battery voltage drops below the limit.

WHEN MONITORED:

With the engine running and the Powertrain Control Module (PCM) has requested the Totally Integrated Power Module (TIPM) to activate the Transmission Control Output circuit.

SET CONDITION:

If the battery voltage of the Transmission Output circuit(s) to the PCM is less than 10.0 volts for the period of 15 seconds. Note: P0562 generally indicates a gradually falling battery voltage or a resistive connection(s) to the PCM. The DTC will also set if the battery voltage sensed at the PCM is less than 6.5-volts for 200ms or where the Transmission Output circuits are less than 7.2-volts for 200ms.

POSSIBLE CAUSES

Possible Causes
RELATED CHARGING SYSTEM DTCS
(Z908) GROUND CIRCUITS OPEN OR HIGH RESISTANCE
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **RELATED CHARGING SYSTEM DTCS**
    1. With the scan tool, read Powertrain Control Module (PCM) DTCs.

       Are there any related Charging System DTCs also present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure. NOTE: After repairing the Engine Charging System DTCs, perform the Transmission Verification test to verify the transmission control system was not damaged.
       - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To 2.

2. **CHECK FOR TIPM DTCS**

NOTE: Generator, battery, and charging system must be fully functional before performing this test.

1. With the scan tool, read TIPM DTCs.

   Are there any TIPM TCM Power Control Circuit DTCs present.

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Go To 3.

3. **CHECK IF THE DTC IS CURRENT**

1. With the scan tool, read DTCs.

   Is the status Active or is the Starts Since Set counter set at 0 for this DTC?

   Yes

   - Go To 4.

   No

   - Go To 7.

4. **CHECK THE (Z908) GROUND CIRCUITS**

Fig. 2: Checking Ground Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the PCM C4 harness connector and connect the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the (special tool #8815A, Kit, NGC, 38 Position) to perform diagnosis.

3. Using a 12-volt test light connected to 12-volts, check the PCM (Z908) Ground circuits at the

appropriate terminals of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly for all of the Ground circuits?

Yes

- Go To 5.

No

- Repair the (Z908) Ground circuit(s) for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

5. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT**

Fig. 3: Checking Transmission Control Output Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Transmission Solenoid/TRS Assembly harness connector.
3. Ignition on, engine not running.
4. With the scan tool under TIPM, actuate the Transmission.
5. Using a 12-volt test light connected to ground, check all (T16) Transmission Control Output circuits at the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminals of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

NOTE: **The (T16) Transmission Control Output circuit branches off to both Transmission Solenoid/TRS Assembly and the PCM.**

Does the test light illuminate brightly while cycling on and off on all (T16) Transmission Control Output circuits?

Yes

- Go To 6.

No

- Repair the (T16) Transmission Control Output circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

6. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN**

Fig. 4: Checking Transmission Control Output Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off to the lock position.
2. Disconnect the TIPM C2 harness connector.
3. Measure the resistance of the (T16) Transmission Control Output circuit between the TIPM C2 harness connector and both the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminals of the PCM Pinout Box (special tool #8815A, Kit, NGC, 38 Position).

   Is the resistance above 5.0 Ohms on any circuit?

   Yes

- Repair the (T16) Transmission Control Output circuit for an open or high resistance.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM in accordance with the Service Information. With the scan tool, perform Quick Learn.
- Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

   Where there any problems found?

   Yes

   - Repair as necessary.
   - Refer to **STANDARD PROCEDURE** and perform the 545RFE TRANSMISSION VERIFICATION TEST.

   No

   - Test Complete.

P0602-CONTROL MODULE PROGRAMMING ERROR/NOT PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION
